of plants, lions, leopards, or, still more frequently, lithe-necked wyvers. John of Segrave in 1301 flanks his shields with two of the sheaves of the older coat of Segrave: William Marshal of Hingham does the like with his two marshal's staves. Henry of Lancaster at the same time shows on his seal a shield and a helm crested with a wyver, with two like wyvers ranged on either side of the shield as "supporters." It is uncertain at what time in the 14th century these various fashions crystallize into the recognized use of beasts, birds, reptiles, men or inanimate objects, definitely chosen as "supporters" of the shield, and not to be taken as the ornaments suggested by the fancy of the seal engraver. That supporters originate in the decoration of the seal there can be little doubt. Some writers, the learned Menétrier among them, will have it that they were first the fantastically clad fellows who supported and displayed the knight's shield at the opening of the tournament. If the earliest supporters were wild men, angels or Saracens, this theory might be defended; but lions, boars and talbots, dogs and trees are guises into which a man would put himself with difficulty. By the middle of the 14th century we find what are clearly recognizable as supporters. These, as in a lesser degree the crest, are often personal rather than hereditary, being changed generation by generation. The same person is found using more than one pair of them. The kings of France have had angels as supporters of the shield of the fleurs de lys since the 15th century, but the angels have only taken their place as the sole royal supporters since the time of Louis XIV. Sovereigns of England from Henry IV. to Elizabeth changed about between supporters of harts, leopards, antelopes, bulls, greyhounds, boars and dragons. James I. at his accession to the English throne brought the Scottish

unicorn to face the English leopard rampant across his shield, and, ever since, the "lion and unicorn" have been the royal supporters.

An old herald wrote as his opinion that "there is little or nothing in precedent to direct the use of supporters." Modern custom gives them, as a rule, only to peers, to knights of the Garter, the Thistle and St. Patrick, and to knights who are "Grand Crosses" or Grand Commanders of other orders. Royal warrants are sometimes issued for the granting of supporters to baronets, and, in rare cases, they have been assigned to untitled persons. But in spite of the jealousy with which official heraldry hedges about the display of these supporters once assumed so freely, a few old English families still assert their right by hereditary prescription to use these ornaments as their forefathers were wont to use them.

Badges.—The badge may claim a greater antiquity and a wider use than armorial bearings. The "Plantagenet" broom is an early example in England, sprigs of it being figured on the seal of Richard I. In the 14th and 15th centuries every magnate had his badge, which he displayed on his horse-furniture, on the hangings of his bed, his wall and his chair of state, besides giving it as a "livery" to his servants and followers. Such were the knots of Stafford, Bourchier and Wake, the scabbard-crampe of La Warr, the sickle of Hungerford, the swan of Toesni, Bohun and Lancaster, the dun bull of Nevill, the blue boar of Vere and the bear and ragged staff of Beauchamp, Nevill of Warwick and Dudley of Northumberland. So well known of all were these symbols that a political ballad of 1449 sings of the misfortunes of the great lords without naming one of them, all men understanding what signified the Falcon, the Water Bowge and the Cresset and the other badges of the doggerel. More famous still were the White Hart, the Red Rose, the White Rose, the Sun, the Falcon and Fetterlock, the Portcullis and the many other badges of the royal house. The Prince of Wales's feathers are as well known to-day as the royal arms. The Flint and Steel of Burgundy make a collar for the order of the Golden Fleece.

Mottoes.—The motto now accompanies every coat of arms in Great Britain. Few of these Latin aphorisms, these bald assertions of virtue, high courage, patriotism, piety and loyalty have any antiquity. Some few, however, like the "Espérance" of Percy, were the war-cries of remote ancestors. "I mak' sicker" of Kirkpatrick recalls pridefully a bloody deed done on a wounded man, and the "Dieu Ayde," "Aginccourt" and "D'Accomplir Aginccourt" of the Irish Montmorencys and the English Wodehouses and Dalisons, glorious traditions based upon untrustworthy genealogy. The often-quoted punning mottoes may be illustrated by that of Cust, who says "Qui Cust-odit caveat," a modern example and a fair one. Ancient mottoes, as distinct from the war or gathering cry of a house, are often cryptic sentences whose meaning might be known to the user and perchance to his mistress. Such are the "Plus est en vous" of Louis de Bruges, the Flemish earl of Winchester, and the "So have I cause" and "Till then thus" of two Englishmen. The word motto is of modern use, our forefathers speaking rather of their "word" or of their "reason."

Lines.—Eleven varieties of lines, other than straight lines, which divide the shield, or edge our cheverons, pales, bars and the like, are pictured in the heraldry books and named as engrailed, embattled, indented, invected, wavy or undy, nebuly, dancetty, raguly, potenté, dovetailed and urdy. As in the case of many other such lists of the later armorists these eleven varieties need some pruning and a new explanation. The most commonly found is the line engrailed, which for the student of mediaeval armory must be associated with the line indented. In its earliest form the line which a roll of arms will describe indifferently as indented or engrailed takes almost invariably the form to which the name indented is restricted by modern armorists.

The cross may serve as our first example. A cross, engrailed or indented, the words being used indifferently, is a cross so deeply notched at the edges that it seems made up of so many lozenge-shaped wedges or fusils. About the middle of the 14th century begins a tendency, resisted in practice by many conservative families, to draw the engrailing lines in the fashion to which modern armorists restrict the word "engrailed," making shallower indentures in the form of lines of half circles. Thus the engrailed

cross of the Mohuns takes either of the two forms which we illustrate. Bends follow the same fashion, early bends engrailed or indented being some four or more fusils joined bendwise by their blunt sides, bends of less than four fusils being very rare. Thus also the engrailed or indented saltires, pales or cheverons, the exact number of the fusils which go to the making of these being unconsidered. For the fesse there is another law. The fesse indented or engrailed is made up of fusils as is the engrailed bend. But although early rolls of arms sometimes neglect this detail in their blazon, the fusils making a fesse must always be of an ascertained number. Montagu, earl of Salisbury, bore a fesse engrailed or indented of three fusils only, very few shields imitating this. Mediaeval armorists will describe his arms as a fesse indented of three indentures, as a fesse fusilly of three pieces, or as a fesse engrailed of three points or pieces, all of these blazons having the same value. The indented fesse on the red shield of the Dynhams has four such fusils of ermine. Four, however, is almost as rare a number as three, the normal form of a fesse indented being that of five fusils as borne by Percys, Pinkenys, Newmarches and many other ancient houses. Fesses of six fusils are not to be found. Note that bars indented or engrailed are, for a reason which will be evident, never subject to this counting of fusils. Fauconberg, for example, bore "Silver with two bars engrailed, or indented, sable." Displayed on a shield of the flat-iron outline, the lower bar would show fewer fusils than the upper, while on a square banner each bar would have an equal number—usually five or six.

While bends, cheverons, crosses, saltires and pales often follow, especially in the 15th century, the tendency towards the rounded "engrailling," fesses keep, as a rule, their bold indentures—neither Percy nor Montagu being ever found with his bearings in aught but their ancient form. Borders take the newer fashion as leaving more room for the charges of the field. But indented chiefs do not change their fashion, although many saw-teeth sometimes take the place of the three or four strong points of early arms, and parti-coloured shields whose parting line is indented never lose the bold zig-zag.

While bearing in mind that the two words have no distinctive force in ancient armory, the student and the herald of modern times may conveniently allow himself to blazon the sharp and saw-toothed line as "indented" and the scalloped line as "engrailed," especially when dealing with the debased armory in which the distinction is held to be a true one and one of the first importance. One error at least he must avoid, and that is the following of the heraldry-book compilers in their use of the word "dancetty." A "dancetty" line, we are told, is a line having fewer and deeper indentures than the line indented. But no dancetty line could make a bolder dash across the shield than do the lines which the old armorists recognized as "indented." In old armory we have fesses dancy—commonly called "dances"—bends dancy, or cheverons dancy; there are no chiefs dancy nor borders dancy, nor are there shields blazoned as parted with a dancy line. Waved lines, battled lines and ragged lines need little explanation that a picture cannot give. The word invected or invected is sometimes applied by old-fashioned heraldic pedants to engrailed lines; later pedants have given it to a line found in modern grants of arms, an engrailed line reversed. Dovetailed and undy lines are mere modernisms. Of the very rare nebuly or clouded line we can only say that the ancient form, which imitated the conventional cloud-bank of the old painters, is now almost forgotten, while the bold "wavy" lines of early armory have the word "nebuly" misapplied to them.

CHARGES

The Ordinary Charges.—The writers upon armory have given the name of Ordinaries to certain conventional figures commonly charged upon shields. Also they affect to divide these into Honourable Ordinaries and Sub-Ordinaries without explaining the reason for the superior honour of the Saltire or for the subordination of the Quarter. Disregarding such distinctions, we may begin with the description of the "Ordinaries" most commonly to be found.

From the first the Cross was a common bearing on English shields, "Silver a cross gules" being given early to St. George, patron of knights and of England, for his arms; and under St. George's red cross the English were wont to fight. Our armorial crosses took many shapes, but the "crosses innumerable" of the Book of St. Albans and its successors may be left to the heraldic dictionary makers who have devised them. It is more important to define those forms in use during the middle ages, and to name them accurately after the custom of those who bore them in war, a task which the heraldry books have never as yet attempted with success.

The cross in its simple form needs no definition, but it will be noted that it is sometimes borne "voided" and that in a very few cases it appears as a lesser charge with its ends cut off square, in which case it must be clearly blazoned as "a plain Cross."

Andrew Harcla, the march-warden, whom Edward II. made an earl and executed as a traitor, bore the arms of St. George with a martlet sable in the quarter. Crevequer of Kent bore "Gold, a voided cross gules." Newsom (14th century) bore "Azure, a fesse silver with three plain crosses gules."

Next to the plain Cross may be taken the Cross paty, the *croiz patée* or *paté* of old rolls of arms. It has several forms, according to the taste of the artist and the age. So, in the 13th and early 14th centuries, its limbs curve out broadly, while at a later date the limbs become more slender and of even breadth, the ends somewhat resembling fleurs-de-lys. Each of these forms has been seized by the heraldic writers as the type of a distinct cross for which a name must be found, none of them, as a rule, being recognized as a cross paty, a word which has its misapplication elsewhere. Thus the books have "cross patonce" for the

earlier form, while "cross clechée" and "cross fleurie" serve for the others. But the true identification of the various crosses is of the first importance to the antiquary, since without it descriptions of the arms on early seals or monuments must needs be valueless. Many instances of this need might be cited from the British Museum catalogue of seals, where, for example, the cross paty of Latimer is described twice as a "cross flory," six times as a "cross patonce," but not once by its own name, although there is no better known example of this bearing in England. Latimer bore "Gules, a cross paty gold."

The cross formy follows the lines of the cross paty save that its broadening ends are cut off squarely. Chetwode bore "Quarterly silver and gules with four crosses formy countercoloured"—that is to say, the two crosses in the gules are of silver and the two in the silver of gules.

The cross flory or flowered cross, the "cross with the ends flowered"—*od les bouttes floretes* as some of the old rolls have it—is, like the cross paty, a mark for the misapprehension of writers on armory, who describe some shapes of the cross paty by its name. Playing upon discovered or fancied variants of the word, they bid us mark the distinctions between crosses "fleur-de-lisée," "fleury" and "fleurette," although each author has his own version of the value which must be given these precious words. But the facts of the mediaeval practice are clear to those who take their armory from ancient examples and not from phrases plagiarized from the hundredth plagiarist. The flowered cross is one whose limbs end in fleur-de-lys, which spring sometimes from a knop or bud but more frequently issue from the square ends of a cross of the "formy" type. Swynnerton bore "Silver, a flowered cross sable."

The mill-rind, which takes its name from the iron of a mill-stone—*fer de moline*—must be set with the crosses. Some of the old rolls call it *croiz recercelé*, from which armorial writers have leaped to imagine a distinct type. Also they call the mill-rind itself a "cross moline" keeping the word mill-rind for a charge having the same origin but of somewhat differing form. Since this charge became common in Tudor armory it is perhaps better that the original mill-rind should be called for distinction a mill-rind cross. Willoughby bore "Gules, a mill-rind cross silver."

The crosslet, cross bottonny or cross crosletted, is a cross whose limbs, of even breadth, end as trefoils or treble buds. It is rarely found in mediaeval examples in the shape—that of a cross with limbs ending in squarely cut plain crosses—which it took during the 16th-century decadence. As the sole charge of a shield it is very rare; otherwise it is one of the commonest of charges. Brerelegh bore "Silver, a crosslet gules."

Within these modest limits we have brought the greater part of that monstrous host of crosses which cumber the dictionaries. A few rare varieties may be noticed.

Dukinfield bore "Silver, a voided cross with sharpened ends." Skirlaw, bishop of Durham (d. 1406), the son of a basket-weaver, bore "Silver, a cross of three upright wattles sable, crossed and interwoven by three more." Drury bore "Silver, a chief vert with a St. Anthony's cross gold between two golden molets, pierced gules." Brytton bore "Gold, a patriarch's cross set upon three degrees or steps of gules."

The crosses paty and formy, and more especially the crosslets, are often borne fitchy, that is to say, with the lower limb somewhat lengthened and ending in a point, for which reason the 15th-century writers call these "crosses fixabill." In the 14th-century rolls the word "potent" is sometimes used for these crosses fitchy, the long foot suggesting a potent or staff. From this source modern English armorists derive many of their "crosses potent," whose four arms have the **T** heads of old-fashioned walking staves. Howard bore "Silver, a bend between six crosslets fitchy gules." Scott of Congerhurst in Kent bore "Silver, a crosslet fitchy sable."

The Saltire is the cross in the form of that on which St. Andrew suffered, whence it is borne on the banner of Scotland, and by the Andrew family of Northamptonshire. Nevile of Raby bore "Gules, a saltire silver." Nicholas Upton, the 15th-century writer on armory, bore "Silver, a saltire sable with the ends coupé and five golden rings thereon." Aynho bore "Sable, a saltire silver, having the ends flowered, between four leopards gold."

The chief is the upper part of the shield and, marked out by a line of division, it is taken as one of the Ordinaries. Shields with a plain chief and no more are rare in England, but Tichborne of Tichborne has borne since the 13th century "Vair, a chief gold." According to the heraldry books the chief should be marked off as a third part of the shield, but its depth varies, being broader when charged with devices and narrower when, itself uncharged, it surmounts a charged field. Fenwick bore "Silver, a chief gules with six martlets countercoloured," and in this case the chief would be the half of the shield. Clinging to the belief that the chief must not fill more than a third of the shield, the heraldry books abandon the word in such cases, blazoning them as "party per fesse."

Hastang bore "Azure, a chief gules and a lion with a forked tail over all." Walter Kingston seals in the 13th century with a shield of "Two rings or annelets in the chief."

With the chief may be named the Foot, the nether part of the shield marked off as an Ordinary. So rare is this charge that we can cite but one example of it, that of the shield of John of Skipton, who in the 14th century bore "Silver with the foot indented purple and a lion purple." The foot, however, is a recognized bearing in France, whose heralds gave it the name of *champagne*.

The Pale is a broad stripe running the length of the shield. Of a single pale and of three pales there are several old examples. Four red pales in a golden shield were borne by Eleanor of Provence, queen of Henry III.; but the number did not commend itself to English armorists. When the field is divided

evenly into six pales it is said to be paly; if into four or eight pales, it is blazoned as paly of that number of pieces. But paly of more or less than six pieces is rarely found.

The Yorkshire house of Gascoigne bore "Silver, a pale sable with a golden conger's head thereon, cut off at the shoulder." Ferlington bore "Gules, three pales vair and a chief gold."

When the shield or charge is divided palewise down the middle into two tinctures it is said to be "party." "Party silver and gules" are the arms of the Waldegraves. Birmingham bore "Party silver and sable indented." Such partings of the field often cut through charges whose colours change about on either side of the parting line. Thus Chaucer the poet bore "Party silver and gules with a bend countercoloured."

The Fesse is a band athwart the shield, filling, according to the rules of the heraldic writers, a third part of it. By ancient use, however, as in the case of the chief and pale, its width varies with the taste of the painter, narrowing when set in a field full of charges and broadening when charges are displayed on itself. When two or three fesses are borne they are commonly called Bars. "Ermine four bars gules" is given as the shield of Sir John Sully, a 14th-century Garter knight, on his stall-plate at Windsor; but the plate belongs to a later generation, and should probably have three bars only. Little bars borne in couples are styled Gemels (twins). The field divided into an even number of bars of alternate colours is said to be barry, barry of six pieces being the normal number. If four or eight divisions be found the number of pieces must be named; but with ten or more divisions the number is unreckoned and "burely" is the word.

Coleville of Bitham bore "Gold, a fesse gules." West bore "Silver, a dance (or fesse dancy) sable." Fauconberg bore "Gold, a fesse azure with three pales gules in the chief." Cayville bore "Silver, a fesse gules, flowered on both sides." Devereux bore "Gules, a fesse silver with three roundels silver in the chief." Chamberlayne of Northamptonshire bore "Gules, a fesse and three scallops gold." Harcourt bore "Gules, two bars gold." Manners bore "Gold, two bars azure and a chief gules." Wake bore "Gold, two bars gules with three roundels gules in the chief."

The Bend is a band traversing the shield aslant, arms with one, two or three bends being common during the middle ages in England. Bendy shields follow the rule of shields paly and barry, but as many as ten pieces have been counted in them. The bend is often accompanied by a narrow bend on either side, these companions being called Cotices. A single narrow bend, struck over all other charges, is the Baston, which during the 13th and 14th centuries was a common difference for the shields of the younger branches of a family, coming in later times to suggest itself as a difference for bastards.

The Bend Sinister, the bend drawn from right to left beginning at the "sinister" corner of the shield, is reckoned in the heraldry books as a separate Ordinary, and has a peculiar significance accorded to it by novelists. Mediaeval English seals afford a group of examples of Bends Sinister or Bastons Sinister, but there seems no reason for taking them as anything more than cases in which the artist has neglected the common rule.

Mauley bore "Gold, a bend sable." Harley bore "Gold, a bend with two cotices sable." Wallop bore "Silver, a bend wavy sable." Bishopsdon bore "Bendy of six pieces, gold and azure, with a quarter ermine." Montfort of Whitchurch bore "Bendy of ten pieces gold and azure." Henry of Lancaster, second son of Edmund Crouchback, bore the arms of his cousin, the king of England, with the difference of "a baston azure." Adam Fraunceys (14th century) bore "Party gold and sable bendwise with a lion countercoloured." The parting line is here commonly shown as "sinister."

The Cheveron, a word found in mediaeval building accounts for the barge-boards of a gable, is an Ordinary whose form is explained by its name. Perhaps the very earliest of English armorial charges, and familiarized by the shield of the great house of Clare, it became exceedingly popular in England. Like the bend and the chief, its width varies in different examples. Likewise its angle varies, being sometimes so acute as to touch the top of the shield, while in post-mediaeval armory the point is often blunted beyond the right angle. One, two or three cheverons occur

in numberless shields, and five cheverons have been found. Also there are some examples of the bearing of cheveronny.

The earls of Gloucester of the house of Clare bore "Gold, three cheverons gules" and the Staffords derived from them their shield of "Gold, a cheveron gules." Chaworth bore "Azure, two cheverons gold." Peytevyne bore "Cheveronny of ermine and gules." St. Quintin of Yorkshire bore "Gold, two cheverons gules and a chief vair." Sheffield bore "Ermine, a cheveron gules between three sheaves gold."

Shields parted cheveronwise are common in the 15th century, when they are often blazoned as having chiefs "enty" or grafted. Aston of Cheshire bore "Party sable and silver cheveronwise" or "Silver, a chief enty sable."

The Pile or stake (*estache*) is a wedge-shaped figure jutting from the chief to the foot of the shield, its name allied to the pile of the bridge-builder. A single pile is found in the notable arms of Chandos, and the black piles in the ermine shield of Hollis are seen as an example of the bearing of two piles. Three piles are more easily found, and when more than one is represented the points are brought together at the foot. In ancient armory piles in a shield are sometimes reckoned as a variety of pales, and a Basset with three piles on his shield is seen with three pales on his square banner. Chandos bore "Gold, a pile gules."

The Quarter is the space of the first quarter of the shield divided crosswise into four parts. As an Ordinary it is an ancient charge and a common one in mediaeval England, although it has all but disappeared from modern heraldry books, the "Canton," an alleged "diminutive," unknown to early armory, taking its place. Like the other Ordinaries, its size is found to vary with

the scheme of the shield's charges, and this has persuaded those armorists who must needs call a narrow bend a "bendlet," to the invention of the "Canton," a word which in the sense of a quarter or small quarter appears for the first time in the latter part of the 15th century. Writers of the 14th century sometimes give it the name of the Cantel, but this word is also applied to the void space on the opposite side of the chief, seen above a bend.

Blencowe bore "Gules, a quarter silver." Basset of Drayton bore "Gold, three piles (or pales) gules with a quarter ermine." Wydevile bore "Silver, a fesse and a quarter gules." Odingsheles bore "Silver, a fesse gules with a molet gules in the quarter."

Shields or charges divided crosswise with a downward line and a line athwart are said to be quarterly. An ancient coat of this fashion is that of Say who bore (13th century) "Quarterly gold and gules"—the first and fourth quarters being gold and the second and third red. Ever or Eure bore the same with the addition of "a bend sable with three silver scallops thereon."

With the 15th century came a fashion of dividing the shield into more than four squares, six and nine divisions being often found in arms of that age. The heraldry books, eager to work out problems of blazonry, decide that a shield divided into six squares should be described as "Party per fesse with a pale counterchanged," and one divided into nine squares as bearing "a cross quarter-pierced." It seems a simpler business to follow a 15th-century fashion and to blazon such shields as being of six or nine "pieces." Thus John Garther (15th century) bore "Nine pieces erminees and ermine" and Whitgreave of Staffordshire "Nine pieces of azure and of Stafford's arms, which are gold with a cheveron gules." The Tallow Chandlers of London had a grant

in 1456 of "Six pieces azure and silver with three doves in the azure, each with an olive sprig in her beak."

Squared into more than nine squares the shield becomes checky or checkered and the number is not reckoned. Warenne's checker of gold and azure is one of the most ancient coats in England and checkered fields and charges follow in great numbers. Even lions have been borne checkered. Warenne bore "Checky gold and azure." Clifford bore the like with "a fesse gules." Cobham bore "Silver, a lion checky gold and sable." These checkered fesses, bars, bends, borders and the like, will commonly bear but two rows of squares, or three at the most. The heraldry writers are ready to note that when two rows are used "counter-compony" is the word in place of checky, and "compony-counter-compony" in the case of three rows. It is needless to say that these words have neither practical value nor antiquity to commend them. But bends and bastons, labels, borders and the rest are often coloured with a single row of alternating tinctures. In this case the pieces are said to be "gobony." Thus John Cromwell (14th century) bore "Silver, a chief gules with a baston gobony of gold and azure."

The scocheon or shield used as a charge is found among the earliest arms. Itself charged with arms, it served to indicate alliance by blood or by tenure with another house, as in the bearings of St. Owen whose shield of "Gules with a cross silver" has a scocheon of Clare in the quarter. In the latter half of the 15th century it plays an important part in the curious marshalling of the arms of great houses and lordships. Erpingham bore "Vert, a scocheon silver with an orle (or border) of silver martlets." Davillers bore at the battle of Boroughbridge "Silver, three scocheons gules."

The scocheon was often borne voided or pierced, its field cut away to a narrow border. Especially was this the case in the far North, where the Balliols, who bore such a voided scocheon, were powerful. The voided scocheon is wrongly named in all the heraldry books as an orle, a term which belongs to a number of small charges set round a central charge. Thus the martlets in the shield of Erpingham, already described, may be called an orle of martlets or a border of martlets. This misnaming of the voided scocheon has caused a curious misapprehension of its form, even Dr. Woodward, in his *Heraldry, British and Foreign*, describing the "orle" as "a narrow border detached from the edge of the shield." Following this definition modern armorial artists will, in the case of quartered arms, draw the "orle" in a first or second quarter of a quartered shield as a rectangular figure and in a third or fourth quarter as a scalene triangle with one arched side. Thereby the original voided scocheon changes into forms without meaning. Balliol bore "Gules, a voided scocheon silver." Surtees bore "Ermine, with a quarter of the arms of Balliol."

The *Tressure* or flowered tressure is a figure which is correctly described by Woodward's incorrect description of the orle as cited above, being a narrow inner border of the shield. It is distinguished, however, by the fleurs-de-lys which decorate it, setting off its edges. The double tressure which surrounds the lion in the royal shield of Scotland, and which is borne by many Scottish houses who have served their kings well or mated with their daughters, is carefully described by Scottish heralds as "flowered and counter-flowered," a blazon which is held to mean that the fleurs-de-lys show head and tail in turn from the outer rim of the outer tressure and from the inner rim of the innermost. But this seems to have been no essential matter with mediaeval armorists and a curious 15th-century enamelled roundel of the arms of Vampage shows that in this English case the flowering takes the more convenient form of allowing all the lily heads to sprout from the outer rim. Vampage bore "Azure, an eagle silver within a flowered tressure silver." The king of Scots bore "Gold, a lion within a double tressure flowered and counter-flowered gules."

The Border of the shield when marked out in its own tincture is counted as an Ordinary. Plain or charged, it was commonly used as a difference. As the principal charge of a shield it is very rare, so rare that in most cases where it apparently occurs we may, perhaps, be following mediaeval custom in blazoning the shield as one charged with a scocheon and not with a border. Thus Hondes-cote bore "Ermine, a border gules" or "Gules, a scocheon ermine."

Somerville bore "Burely silver and gules and a border azure with golden martlets."

The Flaunches are the flanks of the shield which, cut off by rounded lines, are borne in pairs as Ordinaries. These charges are found in many coats devised by 15th-century armorists. "Ermine, two flaunches azure with six golden wheat-ears" was borne by John Greyby of Oxfordshire (15th century).

The Label is a narrow fillet across the upper part of the chief, from which hang three, four, five or more pendants, the pendants being, in most old examples, broader than the fillet. Reckoned with the Ordinaries, it was commonly used as a means of differing a cadet's shield, and in the heraldry books it has become the accepted difference for an eldest son, although the cadets often bore it in the middle ages. John of Hastings bore in 1300 before Carlaverock "Gold, a sleeve (or maunche) gules," while Edmund his brother bore the same arms with a sable label. In modern armory the pendants are all but invariably reduced to three, which, in debased examples, are given a dovetailed form while the ends of the fillet are cut off.

The Fret, drawn as a voided lozenge interlaced by a slender saltire, is counted an Ordinary. A charge in such a shape is extremely rare in mediaeval armory, its ancient form when the field is covered by it being a number of bastons—three being the customary number—interlaced by as many more from the sinister side. Although the whole is described as a fret in certain English blazons of the 15th century, the adjective "fretty" is more commonly used. Trussel's fret is remarkable for its bezants at the joints, which stand, doubtless, for the golden nail-heads of the "trellis" suggested by his name. Curwen, Wyville and other northern houses bearing a fret and a chief have, owing to their fashion of drawing their frets, often seen them changed by the heraldry books into "three cheverons braced or interlaced."

Huddleston bore "Gules fretty silver." Trussel bore "Silver fretty gules, the joints bezanty." Hugh Giffard (14th century) bore "Gules with an engrailed fret of ermine."

Another Ordinary is the Giron or Gyron—a word now commonly mispronounced with a hard "g." It may be defined as the lower half of a quarter which has been divided bendwise. No old example of a single giron can be found to match the figure in the heraldry books. Gironny, or gyronny, is a manner of dividing the field into sections, by lines radiating from a centre point, of which many instances may be given. Most of the earlier examples have some twelve divisions although later armory gives eight as the normal number, as Campbell bears them.

Bassingbourne bore "Gironny of gold and azure of twelve pieces." William Stoker, who died Lord Mayor of London in 1484, bore "Gironny of six pieces azure and silver with three popinjays in the silver pieces." A pair of girones on either side of a chief were borne in the strange shield of Mortimer, commonly blazoned as "Barry azure and gold of six pieces, the chief azure with two pales and two girones gold, a scocheon silver over all." An early example shows that this shield began as a plain field with a gobony border.

With the Ordinaries we may take the Roundels or Pellets, disks or balls of various colours. Ancient custom gives the name of a bezant to the golden roundel, and the folly of the heraldic writers has found names for all the others, names which may be disregarded together with the belief that, while bezants and silver roundels, as representing coins, must be pictured with a flat surface, roundels of other hues must needs be shaded by the painter to represent rounded balls. Rings or Annelets were common charges in the North, where Lowthers, Musgraves and many more, differenced the six rings of Vipont by bearing them in various colours.

Burley of Wharfedale bore "Gules, a bezant." Courtenay, earl of Devon, bore "Gold, three roundels gules with a label azure." Caraunt bore "Silver, three roundels azure, each with three chevrons gules." Vipont bore "Gold, six annelets gules." Avenel bore "Silver, a fesse and six annelets (aunels) gules." Stourton bore "Sable, a bend gold between six fountains." The fountain is a roundel charged with waves of white and blue.

The Lozenge is linked in the heraldry book with the Fusil. This

Fusil is described as a lengthened and sharper lozenge. But it will be understood that the Fusil, other than as part of an engrailed or indented bend, pale or fesse, is not known to true armory. Also it is one the notable achievements of the English writers on heraldry that they should have allotted to the lozenge, when borne voided, the name of Mascle. This "mascle" is the word of the oldest armorists for the unvoided charge, the voided being sometimes described by them as a lozenge, without further qualifications. Fortunately the difficulty can be solved by following the late 14th-century custom in distinguishing between "lozenges" and "voided lozenges" and by abandoning altogether this misleading word Mascle.

Thomas of Merstone, a clerk, bore on his seal in 1359 "Ermine, a lozenge with a pierced molet thereon." Braybroke bore "Silver, seven voided lozenges gules." Charles bore "Ermine, a chief gules with five golden lozenges thereon."

Billets are oblong figures set upright. Black billets in the arms of Delves of Cheshire stand for "delves" of earth and the gads of steel in the arms of the London Ironmongers' Company took a somewhat similar form. Sir Ralph Mouchensy bore in the 14th century "Silver, a cheveron between three billets sable."

With the Billet, the Ordinaries, uncertain as they are in number, may be said to end. But we may here add certain armorial charges which might well have been counted with them.

First of these is the Molet, a word corrupted in modern heraldry to Mullet, a fish-like charge with nothing to commend it. This figure is as a star of five or six points, six points being perhaps the commonest form in old examples, although the sixth point is, as a *ruel*, lost during the later period. Mediaeval armorists are not, it seems, inclined to make any distinction between molets of five and six points, but some families, such as the Harpedens and Asshetons, remained constant to the five-pointed form. It was generally borne pierced with a round hole, and then represents, as its name implies, the rowel of a spur. In ancient rolls of arms the word Rowel is often used, and probably indicated the pierced molet. That the piercing was reckoned an essential difference is shown by a roll of the time of Edward II., in which Sir John of Pabenharn bears "Barry azure and silver, with a bend gules and three molets gold thereon," arms which Sir John his son differences by piercing the molets. Beside these names is that of Sir Walter Baa with "Gules a cheveron and three rowels silver," rowels which are shown on seals of this family as pierced molets. Probably an older bearing than the molet, which would be popularized when the rowelled spur began to take the place of the prick-spur, is the Star or Estoile, differing from the molet in that its five or six points are wavy. It is possible that several star bearings of the 13th century were changed in the 14th for molets. The star is not pierced in the fashion of the molet; but, like the molet, it tends to lose its sixth point in armory of the decadence. Suns, sometimes blazoned in old rolls as Sun-rays—*rays de soleil*—are pictured as unpierced molets of many points, which in rare cases are waved.

Harpeden bore "Silver, a pierced molet gules." Gentil bore "Gold, a chief sable with two molets goles pierced gules." Grimston bore "Silver, a fesse sable and thereon three molets silver pierced gules." Ingleby of Yorkshire bore "Sable, a star silver."

The Crescent is a charge which has to answer for many idle tales concerning the crusading ancestors of families who bear it. It is commonly borne with both points uppermost, but when representing the waning or the waxing moon—decrecent or increcent—its horns are turned to the sinister or dexter side of the shield. Peter de Marines (13th century) bore on his seal a shield charged with a crescent in the chief. William Gobioun (14th century) bore "A bend between two waxing moons."

Tinctures.—The tinctures or hues of the shield and its charges are seven in number—gold or yellow, silver or white, red, blue, black, green and purple. Mediaeval custom gave, according to a rule often broken, "gules," "azure" and "sable" as more high-sounding names for the red, blue and black. Green was often named as "vert," and sometimes as "synobill," a word which as "sinople" is used to this day by French armorists. The song of the siege of Carlaverock and other early documents have red,

gules or "vermeil," sable or black, azure or blue, but gules, azure, sable and vert came to be recognized as armorists' adjectives, and an early 15th-century romance discards the simple words deliberately, telling us of its hero that

His shield was black and blue, sanz fable,
Barred of azure and of sable.

But gold and silver served as the armorists' words for yellows and whites until late in the 16th century, when, gold and silver made way for "or" and "argent," words which those for whom the interest of armory lies in its liveliest days will not be eager to accept. Likewise the colours of "sanguine" and "tenné" brought in by the pedants to bring the tinctures to the mystical number of nine may be disregarded.

A certain armorial chart of the duchy of Brabant, published in 1600, is the earliest example of the practice whereby later engravers have indicated colours in uncoloured plates by the use of lines and dots. Gold is indicated by a powdering of dots; silver is left plain. Azure is shown by horizontal shading lines; gules by upright lines; sable by cross-hatching of upright and horizontal lines. Diagonal lines from sinister to dexter indicate purple; vert is marked with diagonal lines from dexter to sinister. The practice, in spite of a certain convenience, has been disastrous in its cramping effects on armorial art, especially when applied to seals and coins.

Besides the two "metals" and five "colours," fields and charges are varied by the use of the furs ermine and vair. Ermine is shown by a white field flecked with black ermine tails, and vair by a conventional representation of a fur of small skins sewn in rows, white and blue skins alternately. In the 15th century there was a popular variant of ermine, white tails upon a black field. To this fur the books now give the name of "ermine"—a most unfortunate choice, since ermine is a name used in old documents for the original ermine. "Erminees," which has at least a 15th-century authority, will serve for those who are not content to speak of "sable ermined with silver." Vair, although silver and blue be its normal form, may be made up of gold, silver or ermine, with sable or gules or vert, but in these latter cases the colours must be named in the blazon. To the vairs and ermines of old use the heraldry books have added "erminois," which is a gold field with black ermine tails, "pean," which is "erminois" reversed, and "erminites," which is ermine with a single red hair on either side of each black tail. The vairs, mainly by misunderstanding of the various patterns found in old paintings, have been amplified with "countervair," "potent," "counter-potent" and "vair-en-point," no one of which merits description.

No shield of a plain metal or colour has ever been borne by an Englishman, although the knights at Carlaverock and Falkirk saw Amaneu d'Albret with his banner all of red having no charge thereon. Plain ermine was the shield of the duke of Brittany and no Englishman challenged the bearing. But Beauchamp of Hatch bore simple vair, Ferrers of Derby "Vairy gold and gules," and Ward "Vairy silver and sable."

Only one English example has hitherto been discovered of a field covered not with a fur but with overlapping feathers. A 15th-century book of arms gives "Plumetty of gold and purple" for "Myddlam in Coverdale."

Drops of various colours which variegated certain fields and charges are often mistaken for ermine tails when ancient seals are deciphered. A simple example of such spattering is in the shield of Grayndore, who bore "Party ermine and vert, the vert dropped with gold."

A very common variant of charges and fields is the sowing or "powdering" them with a small charge repeated many times. Mortimer of Norfolk bore "gold powdered with fleurs-de-lys sable" and Edward III. quartered for the old arms of France "Azure powdered with fleurs-de-lys gold," such fields being often described as flowered or flory. Golden billets were scattered in Cowdray's red shield, which is blazoned as "Gules biliety gold," and bezants in that of Zouche, which is "Gules bezanty with a quarter ermine." The disposition of such charges varied with the users. Zouche as a rule shows ten bezants placed four, three, two and one on his shield, while the old arms of France in the

royal coat allows the pattern of flowers to run over the edge, the shield border thus showing halves and tops and stalk ends of the fleurs-de-lys. But the commonest of these powderings is that with crosslets, as in the arms of John la Warr "Gules crusily silver with a silver lion."

Trees, Leaves and Flowers.—Sir Stephen Cheyndut, a 13th-century knight, bore an oak tree, the *cheyne* of his first syllable, while for like reasons a Piriton had a pear tree on his shield. Three pears were borne (*temp.* Edward III.) by Nicholas Stivecle of Huntingdonshire, and about the same date is Applegarth's shield of three red apples in a silver field. Leaves of burdock are in the arms (14th century) of Sir John de Lisle and mulberry leaves in those of Sir Hugh de Morieus. Three roots of trees are given to one Richard Rotour in a 14th-century roll. Malherbe (13th century) bore the "evil herb"—a teazle bush. Pineapples are borne here and there, and it will be noted that armorists have not surrendered this, our ancient word for the "fir-cone," to the foreign *ananas*. Out of the cornfield English armory took the sheaf, three sheaves being on the shield of an earl of Chester early in the 13th century and Sheffield bearing sheaves for a play on his name. For a like reason Peverel's sheaves were sheaves of pepper. Rye bore three ears of rye on a bend, and Graindorge had barley-ears. Flowers are few in this field of armory, although lilies with their stalks and leaves are in the grant of arms to Eton College. Ousethorpe has water flowers, and now and again we find some such strange charges as those in the 15th-century shield of Thomas Porthelyne who bore "Sable, a cheveron gules between three 'poppebolles,' or poppy-heads vert."

The fleur-de-lys, a conventional form from the beginnings of armory, might well be taken amongst the "ordinaries." In England as in France it is found in great plenty. Aguylon bore "Gules, a fleur-de-lys silver." Peyferer bore "Silver, three fleur-de-lys sable."

Trefoils are very rarely seen until the 15th century, although Hervey has them, and Gausill, and a Bosville coat seems to have borne them. They have always their stalk left hanging to them. Vincent, Hattecliffe and Massingberd all bore the quatrefoil, while the Bardolfs, and the Quincys, earls of Winchester, had cinquefoils. The old rolls of arms made much confusion between cinquefoils and sixfoils (*quintefoilles* e *sixfoilles*) and the rose. It is still uncertain how far that confusion extended amongst the families which bore these charges. The cinquefoil and sixfoil, however, are all but invariably pierced in the middle like the spur rowel, and the rose's blunt-edged petals give it definite shape soon after the decorative movement of the Edwardian age began to carve natural buds and flowers in stone and wood. Hervey bore "Gules, a bend silver with three trefoils vert thereon." Vincent bore "Azure, three quatrefoils silver."

Quincy bore "Gules, a cinquefoil silver." Bardolf of Wormegay bore "Gules, three cinquefoils silver." Cosington bore "Azure, three roses gold."

Beasts and Birds.—The book of natural history as studied in the middle ages lay open at the chapter of the lion, to which royal beast all the noble virtues were set down. What is the oldest armorial seal of a sovereign prince as yet discovered bears the rampant lion of Flanders. In England we know of no royal shield earlier than that first seal of Richard I. which has a like device. A long roll of English earls, barons and knights wore the lion on their coats—Lacy, Marshal, Fitzalan and Montfort, Percy, Mowbray and Talbot. By custom the royal beast is shown as rampant, touching the ground with but one foot and clawing at the air in noble rage. So far is this the normal attitude of a lion that the adjective "rampant" was often dropped, and we have leave and good authority for blazoning the rampant beast simply as "a lion," leave which a writer on armory may take gladly to the saving of much repetition. In France and Germany this licence has always been the rule, and the modern English herald's blazon of "Gules a lion rampant or" for the arms of Fitzalan, becomes in French *de gueules au lion d'or* and in German *in Rot ein goldener Loewe*. Other positions must be named with care and the prowling "lion passant" distinguished from the rampant beast, as well as from such rarer shapes as the

couchant lion, the lion sleeping, sitting or leaping. Of these the lion passant is the only one commonly encountered. The lion standing with his forepaws together is not a figure for the shield, but for the crest, where he takes this position for greater stability upon the helm, and the sitting lion is also found rather upon helms than in shields. For a couchant lion or a dormant lion one must search far afield, although there are some mediaeval instances. The leaping lion is in so few shields that no maker of a heraldry book has, it would appear, discovered an example. In the books this "lion salient" is described as with the hind paws together on the ground and the fore paws together in the air, somewhat after the fashion of a diver's first movement. But examples from seals and monuments of the Felbriggs and the Merks show that the leaping lion differed only from the rampant in that he leans somewhat forward in his eager spring. The compiler of the British Museum catalogue of mediaeval armorial seals, and others equally unfamiliar with mediaeval armory, invariably describe this position as "rampant," seeing no distinction from other rampings. As rare as the leaping lion is the lion who looks backward over his shoulder. This position is called "regardant" by modern armorists. The old French blazon calls it *rere regardant* or *turnante le visage arere*, "regardant" alone meaning simply "looking," and therefore we shall describe it more reasonably in plain English as "looking backward." The two-headed lion occurs in a 15th-century coat of Mason, and at the same period a monstrous lion of three bodies and one head is borne, apparently, by a Sharingbury.

The lion's companion is the leopard. What might be the true form of this beast was a dark thing to the old armorist, yet knowing from the report of grave travellers that the leopard was begotten in spouse-breach between the lion and the pard, it was felt that his shape would favour his sire's. But nice distinctions of outline, even were they ascertainable, are not to be marked on the tiny seal, or easily expressed by the broad strokes of the shield painter. The leopard was indeed lesser than the lion, but in armory, as in the Noah's arks launched by the old yards, the bear is no bigger than the badger. Then a happy device came to the armorist. He would paint the leopard like the lion at all points. But as the lion looks forward the leopard should look sidelong, showing his whole face. The matter was arranged, and until the end of the middle ages the distinction held and served. The disregarded writers on armory, Nicholas Upton, and his fellows, protested that a lion did not become a leopard by turning his face sidelong, but none who fought in the field under lion and leopard banners heeded this pedantry from cathedral closes. The English king's beasts were leopards in blazon, in ballad and chronicle, and in the mouths of liegeman and enemy. Henry V.'s herald, named from his master's coat, was Leopard Herald; and Napoleon's gazettes never fail to speak of the English leopards. In our own days, those who deal with armory as antiquaries and students of the past will observe the old custom for convenience sake. Those for whom the interest of heraldry lies in the nonsense-language brewed during post-mediaeval years may correct the mediaeval ignorance at their pleasure. The knight who saw the king's banner fly at Falkirk or Crécy tells us that it bore "Gules with three leopards of gold." The modern armorist will shame the uninstructed warrior with "Gules, three lions passant gardant in pale or."

As the lion rampant is the normal lion, so the normal leopard is the leopard passant, the adjective being needless. In a few cases only the leopard rises up to ramp in the lion's fashion, and here he must be blazoned without fail as a leopard rampant.

Parts of the lion and the leopard are common charges. Chief of these are the demi-lion and the demi-leopard, beasts complete above their slender middles, even to the upper parts of their lashing tails. Rampant or passant, they follow the customs of the unmaimed brute. Also the heads of lion and leopard are in many shields, and here the armorist of the modern handbooks stumbles by reason of his refusal to regard clearly marked mediaeval distinctions. The instructed will know a lion's head because it shows but half the face and a leopard's head because it

is seen full-face. But the handbooks of heraldry, knowing naught of leopards, must judge by absence or presence of a mane, speaking uncertainly of leopards' faces and lions' heads and faces. Here again the old path is the straighter. The head of a lion, or indeed of any beast, bird or monster, is generally painted as "razed," or torn away with a ragged edge which is pleasantly conventionalized. Less often it is found "couped" or cut off with a sheer line. But the leopard's head is neither razed nor couped, for no neck is shown below it. Likewise the lion's fore leg or paw—"gamb" is the book word—may be borne, razed or couped. Its normal position is raised upright, although Newdegate seems to have borne "Gules, three lions' legs razed silver, the paws downward." With the strange bearing of the lion's whip-like tail cut off at the rump, we may end the list of these oddments.

Fitzalan, earl of Arundel, bore "Gules, a lion gold." Simon de Montfort bore "Gules, a silver lion with a forked tail." Segrave bore "Sable, a lion silver crowned gold." Havering bore "Silver, a lion rampant gules with a forked tail, having a collar azure." Felbrigg of Felbrigg bore "Gold, a leaping lion gules." Esturmy bore "Silver, a lion sable (or purple) looking backward." Marmion bore "Gules, a lion vair." Mason bore "Silver, a two-headed lion gules." Lisle bore "Gules, a leopard silver crowned gold." Ludlow bore "Azure, three leopards silver." Brocas bore "Sable, a leopard rampant gold."

John Hardrys of Kent seals in 1372 with arms of "a sitting leopard." John Northampton, Lord Mayor of London in 1381, bore "Azure, a crowned leopard gold with two bodies rampant against each other." Newenham bore "Azure, three demi-lions silver." A deed delivered at Lapworth in Warwickshire in 1466 is sealed with arms of "a molet between three demi-leopards."

The tiger is rarely named in collections of mediaeval arms. Deep mystery wrapped the shape of him, which was never during the middle ages standardized by artists. A crest upon a 15th-century brass shows him as a lean wolf-like figure, with a dash of the boar, gazing after his vain went into a looking-glass; and the 16th-century heralds gave him the body of a lion with the head of a wolf, head and body being tufted here and there with thick tufts of hair. But it is noteworthy that the arms of Sir John Norwich, a well-known knight of the 14th century, are blazoned in a roll of that age as "party azure and gules with a tiger rampant ermine." Now this beast in the arms of Norwich has been commonly taken for a lion, and the Norwich family seem in later times to have accepted the lion as their bearing. But a portion of a painted roll of Sir John's day shows on careful examination that his lion has been given two moustache-like tufts to the nose. A copy made about 1600 of another roll gives the same decoration to the Norwich lion, and it is at least possible we have here evidence that the economy of the mediaeval armorist allowed him to make at small cost his lion, his leopard and his tiger out of a single beast form.

Take away the lions and the leopards, and the other beasts upon mediaeval shields are a little herd. In most cases they are here to play upon the names of their bearers. Thus Swinburne of Northumberland has the heads of swine in his coat and Bacon has bacon pigs. Three white bears were borne by Barlingham, and a bear ramping on his hind legs is for Barnard. Lovett of Astwell has three running wolves, Videllou three wolves' heads, Colfox three foxes' heads.

An elephant was brought to England in the days of Henry III., but he had no immediate armorial progeny, although Sanders of Northants may have borne before the end of the middle ages the elephants' heads which speak of Alysander the Great, patron of all Sanderses. Of dogs the greyhound and the talbot, or mastiff, are found most often. Thus Talbot of Cumberland had talbots, and Mauleverer, running greyhounds or "leverers" for his name's sake. The alaund, a big, crop-eared dog, is in the 15th-century shield of John Woode of Kent, and "kenets," or little tracking dogs, in a 13th-century coat of Kenet. The horse is not easily found as an English charge, but Moyle's white mule seems an old coat; horses' heads are in Horsley's shield, and ass heads make crests for more than one noble house. Askew has three asses in his arms. Three bats or flittermice are in the shield

of Burningham and in that of Heyworth of Whethamstede.

As might be looked for in a land where forest and greenwood once linked from sea to sea, the wild deer is a common charge in the shield. Downes of Cheshire bore a hart "lodged" or lying down. Hertford had harts' heads. Malebis, fawns' heads (*testes de bis*). Buckingham, heads of bucks. The harts in Rotherham's arms are the roes of his name's first syllable. Reindeer heads were borne by Bowet in the 14th century. Antelopes,

fierce beasts with horns that have something of the ibex, show by their great claws, their lion tails and their boar muzzles and tusks that they are midway between the hart and the monster. The yale, eale or gall, is found among fifteenth century supporters, an antelope-like creature sometimes shown with one horn curving behind and the other curving to the front.

Of the outlandish monsters the griffon is the oldest and the chief. With the hinder part of a lion, the rest of him is eagle, head and shoulders, wings and fore legs. The long tuft under the beak and his pointed ears mark him out from the eagle when his head alone is borne. At an early date a griffon rampant, his normal position, was borne by the great house of Montagu as a quartering, and another griffon played upon Griffin's name.

The wyver, who becomes wyvern in the 16th century, and takes a new form under the care of inventive heralds, was in the middle ages a lizard-like dragon, generally with small wings. Sir Edmund Mauley in the 14th century is found differencing the black bend of his elder brother by charging it with three wyvers of silver. During the middle

FIG. 6.—BRITISH SHIELDS OF ARMS (1) Burton. (2) Rokeby. (3) Pelham. (4) Lucy. (5) Fishacre. (6) Roche. (7) Daore. (8) Shelley. (9) See of Salisbury. (10) Isle of Man

ages there seems small distinction between the wyver and the still rarer dragon, which, with the coming of the Tudors, who bore it as their badge, is seen as a four-legged monster with wings and a tail that ends like a broad arrow. The monster in the arms of Drake, blazoned by Tudor heralds as a wyvern, is clearly a fire-drake or dragon in his origin.

The unicorn rampant was borne by Harlyn of Norfolk; unicorn's heads by the Cambridgeshire family of Paris. The mermaid with her comb and looking-glass makes a 14th-century crest for Byron, while "Silver, a bend gules with three silver harpies thereon" is found in the 15th century for Entyrden.

Concerning beasts and monsters the heraldry books have many adjectives of blazonry which may be disregarded. Even as it was once the pride of the cook pedant to carve each bird on the board with a new word for the act, so it became the delight of the pedant herald to order that the rampant horse should be "forcené," the rampant griffon "segreant," the passant hart "trippant"; while the same hart must needs be "attired" as to its horns and "unguled" as to its hoofs. There is ancient authority for the nice blazonry which sometimes gives a separate colour to the tongue and claws of the lion, but even this may be set aside. Though a black lion in a silver field may be armed with red claws, and a golden leopard in a red field given blue claws and tongue, these trifles are but fancies which follow the taste of the painter, and are never of obligation. The tusks and hoofs of the

boar, and often the horns of the hart, are thus given in some paintings a colour of their own which elsewhere is neglected.

As the lion is among armorial beasts, so is the eagle among the birds. A bold convention of the earliest shield painters displayed him with spread wing and claw, the feat of a few strokes of the brush, and after this fashion he appears on many scores of shields. Like the claws and tongue of the lion, the beak and claws of the eagle are commonly painted of a second colour in all but very small representations. Thus the golden eagle of Lymesey in a red field may have blue beak and claws, and golden beak and claws will be given to Jorce's silver eagle upon red. A lure, or two wings joined and spread like those of an eagle, is a rare charge sometimes found. When fitted with the cord by which a falconer's lure is swung, the cord must be named.

Monhermer bore "Gold, an eagle vert." Sigeston bore "Silver, a two-headed eagle sable." Gavaston, earl of Cornwall, bore "Vert, six eagles gold." Bayforde of Fordingbridge sealed (in 1388) with arms of "An eagle bendwise, with a border engrailed and a baston." Graunson bore "Paly silver and azure with a bend gules and three golden eagles thereon."

Commoner than the eagle as a charge is the martlet, a humbler bird which is never found as the sole charge of a shield. In all but a few early representations the feathers of the legs are seen without the legs or claws. The martlet indicates both swallow and martin, and in the arms of the Cornish Arundels the martlets must stand for "hirundels" or swallows.

The falcon or hawk is borne as a rule with close wings, so that he may not be taken for the eagle. In most cases he is there to play on the bearer's name, and this may be said of most of the flight of lesser birds.

Naunton bore "Sable, three martlets silver." Heron bore "Azure, three herons silver." Fauconer bore "Silver, three falcons gules." Hauvile bore "Azure, a dance between three hawks gold." Twenge bore "Silver, a fesse gules between three popinjays (or parrots) vert." Cranesley bore "Silver, a chevron gules between three cranes azure." Asdale bore "Gules, a swan silver." Dalston bore "Silver, a chevron engrailed between three daws' heads razed sable." Corbet bore "Gold, two corbies sable." Sumeri (13th century) sealed with arms of "A peacock with his tail spread." John Pyeshale of Suffolk (14th century) sealed with arms of "Three magpies."

Fishes, Reptiles and Insects.—Like the birds, the fishes are borne for the most part to call to mind their bearers' names. Unless their position be otherwise named, they are painted as upright in the shield, as though rising towards the water surface. The dolphin is known by his bowed back, old artists making him a grotesquely decorative figure.

Lucy bore "Gules, three lucas (or pike) silver." Heringaud bore "Azure, crusilly gold, with six golden herrings." Fishacre bore "Gules, a dolphin silver." La Roche bore "Three roach swimming." John Samon (14th century) sealed with arms of "Three salmon swimming."

Shell-fish would hardly have place in English armory were it not for the abundance of scallops which have followed their appearance in the banners of Dacre and Scales. The crest of the Yorkshire Scropes, playing upon their name, was a pair of crabs' claws. Dacre bore "Gules, three scallops silver." Shelley bore "Sable, a fesse engrailed between three whelk-shells gold."

Reptiles and insects are barely represented. The lizards in the crest and supporters of the Ironmongers of London belong to the 15th century. Gawdy of Norfolk may have borne the tortoise in his shield in the same age. "Silver, three toads sable" was quartered as a second coat for Botreaux of Cornwall in the 16th century—Botereau or Boterel signifying a little toad in the old French tongue—but the arms do not appear on the old Botreaux seals beside their ancient bearing of the griffon. Beston bore "Silver, a bend between six bees sable" and a 15th-century Harbottle seems to have sealed with arms of three bluebottle flies. Three butterflies are in the shield of Presfen of Lancashire in 1415, while the winged insect shown on the seal of John Mayre, a King's Lynn burgess of the age of Edward I., is probably a mayfly.

Human Charges.—Man and the parts of him play but a small part in English shields, and we have nothing to put beside such a coat as that of the German Manessen, on which two armed knights attack each other's hauberks with their teeth. But certain arms of religious houses and the like have the whole figure, the see of Salisbury bearing the Virgin and Child in a blue field. And old crests have demi-Saracens and falchion men, coal-miners, monks and blackamoors. Sowdan bore in his shield a turbaned soldan's head; Eady, three old men's "eads"! Heads of maidens, the "winsome marrows" of the ballad, are in the arms of Marow. The Stanleys, as kings of Man, quartered the famous three armed legs whirling mill-sail fashion, and Tremayne of the west bore three men's arms in like wise. "Gules, three hands silver" was for Malmeyns as early as the 13th century, and Tynte of Colchester displayed hearts.

Miscellaneous Charges.—Other charges of the shield are less frequent but are found in great variety, the reason for most of them being the desire to play upon the bearer's name.

Weapons and the like are rare, having regard to the military associations of armory. Daubeney bore three helms; Philip Marmion took with his wife, the coheir of Kilpek, the Kilpek shield of a sword (*espek*). Tuck had a stabbing sword or "tuck." Bent bows were borne by Bowes, an arblast by Arblaster, arrows by Archer, birding-bolts or *bosouns* by Bosun, the mangonel by Mangnall. The three lances of Amherst is probably a mediaeval coat; Leweston had battle-axes.

Of horse-furniture we have the stirrups of Scudamore and Giffard, the horse-barnacles of Bernake and the horse-shoes borne by many branches and tenants of the house of Ferrers.

Of musical instruments there are pipes, trumps and harps for Pipe, Trumpington and Harpesfeld. Hunting horns are common among families bearing such names as Forester or Horne. Remarkable charges are the three organs of Grenville, who held of the house of Clare, the lords of Glamorgan.

The most notable of the charges derived from clothing is the hanging sleeve familiar in the arms of Hastings, Conyers and Mansel.

Chess-rooks, hardly to be distinguished from the *roc* or *roquet* at the head of a jousting-lance, were borne by Rokewode and by many more. Topcliffe had pegtops in his shield, while Ambesas had a cast of three dice which should each show the point of one, for "to throw ambesace" is an ancient phrase used of those who throw three aces.

Although the British are a sea-going people, there are few ships in British armory, most of these in the arms of sea-ports. Anchors are commoner.

Castles and towers, bridges, portcullises and gates have all examples, and a minster-church was the curious charge borne by the ancient house of Musters of Kirklington.

Letters of the alphabet are very rarely found in ancient armory; but three capital T's, in old English script, were borne by Toft of Cheshire in the 14th century. In the period of decadence whole words or sentences, commonly the names of military or naval victories, are often seen.

Blazonry.—An ill-service has been done to the students of armory by those who have pretended that the phrases in which the shields and their charges are described or blazoned must follow arbitrary laws devised by writers of the period of armorial decadence. One of these laws, and a mischievous one, asserts that no tincture should be named a second time in the blazon of one coat. Thus if gules be the hue of the field any charge of that colour must thereafter be styled "of the first." Obeying this law the blazoner of a shield of arms elaborately charged may find himself sadly involved among "of the first," "of the second" and "of the third." It is needless to say that no such law obtained among armorists of the middle ages. The only rule that demands obedience is that the brief description should convey to the reader a true knowledge of the arms described.

The examples of blazonry given in that part of this article which deals with armorial charges will be more instructive to the student than any elaborated code of directions. It will be observed that the description of the field is first set down, the

blazoner giving its plain tincture or describing it as burely, party, paly or barry, as powdered or sown with roses, crosslets or fleurs-de-lys. Then should follow the main or central charges, the lion or griffon dominating the field, the cheveron or the pale, the fesse, bend or bars, and next the subsidiary charges in the field beside the "ordinary" and those set upon it. Chiefs and quarters are blazoned after the field and its contents, and the border, commonly an added difference, is taken last of all. Where there are charges both upon and beside a bend, fesse or the like, a curious inversion is used by pedantic blazoners. The arms of Mr. Samuel Pepys of the Admiralty Office would have been described in earlier times as "Sable, a bend gold between two horses' heads razed silver, with three fleurs-de-lys sable on the bend." Modern heraldic writers would give the sentence as "Sable, on a bend or between two horses' heads erased argent, three fleurs-de-lys of the first." Nothing is gained by this inversion but the precious advantage of naming the bend but once. On the other side it may be said that, while the newer blazon couches itself in a form that seems to prepare for the naming of the fleurs-de-lys as the important element of the shield, the older form gives the fleur-de-lys as a mere postscript, and rightly, seeing that charges in such a position are very commonly the last additions to a shield by way of difference. In like manner when a crest is described it is better to say "a lion's head out of a crown" than "out of a crown a lion's head." The first and last necessity in blazonry is lucidity, which is cheaply gained at the price of a few syllables repeated.

Modern Heraldry.—With the accession of the Tudors armory began a rapid decadence. Heraldry ceased to play its part in military affairs, the badges and banners under which the mediaeval noble's retinue came into the field were banished, and even the tournament in its later days became a renaissance pageant which did not need the painted shield and armorial trappers. Treatises on armory had been rare in the days before the printing press, but even so early a writer as Nicholas Upton had shown himself as it were unconcerned with the heraldry that any man might see in the camp and the street. From the Book of St. Albans onward the treatises on armory are informed with a pedantry which touches the point of crazy mysticism in such volumes as that of Sylvanus Morgan. Thus came into the books those long lists of "diminutions of ordinaries," the closets and escarpes, the endorses and ribands, the many scores of strange crosses, and such wild fancies as the rule, based on an early German pedantry, that the tinctures in peers' shields should be given the names of precious stones and those in the shields of sovereigns the names of planets. Blazon became cumbered with that vocabulary whose French of Stratford atte Bowe has driven serious students from a business which, to use a phrase as true as it is hackneyed, was at last "abandoned to the coachpainter and the undertaker."

With the false genealogy came in the assumption or assigning of shields to which the new bearers had often no better claim than lay in a surname resembling that of the original owner. The ancient system of differencing arms disappeared. Now and again we see a second son obeying the book-rules and putting a crescent in his shield or a third son displaying a molet, but long before our own times the practice was disregarded, and the most remote kinsman of a gentle house displayed the "whole coat" of the head of his family.

The art of armory had no better fate. An absurd rule current for some three hundred years has ordered that the helms of princes and knights should be painted full-faced and those of peers and gentlemen sidelong. Obeying this, the herald painters have displayed the crests of knights and princes as sideways upon a full-faced helm; the torse or wreath, instead of being twisted about the brow of the helm, has become a sausage-shaped bar see-sawing above the helm, and upon this will be balanced a crest which might puzzle the ancient craftsman to mould in his leather or parchment. A ship on a lee-shore with a thunderstorm lowering above its masts may stand as an example of such devices. "Tastes, of course, differ," wrote Dr. Woodward, "but the writer can hardly think that the *épergne* given to Lieut.

General Smith by his friends at Bombay was a fitting ornament for a helmet." As with the crest, so with the shield. It became crowded with ill-balanced figures devised by those who despised and ignored the ancient examples whose painters had followed instinctively a simple and pleasant convention. Landscapes and seascapes, musical lines, military medals and corrugated boiler-flues have all made their appearance in the shield. Even as on the signs of public houses, written words have taken the place of figures, and the often-cited arms exemplified to the first Earl Nelson marked, it may be hoped, the high watermark of these distressing modernisms. Of late years, indeed, official armory in England has shown a disposition to follow the lessons of the archaeologist, although the recovery of mediaeval use has not yet been as successful as in Germany, where for a long generation a school of vigorous armorial art has flourished.

OFFICERS OF ARMS

Officers of arms, styled kings of arms, heralds and pursuivants, make their appearance at an early period of the history of armory as the messengers both in peace and in war of princes and magnates. It is probable that from the first they bore in some wise their lord's arms as the badge of their office. In the 14th century we have heralds with the arms on a short mantle; witness the figure of the duke of Gelderland's herald painted in the *Armorial de Gelre*. The title of Blue Mantle pursuivant, as old as the reign of Edward III., suggests a like usage in England. When the tight-laced coat of arms went out of fashion among the knighthood the loose tabard of arms with its wide sleeves was at once taken in England as the armorial dress of both herald and cavalier, and the fashion of it has changed but little since those days. Clad in such a coat the herald was the image of his master and, although he himself was rarely chosen from any rank above that of the lesser gentry, his person, as a messenger, acquired an almost priestly sacredness. To injure or to insult him was to affront the coat that he wore.

We hear of kings of arms in the royal household of the 13th century, and we may compare their title with those of such officers as the King of the Ribalds and the King of the Minstrels; but it is noteworthy that, even in modern warrants for heralds' patents, the custom of the reign of Edward III. is still cited as giving the necessary precedents for the officers' liveries. Officers of arms took their titles from their provinces or from the titles and badges of their masters. Thus we have Garter, Norroy and Clarenceux, March, Lancaster, Windsor, Leicester, Leopard, Falcon and Blanc Sanglier as officers attached to the royal house; Chandos, the herald of the great Sir John Chandos; Vert Eagle of the Nevill earls of Salisbury, Esperance and Crescent of the Percys of Northumberland. The spirit of Henry VII.'s legislation was against such usages in baronial houses, and in the age of the Tudors the last of the private heralds disappears.

In England the royal officers of arms were made a corporation by Richard III. Nowadays the members of this corporation, known as the College of Arms or Heralds' College, are Garter Principal King of Arms, Clarenceux King of Arms South of Trent, Norroy King of Arms North of Trent, the heralds Windsor, Chester, Richmond, Somerset, York and Lancaster, and the pursuivants Rouge Croix, Bluemantle, Rouge Dragon and Portcullis. Another king of arms, not a member of this corporation, has been attached to the order of the Bath since the reign of George I., and an officer of arms, without a title, attends the order of St. Michael and St. George.

There is no college or corporation of heralds in Scotland or Ireland. In Scotland "Lyon-king-of-arms," "*Lyon rex armorum*," or "*Leo fecialis*," so called from the lion on the royal shield, is the head of the office of arms. When first the dignity was constituted is not known, but Lyon was a prominent figure in the coronation of Robert II. in 1371. The office was at first, as in England, attached to the earl marshal, but it has long been conferred by patent under the great seal, and is held direct from the crown. Lyon is also king-of-arms for the national order of the Thistle. He is styled "Lord Lyon," and the office has always been held by men of family, and frequently by a peer who would appoint a

"Lyon depute." He is supreme in all matters of heraldry in Scotland. Following him there are the Scottish heralds, Albany, Ross and Rothesay, with precedence according to date of appointment; and the pursuivants, Carrick, March and Unicorn. Heralds and pursuivants are appointed by Lyon.

In Ireland also there is but one king-of-arms, Ulster. The office was instituted by Edward VI. in 1553. The patent is given by Rymer, and refers to certain emoluments as "*praedicto officio . . . ab antiquo spectantibus*." The allusion is to an Ireland king-of-arms mentioned in the reign of Richard II. and superseded by Ulster. Ulster holds office by patent, during pleasure; under him the Irish office of arms consists of two heralds, Cork and Dublin; and a pursuivant, Athlone. Ulster is king-of-arms to the order of St. Patrick. He held visitations in parts of Ireland from 1568 to 1620, and these and other records, including all grants of arms from the institution of the office, are kept in the Birmingham Tower, Dublin.

The armorial duties of the ancient heralds are not clearly defined. The patent of Edward IV., creating John Wrythe king-of-arms of England with the style of Garter, speaks vaguely of the care of the office of arms and those things which belong to that office. We know that the heralds had their part in the ordering of tournaments, wherein armory played its greatest part, and that their expert knowledge of arms gave them such duties as reckoning the noble slain on a battlefield. But it is not until the 15th century that we find the heralds following a recognized practice of granting or assigning arms, a practice on which John of Guildford comments, saying that such arms given by a herald are not of greater authority than those which a man has taken for himself. The Book of St. Albans, put forth in 1486, speaking of arms granted by princes and lords, is careful to add that "armys bi a mannys proper auctorite taken, if an other man have not borne theym afore, be of strength enogh," repeating, as it seems, Nicholas Upton's opinion which, in this matter, does not conflict with the practice of his day. It is probable that the earlier grants of arms by heralds were made by reason of persons uncunning in armorial lore applying for a suitable device to experts in such matters—and that such setting forth of arms may have been practised even in the 14th century.

The earliest known grants of arms in England by sovereigns or private persons are, as a rule, the conveyance of a right in a coat of arms already existing or of a differenced version of it. Thus in 1391 Thomas Grendale, a squire who had inherited through his grandmother the right in the shield of Beaumeys, granted his right in it to Sir William Moigne, a knight who seems to have acquired the whole or part of the Beaumeys manor in Sawtry. Under Henry VI. we have certain rare and curious letters of the crown granting nobility with arms "*in signum huiusmodi nobilitatis*" to certain individuals, some, and perhaps all of whom, were foreigners who may have asked for letters which followed a continental usage. After this time we have a regular series of grants by heralds who in later times began to assert that new arms, to be valid, must necessarily be derived from their assignments, although ancient use continued to be recognized.

An account of the genealogical function of the heralds, so closely connected with their armorial duties will be found in the article GENEALOGY. In spite of the work of such distinguished men as Camden and Dugdale they gradually fell in public estimation until Blackstone could write of them that the marshalling of coat-armour had fallen into the hands of certain officers called heralds, who had allowed for lucre such falsity and confusion to creep into their records that even their common seal could no longer be received as evidence in any court of justice. From this low estate they rose again when the new archaeology included heraldry in its interests, and several antiquaries of repute have of late years worn the herald's tabard.

In spite of the vast amount of material which the libraries catalogue under the head of "Heraldry," the subject has as yet received little attention from antiquaries working in the modern spirit. The old books are as remarkable for their detachment from the facts as for their folly. The work of Nicholas Upton, *De studio militari*, although written in the first half of the 15th century,

shows, as has been already remarked, no attempt to reconcile the conceits of the author with the armorial practice which he must have seen about him on every side. Gerard Leigh, Bossewell, Ferne and Morgan carry on this bad tradition, each adding his own extravagances. The *Display of Heraldry*, first published in 1610 under the name of John Guillim, is more reasonable if not more learned, and in its various editions gives a valuable view of the decadent heraldry of the 17th century. In the 19th century many important essays on the subject are to be found in such magazines as the *Genealogist*, the *Herald and Genealogist* and the *Ancestor*, while Planché's *Pursuivant of Arms* contains some slight but suggestive work which attempts original enquiry. But Dr. Woodward's *Treatise on Heraldry, British and Foreign* (1896), in spite of many errors arising from the author's reliance upon unchecked material, must be counted the only scholarly book in English upon a matter which has engaged so many pens. Among foreign volumes may be cited those of Menestrier and Spener, and the vast compilation of the German Siebmacher. Notable ordinaries of arms are those of Papworth and Renesse, companions to the armorials of Burke and Rietstap. The student may be advised to turn his attention to all works dealing with the effigies, brasses and other monuments of the middle ages, to the ancient heraldic seals and to the heraldry of mediaeval architecture and ornament.

(O.B.)

HERAT, city and province, Afghanistan. The city lies in 34° 20' 30" N., and 62° 11' 0" E., 2,500 ft. above sea-level. Estimated pop. about 10,000. It has quite lost its ancient commercial importance. From it lines of communication radiate to Russian, British, Persian and Afghan territory. The city forms a quadrangle about 1,600 yd. by 1,500 yd.; on the west, south and east, only the gateways project from the line of defence but on the north there is a double outwork consisting of the *Ark* or citadel, and a lower work at its foot, called the *Ark-i-nao*, or "new citadel," which extends 100 yd. beyond the line of the city wall. That which distinguishes Herat from all other Oriental cities is the stupendous earthwork upon which the city wall is built. This earthwork averages 250 ft. in width at the base and about 50 ft. in height, and as it is crowned by a wall 25 ft. high and 14 ft. thick at the base, supported by about 150 semi-circular towers, and is further protected by a ditch 45 ft. in width and 16 in depth, it presents an appearance of imposing strength.

Defences.—When the royal engineers of the Russo-Afghan Boundary Commission entered Herat in 1885 they found its buildings in various stages of disrepair and lacking all effective defences. Outside, ancient ruins and mounds impeded all field of fire. To the north-west, beyond the Tal-i-Bangi, the magnificent outlines of the Mosalla filled a wide space with the glorious curves of dome and gateway and the stately grace of tapering minars. The needs of defence, however, called for its destruction, but four minars standing at the corners of the wide plinth still remain to attest to its glory and to exhibit samples of decorative tilework of intricate beauty of design and exquisite taste in the blending of colour. At the same time the ancient graveyards round the city were swept smooth and levelled; obstructions were demolished, outworks constructed, and the defences generally renovated. Whether or no the strength of this bulwark of north-western Afghanistan should ever be practically tested, the general result of the most recent investigations into the value of Herat as a strategic centre has been largely to modify the once widely-accepted view that the key to India lies within it. Abdur Rahman and his successor Habibullah steadfastly refused the offer of British engineers to strengthen its defences; and though the Afghans themselves have occasionally undertaken repairs, it is doubtful whether the old walls of Herat are maintained in a state of efficiency.

The City Gates.—The city possesses five gates, two on the northern face, the Kutab-chak near the north-east angle of the wall, and the Malik at the re-entering angle of the Ark-i-nao; and three others in the centres of the remaining faces, the Irak gate on the west, the Kandahar gate on the south and the Kushk gate on the east face. The main streets, the *Chahar-súk* are well built, the principal one having a vaulted roof. Near the central quadrangle of the city is a vast domed reservoir of water. The only other

public building of any consequence in Herat is the Jamma Musjid or Great Mosque which comprises an area of 800 yd. square, and must have been a most magnificent structure. It was erected towards the close of the 15th century, during the reign of Shah Sultan Hussein of the family of Timur, and is said when perfect to have been 465 ft. long by 275 ft. wide, to have had 408 cupolas, 130 windows, 444 pillars and 6 entrances, and to have been adorned in the most magnificent manner with gilding, carving, precious mosaics and other elaborate and costly embellishments.

Ancient Ruins.—Along the slopes of the northern hills there is a space of some 4 m. in length by 3 m. in breadth, the surface of the plain, strewn over its whole extent with pieces of pottery and crumbling bricks, and also broken here and there by earthen mounds and ruined walls, the débris of palatial structures which at one time were the glory and wonder of the East. Of these structures indeed some have survived to the present day in a sufficiently perfect state to bear witness to the grandeur and beauty of the old architecture of Herat. Scarcely inferior to the mosque of the Mosalla though of more moderate dimensions, is the tomb of the saint Abdullah Ansari, in the same neighbourhood. This building, erected by Shah Rukh Mirza, grandson of Timur, over 500 years ago, contains exquisite Oriental sculpture. Adjoining the tomb also are marble sepulchres of princes of the house of Timur; and especially deserving of notice is a royal building tastefully decorated by an Italian artist named Geraldini, in the service of Shah Abbas the Great. It is held in high veneration by all classes, and the famous Dost Mohammed Khan is himself buried at the foot of the tomb of the saint. Two other royal palaces named respectively *Bagh-i-Shah* and *Takht-i-Sefer*, are on the same rising ground somewhat farther to the west.

Character of Inhabitants.—The original inhabitants of Ariana were no doubt of the Aryan family, cognate with the Persian race, but they probably intermixed at a very early period with the Sacae and Massagetae, who seem to have held the mountains from Kabul to Herat and to whom must be ascribed—rather than to an infusion of Turco-Tartaric blood introduced by the armies of Jenghiz and Timur—the peculiar broad features and flattish countenance of the inhabitants of Herat, Seistan and the eastern provinces of Persia. Under Herat, however, there are a very large number of tribes, ruled over by separate and semi-independent chiefs, and belonging probably to different nationalities. The principal group of tribes is called the *Chakar-Aimak*, or “four races,” the constituent parts of which, however, are variously stated by different authorities both as to strength and nomenclature. The Heratis are agricultural and not nearly so warlike as the Pathans from the neighbourhood of Kabul or Kandahar.

Environs of Herat.—The long narrow valley of the Hari Rud, starting from the western slopes of the Koh-i-Baba, extends almost due west for 300 m. before it takes its great northern bend at Kuhsan, and passes northwards through the broken ridges of the Siah Bubuk (the western extremity of the range which we now call Paropamisus) towards Sarakhs. For the greater part of its length it drains the southern slopes only of the Paropamisus and the northern slopes of a parallel range called Koh-i-Safed. The Paropamisus forms the southern face of the Turkistan plateau, which contains the sources of the Murghab river; the northern face of the same plateau is defined by the Band-i-Turkistan. On the south of the plateau we find a similar succession of narrow valleys dividing parallel flexures, or anticlinals, formed under similar geological conditions to those which appear to be universally applicable to the Himalaya, the Hindu Kush, and the Indus frontier mountain systems. From one of these long lateral valleys the Hari Rud receives its principal tributary, which joins the main river below Obeh, 180 m. from its source; and it is this tributary (separated from the Hari Rud by the narrow ridges of the Koh-i-Safed and Band-i-Baian) that offers the high road from Herat to Kabul, and not the Hari Rud itself. From its source to Obeh the Hari Rud is a valley of sandy desolation. Masses of melting snow annually give rise to floods, frequently rendering the river impassable and cutting off the crazy brick bridges at Herat and Tirpul. It is impossible, whilst watching the rolling, seething volume of flood-water which swirls westwards in April, to imagine

the waste stretches of dry river-bed which in a few months' time (when every available drop of water is carried off for irrigation) will represent the Hari Rud. The soft shales or clays of the hills bounding the valley render these hills especially subject to the action of denudation, and the result, in rounded slopes and easily accessible crests, determines the nature of the easy tracks and passes which intersect them. At the same time, any excessive local rainfall is productive of difficulty and danger from the floods of liquid mud and loose boulders which sweep like an avalanche down the hill sides. The intense cold which usually accompanies these sudden northern blizzards of Herat and Turkistan is a further source of danger.

Cultivated Area.—From Obeh, 50 m. east of Herat, the cultivated portion of the valley commences, and it extends, with a width which varies from 8 to 16 m., in Kuhsan, 60 m. west of the city, presenting a remarkable scene of luxurious fertility. The system of irrigation by which these agricultural results are attained is most elaborate. The Herati Tajik, adopts the karez (or, Persian, *kanat*) system of underground irrigation and brings every drop of water that he can find to the surface. The valley about Herat includes a flat alluvial plain. Three miles to the south of the city the river flows from east to west, spanned by the Pal-i-Malun. East and west stretches the long vista of the Hari Rud. Due north lie the hills called the Koh-i-Mulla Khwaja about 3 m. distant from the city. This northern line of barren, broken sandstone hills is geographically no part of the Paropamisus range, from which it is separated by a stretch of sandy upland about 20 m. in width, called the Dasht-i-Hamdamao, or Dasht-i-Ardewan, formed by the talus or drift of the higher mountains. Through this stretch of *dasht* the drainage from the main water-divide breaks downwards to the plains of Herat, where it is arrested and utilized for irrigation purposes.

The Korokh Valley.—To the north-east of the city a very considerable valley has been formed between the Paropamisus and the subsidiary Koh-i-Mulla Khwaja range, called Korokh. Here there are one or two important villages and a well-known shrine marked by a group of pine trees which is unique in this part of Afghanistan. The valley leads to a group of passes across the Paropamisus into Turkistan, of which the Zirmast is perhaps the best known. The main water-divide between Herat and the Turkistan Chol (the loess district) has been called Paropamisus for want of any well-recognized general name. To the north of the Korokh valley it exhibits something of the formation of the Hindu Kush (of which it is apparently a geological extension), but as it passes westwards it becomes broken into fragments by processes of denudation, until it is hardly recognizable as a distinct range at all. The direct passes across it from Herat (the Baba and the Ardewan) wind amongst masses of disintegrating sandstone for some miles on each side of the dividing watershed, but farther west the rounded knolls of the rain-washed downs may be crossed almost at any point without difficulty.

HISTORY

The name of Herat first appears in the list of primitive Zoroastrian settlements contained in the *Vendidād Sadē*, where it seems to apply to the river or river-basin, which was the special centre of population. Of the foundation of Herat (or Heri) nothing is known. We can only infer from the colossal character of the earthworks which surround the modern town that, like the similar remains at Bost on the Helmund and at Ulan Robat of Arachosia, they belong to that period of Central-Asian history which preceded the rise of Achaemenian power, and which in Grecian romance is illustrated by the names of Bacchus, of Hercules, and of Semiramis. To trace in any detail the fortunes of Herat would be to write the modern history of the East, for there has hardly been a revolution, or war, in Central Asia since the time of the prophet in which Herat has not played a conspicuous part. Under the Tahirids of Khorasan, the Saffarids of Seistan, and the Samanids of Bokhara it flourished for some centuries in peace and progressive prosperity; but during the succeeding rule of the Ghaznevid kings its metropolitan character was for a time obscured by the celebrity of the neighbouring capital of Ghazni.

(*q.v.*) until finally in the reign of Sultan Sanjar of Merv, about 1157, the city was entirely destroyed by an irruption of the Ghuzz, the predecessors of the modern Turkomans. Herat gradually recovered under the enlightened Ghorid kings, so that at the time of Jenghiz Khan's invasion it equalled or even exceeded in populousness and wealth its sister capitals of Balkh, Merv, and Nishapur, the united strength of the four cities being estimated at three millions of inhabitants. But this Mongol visitation was most calamitous: only 40 persons are said to have survived the general massacre of 1232, and a similar catastrophe overtook the city in 1398 on the fall of the Kurt dynasty (*see* MONGOLS). It is, therefore, astonishing to find that early in the 15th century Herat was again flourishing and populous, and the favoured seat of the art and literature of the East. It was under the princes of the house of Timur that most of the noble buildings were erected, of which the remains still excite our admiration at Herat, while all the great historical works relative to Asia, such as the *Rozet-es-Sefā*, the *Habib-es-Seir*, *Hafiz Abrū's Tarikh*, the *Matlā a-es-Sa'adin*, etc., date from the same place and the same age. Four times was Herat sacked by Turkomans and Usbeks during the centuries which intervened between the Timuride princes and the rise of the Afghan power, and it has never in modern times attained to anything like its old importance. Afghan tribes, who had originally dwelt far to the east, were first settled at Herat by Nadir Shah, and from that time they have monopolized the government and formed the dominant element in the population. It is needless to trace the revolutions and counter-revolutions which have followed each other in quick succession at Herat since Ahmad Shah Durani founded the Afghan monarchy about the middle of the 18th century; it is enough to say that Herat has been throughout the seat of an Afghan Government, sometimes in subordination to Kabul and sometimes independent. Persia indeed for many years showed a strong disposition to reassert the supremacy over Herat which was exercised by the Safawid kings, but Britain steadily resisted the encroachment; and, indeed, after helping the Heratis to beat off the attack of the Persian army in 1838, the British at length compelled the shah in 1857, at the close of his war with them, to sign a treaty recognizing the further independence of the place, and pledging Persia against any further interference with the Afghans. In 1863 Herat, which for 50 years previously had been independent of Kabul, was incorporated by Dost Mohammed Khan in the Afghan monarchy.

See C. E. Yate, *Northern Afghanistan* (1888); Holdich, *Indian Borderland* (1901); Angus Hamilton, *Afghanistan* (1906).

HÉRAULT, a department in the south of France, formed from Lower Languedoc. Pop. (1926) 500,575. Area, 2,402 sq.m. It is bounded north-east by Gard, north-west by Aveyron and Tarn, and south by Aude and the Golfe du Lion. The southern prolongation of the Cévennes mts., composed of Archæan and Palæozoic rocks, with Mesozoic rocks on the southern edge and in the plateau of Larzac, occupies the north-west of the department, the highest point being about 4,250 ft. above sea-level. South-east of this come hills and plateaus decreasing as they approach the rich coastal plains at the mouth of the Orb and the Hérault and, farther to the north-east the line of intercommunicating coastal salt lagoons (Etang de Thau, etc.). North-west the Garrigues, a district of dry Mesozoic limestone plateaus and hills, stretches into the neighbouring department of Gard. South-west of this is the plain of Pliocene rocks with recent eruptive rocks near Agde. The mountains of the north-west form the watershed between the Atlantic and Mediterranean basins. From them flow the Hérault, its tributary the Lergue, and more to the south-west the Livron and the Orb, the main rivers of the department.

The climate is colder and more rainy in the mountains than on the plain which has dry summers with occasional storms. Hérault ranks first among French departments for area of vineyards; the red wines of St. Georges, Cazouls-lès-Béziers, Picpoul and Maranssan, and the white wines of Frontignan and Lunel are famous. Mulberries, olives and chestnuts flourish. Silk-worms are reared. Considerable numbers of sheep are raised, their milk being utilized for the preparation of Roquefort cheeses. There are quarries of

marble, limestone, gypsum, etc.; the marshes supply salt. The most important mineral springs are at Lamalou-les-Bains and Balaruc-les-Bains. Woollen and cotton cloth, especially for military use, silk (Ganges), casks, soap and fertilizing stuffs are made. There are also oil-works, distilleries (Béziers) and tanneries (Bédarieux). Fishing is important; Certe and Mèze are the chief ports. Hérault exports salt fish, wine, liqueurs, timber, salt, building-material, etc. It imports cattle, skins, wool, cereals, vegetables, coal and other commodities.

The railway lines belong chiefly to the Southern and P.L.M. companies. The Canal du Midi traverses the south of the department for 44 m. and terminates at Certe. The Canal des Étangs traverses the department for about 20 m., forming part of a line of communication between Certe and Aigues-Mortes. Montpellier, the capital, is the seat of a bishopric of the province of Avignon, and of a court of appeal and centre of an académie (educational division). The department belongs to the 16th military region, (Montpellier). It is divided into the arrondissements of Montpellier and Béziers, with 36 cantons and 342 communes.

Montpellier, Béziers, Lodève, Bédarieux, Certe, Agde, Pézenas, Lamalou-les-Bains and Clermont-l'Hérault are the more important towns. Among the other interesting places in the department are St. Pons, with a church of the 12th century, once a cathedral; Villemagne, which has two ruined churches, one of the 13th, the other of the 14th century; Pignan, a mediaeval town, near which is the 13th century abbey-church of Vignogoul in the early Gothic style; and St. Guilhem-le-Désert, which has a church of the 11th and 12th centuries. Maguelonne, which in the 6th century became the seat of a bishopric transferred to Montpellier in 1536, has a cathedral of the 12th century.

HÉRAULT DE SÉCHELLES, MARIE JEAN (1759-1794), French politician, was born at Paris on Sept. 20, 1759. He made his début as a lawyer at the Châtelet, and later was *avocat général* to the parlement of Paris. He devoted himself to literature, and his account of his visit to the comte de Buffon at Montbard has with some justice been called a masterpiece of interviewing, before the day of journalists. Hérault took part in the taking of the Bastille, and on Dec. 8, 1789, was appointed a judge in Paris. On his return from a mission to Alsace (Jan.-April, 1791) he was appointed *commissaire du roi* in the court of cassation. He was elected as a deputy for Paris to the Legislative Assembly, where he gravitated towards the extreme left, and, as a member of the diplomatic committee, presented a famous report demanding that the nation should be declared to be in danger (June 11, 1793). After the revolution of Aug. 10, 1792 (*see* FRENCH REVOLUTION), he co-operated with Danton, and on Sept. 2, was appointed president of the Legislative Assembly. Hérault was several times president of the Convention, notably on June 2, 1793, the occasion of the attack on the Girondins, and on Aug. 10, 1793, when the passing of the new constitution was celebrated. On the rejection of the projected constitution drawn up by Condorcet, he was entrusted with the task of preparing a fresh one; his plan became the Constitution of 1793, which was passed, but never applied. As a member of the Committee of Public Safety Hérault was employed on a mission in Alsace (Oct.-Dec. 1793) which made him an object of suspicion to the other members of the Committee of Public Safety, and especially to Robespierre. He was accused of treason, condemned with Danton, and executed on the 16th Germinal in the year II. (April 5, 1794).

See the *Voyage à Montbard*, published by A. Aulard (1890); A. Aulard, *Les Orateurs de la Législative et de la Convention* (2nd ed. 1906); J. Claretie, *Camille Desmoulins . . . étude sur les Dantonistes* (1875); Dr. Robinet, *Le Procès des Dantonistes* (1879); "Hérault de Séchelles, sa première mission en Alsace" in the review *La Révolution Française*, tome 22; E. Daudet, *Le Roman d'un conventionnel. Hérault de Séchelles et les dames de Bellegarde* (1904). His *Oeuvres littéraires* were edited (1907) by E. Dard.

HERB, in botany, the name given to those plants whose stem or stalk dies entirely or down to the root each year, and does not become, as in shrubs or trees, woody or permanent; such plants are also called "herbaceous." The term "herb" is also used of those herbaceous plants, which possess certain properties, and are used for medicinal purposes, for flavouring or garnishing in cook-

ing, and also for perfumes (see HORTICULTURE and PHARMACOLOGY).

HERBARIUM or **HORTUS SICCUS**, a collection of plants so dried and preserved as to illustrate as far as possible their characters. Since the same plant, owing to peculiarities of climate, soil and situation, degree of exposure to light and other influences may vary greatly according to the locality in which it occurs, it is only by gathering together for comparison and study a large series of examples of each species that the flora of different regions can be satisfactorily represented. Even in the best equipped botanical garden it is impossible to have, at one and the same time, more than a very small percentage of the representatives of the flora of any given region or of any large group of plants. Hence a good herbarium forms an indispensable part of a botanical museum or institution. There are large herbaria at the British Museum and at the Royal Gardens, Kew, and smaller collections at the botanical institutions of the principal British universities. The original herbarium of Linnaeus is in the possession of the Linnean Society of London. It was purchased from the widow of Linnaeus by Dr. (afterwards Sir) J. E. Smith, one of the founders of the Linnean Society, and after his death was purchased by the society. Herbaria are also associated with the more important botanic gardens and museums in other countries. The value of a herbarium is much enhanced by the possession of "types," that is, the original specimens on the study of which a species was founded. Thus the herbarium at the British Museum, which is especially rich in the earlier collections made in the 18th and early 19th centuries, contains the types of many species founded by the earlier workers in botany. It is also rich in the types of Australian plants in the collections of Sir Joseph Banks and Robert Brown, and contains in addition many valuable modern collections. The Kew herbarium, founded by Sir William Hooker and greatly increased by his son Sir Joseph Hooker, is also very rich in types, especially those of plants described in the *Flora of British India* and various colonial floras. The collection of Dillenius is deposited at Oxford, and that of Professor W. H. Harvey at Trinity College, Dublin. The collections of Antoine Laurent de Jussieu, his son Adrien, and of Auguste de St. Hilaire, are included in the large herbarium of the Jardin des Plantes at Paris, and in the same city is the extensive private collection of Dr. Ernest Cosson. At Geneva are three large collections—Augustin Pyramide de Candolle's, containing the typical specimens of the *Prodromus*, a large series of monographs of the families of flowering plants, Benjamin Delessert's fine series at the Botanic Garden, and the Boissier Herbarium, which is rich in Mediterranean and Oriental plants. The university of Göttingen had bequeathed to it the largest collection (exceeding 40,000 specimens) ever made by a single individual—that of Professor Grisebach. At the herbarium in Brussels are the specimens obtained by the traveller Karl Friedrich Philipp von Martius, the majority of which formed the groundwork of his *Flora Brasiliensis*. The Berlin herbarium is especially rich in more recent collections; and other national herbaria sufficiently extensive to subserve the requirements of the systematic botanist exist at Leningrad, Vienna, Leyden, Stockholm, Uppsala, Copenhagen and Florence. Of those in the United States of America, the chief, formed by Asa Gray, is the property of Harvard university; there is also a large one at the New York Botanical Garden. The herbarium at Melbourne, Australia, under Baron Müller, attained large proportions; and that of the Botanical Garden of Calcutta is noteworthy as the repository of numerous specimens described by writers on Indian botany.

Specimens of flowering plants and vascular cryptogams are generally mounted on sheets of stout smooth paper, of uniform quality; the size adopted at Kew is 17 in. long by 11 in. broad, that at the British Museum is slightly larger; the palms and their allies, however, and some ferns, require a larger size. The tough but flexible coarse grey paper, upon which on the Continent specimens are commonly fixed by gummed strips of the same, is less hygroscopic than ordinary cartridge paper, but has the disadvantage of affording harbourage in the inequalities of its surface

to a minute insect, *Atropos pulsatoria*, which commits great havoc in damp specimens, and which, even if noticed, cannot be dislodged without difficulty. The majority of plant specimens are most suitably fastened on paper by a mixture of equal parts of gum tragacanth and gum arabic made into a thick paste with water. Rigid leathery leaves are fixed by means of glue, or, if they present too smooth a surface, by stitching at their edges. Where, as in private herbaria, the specimens are not liable to be handled with great frequency, a stitch here and there round the stem, tied at the back of the sheet, or slips of paper passed over the stem through two slits in the sheet and attached with gum to its back, or simply strips of gummed paper laid across the stem, may be resorted to.

To preserve them from insects, the plants, after mounting, are often brushed over with a liquid formed by the solution of $\frac{1}{4}$ lb. each of corrosive sublimate and carbolic acid in 1 gallon of methylated spirits. They are then laid out to dry on shelves made of a network of stout galvanized iron wire. The use of corrosive sublimate is not, however, recommended, as it forms on drying a fine powder which when the plants are handled will rub off and, being carried into the air, may prove injurious to workers. If the plants are subjected to some process, before mounting, by which injurious organisms are destroyed, such as exposure in a closed chamber to vapour of carbon bisulphide for some hours, the presence of pieces of camphor or naphthalene in the cabinet will be found a sufficient preservative. After mounting are written—usually in the right-hand corner of the sheet, or on a label there affixed—the designation of each species, the date and place of gathering, and the name of the collector. Particulars as to habit, local abundance, soil and claim to be indigenous may be written on the back of the sheet. A careful dissection of a flower greatly increases the value of the specimen. The species of each genus are then arranged either systematically or alphabetically in separate covers of stout, usually light brown paper, or, if the genus be large, in several covers with the name of the genus clearly indicated in the lower left-hand corner of each, and opposite it the names or reference numbers of the species. Undetermined species are relegated to the end of the genus. Thus prepared, the specimens are placed on shelves or movable trays, at intervals of about 6 in., in an air-tight cupboard, on the inner side of the door of which, as a special protection against insects, is suspended a muslin bag containing a piece of camphor.

The systematic arrangement varies in different herbaria. In the great British herbaria the orders and genera of flowering plants are usually arranged according to Bentham and Hooker's *Genera plantarum*; the species generally follow the arrangement of the most recent complete monograph of the family. In non-flowering plants the works usually followed are for ferns, Hooker and Baker's *Synopsis filicum*; for mosses, Müller's *Synopsis muscorum frondosorum*, Jaeger & Sauerbeck's *Genera et species muscorum*, and Engler & Prantl's *Pflanzenfamilien*; for algae, de Toni's *Sylloge algarum*; for hepaticae, Gottsche, Lindenberg and Nees ab Esenbeck's *Synopsis hepaticarum*, supplemented by Stephani's *Species hepaticarum*; for fungi, Saccardo's *Sylloge fungorum*, and for mycetozoa Lister's monograph of the group. For the members of large genera, e.g., *Piper* and *Ficus*, since the number of cosmopolitan or very widely distributed species is comparatively few, a geographical grouping is found specially convenient by those who are constantly receiving parcels of plants from known foreign sources. The ordinary systematic arrangement possesses the great advantage, in the case of large genera, of readily indicating the affinities of any particular specimen with the forms most nearly allied to it.

HERBART, JOHANN FRIEDRICH (1776–1841), German philosopher and educationist, was born at Oldenburg on May 4, 1776. After studying under Fichte at Jena he tutored in Switzerland where he met Pestalozzi. He lectured at Göttingen in 1805, whence he removed in 1809 to occupy the chair formerly held by Kant at Königsberg. Here he also conducted a seminary of pedagogy till 1833, when he returned as professor of philosophy to Göttingen, where he died on Aug. 14, 1841.

Philosophy, according to Herbart, means the reflection upon and

elaboration of our empirical conceptions. Logic, its first division, clarifies our conceptions and the judgments and reasonings arising from them. But the more distinct some conceptions are, the more contradictory their elements become; so to manipulate these as to make them thinkable is the problem of metaphysics.

Logic receives comparatively meagre notice from Herbart, though he insists on its purely formal character, and expresses himself in the main at one with Kantians such as Fries and Krug.

As a metaphysician he starts from the scepticism of Hume and Kant, and on account of the contradictions involved, questions the real validity of even the *forms* of experience which he admits are "given." Suppose we are given a conception A uniting among its constituent marks two contradictory ones, M and N. We can neither deny the unity nor reject one of the contradictory members. To do either is forbidden by experience; to do nothing is forbidden by logic. We must assume then that the conception is contradictory because incomplete, and what we have must point the way to what we want. Experience asserts that M is the same (*i.e.*, a mark of the same concept) as N, while logic denies it; and so—it being impossible for one and the same M to sustain these contradictory positions, we must posit several M's. But even now we cannot say one of these M's is the same as N, another is not; for every M must be both thinkable and valid. We must take the M's not singly but together, and assume that N results from a combination of M's. This is Herbart's method of relations, the counterpart in his system of the Hegelian dialectic.

In the *Ontology* this method is employed to determine what in reality corresponds to the empirical conceptions of substance and cause, or rather of inherence and change. The conception of the real consists of the two conceptions of being and quality. That which we are compelled to "posit" is that which *is*, and in the recognition of this lies the simple conception of being. We know what being is because we are bound against our will to endure the persistence of a presentation. As to the quality of the real, it must exclude everything negative; for non-A sublates instead of positing, and is but relative to A. The real must be absolutely simple; for if it contain two determinations, then either these are reducible to one, which is the true quality, or they are not, when each is conditioned by the other and their position no longer absolute. The simplicity also excludes quantitative conceptions. But there may be a plurality of "reals," albeit the mere conception of being tells us nothing of this. This cardinal point of Herbart's system makes it a "pluralistic realism."

The contradictions in the common-sense conception of inherence is now obvious. For example, when A has attributes, a, b, c, \dots , each presented in intuition, A, as a real, being simple, must $=a$; similarly it must $=b$; and so on. Now this would be possible if a, b, c, \dots were but "contingent aspects" of A, as, *e.g.*, $2^3, \sqrt{64}, 4+3+1$ are contingent aspects of 8. Such is not the case, and so we have as many contradictions as attributes; for we must say A is a , is not a , is b , is not b , etc. There must then, according to the method of relations, be several A's. For a let us assume $A_1+A_2+A_3, \dots$; for b , $A_2+A_3+A_4, \dots$; and so on. But what relation can there be among these several A's, which will restore to us the unity of our original A or substance? There is but one; we must assume that the first A of every series is identical, just as the centre is the same point in every radius. In place of the one absolute position, which the common understanding substitutes for the absolute positions of the n attributes, we have really a series of two or more positions for each attribute, every series, however, beginning with the same central real (hence the unity of substance in a group of attributes), but each being continued by different reals (hence the plurality of attributes in unity of substance). Where there is the appearance of inherence, therefore, there is always a plurality of reals and no such correlative to substance as attribute or accident. Substantiality is impossible without causality, and to this as its true correlative we now turn.

The common-sense conception of change involves the same contradiction of opposing qualities in one real. The same A that was a, b, c, \dots becomes a, b, d, \dots ; and this on reflection proves unthinkable. The metaphysical supplementing is also fundamen-

tally as before. Since c depended on a series of reals $A_3+A_4+A_5, \dots$ in connection with A, and d may be said similarly to depend on a series $A_4+A_5+A_6, \dots$, then the change from c to d means, not that the central real A or any real has changed, but that A is now in connection with A_4 , etc., and no longer in connection with A_3 , etc.

What happens when a number of reals are in connection? The answer is the second hinge-point of Herbart's theoretical philosophy. What actually happens as distinct from what seems to happen, when two reals A and B are together is that, assuming them to differ in quality, they tend to disturb each other to the extent of that difference, at the same time that each preserves itself intact by resisting the other's disturbance. And so by coming into connection with different reals the "self-perservations" of A will vary accordingly.

Having determined what really is and what actually happens, Herbart next explains synthetically the objective semblance that results from these. If this construction is to be objective, and valid for all intelligences, ontology must furnish us with a clue. This we have in the forms of Space, Time and Motion which are involved whenever we think the reals as being in, or coming into, connection and the opposite. These forms are "intelligible" because valid for all who comprehend the real and actual, although no such forms are predicable of the real and actual themselves. The elementary spatial relation is "the contiguity of two points," so that every "pure and independent line" is discrete. But an investigation of dependent lines which are often incommensurable forces us to adopt the contradictory fiction of partially overlapping, *i.e.* divisible points, or in other words, the conception of Continuity. But this contradiction is one we cannot eliminate by the method of relations, because it does not involve anything real; and in fact as a necessary outcome of an "intelligible" form, the fiction of continuity is valid for the "objective semblance." By its help we comprehend what actually happens among reals to produce the appearance of matter. When three or more reals are together, each disturbance and self-preservation will (in general) be imperfect, *i.e.*, of less intensity than when only two reals are together. But "objective semblance" corresponds with reality; the spatial or external relations of the reals in this case must, therefore, tally with their inner or actual states. Had the self-perservations been perfect, the coincidence in space would have been complete, and the group of reals inextended; or had the several reals been simply contiguous, *i.e.*, without connection, then, as nothing would actually have happened, nothing would appear. Motion, likewise, implicates the contradictory conception of continuity, and cannot, therefore, be a real predicate, though necessary to the comprehension of the objective semblance. For we have to think of the reals as absolutely independent and yet as entering into connections. This we can only do by conceiving them as originally moving through intelligible space in rectilinear paths and with uniform velocities. For such motion no cause need be supposed; motion, in fact, is no more a state of the moving real than rest is, both alike being but relations, with which, therefore, the real has no concern. The changes in this motion, however, for which we *should* require a cause, would be the objective semblance of the self-perservations that actually occur when reals meet. Further, by means of such motion these actual occurrences, which are in themselves timeless, fall for an observer in a definite time—a time which becomes continuous through the partial coincidence of events.

It remains to make good the assumption that we are spectators of the objective semblance and to show the possibility of knowledge. Here, again, a contradictory conception appears, *viz.*, that of the Ego as the identity of knowing and being, and as such the stronghold of idealism. The contradiction is evident when the ego is defined to be a subject (and so a real) that is its own object. The solution the method of relations furnishes is summarily that there are several objects which modify each other, and so constitute that ego we take for the presented real. The subject like all reals is necessarily unknown, but we can know what actually happens when the soul is in connection with other's reals, for its self-

preservations then are what we call sensations. These sensations are the sole material of our knowledge and are given to us in definite groups and series, whence we come to know the relations of those reals, which, though themselves unknown, our sensations compel us to posit.

Herbart regards the doctrine of mental faculties as refuted by his metaphysics, and contends that all psychical phenomena result from the action and interaction of elementary ideas or presentations. The soul being one and simple, its separate acts of self-preservation or primary presentations must be simple too, and its several presentations must become united. If they are of opposite quality, the presentations mutually suppress or obscure each other. The act of presentation then becomes partly an effort, and its product, the idea, becomes in the same proportion less and less intense till equilibrium is reached, and the remainders coalesce. We have thus a mechanics and a statics of mind. In the statics two magnitudes have to be determined: (1) the amount of the suppression or inhibition and (2) the ratio in which this is shared among the opposing presentations. Equilibrium is never quite obtained for those presentations which continue above the threshold of consciousness, while the rest which cannot so continue are speedily driven beyond the threshold. The law according to which a presentation freed from inhibition and rising anew into consciousness tends to raise the other presentations with which it is combined is important. Suppose two presentations p and π united by the residua r and ρ ; then the amount of p 's "help" to π is r , the portion of which appropriated by π is given by the ratio $\rho : \pi$; and thus the initial help is $\frac{r\rho}{\pi}$.

But after a time t , when a portion of ρ represented by ω has been actually brought into consciousness, the help afforded in the next instant will be found by the equation

$$\frac{r\rho}{\pi} \cdot \frac{\rho - \omega}{\rho} dt = d\omega,$$

from which by integration we have the value of ω .

$$\omega = \rho \left(1 - e^{-\frac{rt}{\pi}} \right).$$

So that if there are several π 's connected with p by smaller and smaller parts, there will be a definite "serial" order in which they will be revived by p ; and on this fact Herbart rests all the phenomena of memory and the development of spatial and temporal forms. Emotions and volitions, he holds, are not directly self-perservations of the soul, as presentations are, but variable states of such presentations resulting from their interaction when above the threshold of consciousness. Thus when some presentations tend to force a presentation into consciousness, and others tend to drive it out, that presentation is the seat of painful feeling. Desires are presentations struggling into consciousness against hindrances, and when accompanied by the supposition of success become volitions. Transcendental freedom in Kant's sense is impossible. Self-consciousness is the result of an interaction essentially the same as that which takes place when a comparatively simple presentation finds the field of consciousness occupied by a long-formed and well-consolidated "mass" of presentations. What we call Self is such a central mass.

Aesthetics elaborates the "ideas" involved in the expression of taste called forth by those relations of object which acquire for them the attribution of beauty or the reverse. The beautiful is predicated absolutely and involuntarily by all who have attained the right standpoint. Ethics, the chief branch of aesthetics, deals with such relations among volitions as thus unconditionally please or displease. These relations Herbart reduces to five: (1) *Internal Freedom*, the underlying relation being that of the individual's will to his judgment of it; (2) *Perfection*, the relation being that of his several volitions to each other in respect of intensity, variety and concentration; (3) *Benevolence*, the relation being that between his own will and the thought of another's; (4) *Right*, in case of actual conflict with another; and (5) *Retribution or Equity*, for intended good or evil done. The ideas of a final society, a system of rewards and punishments, a system of administra-

tion, a system of culture and an "unanimated society," corresponding to the ideas of law, equity, benevolence, perfection and internal freedom respectively, result when we take account of a number of individuals. Virtue is the perfect conformity of the will with the moral ideas. The conception of duty arises from the existence of hindrances to the attainment of virtue. The application of ethics to things as they are with a view to the realization of the moral ideas is moral technology, which includes Politics and Paedagogy. The aim of education should be the cultivation of the good will and the formation of character. Since ideas build up the Ego, an intelligent interest involving the process of observation, expectation, demand and action, should be extended to a variety of subjects.

In *Theology* Herbart held the argument from design to be valid for divine activity and to justify belief in a supersensible real, concerning which, however, exact knowledge is neither attainable nor on practical grounds desirable.

Among the post-Kantians Herbart doubtless ranks next to Hegel in importance. His criticisms are worth more than his constructions; indeed for exactness and penetration of thought he is on a level with Hume and Kant. (J. WAR; X.)

BIBLIOGRAPHY.—Herbart's works were collected and published by his disciple G. Hartenstein (Leipzig, 1850-52; reprinted Hamburg, 1883-93), another edition by K. Kehrbach (Langensalza, 1887). The most important are: *Allgemeine Pädagogik* (1806); *Hauptpunkte der Metaphysik* (1808); *Allgemeine praktische Philosophie* (1808); *Einkleitung in die Philosophie* (1813); *Lehrbuch der Psychologie* (1816, Eng. trs. 1891); *Psychologie als Wissenschaft* (1824); *Allgemeine Metaphysik* (1828); *Encyclopädie der Philosophie* (2nd ed., 1841); *Umriss pädagogischer Vorlesungen* (2nd ed., 1841); *Psychologische Untersuchungen* (1839). Eng. translations of his educational works include: *The Science of Education* (1892), *Letters and Lectures on Education* (1898); *A B C of Sense Perception and minor pedagogical works* (1896); *Application of Psychology to the Science of Education* (1898); *Outlines of Educational Doctrine* (1901).

There is a life of Herbart in Hartenstein's introduction to his *Kleinere philosophische Schriften und Abhandlungen* (1842) and by F. H. T. Allihn in *Zeitschrift für exacte Philosophie* (Leipzig, 1861). See also: H. A. Fechner, *Zur Kritik der Grundlagen von Herbart's Metaphysik* (Leipzig, 1853); M. W. Drobisch, *Über die Fortbildung der Philosophie durch Herbart* (Leipzig, 1876); K. S. Just, *Die Fortbildung der Kant'schen Ethik durch Herbart* (Eisenach, 1876); C. HERBELOT DE MOLAINVILLE, BARTHELEMY D' (1625-1695), French orientalist, was born on Dec. 14, 1625, in Paris. He was educated at the University of Paris, and devoted himself to the study of oriental languages, going to Italy to perfect himself in them by converse with the orientals who frequented its sea-ports. There he also made the acquaintance of Holstenius, the Dutch humanist (1596-1661), and Leo Allatius, the Greek scholar (1586-1669). On his return to France after a year and a half, he was received into the house of Fouquet, superintendent of finance, who gave him a pension of 1,500 livres. On Fouquet's disgrace in 1661, he was appointed secretary and interpreter of Eastern languages to the king. On a second visit to Italy the grand-duke Ferdinand II. of Tuscany presented him with a large number of valuable oriental mss., and tried to attach him to his court. Herbelot, however, was recalled to France by Colbert, and in 1692 he succeeded D'Auvergne in the chair of Syriac, in the Collège de France. He died in Paris on Dec. 8, 1695. His great work is the *Bibliothèque orientale, ou dictionnaire universel contenant tout ce qui regarde la connoissance des peuples de l'Orient*, based mainly on the Arabic dictionary of Hadji Khalfa, which occupied him nearly all his life, and was completed in 1697 by A. Galland.

The *Bibliothèque* was reprinted at Maestricht (1776), and at The Hague (4 vols., 1777-99). The latter edition is enriched with the contributions of the Dutch orientalist Schultens, Johann Jakob Reiske (1716-74), and by a supplement provided by Visdelow and Galland.

HERBERAY DES ESSARTS, NICOLAS DE (d. about 1557), French translator, was born in Picardy. He served in the artillery, and at the expressed desire of Francis I. he translated into French the first eight books of *Amadis de Gaul* (1540-48). His other translations from the Spanish include *L'Amant mal-traité de sa mye* (1539); *Le Premier Livre de la chronique de dom Florès de Grèce* (1552); and *L'Horloge des princes* (1555) from Guevara. The *Amadis de Gaul* was translated into English by Anthony Munday in 1619.

HERBERT (FAMILY). Earlier generations of a pedigree which carries the origin of the Herberts to Herbert the Chamberlain, a Domesday tenant, being disregarded, their patriarchy may be taken to be one Jenkin ap Adam (temp. Edward III.), who had a small Monmouthshire estate at Llanvapley and the office of master sergeant of the lordship of Abergavenny, a place which gave him precedence after the steward of that lordship.

Sir William Herbert, called by the Welsh Gwiliam Ddu or Black William, was a baron in 1461 and a Knight of the Garter in the following year. With many manors and castles on the Marches he had the castle, town and lordship of Pembroke, and after the attainder of Jasper Tudor in 1468 was created earl of Pembroke. When in July 1469 he was taken by Sir John Conyers and the northern Lancastrians on Hedgecote, he was beheaded with his brother Sir Richard Herbert of Coldbrook. The second earl while still a minor exchanged at the king's desire in 1479 his earldom of Pembroke for that of Huntingdon. In 1484 this son of one whom Hall not unjustly describes as born "a mean gentleman" contracted to marry Katharine the daughter of King Richard III., but her death annulled the contract and the earl married Mary, daughter of the Earl Rivers, by whom he had a daughter Elizabeth, whose descendants, the Somersets, lived in the Herbert's castle of Raglan until the cannon of the parliament broke it in ruins. With the second earl's death in 1491 the first Herbert earldom became extinct. The ancestor of the present earls of Pembroke and Carnarvon and of the Herbert who was created marquess of Powis was a natural son of the first earl, one Richard Herbert, whom the restored inscription on his tomb at Abergavenny incorrectly describes as a knight. He was constable and porter of Abergavenny Castle, and his son William, "a mad fighting fellow" in his youth, married a sister of Catherine Parr and thus in 1543 became nearly allied to the king, who made him one of the executors of his will. The earldom of Pembroke was revived for him in 1551.

The honours and titles of this clan of marchmen make a long list. They include the marquessate of Powis, two earldoms with the title of Pembroke, two with that of Powis, and the earldoms of Huntingdon and Montgomery, Torrington and Carnarvon, the viscounties of Montgomery and Ludlow, fourteen baronies and seven baronetcies. Seven Herberts have worn the Garter. The knights and rich squires of the stock can hardly be reckoned, more especially as they must be sought among Raglans, Morgans, Parrys, Vaughans, Progers, Hugheses, Thomases, Philips, Powells, Gwyns, Evanses and Joneses, as well as among those who have borne the surname of Herbert, a surname which in the 19th century was adopted by the Joneses of Llanarth and Clytha, although they claim no descent from those sons of Sir William ap Thomas for whom it was devised.

HERBERT, EDMOND (1812-1890), French geologist, was born at Villefargau, Yonne, on June 12, 1812. He was educated at the Collège de Meaux, Auxerre, and at the École Normale in Paris. After holding various appointments he was appointed in 1857 professor of geology at the Sorbonne. To him we owe the first definite arrangement of the Chalk into palaeontological zones (see Table in *Geol. Mag.*, 1869, p. 200). During his later years he was regarded as the leading geologist in France. He was a member of the Institute, and was three times president of the Geological Society of France in the course of his life. He died in Paris on April 4, 1890.

HERBERT, GEORGE (1593-1633), English poet, was born at Montgomery castle, on April 3, 1593, the fifth son of Sir Richard Herbert and a brother of Lord Herbert of Cherbury. His mother, Lady Magdalen Herbert, a woman of great good sense and sweetness of character, and a friend of John Donne, exercised great influence over her son. Educated privately until 1605, he was then sent to Westminster and in 1609 he became a scholar of Trinity college, Cambridge, where he was made major fellow in 1616. In 1616 he became reader in rhetoric and in 1619 orator for the university. In this capacity he spent most of his time at court, and was not often at Cambridge except when the king was there. He hoped, indeed, that the post would lead for him, as it had for his predecessors, to political advancement; but the death of James I. in 1625 put an end to these hopes and he accepted an appointment as prebendary of Layton Ecclesia (Leighton Bromswold), Huntingdon, where he rebuilt the church. In his Cambridge days he had already written some Latin satiric verses in defence of the universities and the English Church in reply to Andrew Melville's *Anti-Jami-Cami-Categoria*. His friends at this period included Dr. Donne, Sir Henry Wotton, Izaak Walton, Bishop Andrewes and Francis Bacon, who dedicated to him his translation of the Psalms. At Leighton he was within two miles of Little Gidding, and came under the influence of Nicholas Ferrar. There is little doubt that the close friendship with Ferrar had a large share in Herbert's definite adoption of the religious life. We have Herbert's own authority for saying that this period and some space of time after was for him a time of intense religious conflict, out of which eventually came the serenity mirrored in his verse.

In 1630 Charles I., at the instance of the earl of Pembroke, whose kinsman Herbert was, presented him to the living of Fugglestone with Bemerton, near Salisbury, and he was ordained priest in September. A year before, after three days' acquaintance, he had married Jane Danvers, whose father had been set on the marriage for a long time. The story of the poet's life at Bemerton, as told by Walton, is one of the most exquisite pictures in literary biography. He devoted much time to explaining the meaning of various parts of the prayer-book, and held services twice every day, at which many of the parishioners attended, and some "let their plough rest when Mr. Herbert's saints-bell rung to prayers, that they might also offer their devotions to God with him."

Next to Christianity itself he loved the English Church. He was passionately fond of music, and his own hymns were written to the accompaniment of his lute or viol. He usually walked once or twice a week to attend the cathedral at Salisbury and before returning home, would "sing and play his part" at a meeting of music lovers. Walton illustrates his kindness to the poor by many touching anecdotes, but he had not been three years at Bemerton when he succumbed to consumption. He was buried beneath the altar of his own church on March 3, 1633.

None of Herbert's English poems was published during his lifetime. On his death-bed he gave to Nicholas Ferrar a manuscript with the title *The Temple; Sacred Poems and Private Ejaculations*, published at Cambridge, apparently for private circulation, almost immediately after Herbert's death. *The Temple* is a collection of religious poems connected by unity of sentiment and inspiration. There is apparent throughout great neatness of execution, particularly in the conclusion, which often comes as a surprise. Herbert was thoroughly imbued with the "metaphysical" tendencies of the age. He was a notable amateur of the "conceit," which, like Donne, he "transplanted" to religious uses. Nothing in his own church at Bemerton was too commonplace to serve as a starting-point for the epigrammatic expression of his piety. The church key reminds him that "it is my sin that locks his hands," and the stones of the floor are patience and humility, while the cement that binds them together is love and charity. The same use is made of illustrations from everyday life, and the curious store of medical and chemical information beloved of the time.

BIBLIOGRAPHY.—Nicholas Ferrar's translation (1638) of the *Hundred and Ten Considerations* . . . of Juan de Valdes contained a letter and notes by Herbert. In 1652 appeared *Herbert's Remains; or, Sundry Pieces of that Sweet Singer of the Temple, Mr. George Herbert*. This included *A Priest to the Temple; or, The Country Parson, his Character, and Rule of Holy Life*, in prose; *Jacula prudentum*, a collection of

proverbs with a separate title-page dated 1651, which had appeared in a shorter form as *Outlandish Proverbs* in 1640; and some miscellaneous matter. The most complete edition of his works is that by Dr. A. B. Grosart in 1874, this edition of the poetical works being reproduced in the "Aldine edition" in 1876. *The English Works of George Herbert* . . . (3 vols., 1905) were edited in much detail by G. H. Palmer. A contemporary account of Herbert's life by Barnabas Oley was prefixed to the *Remains* of 1652, but the classic authority is Izaak Walton's *Life of Mr. George Herbert*, published in 1670, with some letters from Herbert to his mother. See also A. G. Hyde, *George Herbert and his Times* (1907), and the "Oxford" edition of his poems by A. Waugh (1908).

HERBERT, SIR THOMAS (1606–82), English traveller and author, born at York in 1606, became a commoner of Jesus college, Oxford, in 1621, but afterwards removed to Cambridge. In 1627 he joined the suite of Sir Dodmore Cotton, then starting as ambassador for Persia with Sir Robert Shirley. Sailing in March they visited the Cape, Madagascar, Goa and Surat; landing at Gambrun (Jan. 10, 1627–28), they travelled inland to Ashraf and thence to Kazvin, where both Cotton and Shirley died, and whence Herbert made extensive travels in the Persian Hinterland, visiting Kashan, Bagdad, etc. On his return voyage he touched at Ceylon, the Coromandel coast, Mauritius and St. Helena. He reached England in 1629, travelled in Europe in 1630–31, married in 1632 and retired from court in 1634. After this he resided on his Tintern estate and elsewhere till the Civil War, siding with the parliament till his appointment to attend on the king in 1646. He was rewarded with a baronetcy at the Restoration (1660). He died at Petergate house, York, on March 1, 1682.

Herbert's chief work is the *Description of the Persian Monarchy now being: the Oriental Indyes, Iles and other parts of the Greater Asia and Africk* (1634), reissued with additions, etc., in 1638 as *Some Yeares Travels into Africa and Asia the Great (also into divers parts of Asia and Afrique)*; a third edition followed in 1664, and a fourth in 1677. Among its illustrations are remarkable sketches of the dodo, cuneiform inscriptions and Persepolis.

See Robert Davies' account of Herbert in *The Yorkshire Archaeological and Topographical Journal* (1870), containing a facsimile of the inscription on Herbert's tomb; Wood's *Athenae*, iv.; and *Fasti*, ii.

HERBERT, VICTOR (1859–1924), American musical composer, was born in Dublin, Ireland, Feb. 1, 1859. His musical education was received in Germany, where he studied under the leading masters. He became principal violoncello player in the court orchestra, Stuttgart, also appearing as a soloist on the concert platform in European musical centres. In 1886 he accepted a position as solo violoncellist in the Metropolitan orchestra, New York city. He organized Victor Herbert's New York orchestra in 1904. Of a number of light operas he composed, his greatest successes were *Babes in Toyland* (1903), *Mlle. Modiste* (1905), and *The Red Mill* (1906). In 1911 he wrote a grand opera, *Natoma*. More successful, however, was the music which he composed for the photoplay *The Birth of a Nation*. In his later years he composed much for musical revues. He died in New York city May 26, 1924.

HERBERT OF CHERBURY, EDWARD HERBERT, BARON (1583–1648), English soldier, diplomatist, historian and religious philosopher, eldest son of Richard Herbert of Montgomery Castle (a member of a collateral branch of the family of the earls of Pembroke), was born at Eyton-on-Severn on March 3, 1583, and educated at University college, Oxford. On the accession of James I. he presented himself at court and was created a knight of the Bath in 1603. In 1608 he went to Paris where he was entertained by Henry IV. In 1610 he served as a volunteer in the Low Countries under the prince of Orange, whose intimate friend he became, and distinguished himself at the capture of Juliers from the emperor. He then travelled in Italy, and two years after his return to England in 1617, Buckingham made him ambassador at Paris, but a quarrel with de Luynes occasioned his recall in 1621. After the death of de Luynes, Herbert resumed his post in Feb. 1622, and tried to accomplish the union between Charles and Henrietta Maria and secure the assistance of Louis XIII. for the unfortunate elector palatine. On being dismissed in April 1624, he received the Irish peerage of Castle island in 1624 and the English barony of Cherbury, or Chirbury, in 1629.

In 1632 he was appointed a member of the council of war. He attended the king at York in 1639, and in May 1642 was imprisoned by the parliament for urging the addition of the words "without cause" to the resolution that the king violated his oath by making war on parliament. He retired to Montgomery Castle, and declined the king's summons. On Sept. 5, 1644, he surrendered the castle to the parliamentary forces. He died in London on Aug. 20, 1648.

Lord Herbert's most important work is the *De veritate prout distinguitur a revelatione, a verisimile, a possibile et a falso* (1624) which combines a theory of knowledge with a partial psychology, a methodology for the investigation of truth, and a scheme of natural religion. His other writings include the *De religione gentilium* (1663), a natural history of religion; *Expeditio Buckinghami ducis* (1656); *Life and Raigne of Henry VIII.* (1649) based on authentic papers; a volume of poems (1665) and an autobiography, first published by Horace Walpole in 1764, and edited by Sidney Lee (1886, 2nd ed. 1907). His English and Latin poems have been recently edited by G. C. Moore Smith (Oxford, 1923).

See Lee's article in *Dict. National Biography*; C. de Rémusat, *Lord Herbert de Cherbury* (1874) and C. Güttler, *Eduard, Lord Herbert von Cherbury* (1897).

HERBERT OF LEA, SIDNEY HERBERT, 1ST BARON (1810–1861), English statesman, was the younger son of the 11th earl of Pembroke. Educated at Harrow and Oriel, Oxford, he made a reputation at the Oxford Union as a speaker, and entered the House of Commons as Conservative member for a division of Wiltshire in 1832. Under Peel he held minor offices, and in 1845 was included in the cabinet as secretary for war, and again held this office in 1852–1855, being responsible for the War Office during the Crimean difficulties, and in 1859. It was Sidney Herbert who sent Florence Nightingale out to the Crimea, and he led the movement for War Office reform after the war, the hard work entailed causing his breakdown in health, so that in July 1861, having been created a baron, he had to resign office, and died on Aug. 2, 1861.

See Lord Stanmore, *Life of Lord Herbert of Lea* (1906). See also references under NIGHTINGALE, FLORENCE.

HERBERTON, a small mining town of Cardwell county, Queensland, Australia, 55 m. S.W. of Cairns. Tin was discovered in the locality in 1879, and has been worked together with some copper, bismuth, silver and gold.

HERCEGOVINA: see BOSNIA, HERCEGOVINA.

HERCULANEUM, an ancient city of Italy, situated about two-thirds of a mile from the Portici station of the railway from Naples to Pompeii. The small part of the city, which was investigated at the spot called *Gli scavi nuovi* (the new excavations) was discovered in the 19th century. But the more important works were executed in the 18th century; and of the buildings then explored at a great depth, by means of tunnels, none is visible except the theatre, the orchestra of which lies 85 ft. below the surface.

Herculaneum was a small city of Campania between Neapolis and Pompeii, situated between two streams at the foot of Vesuvius on a hill overlooking the sea with a safe harbour. It fell under the power of Rome during the Samnite wars. It remained faithful to Rome for a long time, but it joined the Italian allies in the Social War. Having submitted anew in June of the year 665 (88 B.C.), it appears to have been less severely treated than Pompeii. It enjoyed great prosperity towards the close of the republic and in the earlier times of the empire, since many splendid villas were built here, one belonging to the imperial house, another to the family of Calpurnius Piso. By means of the Via Campana it had easy communication north-westward with Neapolis, Puteoli and Capua, and thence by the Via Appia with Rome; and southwards with Pompeii and Nuceria, and thence with Lucania and the Bruttii. In the year A.D. 63 it suffered terribly from an earthquake; and hardly had it completed the restoration of some of its principal buildings when it fell beneath the great eruption of the year 79, described by Pliny the younger (*Ep.* vi. 16, 20), in which Pompeii also was destroyed, with other cities of

Campania. On August 23 Pliny the elder, who had command of the Roman fleet at Misenum, set out to render assistance to Recitina and others dwelling on that coast, but, as there was no escape by sea, the harbour having been filled up, he was obliged to abandon those who had managed to flee from their houses, overwhelmed in a moment by the material poured forth by Vesuvius. Thus, while many made their escape from Pompeii (which was overwhelmed by the fall of the small stones and afterwards by the rain of ashes), comparatively few could manage to escape from Herculaneum, and these found shelter in Neapolis, where they inhabited a quarter called after the buried city. The name of Herculaneum, which for some time remained attached to the site of the disaster, is mentioned in the later itineraries.

In 1719, while Prince Elbeuf was seeking crushed marble, he learned from the peasants that there were in the vicinity some pits from which they had extracted many statues. In 1738, excavations were begun on the spot. At first it was believed that a temple was being explored, but afterwards the inscriptions proved that the building was a theatre, and many scholars hastened to Naples to see the marvellous statues of the Balbi and the paintings on the walls. Bernardo Tanucci, secretary of state in 1755, founded the Accademia Ercolanese, which published the principal works on Herculaneum (*Le Pitture ed i bronzi d' Ercolano*, 8 vols., 1757-1792; *Dissertationis isagogicae ad Herculaneusium voluminum explanationem pars prima*, 1797). The excavations, which continued for more than forty years (1738-1780), were executed at first under Alcubierre (1738-1741), and then with the assistance of the engineers Rorro and Bardet (1741-1745), Carl Weber (1750-1764), and Francesco La Vega. After the death of Alcubierre (1780) the last-named was appointed director-in-chief, but from that time the investigations at Herculaneum were intermitted, and the researches at Pompeii were vigorously carried on. Resumed in 1827, the excavations at Herculaneum were shortly afterwards suspended, nor were the new attempts made in 1866 attended with any success. The antiquities excavated at Herculaneum in the 18th century form a collection of the highest scientific and artistic value. They come partly from the buildings of the ancient city (theatre, basilica, houses and forum), and partly from the private villa of a great Roman family (cf. Comparetti and de Petra, *La Villa Ercolanese dei Pisoni*, Turin, 1883). From the city come, among many other marble statues, the two equestrian statues of the Balbi and the great imperial and municipal bronze statues. Mural paintings of extraordinary beauty were also discovered here, such as those that represent Theseus after the slaughter of the Minotaur, Chiron teaching Achilles the art of playing on the lyre and Hercules finding Telephus who is being suckled by the hind.

The monochromes of Herculaneum remain among the finest specimens of the exquisite taste and consummate skill displayed by the ancient artists. Among the best preserved is Leto and Niobe. The Villa Suburbana has given up a good number of marble busts, and the so-called statue of Aristides, but above all that splendid collection of bronze statues and busts (mostly reproductions of famous Greek works) now to be found in the Naples Museum, the reposing Hermes, the drunken Silenus, the sleeping Faunus, the dancing girls, the bust called Plato, that wrongly believed to be Seneca, the two quoit-throwers or discoboli, and other masterpieces. But a still further discovery made in the Villa Suburbana contributed to magnify the greatness of Herculaneum; within its walls was found the famous library, of which, counting both entire and fragmentary volumes, 1,803 papyri are preserved. Among the nations which took the greatest interest in the discovery of the Herculaneum library, the most honourable rank belongs to England, which sent Hayter and other scholars to Naples to hasten the publication of the volumes. Of the 341 papyri which have been unrolled, 195 have been published (*Herculaneusium voluminum quae supersunt* [Naples, 1793-1809]; *Collectio altera*, 1862-1876). They contain works by Epicurus, Demetrius, Polystratus, Colotes, Chrysippus, Carniscus and Philodemus. The names of the authors are in themselves sufficient to show that the library belonged to a person whose principal study was the Epicurean philosophy. But of the great master of this school

only a few works have been found. Of his treatise *Περὶ φύσεως*, divided into 37 books, it is known that there were three copies in the library. Even the other authors above mentioned are but poorly represented, with the exception of Philodemus, of whom 26 different treatises have been recognized. But all these philosophic discussions, belonging for the most part to an author less than secondary among the Epicureans, fall short of the high expectations excited by the first discovery of the library. Among the many volumes unrolled only a few are of historical importance—that which treats of the philosophers of the Academy and that which deals with the Stoics. There are in the library some volumes written in Latin, all so damaged that hardly any of them can be deciphered. One with verses relating to the battle of Actium is believed to belong to a poem of Rabirius. The plan of the villa is the only satisfactory document for the topography of Herculaneum.

The most important reference work is C. Waldstein and L. Shoo-bridge, *Herculaneum, Past, Present and Future* (1908); it contains full references to the history and the explorations, and to the buildings and objects found (with illustrations). Miss E. R. Barker's *Buried Herculaneum* (1908) is exceedingly useful. Excavations were resumed by the Italian Government in 1927, and interesting buildings found.

HERCULANO DE CARVALHO E ARAUJO, ALEX-ANDRE (1810-1877), Portuguese historian, was born in Lisbon of humble stock, his grandfather having been a foreman stonemason in the royal employ. In 1831 under the absolute rule of D. Miguel, Herculano had to take refuge in England and France. In 1832 he accompanied the Liberal expedition to Terceira as a volunteer, and was one of D. Pedro's famous army of 7,500 men who landed at Mindello and occupied Oporto. He published his first volume of verses, *A Voz do Profeta*, in 1836, and two years later another entitled *A Harpa do Crente*. In 1837 he founded the *Panorama* in imitation of the *English Penny Magazine*, and there and in *Ilustração* he published the historical tales which were afterwards collected into *Lendas e Narrativas* (1851); in the same year he became royal librarian at the Ajuda Palace. On entering parliament in 1840 he resigned the editorship of *Panorama* to devote himself to history.

Herculano introduced the historical novel into Portugal in 1844 by a book written in imitation of Walter Scott. *Eurico* treats of the fall of the Visigothic monarchy and the beginnings of resistance in the Asturias, while the *Monge de Cister* (1848) describes the time of King John I. Herculano had greater book learning than Scott, but lacked descriptive talent and skill in dialogue. These and editions of two old chronicles, the *Chronica de D. Sebastião* (1839) and the *Annaes del rei D. João III.* (1844), prepared Herculano for his life's work, and the year 1846 saw the first volume of his *History of Portugal*, a book written on critical lines and based on documents. Serious students in Portugal and abroad welcomed the book as an historical work of the first rank, but the first volume gave rise to a celebrated controversy, because Herculano had reduced the famous battle of Ourique to a mere skirmish, and denied the apparition of Christ to King Alphonso. Herculano was denounced from the pulpit and the press; in a letter to the cardinal patriarch of Lisbon entitled *Eu e o Clero* (1850), he denounced the fanaticism and ignorance of the clergy in plain terms. The second volume of his history appeared in 1847, the third in 1849 and the fourth in 1853. His *History of the Origin and Establishment of the Inquisition* (1854-55) was compiled, as the preface showed, to stem the Ultramontane reaction. In 1856 he began editing a series of *Portugaliae monumenta historica*, but personal differences between him and the keeper of the Archive office, which he was forced to frequent, caused him to interrupt his historical studies, and on the death of his friend King Pedro V. he left the Ajuda and retired to a country house at Val de Lobos near Santarem. His protest against the Concordat of Feb. 21, 1857, between Portugal and the Holy See, his successful opposition to the entry of foreign religious orders, and his advocacy of civil marriage, were the chief landmarks in his battle with Ultramontanism, and his *Estudos sobre o Casamento Civil* were put on the Index. Finally in 1871 he attacked the dogmas

of the Immaculate Conception and Papal infallibility, and fell into line with the Old Catholics.

A rare capacity for tedious work, a dour Catonian rectitude, a passion for truth, pride, irritability at criticism and independence of character, are the marks of Herculano as a man. He could be broken but never bent, and his rude frankness accorded with his hard, sombre face, and alienated men's sympathies though it did not lose him their respect. His lyricism is vigorous, sensitive, austere and almost entirely subjective and personal, while his pamphlets are distinguished by energy of conviction, strength of affirmation, and contempt for weaker and more ignorant opponents. His *History of Portugal*, by its style a Portuguese classic, is a great but incomplete monument (it ends with the year 1279). A lack of imagination and of the philosophic spirit prevented him from penetrating or drawing characters, but his analytical gift, joined to persevering toil and honesty of purpose, enabled him to present a faithful account of ascertained facts and a satisfactory and lucid explanation of political and economic events. He is the greatest modern historian of Portugal and the Peninsula.

See A. Romero Ortiz, *La Literatura Portuguesa en el siglo xix.* (1869); Antonio de Serpa Pimentel, *Alexandre Herculano e o seu tempo* (1881); Moniz Barreto in *Revista de Portugal* (July 1889). A definitive edition of the *Historia de Portugal* was published by Prof. David Lopes in 8 illus. vols. (1914-16). (E. P.; A. B.)

HERCULES, the latinized form of the Greek HERACLES, the most famous Greek hero. His name (Gr. Ἡρακλῆς, probably "glorious gift of Hera," cf. Diocles) shows that he cannot be originally a god, since no Greek god ever has a name compounded of that of another deity. Probably a real man, a chieftain of Tiryns in Mycenaean times and vassal to Argos, lies behind the very complicated mythology of Heracles. As told in later ages, the story in its main outline runs as follows:

Zeus loved Alcmene, wife of Amphitryon of Tiryns, who at the time was living in exile at Thebes. Taking the shape of Amphitryon, he begat a son who he intended should be lord of the Argolid; but by a trick of Hera that position was won for Eurystheus, who was born shortly before Heracles. Hera pursued Heracles with her hatred. In his cradle she sent serpents to kill him, which, however, he despatched. In young manhood, after his first adventure (the killing of the lion of Mt. Cithaeron), Heracles won for his wife Megara, daughter of Creon, king of Thebes, but again Hera interfered, and in a fit of madness sent by her he murdered Megara and her children. For this or for some other reason he became the servant of Eurystheus, son of Sthenelus and king of Argos. The numerous tasks imposed by his master were arranged at some unknown but not early date in antiquity into a cycle of 12 (the 12 Labours or *Dodekathlos*), usually in the following order: 1, capture of the lion of Nemea; 2, the Hydra of Lerna; 3, capture of the hind (or stag) of Arcadia; 4, capture of the boar of Erymanthus; 5, cleansing of Augeias' stables in Elis; 6, shooting the birds of Stymphalus (so far we have Peloponnesian adventures only, and these are probably the oldest); 7, capture of the Cretan bull; 8, capture of the mares of Diomedes in Thrace; 9, taking the girdle of Hippolyte, queen of the Amazons; 10, seizing the cattle of Geryon; 11, bringing the apples of the Hesperides; 12, fetching up Cerberus from the lower world. It will be seen that the last two take place in the other world; there is little doubt that they represent a forcible seizure of immortality, and are parallel to the adventure mentioned by Homer (*Iliad*, v., 395) in which he fights and wounds Hades.

Subsidiary to the *Dodekathlos* is a series of minor adventures called *Parerga*. For example, during the 4th labour, he met and fought the Centaurs; during the 11th, he wrestled with the giant Antaeus. A further series of enterprises, undertaken after he was freed from the service of Eurystheus, are known as *πράξεις*. These include the campaigns against Troy, Elis and Pylos. Other notable incidents are his struggle with Apollo for the sacred tripod at Delphi, stopped by Zeus throwing a thunderbolt between the combatants, and his share in various famous exploits, such as the battle of the gods and giants, and the Argonautic expedition. His last series of adventures was as follows:

His second wife was Deianeira, daughter of Oeneus king of Calydon, for whom he wrestled with her other suitor, the river Achelous. As he was taking her home, the centaur Nessus tried to violate her, and was shot by Heracles with an arrow dipped in the venom of the Hydra. Dying, the centaur bade Deianeira take the blood from his wound and keep it safe, for anyone wearing a garment rubbed with it would love her for ever. Years after, when Hyllus and several other children had been born to them, Heracles fell madly in love with Iole, daughter of Eurytus king of Oechalia. He was repulsed by Eurytus when he demanded her, and the matter was further complicated by his killing Eurytus' son, for which he had to go into exile for a year, as slave to the Lydian queen Omphale, who set him to do women's work. According to some accounts, Heracles loved her and served her to gain her favours. Returning, he captured Oechalia and took Iole prisoner. Deianeira realized that she was a dangerous rival, and sent Heracles a garment smeared with the blood of Nessus. This was a powerful poison, and Heracles was seized with terrible agonies. At last he had himself brought up to the top of Mt. Oeta where a huge pyre

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

HERCULES RESTING. FROM A CAST MODELLED AFTER A ROMAN BRONZE STATUE IN THE NAPLES MUSEUM

was built. On this he was put and induced a shepherd, Poeas, with the gift of his bow and arrows, to light it. His mortal part was burned, but his divine part ascended to heaven, was reconciled to Hera, and wedded Hebe. The story of the burning is connected with a very ancient ceremony on Oeta at which victims and also puppets in human shape were burned; see Nilsson in *Journ. Hell. Studies*, xliii. (1923) p. 144. This is the latest form of the persistent theme of the winning of immortality.

Even this short sketch shows how complex the saga is. The Peloponnesian adventures may well be in origin an exaggerated account of the exploits of a real man, a great fighter and hunter; many of the others may have been originally accredited to some local hero, afterwards absorbed by Heracles. The incident of Omphale sounds like the tale of some Oriental mother-goddess and her male consort. There are several other traces of Heracles being identified with foreign gods; e.g., he is equated with the Phoenician Melqart.

In cult, he is sometimes a hero, sometimes a god; Athens claimed to have been the first to give him divine honours. His titles are numerous, among the most characteristic being *ἀλεξίκακος* (avertor of evil, also a title of Apollo) and *καλλίνικος* (nobly victorious). In art and literature, he is represented as an enormously strong man, of moderate height, a huge eater and drinker, very amorous, generally kindly but with occasional outbursts of brutal rage. He generally wears the skin of the Nemean lion; his characteristic weapon is the bow, frequently also the club (whether this is original or not, is doubtful). Numerous representations of him survive; of statues the most notorious is the hideous muscle-bound figure, now at Naples, known as the Farnese Hercules.

There is another Heracles, one of the Idaean Dactyli, who has only the name in common with the son of Alcmene.

In Italy, his name is corrupted in various ways, the most familiar being the Latin Hercules. He is worshipped as a god only, hero-cult not being Italian, and is principally a god of merchants and traders, although others also pray to him for his characteristic gifts of good luck or rescue from danger. Tithes of commercial profits, etc., were often presented to him, and feasts held in his honour. His best-known cult was at the Ara

Maxima, in the Forum Boarium at Rome. Though very early, this cult is probably not to be identified with that of any native deity. Late and artificial legends represented him as returning from the raid on Geryon's cattle by way of Italy, visiting the future site of Rome and there introducing more humane rites in place of human sacrifices and teaching Evander's people to worship himself, having earned their gratitude by killing the monster Cacus (really an ancient fire-god).

For Heracles see especially Preller-Robert, *Griechische Mythologie*, ii., p. 421 foll.; L. R. Farnell, *Hero-Cults*, p. 95 foll.; the arts. HERAKLES, HERCULES in the various classical dictionaries may also be consulted with profit. Add for some points B. Schweitzer, *Herakles* (Tübingen, 1922). For Hercules, see Preller-Jordan, *Römische Mythologie*, ii., p. 278 foll.; Wissowa, *Religion u. Kultus*, p. 271 ff. All these works contain references to the older literature, classical and modern.

(H. J. R.)

Hercules was a favourite figure in French mediaeval literature. In the romance of Alexander the tent of the hero is decorated with incidents from his adventures. In the prose romance *Les Prouesses et vaillances du preux Hercule* (Paris, 1500), the hero's labours are represented as having been performed in honour of a Boeotian princess; Pluto is a king dwelling in a dismal castle; the Fates are duennas watching Proserpine; the entrance to Pluto's castle is watched by the giant Cerberus. Hercules conquers Spain and takes Merida from Geryon. The book is translated into English as *Hercules of Greece* (n.d.). Fragments of a French poem on the subject will be found in the *Bulletin de la soc. des anciens textes français* (1877). Don Enrique de Villena took from *Les Prouesses* his prose *Los Doze Trabajos de Hercules* (Zamora, 1483 and 1499), and Fernandez de Heredia wrote *Trabajos y afanes de Hercules* (Madrid, 1682), which belies its title, being a collection of adages and allegories. *Le Fatigue d'Ercole* (1475) is a romance in poetic prose by Pietro Bassi, and the *Dodeci Travagli di Ercole* (1544), a poem by J. Perillos.

HERCULES, in astronomy, a constellation of the northern hemisphere. Represented by a man kneeling, this constellation was first known as "the man on his knees," and was afterwards designated Cetheus, Theseus and Hercules by the ancient Greeks. Hercules contains a famous globular star-cluster (Messier 13) which is the finest example in the northern hemisphere. The sun's motion through space is directed towards a point in this constellation.

HERCZEG, FERENCZ (1863–), Hungarian novelist and dramatist, was born at Versecz (Viršet) on Sept. 22, 1863, of a family of German extraction. He became honorary president of the Petöfi Society and a member of the Hungarian Academy. He was several times elected a deputy and in his review, *Magyar Figyelő*, supported Count Tisza. He was a master of the psychological novel. Among the most notable of his historical novels are *Pogányok* (The Pagans) (1902) and *A hét sváb* (The Seven Swabians), while his tragedy *Byzance* (1912) is considered a masterpiece. His novels and plays have been translated into nearly every European language.

HERD, a number of animals of one kind driven or fed together, usually applied to cattle but used also of whales, porpoises, etc., and of birds, as swans, cranes and curlews. A "herd-book" is a book containing the pedigree and other information of any breed of cattle or pigs.

HERDER, JOHANN GOTTFRIED VON (1744–1803), German poet and philosopher, was born at Mohrungen, East Prussia, on Aug. 25, 1744, of poor parents. The hardships of his early years drove him to introspection and to communion with nature, and thus favoured a more than proportionate development of the sentimental and poetic side of his mind. In 1762 he went to Königsberg to study medicine, but soon, with the help of friends, he abandoned it for theology and philosophy. At Königsberg he came under the influence of Kant and was stimulated to fresh critical enquiry by his revolutionary ideas in philosophy. To Kant's lectures and conversations he also owed something of his large interest in cosmological and anthropological problems. He was still more influenced by J. G. Hamann, "the northern Mage," a vague, incoherent, yet gifted writer from whom Herder acquired some of his strong feeling for the naïve element in poetry, and for the earliest developments of national literature. Even before he went to Königsberg he had begun to write verse; his first published writings were occasional poems and reviews for the *Königsbergische Zeitung*.

On leaving the university Herder became assistant master at the cathedral school of Riga, and a few years later, assistant pastor. In 1767 he published his first considerable work, *Fragmente über die neuere deutsche Literatur*, which secured the interest of Lessing. From this time he continued to pour forth a number of critical writings on literature, art, etc. His bold ideas, which were a great advance even on Lessing's doctrines, excited hostile criticism, which took the form of aspersions on his religious orthodoxy, and he resolved to leave Riga. He contemplated at this time a radical reform of social life in Livonia, which (after the example of Rousseau) he thought to effect by better educational methods, and he visited France, England, Holland, etc., to study their systems of education. During his voyage to France he first shaped his idea of the genesis of primitive poetry, and of the gradual evolution of humanity. But he was turned aside from these plans of practical social reform by an offer of a post as travelling tutor and chaplain to the young prince of Eutin-Holstein. His new duties led him to Strasbourg, where he met the young Goethe, on whose poetical development he exercised so potent an influence. (See GOETHE.) At Darmstadt he made the acquaintance of Caroline Flachsland, his future wife. He soon (1771) threw up his tutorship for an appointment as court preacher and member of the consistory at Bückeburg where he encountered opposition from the orthodox clergy and their followers. His health continued poor, and he suffered from a fistula in the eye. Pecuniary difficulties delayed his marriage and added to his depression.

He was attracted by the poetry of the north, more particularly Percy's *Reliques*, the poems of "Ossian" (the genuineness of which he did not doubt) and the works of Shakespeare. Under these influences he broke with classicism, and became the pioneer of the new *Sturm und Drang* movement. He inspired a band of young writers at Darmstadt and Frankfurt, including Goethe, who in a journal of their own sought to diffuse the new ideas, and finally brought about the release of German literature from the imitation of French classicism.

Herder had married in 1773. Three years later he obtained through Goethe's influence the post of general superintendent and court preacher at Weimar, where he passed the rest of his life. There he enjoyed the society of Goethe, Wieland, Jean Paul (who came to Weimar in order to be near Herder), and the patronage of the court. Yet the social atmosphere of the place did not suit him; his personal relations with Goethe again and again became embittered. This, added to ill-health, intensified his natural irritability, and the history of his later Weimar days is a rather dreary chronicle. At Weimar he made his collection of popular poetry, *Stimmen der Völker in Liedern* (1778–79); his translation of the Spanish romances of the *Cid* (1805); and wrote his important but unfinished work on Hebrew poetry, *Vom Geist der hebräischen Poesie* (1782–83); and his *opus magnum*, the *Ideen zur Philosophie der Geschichte der Menschheit* (4 vols., 1784–91). Towards the close of his life he occupied himself, like Lessing, with philosophy and theology. The boldness of some of his ideas cost him some valuable friendships, as that of Jacobi, Lavater and even of his early teacher Hamann. He died on Dec. 18, 1803.

His Works.—Herder's writings were for a long time regarded principally as of great interest in the history of the Romantic movement, and their permanent value was perhaps underestimated. They may be arranged in an ascending series, corresponding to the way in which the genetic or historical idea, which he may be said to have originated, was developed. First come the works on poetic literature, art, language and religion as special regions of development. Secondly, we have in the *Ideen* a general account of the process of human evolution. Thirdly, there are writings which may be said to supply the philosophic basis of his leading ideas.

1. In the region of poetry Herder sought to persuade his countrymen, both by example and precept, to return to a natural and spontaneous form of utterance. His own poetry has but little value; Herder was a skilful verse-maker but hardly a creative poet. He was most successful in his translation of popular song, in which he shows a rare sympathetic insight into the feelings and ideas of peoples as unlike as Greenlanders and Spaniards, Indians and Scots. In the *Fragmente über die neuere deutsche Literatur* (1767)

he aims at nationalizing German poetry and freeing it from extraneous influence. He ridicules the ambition of German writers to be classic, as Lessing had ridiculed their eagerness to be French. He looked at poetry as a kind of "proteus among the people, which changes its form according to language, manners, habits, according to temperament and climate, nay, even according to the accent of different nations." This fact of the idiosyncrasy of national poetry he illustrated with great fulness in the case of Homer, the nature of whose works he was one of the first to elucidate, the Hebrew poets, and the poetry of the north as typified in "Ossian." This same idea of necessary relation to national character and circumstance is also applied to dramatic poetry, and more especially to Shakespeare, whose essentially modern and Teutonic character Herder brings out.

2. The views on art in Herder's *Kritische Wälder* (1769), *Plastik* (1778), etc., are valuable as a correction of the excesses into which reverence for Greek art had betrayed Winckelmann and Lessing, by help of his fundamental idea of national idiosyncrasy. He argued against the setting up of classic art as an unchanging type, universally valid, and emphasized the excellences of Gothic art. Beyond this, he pleaded the cause of painting as a distinct art, which Lessing in his desire to mark off the formative arts from poetry and music had confounded with sculpture. He regarded painting as less real than sculpture, because lacking the third dimension of space, and admitting of much greater freedom of treatment. Herder appreciated the early German painters, and helped to awaken the modern interest in Dürer.

3. By his *Über den Ursprung der Sprache* (1772), Herder laid the rude foundations of the science of comparative philology and of the ultimate nature and origin of language. Directed against the supposition of a divine communication of language to man, it argues that speech is a necessary outcome of that special arrangement of mental forces which distinguishes man, and more particularly of his habits of reflection. "If," Herder says, "it is incomprehensible to others how a human mind could invent language, it is as incomprehensible to me how a human mind could be what it is without discovering language for itself."

4. Herder also laid the foundations of a comparative science of religion and mythology. He rejected Hume's notion that religion sprang out of the fears of primitive men, in favour of the theory that it represents man's first attempts to explain phenomena. He thus associated religion with mythology and primitive poetry. Later forms of religion owed their vitality to their embodiment of the deep-seated moral feelings of our common humanity. His appreciation of Christianity rested on a belief in its essential humanity. In later life he found his way to a speculative basis for his religious beliefs.

5. Herder's masterpiece, the *Ideen zur Philosophie der Geschichte*, aims at explaining human development in connection with the nature of man's physical environment. Man is viewed as a part of nature, and his widely differing forms of development as strictly natural processes. Herder's philosophy thus stands in contrast to the anthropology of Kant, which regards human development as the gradual manifestation of a growing faculty of rational free will. The *Ideen* shows Herder as an evolutionist after the manner of Leibnitz, and not after that of more modern evolutionists. The lower forms of life prefigure man in unequal degrees of imperfection; they exist for his sake, but do not represent necessary antecedent conditions of human existence. The genetic method is applied to varieties of man, not to man as a whole. Herder in his provokingly tentative way of thinking comes near to ideas propounded by Spencer and Darwin. His account of the first dawns of culture, and of the ruder oriental civilizations, is marked by genuine insight, but his account of the development of classic culture is less skilful.

6. Of Herder's properly metaphysical speculations little needs to be said. He had no accurate knowledge either of Spinoza, whose monism he advocated, or of Kant, whose critical philosophy he fiercely attacked. Herder's Spinozism, set forth in *Vom Erkennen und Empfinden der menschlichen Seele* (1778), is much less logically conceived than Lessing's. It is the religious aspect which attracts him, the presentation in God of an object which at once

satisfies the feelings and the intellect. With respect to his attacks on the critical philosophy in the *Metakritik zur Kritik der reinen Vernunft* (1799), it is easy to understand how his concrete mind, ever alive to the unity of things, instinctively rebelled against that analytic separation of the mental processes which Kant attempted. However crude this critical investigation, it helped to direct philosophic reflection to the unity of mind, and so to develop post-Kantian speculation. Herder was much attracted by Schelling's early writings, but appears to have disliked Hegelianism because of the atheism it seemed to involve. In the *Kalligone* (1800), a work directed against Kant's *Kritik der Urteilskraft*, Herder argues for the close connection of the beautiful and the good. To his mind the content of art, which he conceived as human feeling and human life in its completeness, was much more valuable than the form, and so he naturally emphasized the moral element in art. Thus his theoretic opposition to the Kantian aesthetics is but the reflection of his practical opposition to the form-idolatry of the Weimar poets.

BIBLIOGRAPHY.—Herder's *Sämtliche Werke* in 45 vols. was published by his widow (1805-20); later editions were superseded by the critical edition by B. Suphan (32 vols., 1877 sqq.). Of the many "selected works," mention may be made of those by B. Suphan (4 vols., 1884-87); by H. Lambel, H. Meyer and E. Kühnemann in Kürschner's *Deutsche Nationalliteratur* (10 vols., 1885-94). For Herder's correspondence, see *Aus Herders Nachlass* (3 vols., 1856-57); *Herders Reise nach Italien* (1859); *Von und an Herder: Ungedruckte Briefe* (3 vols., 1861-62)—all edited by H. Düntzer and F. G. von Herder; *Herders Briefwechsel mit Nicolai; Briefe an Hamann*, ed. by O. Hoffmann (1887 and 1889). See also *Erinnerungen aus dem Leben Herders*, by his wife, ed. J. G. Müller (2 vols., 1820); *J. G. von Herders Lebensbild*, by his son, E. G. von Herder (6 vols., 1846); C. Joret, *Herder et la renaissance littéraire en Allemagne au XVIII^e siècle* (1875); R. Haym, *Herder nach seinem Leben und seinen Werken* (2 vols., 1880-85); H. Nevinson, *A Sketch of Herder and his Times* (1884); M. Kronenberg, *Herders Philosophie* (1889); E. Kühnemann, *Herders Leben* (1895); R. Bürkner, *Herder, sein Leben und Wirken* (1904); S. Siegel, *Herder als Philosoph* (1907); G. Jacoby, *Herders und Kants Ästhetik* (1907) and *Herder als Faust* (1911); Hoffart, *Herders "Gott"* (1918); G. Weber, *Herder und das Drama* (1922); K. May, *Lessings und Herders Kunsttheoret* (1923).

HÉRÉDIA, JOSÉ MARIA DE (1842-1905), French poet, the modern master of the French sonnet, was born at Fortuna Cafeyere, near Santiago de Cuba, being in blood part Spanish Creole and part French. At the age of eight he came from the West Indies to France, and received his classical education with the priests of Saint Vincent at Senlis. After a visit to Havana he returned to study at the École des Chartes at Paris. In the later '60s, with François Coppée, Sully-Prudhomme, Paul Verlaine and others less distinguished, he made one of the band of poets who gathered round Leconte de Lisle, and received the name of Parnassiens. To this new school, form—the technical side of their art—was of supreme importance, and, in reaction against the influence of Musset, they rigorously repressed in their work the expression of personal feeling and emotion. "True poetry," said Hérédia in his discourse on entering the Academy—"true poetry dwells in nature and in humanity, which are eternal, and not in the heart of the creature of a day, however great." Hérédia's place in the movement was soon assured. He was the *élève bien-aimé* of the master. He wrote very little, and published even less, but his sonnets circulated in ms., and gave him a reputation before they appeared in 1893, together with a few longer poems, as a volume, under the title of *Les Trophées*. He was elected to the Academy on Feb. 22, 1894, in the place of Louis de Mazade-Percin the publicist. Few purely literary men can have entered the Academy with credentials so small in quantity:—a small volume of verse—a translation, with introduction, of Diaz del Castillo's *History of the Conquest of New Spain* (1878-81)—a translation of the life of the nun Alferez (1894), de Quincey's *Spanish Military Nun*—and one or two short pieces of occasional verse, and an introduction or so. But the sonnets are of their kind among the most superb in modern literature. "A *Légende des siècles* in sonnets," M. François Coppée called them. Each presents a picture, striking, brilliant, drawn with unflinching hand—the picture of some characteristic scene in man's long history. Each line is flawless, polished like a gem. Hérédia was one of the most skilful craftsmen who ever practised the art of verse. In

1901 he became librarian of the Bibliothèque de l'Arsenal at Paris. He died at the Château de Bourdonné (Seine-et-Oise) on Oct. 3, 1905, having completed his critical edition of André Chénier's works.

HEREDIA Y CAMPUZANO, JOSÉ MARIA (1803-1839), Cuban poet, was born at Santiago de Cuba on Dec. 31, 1803, studied at the University of Havana, and was called to the bar in 1823. In 1823 he was arrested on a charge of conspiracy against the Spanish Government, and was sentenced to banishment for life. He took refuge in the United States, published a volume of verses at New York in 1825 and then went to Mexico. In 1832 a collection of his poems was issued at Toluca, and in 1836 he obtained permission to visit Cuba for two months. Disappointed in his political ambitions and broken in health, Heredia returned to Mexico, and died at Toluca on May 21, 1839.

Many of his earlier pieces are merely clever translations from French, English and Italian; but his originality is established by such poems as the *Himno del desterrado*, the epistle to Emilia, *Desengaños*, and the celebrated ode to Niagara. His patriotism and imagination have secured for Heredia a real supremacy among Spanish-American poets.

BIBLIOGRAPHY.—*Poésias líricas de José Maria Heredia*, with a preface by Elias Zerolo (Paris, 1893); *Poésias completas* (Havana, 1913); *The Odes of Bello, Olmedo and Heredia*, ed. by E. J. Hills (1920).

HEREDITAMENT, in law, every kind of property that can be *inherited*. Hereditaments are divided into corporeal and incorporeal; corporeal hereditaments are "such as affect the senses, and may be seen and handled by the body; incorporeal are not the subject of sensation, can neither be seen nor handled, are creatures of the mind, and exist only in contemplation" (Blackstone, *Commentaries*). An example of a corporeal hereditament is land held in freehold, of incorporeal hereditaments, tithes, advowsons, pensions, annuities, rents, franchises, etc. (See **FREEHOLDS**.)

HEREDITARY PENSIONS: see **PENSIONS: PERPETUAL OR HEREDITARY**.

HEREDITY may be defined as "the resemblance between an organism and its ancestors, in so far as this resemblance is not due to similarity of environment." Thus rickets is not a hereditary disease, yet a rickety father is more likely to have rickety children than the average man; because rickets are due to bad food and lighting, and bad environments are to some extent inherited, though not in the biological sense. Similarly syphilis is only hereditary in the sense that a parent may infect his or her child. The causative organism here constitutes a similarity in their environments. In plants certain abnormal conditions, once believed to be hereditary, are only known to be infections because they can be transmitted by grafting. It is very much easier to study the inheritance of such characters as eye colour, which in man and most animals is unaffected by the environment, than body weight or psychological traits, which depend upon surroundings to a greater or less extent.

Pure Lines.—Just as by keeping the environment as nearly as possible constant for all the animals or plants in an experiment, we can study the effects of hereditary differences; so in certain cases, we can eliminate hereditary differences within a group of organisms, and thus determine the limits of the power of heredity in determining structure and function. When an organism can be produced asexually, as in the case of many Protozoa, most fruit-trees, the potato, the tulip and many other plants, a population so produced is very uniform, and the differences within it are not hereditary, except in rare cases. Such a race is called a *clone* (from Gr. *κλώνος*, a mob). A similar condition can be reached by very prolonged self-fertilization as in beans and wheats, or in-breeding, as in rats and guinea-pigs. Such a population is called a pure line. In a pure line of beans the heaviest may weigh three times the lightest; but its progeny weigh no more on the average than those of the lightest bean. The differences of weight are therefore wholly due to environment. It is thought by some biologists that such differences are inherited (see **LAMARCKISM**) but if such a phenomenon occurs it is both rare and slow. Moreover it has never been demonstrated with a pure line as initial

material. Pure lines of men do not exist, but a pair of so-called "identical" human twins, derived from the same fertilized ovum, have the same hereditary make-up, and all differences between them are due to environment.

Segregation.—All the members of a family have the same ancestors, but the differences between them are not wholly, or usually even mainly, due to environment, but to a phenomenon called segregation. These differences are usually inheritable. Thus a pair of cream guinea-pigs will produce yellows, creams and whites, and the yellows and whites will breed true. Segregation is due to an unequal transmission of the material basis of heredity to the offspring by the parents. It is a universal phenomenon except in pure lines. In the case of human stature about half the variance (see **BIOMETRY**) is due to heredity, half to segregation and very little to environment.

The Physical Basis.—Before entering on a detailed account of heredity it is necessary to recall certain facts regarding reproduction (see **REPRODUCTION; SEX and CYTOLOGY**). A higher animal or plant is formed by the union of two gametes (Gr. *γάμηρς*, a spouse), a large egg-cell and a small spermatozoön or generative nucleus from a pollen-grain. The egg-cell contributes most of the cytoplasm, but the nucleus is equally or almost equally derived from both parents. In hermaphrodite plants and animals each parent contributes a similar set of chromosomes to the nucleus of the *zygote* (Gr. *ζυγωτός*, yoked), as the product of the two gametes is called. In bisexual organisms this is only true of one of the sexes. In most bisexual animals, and in all bisexual plants so far investigated in which the sex is determined by the chromosomes (*q.v.*), the eggs all contain the same complement of chromosomes, but there are two types of male gamete. One type contains a set of chromosomes like that of the egg, and produces female zygotes. The other has one chromosome less, or else one of its chromosomes differs from one of those in the egg's set. The chromosome characteristic of the female-producing gamete is called the *X* chromosome, that (if any) characteristic of the male-producing gamete the *Y* chromosome. Thus the females contain two *X* chromosomes, the males an *X* and usually a *Y*. (Figs. 1 and 2.) In birds, Lepidoptera (butterflies and moths) and some fish, the spermatozoa are all alike, but the female forms male-producing and female-producing eggs, the former generally containing a *Y* chromosome, the latter always an *X*.

The chromosomes of paternal and maternal origin preserve their identity throughout the life of the zygote, but shortly before the formation of the gametes they usually twist together and appear in many cases to exchange parts (fig. 1). The gametes each obtain a set of half the zygotic number of chromosomes, and hence are called haploid (Gr. *ἁπλοῦς*, single); the zygote with its double set is described as diploid (Gr. *διπλοῦς*, double). The special cell-division responsible for the halving of the chromosome number is called the reduction division. Except in rare cases the fact that two chromosomes have come from the same parent does not give them any tendency to pass into the same gamete. They are assorted according to the laws of chance. This is the principal material basis of segregation.

CYTOPLASMIC INHERITANCE

Since the mother contributes most of the cytoplasm to the newly-formed zygote, it is clear that, if this played an important part in heredity, she would be more important than the father in determining the characters of the offspring. This is not in general the case, but a few characters are known in plants which are inherited only from the mother, like the family name in a matriarchal society. Thus in *Mirabilis Jalapa* and other plants, the seed borne by the white parts of variegated individuals gives rise to nothing but white, no matter what plant supplies the pollen. In other variegated plants, such as *Pelargonium* and *Oenothera*, the pollen exerts a certain influence, but generally less than that of the egg-cell. Since variegation is due to the presence in the cells of colourless instead of green plastids (see **PLANTS: Cytology**), and the plastids lie outside the nucleus and are rarely transmitted by the pollen, this is quite intelligible.

Again in certain crosses between plant races a factor influencing

sex is transmitted through the cytoplasm only (see SEX).

MENDELIAN INHERITANCE

Heredity in Bryophyta (*q.v.*).—In the higher plants and animals the gametes are inconspicuous, and their hereditary make-up can only be inferred from the zygotes which they produce. In the Bryophyta (mosses and liverworts) the haploid generation or gametophyte is the familiar plant. It produces gametes which fuse to form a sporophyte with a double set of chromosomes. This produces spores with the haploid number, from each of which a gametophyte may be formed. The common moss *Funaria hygrometrica* possesses true-breeding broad- and narrow-leaved races. If they are crossed the sporophyte so formed produces equal numbers of broad- and narrow-leaved offspring. If we denote the haploid gametophytes by the letters *B* and *N* we may call the hybrid sporophyte *BN*. The characters segregate at the reduction division, as is shown by the fact that two of the spores in each tetrad formed from a single diploid cell of a *BN* sporophyte give rise to *B* gametophytes, two to *N*. The diploid generation also varies. *BB* sporophytes have larger capsules than *NN*, while *BN* are intermediate.

Inheritance Without Dominance.—Let us apply this point of view to the higher animals and plants, where it is only in the zygote that differences can be observed. If we mate a yellow guinea-pig with a pink-eyed white, the offspring are cream (the offspring of certain albinos will also have black or chocolate pigment, but the yellow areas of the coat or hairs will always be of a creamy colour). Both yellows and whites always breed true. Now the creams, if mated to a white, give equal numbers of creams and whites; if to a yellow, equal numbers of yellows and creams. Clearly the cream parents are responsible for this heterogeneity. Calling the yellows *YY* and the whites *WW* and their gametes *Y* and *W* respectively, the product of their fusion, *YW*, is a cream, producing *Y* and *W* gametes in equal numbers. Mated with *YY* it therefore gives *YY* (yellow) and *YW* (cream); with *WW*, *YW* (cream) and *WW* (white). When two creams are mated together the *Y* eggs are equally likely to be fertilized by *Y* or *W* spermatozoa, and therefore produce equal numbers of *YY* and *YW* zygotes. Similarly the *W* eggs give equal numbers of *YW* and *WW*. Zygotes are therefore produced in the ratio 1 *YY* : 2 *YW* : 1 *WW*, or 1 yellow : 2 creams : 1 white. Of course these ratios are not generally obtained unless large numbers of animals are counted, any more than the numbers of red and black cards in a hand taken at random from a pack are in general equal. It is to be noted that the results of all these matings

FIG. 1.—DIAGRAM ILLUSTRATING MORGAN'S THEORY OF LINKAGE

are the same whichever type of animal is used as father. The object (for it is known to be a material object) in the gamete which determines the colour is called a gene (*q.v.*) or factor. A zygote possessing two like genes (as the yellow or white guinea-pig) is called a *homozygote* (Gr. *ὁμός*, same, *ζυγόν*, yoke, pair); one possessing two unlike genes (as the cream) is called a *heterozygote* (Gr. *ἕτερος*, other). Two genes which can form a pair of this kind are called *allelomorphs* (Gr. *ἀλλήλων*, one another, *μορφή*, form).

Dominance.—Usually the course of events is slightly obscured by the phenomenon of dominance. If we mate pure-breeding black and blue rabbits, the young are all black, but if these hybrid blacks are mated to blues they give equal numbers of blacks and blues. If we call the pure-bred blacks *II*, the blues *ii* (*I* symbolizes a gene intensifying blue to black, *i* its absence) the hybrid blacks are *Ii*, giving equal numbers of *I* and *i* gametes.

Mated with blues (*i* gametes) they therefore give *Ii* (black) and *ii* (blue) in equal numbers; mated with one another, 3 blacks to one blue; with homozygous blacks, blacks only. It is usual, following G. Mendel, to denote the generation produced by crossing two different individuals or races by *F*₁, their offspring when self-fertilized or mated *inter se* by *F*₂. It will be seen that all possible blacks fall into two classes, homozygotes (*II*) and heterozygotes (*Ii*), which can be distinguished by mating them with a blue. When a gene is as effective in one dose as in two, it is said to be dominant; its allelomorph is said to be recessive. Sometimes these two terms are applied to the characters produced by the genes. Thus black is said to be dominant over blue. In the case of chemical characters such as coat and flower colour, dominance is usually complete. Where form or size is affected the heterozygote is often more or less intermediate, though usually nearer to one parent. But here too dominance may be complete.

A class of organisms whose members cannot be distinguished from one another by observation is called a *phenotype* (Gr. *φαῖνομαι*, I appear, *τύπος*, type); a class which can be distinguished from another by breeding tests is called a *genotype* (Gr. *γένος*, race). Thus in the above example, all the black rabbits form one phenotype, but include two genotypes, *II* and *Ii*.

Mendelian inheritance (see also MENDELISM) has so far been observed in men, other mammals, birds, amphibians, fish, insects, crustaceans, molluscs, algae, mosses, ferns, monocotyledons and dicotyledons. It is thus probably characteristic of all sexually reproducing organisms. For example, in the pea tallness is dominant over dwarfness, coloured flowers over white flowers, and so on. A recessive character breeds true, a dominant does not necessarily do so. This is important in breeding.

Inheritance of Several Genes.—When two different pairs of allelomorphs are involved in a cross, inheritance is usually independent. For example, shortness of hair is dominant over length in rabbits, and is due to a gene which we may call *S*. If we mate a homozygous short-haired black (*IISS*) rabbit with a long-haired (so-called "Angora") blue, which, being recessive, must be homozygous (*iiss*), the offspring are doubly heterozygous short-haired blacks (*IiSs*). Half their gametes carry *I* and half *i*, and the same is true regarding *S* and *s*. As the genes *I* and *S* show no tendency to stay together, the four possible classes of gametes *IS*, *Is*, *iS* and *is* are formed in equal numbers. So if the *IiSs*

FIG. 2.—INHERITANCE OF TWO GENES IN THE RABBIT, SHOWING THE ORIGIN OF NEW TYPES BY CROSSING

rabbits are mated with double recessive (*iiss*) the offspring consist of equal numbers of *IiSs* (short-haired black) *IiSS* (long-haired black) *iiSs* (short-haired blue) and *iiSS* (long-haired blue) (fig. 2). If *IiSs* are mated together the ratios obtained in *F*₂ are 3 black to 1 blue and 3 short to 1 long, or, combining the two, 9 short black : 3 short blue : 3 long black : 1 long blue. The genetical behaviour of double heterozygotes is precisely the same whether they are made from the mating *IISS* × *iiss* as above, from *IiSS* × *iiSS* (long-haired black × short-haired blue) or in any other way, e.g., from the mating *IiSS* × *iiSs*, which will give one *IiSs* in four. Just the same is true where three or more pairs of allelo-

morphs are concerned. Thus if a rose-combed black feathered fowl with four toes is mated with a normal-combed buff with five toes, the offspring are rose-combed black with five toes, these characters being dominant, and in the offspring all the eight possible recombinations will appear. The processes of inheritance and segregation appear relatively simple as soon as attention is focussed as far as possible on the gametes rather than on the zygotes, even though it is only in rare cases such as the Bryophyta that the gametes can be distinguished on inspection.

Sex-linked Inheritance.—With regard to the genes so far considered the results of reciprocal crosses are exactly the same both in appearance and genetical behaviour. It makes no difference whether the gene determining short hair is brought in from the father or the mother, whether that for flower colour is contributed by the pollen or the ovules, and so on. This is not always the case. An extreme example of the opposite condition is furnished by such Hymenoptera as bees and many wasps, in which fertilized eggs become females, and unfertilized males, which are generally haploid. Thus a dominant gene *N* in the wasp *Habrobracon* determines the presence of normal as opposed to defective wings. A normal male is of the composition *N*, and all his daughters by whatever female are *Nn* or *NN*, i.e., normal. (He cannot of course beget sons.) An abnormal male (*n*) begets all normal daughters with a *NN* female, half and half with a *Nn*, and all abnormal with a *nn*. The sons depend on the composition of their mothers only. *NN* mothers produce only *N* males, *Nn* produce *N* and *n*, while *nn* produce *n* only. The same principle holds for the bee.

Now in an animal where the female is the homogametic sex, of composition *XX* (see SEX) it is clear that she transmits an *X* chromosome to all her children; whilst the *XY* or *Xo* male transmits it only to his daughters. Thus if any genes follow this chromosome in their distribution to the gametes, characters determined by them should be inherited like those of the Hymenoptera. This is the case with a number of characters. For example a black male cat may be represented as *B*, a yellow as *Y*, a black female as *BB*, a yellow as *YY*, whilst the heterozygous female *BY* is a black and yellow or tortoiseshell cat. Tortoiseshell males are rare and generally sterile. (The tabby pattern, or piebaldness, may be superimposed on the above colours, but this does not affect the inheritance.) We have 6 possible matings:—

Parents		Offspring	
Mother	Father	Daughters	Sons
Black ♀, <i>BB</i>	Black ♂, <i>B</i>	<i>BB</i> (black)	<i>B</i> (black)
Tortoise ♀, <i>BY</i>	" ♂, <i>B</i>	<i>BB</i> " <i>BY</i> (tortoise)	<i>B</i> (yellow) <i>Y</i>
Yellow ♀, <i>YY</i>	" ♂, <i>B</i>	<i>BY</i> (tortoise)	<i>Y</i> (yellow)
Black ♀, <i>BB</i>	Yellow ♂, <i>Y</i>	<i>BY</i> "	<i>B</i> (black)
Tortoise ♀, <i>BY</i>	" ♂, <i>Y</i>	<i>BY</i> " <i>YY</i> (yellow)	<i>B</i> (black), <i>Y</i> (yellow)
Yellow ♀, <i>YY</i>	" ♂, <i>Y</i>	<i>YY</i> (yellow)	<i>Y</i> (yellow)

These expectations are fulfilled. The difference between the reciprocal crosses of black and yellow is striking. The same holds when dominance is complete, as in human colourblindness, which is completely recessive.

Similarly where the male is homogametic, as in birds, reciprocal crosses give different results. Thus in the fowl, the Light Sussex breed carry a dominant gene *S* inhibiting yellow pigment, which is absent in the Rhode Island Red. If we cross a Light Sussex cock (*SS*) with a Rhode Island hen (*s*) all the *F*₁ chickens are produced from *S* spermatozoa and are therefore nearly white. The cockerels are *Ss*, and if crossed with red hens give equal numbers of white and red chickens of both sexes; the pullets (*S*) behave genetically like Light Sussex hens. If however a Rhode Island cock (*ss*) is crossed with a Light Sussex hen (*S*) the pullets, which have not received an *X* chromosome with an *S* factor from their mother, are *s*, i.e., red, the cockerels, *Ss*, i.e., white (fig. 3). The sexes can thus be distinguished at hatching, a fact of economic importance.

Genes inherited in this way are said to be sex-linked. Sex-linkage has been found in men, cats, fowls, pigeons, fish, flies, moths, grasshoppers and in a few dioecious plants. Except perhaps in fish, genes are very rarely found in the *Y* chromosome. Nevertheless such genes are known in man and in *Drosophila*.

Multiple Allelomorphism.—While genes are generally only found to be allelomorphic in pairs (e.g., those causing dense and

FIG. 3.—SEX-LINKED INHERITANCE IN POULTRY, SHOWING THE METHOD BY WHICH THE SEX OF DAY-OLD CHICKS CAN BE DISTINGUISHED

dilute colour, or short and long hair in rabbits) this is not always the case. Thus in the rabbit four genes *C*, *C^{ch}*, *C^h* and *c* are known, which in the homozygous condition, and in the presence of the other genes found in the wild-coloured grey rabbit, determine the following colours:—*CC* wild colour, *C^{ch}C^{ch}* "Chinchilla" (black hairs with white tips), *C^hC^h* "Himalayan" (white with black nose, ears and feet), *cc* white. Only one of these genes can get into a gamete, only two into a zygote. They are dominant over one another in the order given. Thus any rabbit containing *C* is fully coloured, *C^{ch}C^h* and *C^hc* are chinchilla (rather lighter than the homozygote), *C^hc* is "Himalayan." Hence if we mate *CC* (wild colour) and *cc* (white) the offspring are wild coloured, and mated *inter se* give only wild coloured and white. No Himalayans or chinchillas can appear unless the genes *C^{ch}* or *C^h* have been introduced.

Similarly in *Primula sinensis* the size of the "eye" in the flower is mainly determined by three allelomorphic genes, *E^a*, *E* and *e*. *E^aE^a*, *E^aE*, and *E^ae* give the small "Queen Alexandra" eye, *EE* and *Ee* the normal eye, and *ee* the large "Primrose Queen" eye. So a plant bearing the small eye when self-fertilized may give either normal or large eyes in one quarter of its offspring, but cannot give both. As many as eleven multiple allelomorphs belonging to the same series (determining eye colour in *Drosophila melanogaster*) have been found.

Linkage.—In some cases two genes which are not allelomorphic do not separate independently. Thus in *Primula sinensis* a gene *G* renders the stigma green, whilst in *gg* plants it is red; *SS* and *Ss* plants have a short "thrum" style and long stamens, *ss* a long pin style and short stamens. On crossing *GGSS* (green thrum) with *ggss* (red pin) the offspring are *GgSs* (green thrum). If now the pollen of such plant is used on a *ggss*, the four classes of offspring do not appear in equal numbers, but in the ratios

$$60 \text{ } GsSs : 40 \text{ } GsSs : 40 \text{ } gSs : 60 \text{ } gSs$$

There is thus an excess of *Gs* and *Gs* pollen grains, i.e., genes which have entered the zygote in the same gamete tend to leave it in the same gamete. This phenomenon is called coupling. If the doubly heterozygous plants are made up from the cross green pin (*GGss*) × red thrum (*ggSS*) the pollen of the offspring used on a double recessive gives

$$40 \text{ } GSs : 60 \text{ } GsSs : 60 \text{ } gSs : 40 \text{ } gss$$

This is called repulsion, and the two phenomena together are called linkage. The two types of *GgSs* plant may be denominated *GS* and *gs*. If we fertilize them with *gs* pollen from a double recessive (red pin) the numbers obtained are:—

$$67 \text{ } GSs : 33 \text{ } GsSs : 33 \text{ } gSs : 67 \text{ } gss$$

and

$$33 \text{ } GSs : 67 \text{ } GsSs : 67 \text{ } gSs : 33 \text{ } gss$$

Linkage is thus (in this case) slightly stronger in the formation of ovules than of pollen. In a general way if two genes A and B are linked, then when a double heterozygote $\frac{AB}{ab}$ is formed from

gametes AB and ab then the gametic series formed are

$(1-p) AB : pAB : paB : (1-p)ab$ eggs or ovules, and

$(1-q) AB : qAb : qaB : (1-q)ab$ spermatozoa or pollen grains, where p and q are numbers less than $\frac{1}{2}$, which when expressed as percentages are called cross-over values, for reasons which will

appear later. If the double heterozygote $\frac{Ab}{aB}$ is formed from gametes Ab and aB the corresponding gametic series are:—

$pAB : (1-p)Ab : (1-p)aB : pab$ eggs or ovules

$qAB : (1-q)Ab : (1-q)aB : qab$ spermatozooids or pollen grains.

Now if a zygote $\frac{Ab}{aB}$ is self-fertilized or mated with a similar

zygote, the offspring are produced in the following proportions:—

$2+pq AABb, AaBB, AABb$ and $AaBb$ (i.e., double dominants)

$1-pq Aabb$ and $Aabb$

$1-pq aaBB$ and $aaBb$

$pq aabb$

Or classing them simply by their appearance:—

$(2+pq)AB : (1-pq)Ab : (1-pq)aB : pqab$

This is the zygotic series characteristic of repulsion in F_2 . An

$\frac{AB}{ab}$ zygote producing a gametic series of the coupling type, gives

$[2+(1-p)(1-q)]AB : [1-(1-p)(1-q)]Ab :$

$[1-(1-p)(1-q)]aB : (1-p)(1-p)ab.$

For example, whereas in the absence of linkage the phenotypes AB, aB, Ab, ab would be in the ratios $9:3:3:1$; with linkage values of .25 the numbers would be $33:15:15:1$ for repulsion in F_2 , $41:7:7:9$ for coupling. With strong linkage, $p=q=.01$ would give $20,001 AB : 9,999 Ab : 9,999 aB : 1 ab$ in the case of repulsion, $29,801 AB : 199 Ab : 199 aB : 9801 ab$. It is clear that in the case of strong repulsion it is exceedingly difficult to obtain a double recessive, and in that of strong coupling fairly difficult to separate the two genes.

In the fly *Drosophila melanogaster*, and other insect species, in certain fish, and in the fowl and pigeon, the only organisms so far investigated in this respect, all the sex-linked genes are themselves linked. Thus in the fowl, besides the yellow inhibiting gene S (causing silver as opposed to gold plumage) the gene B causing barring of the feathers with white, as in the Plymouth Rock, is sex-linked. If a hen carrying both these genes is mated with a

gold unbarred cock of composition $\frac{bs}{bs}$, all the pullets, which receive an X chromosome from the father only, are of course bs (gold unbarred), all the cockerels $\frac{BS}{bs}$ (heterozygous silver barred), so linkage is complete. If these cockerels are mated with bs hens, the chickens begotten in their first year of breeding are roughly in the proportions:—

$\frac{3BS}{bs}$ (barred silver) : $\frac{1BS}{bs}$ (barred gold) : $\frac{1bsS}{bs}$ (unbarred silver) : $\frac{3bs}{bs}$ (unbarred gold) i.e., $p=.25$. In the later years the

linkage is less. In the female of *Drosophila melanogaster* more than a hundred sex-linked genes show mutual linkage.

THE CHROMOSOME THEORY

Since the sex-linked genes were associated with the X chromosome, it is natural to suggest that the other genes should be similarly associated with the other chromosomes. If so there should be as many groups of mutually linked genes as there are chromosomes in the gametes. This is the case in *Drosophila melanogaster* and the sweet pea, the organisms most thoroughly investigated. In the former the number of chromosomes in the gamete, and of

linkage groups, is four (fig. 4, 1, 2), in the latter seven. In no organism has it been shown that there are more linkage groups than chromosomes, but in some there appear to be fewer.

The evidence that, in *Drosophila melanogaster* at least, a linked group of genes is carried on or by an individual chromosome, is overwhelming. Thus occasional females are found which have a Y chromosome as well as 2 X 's (fig. 1, 3). These form four types

FIG. 4.—CHROMOSOMES OF DIFFERENT RACES OF *DROSOPHILA MELANOGASTER*, THE MATERIAL BASIS OF HEREDITY

of egg, many containing X and XY and fewer containing XX and Y . If such a female be mated with a male carrying a dominant sex-linked gene (e.g., that for "Bar" or oblong eye) which with a normal female would give bar-eyed daughters and normal sons, the following types of offspring may be expected, representing the bar-carrying X chromosome by X' , so that the spermatozoa carry X' or Y :—

From X' spermatozoa: $X'X$ (bar ♀) $X'XY$ (bar ♀), $X'XX$ (dies), $X'Y$ (bar ♂)

From Y spermatozoa: XY (normal ♂), XYX (normal ♂), XYX (normal ♀), YY (dies).

There are thus exceptional bar-eyed males and normal females, of which the latter behave genetically like their mothers. Similarly the $X'XY$ and XYX individuals behave according to theoretical expectation.

Again the two X chromosomes in a female may be attached to form a V (fig. 1, 4). Such females, as will be seen, also inevitably contain a Y . They therefore form eggs containing XX and Y . With a normal male they produce zygotes:—

XXX (dies), XXY (♀) XY (♂) YY (dies).

Hence the female offspring get two united X chromosomes from their mother, the males get the X from their father. Thus sex-linked genes involved in such a cross are handed down from father to son and from mother to daughter, and not passed from one to the other as in the normal case.

Again *Drosophila melanogaster* may lose one of its small fourth chromosomes, such flies being viable but small (fig. 1, 5). Now of over 400 genes known in this fly one linkage group contains only three, and is therefore thought to be associated with the small chromosome. A recessive character determined by one of these genes is eyelessness. If E is the gene for normal eyes, e for eyelessness, the small unhealthy round-eyed fly with only one small chromosome may be denoted by Eo , the cytologically normal fly heterozygous for eyelessness by Ee . When these are mated the four types of zygote formed are EE (normal), Ee (heterozygote) Eo (small normal) and eo (small eyeless). In a similar way the chromosome containing the recessive gene determining the waltzing habit has been identified in the mouse, though here only a part of it was missing in the cytologically abnormal individuals. Many other cases are known which enable given genes to be allotted to visibly distinguishable chromosomes. For example in *Drosophila melanogaster* individuals with three instead of two of the small fourth chromosome behave as expected on the above theory.

Except in the case of sex-linked genes, linkage is generally of about the same intensity in the formation of masculine and feminine gametes. In the same plant it may be stronger for one pair of genes in the formation of pollen, for another in that of ovules. In animals however it is always slightly more intense in the hetero-

gametic sex, *i.e.*, the male except in birds and Lepidoptera (linkage has not been thoroughly investigated in these groups, except for sex-linked genes). In mammals the intensity is only slightly greater in the male, but in insects sexual dimorphism is very marked in this respect, linkage being almost complete in the males of Orthoptera, and quite complete in the males of *Drosophila* and the females of *Bombyx*, a fact which makes the determination of linkage groups far easier than in plants or mammals. In the fish so far studied sex-linked genes may either be transmitted in the ordinary way, or only by males to males. Occasionally such a gene crosses over, and thus alters its type of inheritance. This is probably due to linkage of other chromosomes with the sex chromosomes, but may be due to sex being determined by a single gene, not a whole chromosome. The intensity of linkage varies with age in *Drosophila* and in fowls, but not appreciably in rats or mice, and with temperature in *Drosophila*. It is also affected by hereditary factors.

Arrangement of the Genes.—If each linkage group corresponds to a chromosome, the two most plausible hypotheses to account for linkage are as follows: (a) The probability that two genes *A* and *B* which have entered in or with the same chromosome should be separated in gametogenesis is the probability that one should cross from a maternal to a paternal chromosome while the other does not, or conversely. (This hypothesis is negated by the facts shortly to be discussed.) (b) Whole blocks of the chromosomes, with their associated genes, may be exchanged. (This hypothesis agrees with the facts.) The farther apart two genes are situated in or on the chromosome the more likely they are to be separated in gametogenesis. Now consider a zygote in which three dominant genes, *A*, *B*, *C* are borne by one chromosome, their recessive allelomorphs *a*, *b*, *c* by the corresponding chromosome derived from the other parent. The formation of an *Abc* or an *aBC* gamete means that the chromosomes have crossed over and exchanged genes at a point between the loci of *A* and *B*. Similarly the formation of an *ABc* or an *abC* gamete means that crossing over has occurred between the loci of *B* and *C*. And *AbC* or *aBc* gametes are only formed if both these events occur. Now if the probability of crossing over between *A* and *B* is p_1 , and between those of *B* and *C* is p_2 , that of a double cross-over is p_1p_2 , if the fact that crossing over has occurred between *A* and *B* does not influence the probability of a cross-over between *B* and *C*. Actually the probability of a double cross-over is always somewhat less than this, presumably on account of a stiffness of the chromosomes, which makes it unlikely that they should bend so much as to cross over at two nearly adjacent points. It follows that if the probability of crossing over between *A* and *B* is 10%, between *B* and *C* is 5%, the probability of a double cross-over is something less than $\frac{1}{2}\%$, whereas if the two genes were not arranged in a line it might have any value up to 35%.

By determining cross-over values for a number of linked genes it is possible to construct a map of any chromosome. The unit of distance on the map is the separation giving a possibility of crossing-over of 1% between genes at this distance. This distance does not correspond to a definite distance in millionths of a centimetre, for there is evidence that crossing over occurs more easily in some parts of a chromosome than others. Such a map for 26 of the most important of the 150 sex-linked genes of *Drosophila melanogaster* is given in fig. 5. If x be the distance on the map between two genes, the probability of crossing over between them is given by

$$y = f(100x)$$

where $y = 100x$ when both are small, but can never exceed $\frac{1}{2}$, however large the value of x . Approximately

$$x = .7y - .15 \log_e(1 - 2y)$$

but the relation between map distance and cross-over value is slightly different in different parts of the same chromosome, so the function is not perfectly definite. In other words, the cross-over value, expressed as a percentage, is equal to the map distance when both are small, very nearly so up to distances of about 20 units, but at 50 units distance (as determined by adding up the distances between the several loci) the cross-over value is only about 40%, and even at a distance of over 100 units it does not exceed

50%, though it is very near to this value. Extensive chromosome maps have been made for several species of *Drosophila*, and in the maize plant and sweet pea, less detailed ones in other species. There is no tendency for genes with like effects to aggregate in the same chromosomes or in the same parts of them. However multiple allelomorphic genes always occur in the same locus. Occasionally a race of *Drosophila* is found which, when crossed with the normal type, gives little or no crossing over in one chromosome or section of a chromosome. This has been found to be due to a reversal in the order of the genes, which prevents the normal pairing. It is generally supposed that crossing over occurs during diakinesis (*see* CYTOLOGY) when the chromosomes may be seen twisting round one another.

LETHAL AND SEMILETHAL GENES DEFICIENCIES

The various phenotypes of a given organism generally differ slightly in viability, for a gene, although its main effect may be local, always affects the organism as a whole. Of course the viability depends on the environment. Thus hairless (recessive) mice are clearly more likely to die of cold than the normal type. Usually the expectation of life of the normal, or wild type, exceeds that of others significantly, but occasionally a mutant may be longer lived or more fertile than the wild type. A combination of several abnormal genes may yield a better expectation of life than any of the genes alone. The table below gives the expectations of life for *Drosophila melanogaster* produced by several genes in the second chromosome.

Type	♂ expectation of life (days)	♀ expectation of life (days)
Normal	38.1	40.6
Purple eye	27.4	21.8
Arc wing	25.2	28.2
Speck (on wing)	46.6	38.9
Purple arc	36.0	32.0
Arc speck	38.4	34.7
Speck purple	23.7	23.0
Purple arc speck	38.4	40.7

(after Gonzalez)

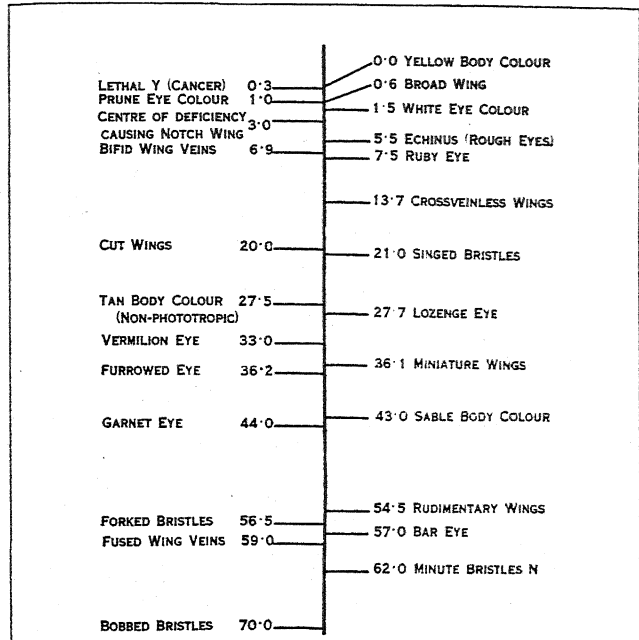

The expectations given are of course under laboratory and not natural conditions. But many phenotypes have an extremely low viability. When only a few per cent of the unsuccessful phenotypes survive to maturity the gene is called a semi-lethal. When none survive it is called a lethal. The deaths may be due to various causes. Thus a recessive sex-linked gene in *Drosophila melanogaster* causes the deaths of half the females heterozygous for it, as the result of a malignant tumour. In plants a very common type of lethal gene produces plants lacking chlorophyll, which therefore soon die.

Linkage of Lethals.—Lethal genes are often discovered because they lead to abnormal ratios in the progeny. Thus in *Drosophila* a female heterozygous for a recessive sex-linked lethal will produce twice as many daughters as sons, for half her sons will receive the lethal gene and die, while half the daughters are heterozygous for it, and resemble the mother in their genetical behaviour. If such a female be mated with a male which carries a sex-linked dominant gene, all her daughters will bear this gene in one of their *X* chromosomes, and half will bear the lethal in the other. Hence all surviving sons of the latter class of females will receive the dominant gene from their grandfather, except where this has crossed over into the same chromosome as the lethal. In this way the cross-over values between lethal and other genes can be found, and the lethal genes can be assigned to their proper places in the chromosome.

Where the normal or wild type of organism is known, more genes are generally found recessive than dominant to it. And of the few dominants a fair proportion are generally lethal when homozygous. Thus when a yellow mouse is mated to a non-yellow, half the offspring are yellow, *i.e.*, the yellows behave as heterozygous dominants. When two yellows are mated, the ratio of yellows to non-yellows is two, not three, to one, and the yellow children are heterozygous. The homozygous yellows per-

ish at an early embryonic stage. Similarly the Dexter Kerry cows (a short-legged form) when mated with normal cattle give equal numbers of normal and short-legged. Mated together they give 1 normal : 2 dexters : 1 aborted or still-born. These homozygotes are dwarfs with bulldog-like faces and only rudiments of a thyroid gland, whose practical absence presumably accounts for their abnormality. In the fowl the homozygotes of the frizzled and Scotch Dumpy breeds die in the shell.

Deficiencies.—Some, but not all, lethals are due to the absence of a section of chromosome including several genes. If a zygote

AFTER BELAR

FIG. 5.—SCALE OF THE X CHROMOSOME OF *DROSOPHILA MELANOGASTER* (SEE FIG. 4) SHOWING LOCATION OF A FEW OF THE GENES IN IT

heterozygous for such a lethal (which is called a deficiency) is mated to another recessive for the genes left out in the deficiency, all the offspring which carry the lethal show the recessive characters, since the dominant allelomorphs carried by a normal chromosome are absent from the deficient section. The probability of crossing-over is diminished in the neighbourhood of a deficiency. The lethal effect when homozygous is clearly due to the complete absence of one or more genes necessary for life.

Gametic Lethals.—In the higher plants the haploid generation, especially the pollen grains, have an independent life of their own. Genes carried by them may affect their behaviour to a greater or less extent. In some cases pollen carrying a given gene may be quite sterile. In others it is handicapped to a greater or less extent in comparison with the normal. Plants heterozygous for such genes therefore give normal ratios when used as mothers, abnormal when used as pollen parents. It is doubtful if gametic lethals occur on the female side of plants. They do not in animals. Spermatozoa may be capable of swimming and fusing with an ovum, even if they contain too few or too many chromosomes.

Balanced Lethals.—One of the dominant genes modifying wing shape in *Drosophila*, beaded, (*B*) is lethal when homozygous. Nevertheless it has been possible to obtain a stock with beaded wings breeding nearly true. When mated with normals only half the offspring are beaded. But the other half also carry a lethal, located, like *B*, in the third chromosome.

Representing this lethal by *l*, the true-breeding beaded are $\frac{BL}{bl}$.

When mated together they give $\frac{1BL}{BL}$ (dies) : $\frac{2BL}{bl}$: $\frac{1bl}{bl}$ (dies)

with a few $\frac{Bl}{bl}$, $\frac{BL}{Bl}$, etc., which die, and $\frac{bL}{bl}$ and $\frac{bl}{bL}$, which are normals, due to crossing over. If a recessive gene is present in either chromosome in the neighbourhood of the lethals, very much

less than one in four of such recessives appear when the stock is inbred. Such cases of balanced lethals occur in nature.

The Case of *Oenothera*.—Most species of the genus *Oenothera* breed nearly true, but give a few "mutants." When crossed with another species the offspring are generally of two, rarely of four, different types, whereas in normal species-crosses all are alike. This behaviour has been shown to be due to balanced lethals. A pollen lethal (causing sterility of half the pollen) may lie in the corresponding chromosome (or chromosome group, for the chromosomes are often attached to one another) with a zygotic lethal (causing sterility of half the seeds) or with a gene acting as a pseudo-lethal to the ovules. Such a gene is not lethal in itself, but when present in the heterozygous condition with a certain allelomorph, a megaspore containing the latter proliferates taking the place of the cell normally giving rise to the embryo. The few "mutants," which are not in general mutants in the ordinary sense, are mostly due to crossing over, which allows the reappearance of recessive genes. Other "mutants" are due to chromosomal aberrations. Any two, or all three, of these lethals may be present in a single plant.

THE CO-OPERATION AND NATURE OF GENES

Epistasy.—In a normal organism very many genes must co-operate to produce the normal structures, chemical substances and functions. Thus in the rabbit at least 10 genes must be present to produce the normal coat colour. The most important of these is *C*. A rabbit of the ultimate recessive genotype *cc* of the series of allelomorphs to which it belongs is a pink-eyed white, and all such rabbits are indistinguishable, no matter what other genes determining colour they may carry. Thus if a white rabbit carries two of the genes *I* for density of pigment, it will give dense-coloured young when mated with a pure-bred blue (*CCii*); if it is recessive it will give blue on some other dilute colour, if heterozygous, half dense and half dilute. But *II* and *ii* whites can only be distinguished by their ancestry or descendants. A gene such as *I* which can only manifest itself in presence of another such as *C* is said to be epistatic to it. All other colour genes are epistatic to *C*.

Inhibitors.—A rabbit of the composition *ee*gg, but bearing the other colour genes of the wild rabbit, is born yellow but develops some black pigment, becoming a "tortoiseshell." *EE*gg or *Eegg* is black, *E* causing extension of the dark eye-pigment into the coat; *eeGG* or *eeGg* is a pure yellow, *G* inhibiting the black pigment in the coat; *EEGG*, *EeGG*, *EEGg* or *EeGg* is the wild coloured grey. Here *G* inhibits all pigmentation on the belly, and also black pigmentation on portions of the hairs, which have therefore yellow tips. Such colour inhibitors are very common. Thus several types of dominant white fowl are known, in which pigmentation has been inhibited by different genes. Similarly there is a dominant white form of *Primula sinensis*, and *Primula elatior* contains a gene which, on crossing the species, inhibits the anthocyanin colour of *Primula juliae*, although *P. elatior* itself does not contain any genes causing the formation of anthocyanin against which the inhibitory gene could act. Again *Drosophila melanogaster* (and doubtless other Diptera) contains two independent genes inhibiting the growth of the balancers or rudimentary wings. In the absence of either, these develop into wing-like structures.

Several genes may co-operate to produce a given effect. Thus in the sweet pea there are two types of recessive whites, due to genes in different chromosomes. Each breeds true but when crossed they give coloured flowers. Calling the colour genes *C* and *R* the heterozygous coloured form is *CcRr*. When selfed it gives an F_2 of 9 *CR* : 3 *cCr* : 3 *cCr* : 1 *ccrr*, i.e., 9 coloured to 7 white. Again any of a number of genes may be sufficient to produce a given effect. Thus in hexaploid wheats any of three genes will produce red colour. If a plant containing all three be crossed with a triple recessive, only 1 in 64 of the F_2 will be white. Still more complicated cases are known, and they constitute one of the greatest practical difficulties in the study of heredity. The case in which the effects of the several genes are not clear-cut will be considered later.

Sex-limited Inheritance.—Many genes, though of course inherited through both sexes, can only find expression in one. Thus milk-production and butter-percentage in cows, and egg-laying in hens, are both determined by genes inherited from the father as well as from the mother. The same is true of characters not obviously connected with sex. For example in *Drosophila* a particular recessive gene, "bobbed," causes a shortening of bristles in the female only. This is because the Y-chromosome normally contains the dominant allelomorph of "bobbed." When this is lost the character appears in both sexes. A gene which only acts upon one sex is described as sex-limited in its expression. Such genes are also sometimes, though not generally, sex-linked. The action of a gene may be delayed for a generation. Thus a particular gene in the sweet pea causes all the pollen grains produced by plants carrying it to be long, as opposed to round. As this gene is dominant, the pollen grains of a heterozygous individual are all long, even though half of them carry the recessive gene for round pollen. Similarly a gene in the silk-worm causes females bearing it to produce pink eggs and larvae, so that here also the appearance of the larvae is no guide to their genetic composition. Such inheritance is called maternal, and is a special (and in practice rather confusing) type of sex-limited inheritance.

Influence of Environment.—Just as genes are influenced by one another in their expression, they are influenced by variations in the environment. For example the size or flowering time of an organism are naturally determined by its nutrition and other environmental factors, as well as by genes. But very often the effect of environment is much greater on one phenotype than on another. Thus cold increases the amount of black pigment in the skin and hair of the "Himalayan" rabbit, where the blackness of the extremities is only due to their low temperature; but it has little or no effect either on the white or the fully coloured rabbit. Again whereas damp food has very little effect on normal *Drosophila*, it causes the production of grossly abnormal abdomens in a particular genotype. Where it is desired to eliminate a hereditary character, the environment should be so adjusted that it can find its fullest expression. Thus the seed of many beets and mangolds, when sown in the open, produces about 1% of bolters, i.e., plants flowering in their first year. Bolting depends both on heredity and environment. If the seed is sown under glass in December and planted out in the spring, half or more of the plants may bolt, and by eliminating them for several generations the hereditary tendency to bolt may be got rid of, which is almost impossible under ordinary conditions of planting.

Presence and Absence Theory.—The simplest explanation of the phenomenon of dominance is the "presence and absence" theory. According to this view a recessive gene is simply the absence of the corresponding dominant gene. One need not of course imagine a mere void in its place, but some structure which does not have its function. Where dominance is complete it is assumed that one of the dominant genes can effectively do the work of two. In a series of multiple allelomorphs it is supposed that the various intermediate members of the series function to a lesser degree than the ultimate dominant. In this case we should expect that the intermediate genes would not be completely dominant. This is generally the case. Thus in *Drosophila melanogaster* there are 10 genes in the same locus giving eye colours intermediate between white and the normal red. None of these show the complete dominance which red shows over them all. If an activity of the gene or genes arbitrarily denoted by 100 or over is needed for complete colour, it is clear that no gene producing by itself an effect of less than 100 could be fully dominant. The presence and absence theory is borne out by the facts of sex linkage and deficiency, where an absent gene behaves like a recessive gene. But it meets with difficulties in explaining the origin of genes dominant over the normal type, and occasionally breaks down where, in a triploid, two recessive genes are dominant over one which is dominant in the diploid. Nevertheless, in a modified form, it is very widely applicable.

In some cases we may say that a dominant gene causes the formation of a certain substance, e.g., a particular anthocyanin pigment or a particular colloid concerned in immunity. Thus in

the guinea-pig the presence of complement (*see* IMMUNITY) in the serum is dominant to its absence. The recessives are so liable to disease that the character has died out. More rarely a gene inhibits such a formation. On the presence and absence theory it should do so by producing a definite substance. This is at least sometimes the case. Thus the skins of black rabbits contain a catalyst which causes the formation of melanin (black pigment) from tyrosin and hydrogen peroxide. This is absent in recessive white and yellow rabbits. The gene *G* which inhibits pigment formation produces a substance in the skin of the white bellies of rabbits carrying it which can be shown in the test-tube to inhibit pigment formation by the extract of black skin. A dominant gene causing the "English" piebald pattern acts by forming the same or a similar inhibitory substance. The co-operation of genes is therefore largely to be explained on biochemical lines.

Growth Rate.—In some cases the genotype determines the rate of a reaction, such as the growth of a given organ, or the rate of formation of a pigment. Thus a series of genotypes in certain insects and crustaceans are characterized by different rates of darkening during larval life. Those which arrive at a certain stage before the end of metamorphosis are indistinguishable in the adult form. But those characterized by very slow rates cannot complete pigment formation before development is over, and yield light-coloured adults.

Nature of the Gene.—The gene then is a unit, situated (during nuclear division) at a definite point in a definite chromosome, and dividing once at each cell division. Its diameter, to judge from data as to linkage, is probably not much more than ten times that of an average protein molecule, and may be less. A gene may be responsible for any of the differences which exist between different varieties of a species, including types so aberrant as to be incapable of life. There is reason to suppose that genes act by promoting or retarding specific chemical reactions. The heads of spermatozoa consist largely of compounds of nucleic acid with rather simple proteins.

POLYPLOIDY AND ANEUPLOIDY

While the above principles apply to inheritance in most plants and animals, they break down to a greater or less extent in many of the most important cultivated plants, because these possess a more complicated mechanism for the reduction division, and therefore a more complex type of segregation.

Tetraploidy.—An organism with double the normal somatic and four times the gametic or haploid number is called a tetra-

FIG. 6.—PART OF A PEDIGREE OF BRACHYDACTYLY (SHORT FINGERS)

ploid (Gr. τετραπλοῦς, fourfold), and in general one with any multiple of this number is called a polyploid (Gr. πολυπλοῦς, manifold). Tetraploids may arise in a species in several ways. The commonest is by a doubling of the chromosome number during vegetative multiplication of a plant. Thus if tomatoes are cut down and allowed to regenerate, about 2% will regenerate a tetraploid branch. Tetraploids can also arise by the union of two gametes in neither of which the reduction division has taken place. They are generally larger than the parent species, and fertile *inter se*, but may be nearly sterile when crossed with the parent. They therefore satisfy many of the criteria of a new species. In such a plant there are four chromosomes of each type, and two of each go into a gamete. The laws of heredity in it can be illustrated by the case of style length in the giant tetraploid form of *Primula sinensis*. The gene *S* for shortness is almost completely dominant. There are five genotypes whose gametes may be tested by mating with long-styled (*ssss*) plants.

Genotype	Gametes
SSSS	SS
SSSs	1 SS : 1 Ss
SSss	1 SS : 4 Ss : 1 ss
Ssss	1 Ss : 1 ss
ssss	ss

The first four are all short-styled. The SSSS and SSSs types can only be distinguished by a genetical analysis of their progeny, but SSss and Ssss differ in that the former give one recessive in six when mated with a recessive, and one in thirty-six when mated *inter se* or self-fertilized, while the latter give the ordinary Mendelian ratios of one in two and one in four.

Allopolyploidy.—A different type of tetraploidy arises from species crossing. If *Primula floribunda* and *Primula verticillata* (which have the same chromosome number of 18) are crossed, the offspring generally have 18 chromosomes, but are sterile, like mules. Such plants occasionally produce a tetraploid branch with the chromosome number 36. Such a branch is self-fertile, and the seeds from it yield the new species *Primula kewensis*. In this the nine pairs of chromosomes derived from each species pair with one another before the reduction division, so the gametes receive one haploid set from each parent species and the new plant breeds true. Such a condition is called allopolyploidy, that of polyploids arising with a species, autopolyploidy. Occasionally a chromosome from *floribunda* will pair with one from *verticillata*, and a new type of gamete will thus arise. Hence *Primula kewensis* does not breed quite true. It will also be clear that when two allopolyploid plants are crossed, the inheritance is not necessarily Mendelian. Recessive characters may disappear on crossing if the conditions before the reduction division are such as to prevent two chromosomes bearing the recessive gene from entering the same gamete.

The following cultivated plants are wholly or mainly polyploid:—Wheat, oats, plum, sour cherry, strawberry, apple, pear, rose, dahlia; and polyploid races of raspberries and other *Rubi*, chrysanthemum and many other plants exist in cultivation. In nature polyploidy is fairly common in certain genera, but inheritance in natural polyploids has been little studied. Polyploidy is rare in animals, but may arise from certain species-crosses.

Aneuploidy.—Besides the polyploids so far described, which have regular reduction divisions, haploid, triploid and other forms exist in which the chromosomes cannot all find mates, and the reduction division is therefore irregular. Such plants cannot therefore be propagated sexually, for the pollen and ovules are often infertile, and their combination practically never reproduces the parent. But they can be and are propagated asexually, and several domestic tulips, hyacinths and ornamental (though not fruit-bearing) cherries are triploids. By irregularities in the reduction division plants may be formed with too many or too few chromosomes. The former are often quite vigorous, and may be economically valuable. Thus all cultivated sweet cherries have one, two or three chromosomes more than the wild form. Their gametogenesis is irregular, and they never breed true sexually, but can be propagated by grafting. The various types of ovule produced by such plants are sometimes equally viable, but the pollen grains with an abnormal chromosome number are always less so than those with the normal number; hence such plants when bred sexually gradually revert to the normal type. Forms with a chromosome number which does not permit of a normal reduction division and normal heredity are called aneuploid.

Triploidy is the normal condition in the endosperm of seeds. The second generative nucleus of the pollen-grain fuses with the double secondary nucleus of the embryo-sac, producing a triploid endosperm nucleus. When this receives a dominant gene from the pollen grain the character of the endosperm may be altered, a phenomenon known as *xenia*.

MULTIPLE FACTORS AND QUASI-CONTINUOUS VARIATION

When a variable species is adequately analysed on Mendelian lines a very large number of genes are found to affect any character considered. Thus in *Primula sinensis* twelve genes affect the flower colour, apart from those determining the size and shape

of the eye; in *Drosophila melanogaster* 103 genes are known which have marked effects on the wings. When almost all the variations in a population are due to one or two genes and the environment, analysis is generally easy. When a large number are present it becomes quite impossible except as the result of prolonged experiment.

Multiple Factors.—While in plants single genes often determine the difference in size between races (as in the case of the tall and short sweet peas) this is rarely so in domestic animals. Thus the difference in size between the Hamburg and Sebright bantam fowls appears to be due to four genes, of which the Hamburg possesses three, *A*, *B* and *C*, and the bantam one, *D*, all in the homozygous form. They are all incompletely dominant. The F_1 is intermediate between the parents, and uniform. The F_2 is very variable and includes the genotypes *AABBCCDD* and *aabbccdd*, which are larger and smaller respectively than either parent race. When two pure-breeding races are crossed, something of this kind usually occurs.

Correlation.—In a species such as man where inbreeding is rare, variation in stature is apparently continuous, though the atomic constitution of matter makes it fairly clear that the number of possible phenotypes is finite. Provided that mating in such a population is at random, or alternatively that the intensity of assortative mating is known, a great deal may be found out regarding heredity in human populations by statistical methods. The resemblance between parents and children, brothers and sisters, and other relatives, can thus be estimated. Great care must be taken to exclude the effect of similar environments in increasing such correlations. But for example among the richer classes in England, where rickets and underfeeding are rare, the environment is relatively unimportant in determining stature. In the case of a number of human characters, such as stature, span, forearm length, the coefficient of correlation between parent and child ranges from .51 to .42, between sibs from .54 to .46. If we consider the variance (see VARIATION AND SELECTION) of a population if the parents (and hence all ancestors) are given, the variance is diminished to about 46%, which is mainly due to segregation, and not to differences in the environment. In other words differences in ancestry and segregation within families have about equal effects in producing variance. While the pre-Mendelian genetics do not account for segregation, Mendel's principles do so. It has been shown that the coefficients of correlation found for human stature are quantitatively predictable on the hypothesis that it is the resultant of very numerous genes. On the other hand until these genes can be determined, statistical methods are the only ones available for the analysis of this kind of inheritance.

INBREEDING AND OUTBREEDING

In numerous animal and plant species prolonged inbreeding may lead to the production of defective and sterile individuals. When members of two inbred lines are mated, there is usually a considerable gain in vigour. But more careful work has shown that inbreeding is not always harmful. Many plants, such as the pea, are normally self-fertilized, and rats have been successfully bred from brother to sister matings for more than 20 generations. If a plant heterozygous for a number of genes is self-fertilized, only half its offspring will be heterozygous for each of them, and the average plant will be heterozygous for only half the original number. The same process occurs, only more slowly, with inbreeding. In either case nearly complete homozygosis is reached in about six generations. Experience shows that most of the harmful effects of inbreeding, if any, appear within the first five to ten generations. If rigid selection is exercised during that period, a vigorous inbreeding race may often be built up, which does not vary appreciably in a constant environment, and cannot, of course, be further altered by selection.

Two distinct views are held as to the advantages of outcrossing. On the one hand it is thought that the bad effects of inbreeding are merely due to the appearance of recessive characters, and that it should be theoretically possible to eliminate these. Of course if the desirable dominant genes were very strongly repelled the practical difficulties would be immense.

Other workers believe that heterozygosis is beneficial as such. It is certainly of interest that the more successful types of asexually propagated plants often give evidence of extreme heterozygosis when self-fertilized. For example, the raspberry "Superlative" gives white plants which die at an early stage, plants sterile on the male side, others sterile on the female side, besides several recessive colour varieties; seedlings from it, which are homozygous for the dominant characters allelomorphic to these, are less satisfactory as fruit plants than their parent. It is possible therefore that it may be advantageous to be heterozygous for one or more lethal genes.

The condition of heterosis or hybrid vigour is of considerable interest as a character which is genetically determined, but yet not inherited. In particular the first generation of a cross between species is often larger and healthier than either parent, though they may be sterile or yield very unsatisfactory offspring. When, however, a cross is made between tetraploid species, or the chromosome number of a hybrid is doubled, an allotetraploid is produced in which there is no segregation, and it is suggested that the good effects of heterosis are not annulled by sexual reproduction in such case though the matter has not as yet been definitely decided.

FERTILITY AND HETEROSTYLISM

Many plants and some hermaphrodite animals are self-sterile. In some species this is a purely individual matter, but in others the species falls into two or more groups, members of each of which are sterile when mated *inter se*, but fertile when crossed with another group. The sterility may be absolute, but is not always so. Plants may sometimes be obtained by unions within an apparently self-sterile group if the end of the style is cut off before fertilization so that the pollen tubes have an abnormally short distance to grow. The mutually infertile groups are anatomically distinguishable in the case of heterostylous plants. Here one type has a short style and long stamens, the other a long style and short stamens. Not only is there a barrier to self-fertilization, but unions between plants of the same class are generally relatively, sometimes completely, infertile. Where this infertility is not complete it is found that the short-styled (or thrum) type is dominant, most of such plants in nature being heterozygous. In some cases intermediate types of plant exist, also genetically determined.

An analysis is often possible where no visible characters distinguish the classes. Thus in self-sterile plants of *Nicotiana* three allelomorphic (or strongly repelled) genes S_1 , S_2 , S_3 are found, no plant being homozygous for all three. A plant of composition S_1S_2 is self-sterile, but if its pollen is used on one of composition S_2S_3 , the S_1 grains are functional. Thus the products of the various possible matings are:—

$S_1S_2 \times S_2S_3$, 1 S_1S_2 : 1 S_2S_3 ; $S_2S_3 \times S_1S_2$, 1 S_1S_2 : 1 S_2S_3 , and so on (the pollen parent is shown on the right). A colour-determining gene exhibits partial linkage with these genes. In the same species other genes allelomorphic to S_1 , S_2 and S_3 exist, and also a gene which renders plants possessing it self-fertile. Self and mutual sterility is of considerable economic importance in the case of apples, plums and cherries, in all of which fertilization is necessary before fruit can be formed, though the fruit persists even if the embryos do not survive beyond a certain stage. Hence the conditions are highly complicated. In the plum it seems probable that fertility is determined by a system of genes like those of *Nicotiana*, their action being further complicated by the condition of polyploidy.

While allopolyploid plants are generally fully fertile *inter se*, autotetraploids are often less so than the corresponding diploids, though of course they are far more fertile *inter se* than in a cross with a diploid. But tetraploid forms of self-sterile species are commonly self-fertile. Very little is known concerning the inheritance of fertility in animals, except that genes involving physiological changes often depress it, and that it is usually increased by a moderate degree of heterosis, and diminished in species-crosses. Of course intersexuality is commonly accompanied by lessened fertility (see SEX).

SOMATIC SEGREGATION

When an organism produces several types of offspring the normal moment of segregation is at the reduction division, in which case segregation usually obeys Mendel's laws. But other types of segregation may occur. Much less is known about them than about the normal type, but a distinction may be made between three types of event, mutation, break-up of a chimaera, and plastid inheritance. Somatic segregation is more important in plants than in animals, because in the latter the germ cells are usually early differentiated from the soma, and whereas in a plant with white and green branches the gametes will often be different on the two branches, an insect whose right and left wings differ will commonly produce only one type of gamete.

Chimaeras.—It will be convenient to begin with a discussion of chimaeras. A chimerical plant may be sectorial, as when one half of a stem, with its leaves, is green, the other white, shoots from the border of the two sectors being of mixed colour. Or it may be periclinal, as when a green core is contained in a white skin, or conversely, a common arrangement in *Pelargonium* (usually called "geranium"). The outer layer may consist of one, two or more cells. Occasionally as the result of grafting, a periclinal chimaera may be composed of layers of two different species; as for example *Cytisus Adami*, which consists of a layer of *C. purpureus* over a core of *C. Laburnum*, and bears flowers of both the species together with those of the chimerical type. Though one type of chimaera may occasionally give rise to another, the periclinal type can generally be propagated vegetatively. Thus many commercial types of potato are periclinal chimaeras. When, however, the vegetative propagation is only from one layer, that layer is alone represented in the offspring. Thus a white-cored geranium can be propagated by an ordinary cutting, but a root-cutting gives only white plants, and when a potato such as Noroton Beauty (a mottled form) has its "eyes" removed the tubers give rise to red potatoes identical with the variety Triumph. It clearly consists of a core of Triumph surrounded by a nearly colourless layer. While periclinal chimaeras are common in such asexually propagated plants as the potato and the geranium, they are rare in the raspberry, because the "suckers" or asexually propagated plants grow from the roots in this case. Occasionally chimaeras are still more complicated, owing to the occurrence of more than two tissue types.

Stable chimaeras cannot be reproduced sexually. Their gametes generally reproduce the characters of the sub-epidermal layer, and are usually of one genotype only. Very often, however, chimaeras are sterile, or only one gender of gamete is produced. Chimaeras may arise from grafting, or more frequently from bud variation, which appears to be simply due to mutation (*q.v.*) in a somatic cell. If so it is usually found that the mutant portion differs by one gene only from the original plant though it may differ in chromosome number. When the chimaera is sectorial the mutant branches can often be propagated by grafting or by cuttings. In this way, for example, the red Magnum Bonum plum arose as a bud sport from yellow Magnum Bonum. In practice it is often impossible to be sure, without further experiment, whether a given case of somatic segregation is due to the break up of a chimaera, or to mutation in a somatic cell.

Plastid Inheritance and Multimutation.—Plants may exhibit variegation either of the chlorophyll in the leaves, or the pigments of the flowers. In some cases the variegated condition is a simple recessive to the normal. Sometimes, however, as in *Mirabilis jalapa*, a recessive plant of the var. *variegata* (here variegated green and yellow), will produce a pure green branch, or, on self-fertilization, a pure green seedling. Such seedlings behave as heterozygotes for the recessive character of variegation. Here it is clear that the recessive gene occasionally mutates back to the dominant. Probably the genetical mutability and the variegation are different aspects of the same phenomenon. While some geneticists regard these "multimutating genes" as an explanation of all abnormally inherited variegation, many cases seem to call for some other explanation. In *Pelargonium zonale*, green or green-skinned branches give only green seedlings when selfed, and white or white-skinned only white. The cross yields a mixture of green,

white and mosaic plants. This kind of inheritance is most readily explained as due to plastids which are not passed on from one cell to another according to any definite law. In such cases inheritance may be through both sexes, as in *Pelargonium* and *Oenothera*, or through the female only, as in *Mirabilis* and *Primula*. Thus in *Mirabilis Jalapa* var. *albomaculata* the leaves are mottled green and white, with occasional green shoots. The condition is not transmitted through the pollen, and the seeds, no matter with what pollen, produce a mixture of green, albomaculata, and white plants. Non-Mendelian variegation occurs even in the prothallia of certain variegated ferns, and is common as a result of species crossing. Non-Mendelian inheritance occurs very rarely.

HEREDITY IN MAN

There is now no doubt that the laws of heredity are the same in man and in other animals, but their application is very different. In the case of domestic animals a new type is often bred from extensively. There is thus a fair probability that two piebald cats will owe their origin to a single common ancestor, and that their condition will therefore be due to the same gene or genes. With two piebald men not known to be related the opposite is probably true. Again in-breeding and in consequence homozygosity are far commoner in most other organisms than in man. It is convenient to divide human heritable characters into well-marked characters exhibiting Mendelian inheritance, other physical characters, and other psychological characters.

Dominant Abnormalities.—Many well-marked hereditary abnormalities run in families. A dominant character is handed down regardless of sex, only by an affected individual, and to about half of his or her children. Among anomalies of the eyes alone, such characters include myopia, two or more types of presenile cataract, retinitis pigmentosa (in certain families), acute glaucoma, and night-blindness (in some families). A pedigree of the latter includes 2,116 individuals, of whom 135 were night-blind, all descended from Jean Nougaret, who was born near Montpellier in 1635. Other dominant characters include several ear and skin diseases, diabetes insipidus and other metabolic diseases. In some cases the inheritance is apparently somewhat irregular. Thus acholuric jaundice is strongly hereditary, but occasionally transmitted through unaffected individuals. The latter however are found to have abnormally fragile red blood corpuscles, and it is this character which is actually inherited, though a person displaying it may actually escape the usual consequence of jaundice. In addition a number of malformations are inherited as dominants, including brachydactyly (absence of one bone in each finger) and lobster-claw (absence of all digits except sometimes the thumb and little finger). Minor anomalies inherited in this way may prove very serious in the homozygous form. Thus a marriage between cousins with a hereditary shortening of one finger produced a child without hands or feet. The social importance of dominant abnormalities, which are inherited only from affected persons may be gauged by the fact that over 10% of blindness in Germany is due to hereditary cataract alone. On the other hand many of the above complaints can also be produced by environmental influences.

Sex-linked Recessive Abnormalities.—Another great group of abnormalities are sex-linked recessives. They are very much commoner in males than in females, and are not passed on by affected males to their children, though their daughters, who receive an abnormal X-chromosome from them, hand the character on to half their sons. The most serious condition inherited in this way is haemophilia, a failure of the blood to clot which generally leads to death by haemorrhage. A very common group of characters inherited in this way are the four types of colour-blindness, namely protanopia (red-blindness) and its milder form

protanomaly, deuteranopia (green-blindness) and its milder form deuteranomaly. The two types of red-blindness, with normal sight, give a series of multiple allelomorphs, as do the two types of green-blindness, but it is not certain whether all five characters are allelomorphic. Among other sex-linked recessives are retinitis pigmentosa (in certain families) and atrophy of the optic nerve.

Autosomal Recessive Anomalies.—Autosomal recessive characters are harder to detect. They do not at first sight appear to be hereditary at all, and are best studied in cases such as deaf-mutism where two affected persons commonly marry, in which case all the children are commonly deaf and dumb. However recessive anomalies are vastly more likely to appear in the children of marriages between cousins, or of incestuous unions, than in the general public, since two relations are likely to carry the same recessive gene. Among such anomalies are albinism, some types of retinitis pigmentosa, "day-blindness" or total colour-blindness, deaf-mutism in many families, a number of skin diseases and several diseases of metabolism, including alcaptonuria. Many other anomalies are very probably inherited in a Mendelian manner, for example an inability to become immune to measles or scarlet fever, which leads to suffering from these diseases more than once. Since however this character can only be demonstrated when infection has occurred, it is impossible to be certain of its heredity. Similarly cancer is a recessive character in certain strains of mice, and is at least in some degree hereditary in man, though undoubtedly due in part to external causes.

Other Mendelian Characters.—Among non-pathological physical characters which are inherited in a Mendelian manner should be named the iso-agglutinins. Every human being falls into one of four groups, AB, A, B and O. The corpuscles of group O are not agglutinated by any sera, and can therefore safely be injected into members of any group. Those of group A are agglutinated by groups B and O, of group B by groups A and O, of group AB by the other groups. Inheritance is Mendelian, the presence of A or B being due to a distinct dominant gene, the two perhaps being a pair of multiple allelomorphs. The groups are found in different proportions in different races, and are also present in the anthropoid apes. In western Europe brown- or green-eyed persons mostly differ from the blue and grey eyed by a single dominant gene, but other genes are also concerned. The sharp segregation which often occurs among the second and later generations of inter-racial crosses makes it clear that Mendelian genes are concerned, but their analysis has not yet gone very far.

Quantitative Characters.—Most of the human characters whose inheritance can be studied in large populations are quantitative and apparently continuously varying characters such as stature, length of forearm or cranial index are probably due to a number of genes. In these cases Mendelian methods are as yet inapplicable, but much may be learned by statistical means. Such characters show the following correlations between relatives:—

Brother with brother or sister with sister	about .52
One parent with son or daughter	about .46
Grandparent and grandchild	about .27
Uncle or aunt and nephew or niece	about .25
First cousins <i>inter se</i>	about .15

The law of ancestral heredity, applied to eye and coat colour, states that the coefficient of correlation between the character in an individual and any ancestor distant by $n+1$ generations is a^n , where a = about $\frac{1}{2}$ and r = about $\frac{2}{3}$. Earlier work suggested higher correlations with remote ancestors.

In other words, if allowing for the slight tendency of like to mate with like, we may say that of the total variance ancestry accounts for about 54%, i.e., less than half is due to segregation within a family with the same parents, and very little indeed to differences in environment. Putting the matter in another way, if the measured character of the average of the parents deviates from the average of the population by a certain amount, their children will on the average deviate by about 75% of that amount. Thus if a father is 4 in. above the average height, and the mother 1 in. below, the "mid-parent" is 1½ in. higher. The average height of children of such parents is just over one inch above the average for their sex. Substantially similar results are obtained for the

AFTER LORT
FIG. 7.—PART OF A PEDIGREE OF HUMAN COLOUR-BLINDNESS, TRANSMITTED BY APPARENTLY NORMAL WOMEN TO HALF THEIR SONS

inheritance of health and longevity, eye- and hair-colour, and other characters. It is important that the correlations are the same for characters such as eye-colour, which are not substantially influenced by the environment, and height, which may be, as in the case of rickets. It follows that, in the populations so far investigated, heredity accounted for much more variation than environment.

Psychological Characters.—Psychological characters are harder to measure, and it is very hard to compare children with their parents, but when brothers and sisters are compared with one another, success at school, intelligence quotients, quick temper, and so on, are correlated to the same extent as physical characters. The question arises how far this resemblance is due to similarity of environment among brothers. Among other tests the following have been applied. If fraternal resemblance depends appreciably on environment, brothers in an orphanage should vary more, in comparison with their companions, than brothers at an ordinary school. They do not do so. Foster-children should resemble their foster-parents in intelligence rating to nearly the extent found among blood-relations. They are found to show a resemblance with their foster-mothers which is slight in comparison with that between blood relations, and practically no resemblance with their foster-fathers. Again attempts to correlate intelligence within elementary schools with economic and other environmental conditions yield very small correlation-coefficients.

Monozygotic Twins.—An important line of evidence is derived from the study of "identical" or monozygotic twins formed from the same fertilized ovum, and therefore genetically identical. They resemble one another far more than ordinary brothers and sisters, or dizygotic twins. Preliminary studies seem to show that when separated at birth their adult intelligence quotients resemble one another to a very great extent, but their emotional reactions and moral character may differ markedly.

Mental defect is very strongly inherited, but only sometimes does it follow a definitely Mendelian course. In some pedigrees feeble-mindedness appears to be recessive, but there is no such sharp line between feeble-minded and dull individuals as would be the case were this always so. Probably many genes are concerned.

HEREDITY IN SOME ANIMALS

Mammals.—The character which has been most extensively studied is colour. This is inherited on very similar lines in the dog, cat, rabbit, guinea-pig, rat and mouse. The horse somewhat resembles these, but the cow, pig and sheep diverge considerably. Albinism is always recessive, though dominant genes producing black-eyed whites are often found. Where the wild colour is grey with a light-coloured belly, blackness is usually recessive, but again dominant genes converting grey into black are known in some species. Yellow is usually recessive to darker colours, and the brindled condition is often due to a multiple allelomorph intermediate in its action between the genes determining yellow and full colour. Chocolate pigmentation, as in the liver spaniel, is always recessive to black. Piebaldness may be recessive or dominant, and different genes may affect the pattern differently. Thus the white face of Hereford cattle is due to a dominant gene, while the ordinary type of piebaldness is neither dominant nor recessive, heterozygotes being intermediate.

Some structural characters are inherited on Mendelian lines. Thus long hair is recessive in rabbits, guinea-pigs, dogs and cats; and the polled character is dominant in cattle. A number of malformations and lethal genes are recessive. But the most economically important characters, such as butter- and milk-yield in cattle, are generally due to several genes. These are inherited through both sexes, even when only one manifests the character. Thus the Danish dairy industry owes much to two "butter bulls" who transmitted a gene or genes determining high butter yield to all their cow calves. In the large domestic animals selection is mainly practiced on the males, and these can often be genetically analysed by testing with a recessive. Thus a black polled bull who gives only black polled calves with red-horned cows must be homozygous for both the polled and black genes, and will yield only polled black calves even with heterozygous cows.

Poultry.—In poultry and pigeons the characters distinguishing the different breeds are mostly determined by quite a few genes. Thus the comb shape is determined by four or five principal genes. One of these determines the presence of a comb. Another converts this into a rose comb, yet a third into a pea comb, the two together giving a "walnut" comb. A fourth gene, not completely dominant, determines a double comb. At least 12 genes are known modifying the structure or arrangement of the feathers, and about the same number determining pigmentation, besides several genes which affect the colour of the skin and internal organs. Egg colour is determined by a number of genes as is broodiness, though here the main gene appears to be a dominant causing broodiness. Fecundity is strongly inherited, and appears to be determined by two dominant genes. At least four genes are sex-linked. Inheritance in pigeons and canaries has been less thoroughly investigated, but in both a number of genes are known.

Drosophila.—A large amount of work has been done on *Drosophila melanogaster* and related species, and on members of the Tettigidae (locusts), and a smaller amount on other invertebrates. In *Drosophila melanogaster* over 400 genes are known, modifying almost every part of the body, and also such psychological characters as phototropism. Many, but by no means all, produce types less viable than the wild form.

HEREDITY IN PLANTS

Flower Colour.—Flower colour has been more extensively studied than any other character. Thus in *Primula sinensis*, in which more genes are known than in any other flower (28 in all), 11 affect flower colour, while 3 others determine the size of the "eye" or central coloured patch, the remainder affecting structural characters, such as leaf shape and habit of the plant. Many of the genes affect several parts. Thus the same gene causes crimping of the leaves and petals, and the light-coloured flowers due to several recessive genes are associated with light stems and leaves.

Flower colour may be due to red or blue anthocyanin in the sap, to yellow pigment in the plastids, or to both. The combination is generally purple or orange. Some plants, e.g., the primrose, have no anthocyanin, others, such as *Primula sinensis*, no yellow pigment, while many, e.g., the rose, tulip and stock, have both. Usually each pigment is governed by a separate set of genes. Loss of the principal gene or genes determining anthocyanin formation gives a yellow plant if plastid pigments are present, otherwise a white. Similarly loss of the principal gene for yellow may convert a bronze into a red. In addition either the anthocyanin or the plastids may be whitened by a dominant gene. A gene may alter the colour of the anthocyanin either by altering the reaction of the cell-sap (for blue anthocyanin is generally reddened by acid) or by altering its molecular structure. The genes which cause large changes in flower colour (e.g., turn a white into a coloured plant) often affect leaf and stem colour too. They may also affect structural characters. Thus whiteness in stocks may be due to the loss of either of two genes. A white stock cannot have hairy leaves. The hairiness or otherwise of the coloured plants is determined by two further dominant genes.

Cereals.—Maize has been very thoroughly analysed, and the inheritance of many economically important characters is understood. Thus the sugary endosperm of the sweet corn is due to a recessive gene, and another recessive gene determines waxy endosperm. But most cultivated wheats and oats are hexaploids, though a few are tetraploids. They are moreover allohexaploids. Hence while certain characters behave in a Mendelian manner, the same character may be due to a gene in either of the three sets of chromosomes, and will therefore exhibit different linkages in different races. Moreover, as usual in allopolyploids, characters which behave as recessives in F_1 do not always reappear in F_2 . The characters known to be Mendelian are not in general those of the greatest economic importance. Resistance to disease varies in its inheritance with the species of rust or mildew concerned. Thus resistance to yellow rust, *Puccinia glumarum*, is recessive,

but that to brown rust, *Puccinia triticea*, and mildew, *Erysiphe graminis*, are dominant. But the matter is greatly complicated by the fact that a wheat which is immune in one environment may be attacked in another, owing to the existence of different races of the same parasite species.

Anisogony.—Among the structural and physiological characters which have been found to obey Mendel's laws are size, habit, leaf shape, flower shape, time of flowering, heterostylism, sterility of either male or female organs, hairiness, and a variety of abnormalities. An occasional complication of plant genetics is anisogony, *i.e.*, the ovules and pollen grains are of different genetical composition. This may be due to differences in the cytoplasm or plastids which are maternally inherited, to only half the pollen grains being functional or, in dioecious plants to sex-linkage. Thus in the stock, *Matthiola incana*, a race exists which, though single, gives slightly more than 50% of double flowered plants when self-fertilized. When used as a female with a normal single, half the F_1 produce doubles; when used as a male all the F_1 do so. But doubleness now behaves as an ordinary recessive. This is generally explained on the view that the dominant gene S for singleness is closely linked with a gene p which prevents the proper functioning of pollen grains bearing it. The ever-sporting type is $\frac{Sp}{SP}$. All its functional pollen is sP , so that

when selfed, about half the seeds are $\frac{Sp}{sp}$ and give doubles, the other half perpetuating the parental type. The gene inhibiting plastid colour is carried in the same chromosome.

Unicellular Organisms.—In Protista, including Bacteria and certain algae, any cell can reproduce, and there is no clear distinction between growth and reproduction. Where reproduction is asexual we have a condition parallel to that of a clone in the higher plants, and variations are rather feebly inherited. Nevertheless selection has sometimes been at least temporarily effective within such a clone. When sexual reproduction occurs, there is often a marked outbreak of variation. Acquired characters, such as those produced by certain poisons in trypanosomes, are inherited at least for a considerable period but are generally lost on sexual reproduction, and sometimes without it. Adaptive characters acquired by a strain of micro-organisms, *e.g.*, a capacity for fermenting sugars not usually attacked, may be genuine adaptations inherited, but are sometimes believed to be due to the selection of mutants.

Species Crosses.—When two species with different chromosome numbers are successfully crossed the reduction divisions of the hybrid are generally irregular, and it is nearly or quite sterile. Occasionally in such cases unreduced gametes may be formed, in which case there is no segregation of characters, and allopolyploidy may result in later generations. When however the chromosome numbers are equal, the normal segregation mechanism may be able to function, though it does not always do so. In this case the F_2 generation, and the results of back-crossing F_1 to either parent, are usually polymorphic, and may include monstrous or more or less inviable forms. In certain cases, owing to the inviability of most gametic and zygotic combinations, the F_2 consists entirely of types resembling one or other parent fairly closely. Sometimes however a partial Mendelian analysis is possible. For example from the cross between the primrose, *Primula acaulis*, and the blue Asiatic primrose, *Primula juliae*, it appears that the former possesses a gene for yellow pigment, the latter for anthocyanin, so that whites appear in F_2 . If the oxlip, *P. elatior*, is crossed with *Juliae* it is found to carry a gene inhibiting anthocyanin formation and one for the umbellate habit as well as those of *acaulis*. At least two genes are concerned in determining hairiness in these crosses, one being linked with a colour gene. Besides genes, species may differ in cytoplasmic factors, as do *Geranium striatum* and *G. Endressii*, and the commonness of variegation as the result of species crosses suggests that the plastids may also differ. Mendelian analysis has been carried some way in specific crosses of the moths of the sub-family Bistoninae, and some other animals, but it is complicated not only by sterility and upsets of sex (*q.v.*), but by the effects of heterosis, which

cause increase in size and vigour.

Where species cannot be crossed their genetics and chromosomal architecture can be compared; thus the Norway rat, *Rattus norvegicus*, has three linked autosomal genes, C , R and P whose loss causes albinism, red-eyed yellowness and pink-eyed yellowness respectively. C and P have also been lost in different mouse races, and are linked with somewhat greater intensity. R has been lost in the black rat *Rattus rattus*, C and R in the Californian deer-mouse, *Peromyscus maniculatus*, where they are also linked. Clearly the architecture of the germ-plasm is similar in these species. On the other hand the arrangement of the genes in the chromosomes differs appreciably in different species of *Drosophila*, and sectors of a chromosome have been reversed in certain geographical races of *D. melanogaster*. In the rodents certain species and varieties differ by colour genes which are multiple allelomorphs of those producing well marked changes such as yellowness; that is to say that these particular genes differ less between species than domestic varieties.

HISTORY

19th Century.—Early thought on this subject was mainly speculative, and has left very little mark on modern theories. On the other hand a considerable empirical knowledge of the subject has long been current among practical breeders of animals, and to a less extent of plants. Among the principles clearly recognized, and formulated among others by C. Darwin in *Variation of Animals and Plants under Domestication*, were the facts that when two widely divergent varieties were crossed the F_1 , tended to resemble the wild form of the species (atavism, *q.v.*) and that in such a case, or a species cross, the F_2 were very variable. Atavism is a consequence of the fact that most variants are recessive to the wild type. Various theories were put forward in the 19th century, mostly based on the assumption that acquired characters were inherited. Thus Darwin supposed that particles were carried by the blood from adult organs to the gonads, and affected the hereditary characters transmitted.

In the late 19th century, apart from Mendel's work, two main lines of enquiry were pursued. A. Weissman (*q.v.*) and others showed that characters acquired by the adult are not in general transmitted to the offspring (*see* LAMARCKISM). It is of course possible that this occurs in exceptional cases, or so slowly that the process is only effective on a geological time-scale. He stressed the continuity of the germ-plasm from one generation to another, and developed a theory of heredity by the chromosomes which has since been abandoned, but which contained the essential idea that inheritance was not of characters, but of determinants which caused them to appear under the right conditions. F. Galton began an enquiry into heredity by statistical methods which enabled him to formulate a law of ancestral heredity which, in a modified form, holds good for large mixed populations. His work on human heredity was particularly important, and he was able to demonstrate the relative importance of heredity and environment by a study of identical twins. The statistical method was later developed by K. Pearson and his colleagues into an instrument of research which is indispensable in the investigation of quantitative characters. H. de Vries began an investigation of heredity on *Oenothera* and its mutant derivatives and stressed the importance of unit characters, *i.e.*, the somatic expressions of single genes or groups of linked genes.

1900-10.—In 1900 G. Mendel's paper on inheritance in peas, published in 1865, was rediscovered by de Vries, Correns and Tschermak, who were able to illustrate the principles there enunciated from other plants. The core of Mendel's discovery was that the factors determining hereditary characters segregate into the gametes of a hybrid according to definite and quantitative laws. In the next few years W. M. Bateson and his pupils (Saunders, Punnett, Hurst, Doncaster, Durham, Gregory, Marryat, Wheldale and Sollas) published a mass of work extending Mendelism to other plants, and to man, other mammals, birds and insects. In the course of this work Doncaster, Durham and Marryat discovered sex-linkage in the moth, *Abaxas grossulariata*, and the canary, while Bateson, Saunders and Punnett discovered linkage between genes. About the same time Cuénot discovered

multiple allelomorphism in the mouse. A large amount of detailed Mendelian work on a variety of organisms was carried out by Correns, Lang, Tschermak and others in Germany, and Castle and Davenport in America. Biffen began the Mendelian analysis of cereals, later carried on by Engledow, Watkins and others, and Nettleship demonstrated the Mendelian inheritance of a number of human defects. This work met with determined opposition from the statistical or biometrical school of Pearson, who laid stress on deviations from Mendel's laws, now known to be due partly to differential viability of zygotes and gametes which distort the theoretical ratios, partly to the fact that varieties generally differ by a number of minor genes as well as those which are readily observed. The Mendelians retorted that the statistical method ignored genetical differences which exist between individuals of the same phenotypical characters and could not account for segregation. Pearson and his school, however, continued to investigate the inheritance of human physical and psychical characters with great success by statistical methods. Meanwhile Johanssen, working with beans, developed the concept of a pure line, which has been fundamental in all subsequent genetics. McClung, E. B. Wilson, T. H. Morgan and others discovered X and Y chromosomes, and R. R. Gates discovered the first case of a hereditary character associated with an abnormal chromosome number. Such was the position about 1910.

Since 1910.—In that year Morgan put forward the view that sex-linked genes were carried by the X chromosome, and in 1913 his pupil Sturtevant enunciated the theory of the linear arrangement of the genes in the chromosome. These theories, which had been foreshadowed by Correns and Sutton, have since been tested on a vast scale on *Drosophila* by Morgan and his school, especially Bridges, H. J. Muller and Sturtevant. Bridges in particular investigated the genetics of cytologically abnormal individuals, and Muller balanced lethals and the frequency of mutation. Thanks to this fundamental work the chromosome theory is now pretty generally accepted, although for some time Bateson and R. C. Punnett regarded linkage as due to differential multiplication of different types of cell. Among the more notable investigations of inheritance on orthodox Mendelian lines carried out in plants of late years are those of Nilsson-Ehle and Kajanus on inheritance in the polyploid cereals, of East, Emerson and Hayes on maize, Goodspeed and Clausen on tobacco, Baur on *Antirrhinum*, Gregory, de Winton and Bateson on *Primula sinensis*, of Punnett on the sweet pea, Andersson on ferns and Wettstein on mosses, where individual gametophytes can be studied. In animals special mention should be made of the work on various rodents by Castle and his colleagues, the rabbit and fowl by Punnett and his colleagues, the fowl by Dunn, *Paratettix* and *Apotettix* by Nabours, and on other *Drosophilae* by Metz and Lutz.

The special problems arising in autopolyploids were attacked by Gregory, Blakeslee and Winkler, while Winge, Heribert-Nilsson, Newton and Pellew, Crane and Darlington dealt mainly with allopolyploids, and Lotsy with the effects of hybridization in general. Little, Crew and Mohr studied lethal genes in animals, and Heribert-Nilsson discovered certation between pollen grains. Bateson, Chittenden, Pellew and Correns studied non-Mendelian inheritance in plants, while Renner brought the genetics of *Oenothera* into line with those of other organisms. Lehmann analysed sterility in *Veronica*, and East and his colleagues in *Nicotiana*.

On the physiological side Onslow studied the chemistry of pigmentation, R. Goldschmidt and J. S. Huxley the detailed effects of genes on growth-rates, and Goldschmidt and F. A. E. Crew the genetics of sexual abnormality (see SEX) while Brink began a study of the effect of genes on the physiology of the pollen grain, and Pearl of the genetics of longevity. Muller, W. H. Harrison and others showed that mutation could be produced by appropriate chemical (metallic salts in the food) or physical (X-rays) stimuli to the germ cells.

On the theoretical side R. A. Fisher showed that the results of Pearson and his colleagues followed from the assumption that such characters as stature were due to multiple genes acted on by natural selection, and thus healed the breach between the Mendelian and biometric schools.

In the last part of the 19th century genetics was studied mainly with a view to elucidating the method of evolution. In the 20th century, it has mainly been studied for its own sake and that of its practical applications. This independence has been of great advantage, but in the last few years the problem of evolution has been taken up again by geneticists. Among the outstanding work is that of Sumner on geographical races of deer-mice, and that of the Russian school. Vaviloff has studied the geographical distribution of the cereals, Serebrovsky that of the poultry genes, and Tschetwerikoff the genetical nature of the wild populations of *Drosophila*.

The facts so far arrived at have had a considerable practical importance in the breeding of cereals, and some in horticulture. They are beginning to influence the breeders of live-stock, especially poultry, and attempts are being made to apply them to the human race (see EUGENICS).

HEREFORD, city, municipal borough, and county town of Herefordshire, England, on the river Wye, 144 m. W.N.W. of London by rail. Pop. (1921) 23,322. Hereford (*Herefortuna*) was founded after the crossing of the Severn by the West Saxons early in the 7th century, as a settlement near the Welsh March. Probably founded by Earl Harold, afterwards Harold II., the castle was taken by Stephen, and was the prison of Prince Edward during the Barons' Wars. The pacification of Wales deprived Hereford of military significance until it became a Royalist stronghold during the Civil Wars. It surrendered easily to Waller in 1643; but was reoccupied by the king's troops and received Rupert on his march to Wales after Naseby. It was besieged by the Scots in 1645, relieved by the king, but fell again to the Parliamentarians. In 1086 the town included fees of the bishop, the dean and chapter, and the Knights Hospitallers, but was otherwise royal demesne. Richard I. in 1189 sold the town to the citizens at a fee farm rent, which grant was confirmed several times. Incorporation was granted in 1597, and confirmed in 1620 and 1697-98. Hereford returned two members to parliament from 1295 until 1885. Hereford was the site of a provincial mint in 1086 and later. A grant of an exclusive merchant gild, in 1215-16, was several times confirmed. The trade in wool was important in 1202, and eventually responsible for many gilds. It brought into the market Welsh friezes and white cloth; but declined in the 16th century.

The cathedral of St. Ethelbert exemplifies all styles from Norman to Perpendicular. The see was detached from Lichfield in 676, Putta being its first bishop. The removal of murdered Aethelbert's body from Marden to Hereford led to the foundation of a superior church, reconstructed by Bishop Athelstane, and burnt by the Welsh in 1055. Begun again in 1079 by Bishop Robert Losinga, it was carried on by Bishop Reynelm and completed in 1148 by Bishop R. de Betun. In 1786 the western tower fell and carried with it the west front and the first bay of the nave. The present west front was completed in 1905. The total length of the cathedral outside is 342 ft., inside 327 ft. 5 in., the nave being 158 ft. 6 in., the choir from screen to reredos 75 ft. 6 in. and the lady

chapel 93 ft. 5 in. The principal features are the central tower, of Decorated work, and the north porch, rich Perpendicular with parvis. The bishop's cloisters, of which only two walks remain, are Perpendicular, of curious design, with heavy tracery in the bays. Of the former decagonal Decorated chapter-house, only the doorway and slight traces remain. Within, the nave has Norman arcades, and there is a late Norman font. The south transept is also Norman, but largely altered by the introduction of Perpendicular work. The north transept was rebuilt in 1287. The dark choir is Norman in the arcades and the stage above, with Early English clerestory and vaulting. At the east end is a Norman arch, blocked until 1841 by a Grecian screen erected in 1717. The choir stalls are largely Decorated. The organ contains original work by Renatus Harris, and was presented by Charles II. The small north-east and south-east transepts are Decorated but retain traces of the Norman apsidal terminations eastward. The eastern lady chapel, dated about 1220, shows elaborate Early English work. On the south side opens the little Perpendicular chantry of Bishop Audley (1492-1502). In the north choir aisle is the fan-vaulted chantry of Bishop Stanbury (1470). The crypt is Early English. The ancient monastic library still retains several rare manuscripts and relics. In the south choir aisle is the Map of the World, dating from about 1314, the work of a Lincolnshire monk, Richard of Haldingham.

From the south-east transept of the cathedral a cloister leads to the quadrangular college of the Vicars-Choral, a Perpendicular building. On this side of the cathedral, too, the bishop's palace, originally a Norman hall, lies near the castle green, the site of the historic castle, now utterly effaced. The church of All Saints is Early English and Decorated. One only of the six gates and a few fragments of the old walls are still to be seen, but there are ruins of the Black Friars' monastery in Widemarsh, and a mile out of Hereford on the Brecon Road, the White Cross, erected in 1347, commemorates the departure of the Black Plague. The "Old House" is a good example of the half-timbered style, dating from 1621, and the Coningsby hospital (almshouses) dates from 1614. St. Ethelbert's hospital is an Early English foundation. Old-established schools are the Cathedral school (1384) and the Blue Coat school (1710). A musical festival of the choirs of Hereford, Gloucester and Worcester cathedrals is held annually in rotation at these cities.

HEREFORDSHIRE, an inland county of England on the south Welsh border, bounded north by Shropshire, east by Worcestershire, south by Monmouthshire and Gloucestershire, west by Radnorshire and Brecknockshire. The area is 839.6 sq.m. The county is almost wholly drained by the Wye and its tributaries, but on the north and east includes a small portion of the Severn basin. The Wye enters Herefordshire from Wales at Hay, and with a sinuous and beautiful course crosses the south-western part of the county, leaving it above the town of Monmouth. Of its tributaries, the Lugg enters near Presteign, and flows east to Leominster, where it turns south, receives the Arrow from the west, and joins the Wye 6 m. below Hereford, the Frome flowing in from the east immediately above the junction. The Monnow rising in the mountains of Brecknockshire forms the boundary between Herefordshire and Monmouthshire over one-half of its course (about 20 m.), but it joins the main river at Monmouth. Its principal tributary in Herefordshire is the Dore. The Wye is celebrated for its salmon fishing, which is carefully preserved, while the Lugg, Arrow and Frome abound in trout and grayling, as does the Teme, a tributary of the Severn, which forms parts of the northern and eastern boundary. The Laddon, also flowing to the Severn, rises in the county and leaves it in the south-east, passing the town of Ledbury. The greater part of the county is underlain by Old Red Sandstone, the harder bands in which form high ground (from 500 to 800 ft.) between the various valleys, while on the eastern boundary rise the Malvern hills, with Worcestershire Beacon (1,395 ft.) and Herefordshire Beacon (1,194 ft.). The Malvern hills form an inlier of Pre-Cambrian gneisses and volcanic rocks along the western edge of which occur Cambrian and Silurian rocks, the limestone bands of the latter forming wooded scarp faces. There is also a similar topography in the

Woolhope region where there is an oval shaped inlier of Silurian rocks. Smaller patches crop out at Westhide east of Hereford and May Hill, but the most important form the hills between Presteign and Ludlow in the north of the county. The Brecknockshire boundary is formed by the Black Mts., which, formed of Old Red Sandstone, exceed 2,000 feet. On its south-eastern margin the county just reaches the Carboniferous Limestone cliffs of the Wye valley near Ross, the scenery of which is famous. Glacial deposits, chiefly sand and gravel, are found in the lower ground along the river-courses, while caves in the Carboniferous Limestone have yielded remains of the hyena, cave-lion, rhinoceros, mammoth and reindeer.

Agriculture and Industries.—The soil is generally marl and clay, but in various parts contains calcareous earth in mixed proportions. Westward the soil is tenacious and retentive of water; on the east it is a stiff and often reddish clay. In the south is found a light sandy loam. More than four-fifths of the total area of the county is under cultivation and about two-thirds of this is in permanent pasture. Ash and oak coppices and larch plantations clothe its hillsides and crests. The rich red soil is famous for its pear and apple orchards, the county ranking in this respect next to Devonshire. The apple crop, generally large, is enormous one year out of four. Twenty hogsheads of cider have been made from an acre of orchard, 12 being the ordinary yield. Cider is the staple beverage of the county, and the trade in cider and perry is large. Hops are another staple of the county, the vines of which are planted in rows on ploughed land.

Herefordshire breeds bright red cattle with mottled or white faces and sleek silky coats, which though not good milkers, put on more meat and fat and produce finer beef at an early age, in proportion to food consumed, than almost any other variety. Its small, white-faced, hornless, symmetrical breed of sheep known as "the Ryelands," from Ross, made the county long famous. In its original form the breed is extinct, crossing with the Leicester having improved size and stamina at the cost of the fleece, and the chief breeds of sheep on Herefordshire farms at present are Shropshire Downs, Cotswolds and Radnors, with their crosses. Agricultural horses of good quality are still bred in the north, and saddle and coach horses may be met with at the fairs.

Manufacturing enterprise is insignificant. There are some iron foundries and factories for agricultural implements, and some paper is made. There are considerable limestone quarries, as, for example, near Ledbury.

Communications.—Hereford is an important railway centre. The Worcester and Cardiff line (G.W. railway) entering on the east, runs to Hereford by Ledbury and then southward. The joint line of the G.W. and L.M.S. companies runs north from Hereford by Leominster, proceeding to Shrewsbury, Crewe and Chester. At Leominster a G.W. branch crosses, connecting Worcester, Bromyard and New Radnor. From Hereford a G.W. branch follows the Wye south to Ross, and thence to the Forest of Dean and to Gloucester; another follows the Wye westward; a branch connects Ledbury with Gloucester, and the Golden Valley is traversed by a branch from Pontrilas on the Worcester-Cardiff line. None of the rivers is commercially navigable and the canals are out of use.

Population and Administration.—The area of the ancient county is 537,363 ac., with a population (1921) of 113,189. The area of the administrative county is 538,924 ac. The county contains 12 hundreds. It is divided into two parliamentary divisions, Leominster and Hereford, each returning one member. There are two municipal boroughs—Hereford (pop. 23,322) and Leominster (5,538). The other urban districts are Bromyard (1,573), King-ton (1,688), Ledbury (3,154) and Ross (4,665). The county is in the Oxford circuit, and assizes are held at Hereford. It has one court of quarter sessions and is divided into 11 petty sessional divisions. The boroughs of Hereford and Leominster have separate commissions of the peace, and the borough of Hereford has in addition a separate court of quarter sessions. The ancient county is almost entirely in the diocese of Hereford, with small parts in those of Gloucester, Worcester and Llandaff.

History.—The prehistoric period in Herefordshire does not seem to have been very important and the county was probably

then very heavily forested. The early Iron Age camp on the Herefordshire Beacon (Malvern hills) is an important earthwork. During the 7th century the West Saxons pushed across the Severn and established themselves between Wales and Mercia, with which kingdom they soon became incorporated. The district, now Herefordshire, was occupied by a tribe, the Hecanas, who congregated chiefly about Hereford and in the mining districts round Ross. In the 8th century Offa extended the Mercian frontier to the Wye, securing it by the earthwork known as Offa's dyke, portions of which are visible at Knighton and Moorhampton in this county. In 915 the Danes made their way up the Severn to the district of Archenfield and in 921 they besieged Wigmore, which had been rebuilt in that year by Edward. The district was the scene of constant border warfare with the Welsh, and Harold, whose earldom included this county, ordered that any Welshman caught trespassing over the border should lose his right hand. In the period preceding the Conquest much disturbance was caused by the outrages of the Norman colony planted in this county by Edward the Confessor. Richard's castle in the north of the county was the first Norman fortress erected on English soil, and Wigmore, Ewyas, Harold, Clifford, Weobley, Hereford, Donnington and Caldecot were all the sites of Norman strongholds.

Hereford and Weobley castles were held against Stephen but were captured in 1138. Edward, afterwards Edward I., was imprisoned in Hereford castle, and made his famous escape thence in 1265. In 1326 the parliament assembled at Hereford which deposed Edward II. In the 14th and 15th centuries the forest of Deerfold gave refuge to some of the most noted followers of Wycliffe. During the Wars of the Roses the county supported the Yorkist cause, and Edward, afterwards Edward IV., raised 23,000 men in this neighbourhood. The battle of Mortimer's Cross was fought in 1461 near Wigmore. During the civil war of the 17th century, the county was royalist and Hereford, Goodrich and Ledbury all endured sieges.

The earldom of Hereford was granted by William I. to William FitzOsbern, about 1067, but the title lapsed until conferred on Henry de Bohun about 1199. It remained in the possession of the Bohuns until the death of Humphrey de Bohun in 1373; in 1397 Henry, afterwards King Henry IV., who had married Mary Bohun, was created duke of Hereford. Edward VI. created Walter Devereux, a descendant of the Bohun family, Viscount Hereford, in 1550, and his grandson, the famous earl of Essex, was born in this county. Since this date the viscounty has been held by the Devereux family, and the holder ranks as the premier viscount of England. Sir John Oldcastle, the leader of the Lollards, was sheriff of Herefordshire in 1406.

Herefordshire probably originated as a shire in the time of Aethelstan, and is mentioned in the Saxon Chronicle in 1051. In the Domesday Survey parts of Monmouthshire and Radnorshire are assessed under Herefordshire, and the western and southern borders remained debatable ground until with the incorporation of the Welsh marches in 1535 considerable territory was restored to Herefordshire. At the time of the Domesday Survey the divisions of the county were very unsettled. As many as 19 hundreds are mentioned, but these were of varying extent, some containing only one manor, some from 20 to 30. Of the 12 modern hundreds, only Greytree, Radlow, Stretford, Wolphy and Wormelow retain Domesday names. Herefordshire has been included in the diocese of Hereford since its foundation in 676.

Herefordshire was governed by a sheriff as early as the reign of Edward the Confessor, the shire-court meeting at Hereford where later the assizes and quarter sessions were also held. In 1606 an act was passed declaring Hereford free from the jurisdiction of the council of Wales, but the county was not finally relieved from the interference of the Lords Marchers until the reign of William and Mary.

Herefordshire has always been a rich agricultural area, manufactures being unimportant, with the sole exception of the woollen and the cloth trade which flourished soon after the Conquest. Iron was worked in Wormelow hundred in Roman times, and the Domesday Survey mentions iron workers in Marcle. At the time of Henry VIII. the towns had become much impoverished. Hops

were grown in the county soon after their introduction into England in 1524. In 1580 and again in 1637 the county was severely visited by the plague, but in the 17th century it had a flourishing timber trade and was noted for its orchards and cider.

Herefordshire was first represented in parliament in 1295, when it returned two members, the boroughs of Ledbury, Hereford, Leominster and Weobley being also represented. Hereford was again represented in 1299, and Bromyard and Ross in 1304, but the boroughs made very irregular returns, and from 1306 until Weobley regained representation in 1627, only Hereford and Leominster were represented. Under the act of 1832 the county returned three members and Weobley was disfranchised. The act of 1868 deprived Leominster of one member, and in 1885 Leominster was disfranchised, and Hereford lost one member. By the act of 1918, Hereford ceased to be a parliamentary borough. The entire county (inclusive of the boroughs) is now represented by two members.

Antiquities.—There are remains of several of the strongholds which Herefordshire possessed as a march county, some of which were maintained and enlarged, after the settlement of the border, to serve in later wars. To the south of Ross are those of Wilton and Goodrich, commanding the Wye. Of the several castles in the valleys of the boundary-river Monnow and its tributaries, those in this county include Pembridge, Kilpeck and Longtown. In the north the finest example is Wigmore.

Beside the cathedral of Hereford, and the fine churches of Ledbury, Leominster and Ross, described under separate headings, the county contains some churches of almost unique interest. In that of Kilpeck Norman work is seen. It consists of the three divisions of nave, choir and chancel, divided by ornate arches, the chancel ending in an apse, with a beautiful and elaborate west end and south doorway. A similar plan is seen in Peterchurch and in Moccas church, above Hereford. The church at Bromyard exhibits Norman details. At Abbey Dore, the Cistercian abbey church, still in use, is a large and beautiful specimen of Early English work. At Madley, south of the Wye, 5 m. W. of Hereford, is a fine Decorated church (with earlier portions), with the rare feature of a Decorated apsidal chancel over an octagonal crypt. Of the churches in mixed styles those in the larger towns are the most noteworthy, together with that of Weobley.

The half-timbered style of domestic architecture beautifies many of the towns and villages. Among country houses, that of Treago, 9 m. W. of Ross, is a remarkable example of a fortified mansion of the 13th century. Rudhall and Sufton Court, between Ross and Hereford, are good specimens of 15th century work, and portions of Hampton Court, 8 m. N. of Hereford, are of the same period. Holme Lacy, 5 m. S.E. of Hereford, is a fine mansion of the latter part of the 17th century. Downton castle possesses historical interest in having been designed in 1774, in a strange mixture of Gothic and Greek styles, by Richard Payne Knight (1750-1824), a famous scholar, numismatist and member of parliament for Leominster and Ludlow; while Eaton hall, now a farm, was the seat of the family of the famous geographer Richard Hakluyt.

HERERO, a Bantu-speaking people inhabiting the central parts of South West Africa. Predominantly a pastoral people, they practise a little agriculture. They live in small household groups which are scattered irregularly over the tribal territory. They have a double clan system, one set (*oruzo*) with patrilineal descent, the other (*eanda*) with matrilineal. The former is associated with religious observances, the latter with economic life. Both are totemic and exogamous. The kinship system is classificatory, and cross-cousin marriage is preferred. Ancestor worship is the main religious cult, and each household keeps permanently alight a sacred fire upon which the welfare of its members is supposed to depend.

See I. Irlé, *Die Herero*, 1906.

HERESY, in its primary meaning signifies an *act of choice*, whether good or bad (*cf.* LXX. in Gen. xlix. 5; Lev. xxii. 18, 21;

Neh. xii. 40; 1 Macc. viii. 30); it is the English equivalent of the Greek *αἵρεσις*. From this arose its later meaning of personal choice of an opinion or belief, or personal adhesion to a group or party advocating certain principles of belief; from this again it was used of the group or party as such, as a school or "sect." In Eusebius (*Hist.* x. 5) the Christian Church itself is described as the "most sacred heresy." But in the N.T. we see the word, acquiring the implication of disparagement or condemnation. It is applied to the Pharisees and Sadducees (Acts v. 17, xv. 5, xxvi. 5) and to Christianity itself by opponents (Acts xxiv. 14, xxviii. 22), with implied censure of a factious spirit. Specially noteworthy is its application to "divisions" due, not to matters of opinion, but to breaches of the law of love (Rom. xvi. 17; Gal. v. 20; 1 Cor. i. 10; iii. 3, 4; xi. 19). In one of the latest books of the N.T. the word is used of doctrinal errors and their advocates (2 Peter ii. 1, and Jude, 4, "false teachers," "sects of perdition"). In general, the apostolic writings show a vehement antagonism towards all teaching opposed to the gospel, whether the word "heresy" is used or not. This is explained by the character of the teachings or movements so attacked. They involved such a blending of the gospel with Jewish and Pagan elements as would have destroyed everything distinctive of it. Before illustrating the theological and ecclesiastical use of the word heresy in the history of Christianity, we must briefly examine its more general significance.

Heresy in Science.—It is evident that the normal conduct of human relations implies a general similarity in the constitution of the human mind, and demands some common ground of belief or (in this sense) an "orthodoxy." Within certain wide limits, all education presupposes the necessity of furnishing to mankind some common measure for the interpretation of the facts of life. Each generation hands on to its successor a common body of knowledge and belief about the facts of the past and the present. The acceptance of a large body of "orthodoxy"—that is, of beliefs commonly held as a basis of thought and conduct—is essential to the effective and coherent action of any organized society. Heresy as to the multiplication table is not allowed. In the life of the average man, the mental forces which are his own in the sense of originality or dissent or deviation from the norm are extremely small in their extent as compared with those due to education, sympathy, imitation and similar social influences. Even in science, the discovering mind has and must have a background or basis of knowledge and belief accepted without analysis or criticism. Science has its orthodoxy as well as religion. There are things which a scientific man may not believe, and other things which he may not disbelieve without treason to the brotherhood of his craft.

From this point of view a "heresy" may be compared to a "paradox," in the sense of a proposition contrary to the body of belief on a given subject held in a particular country or a particular age, or even by most men, always and everywhere. And this fact serves to call attention to the other side of the case which we have stated. Such a proposition is not necessarily false because of its paradoxical or heretical character. Many times in the history of human thought a belief once heretical has become a universally accepted truth, "sometimes a paradox, but now the time gives it proof" (*Hamlet*, iii. i. 115): so Hobbes described a paradox as "an opinion not yet generally received" (*English Works*, edit. Molesworth, v. 304). In every age of the world there have been established systems opposed from time to time by isolated and dissentient reformers (*cf.* De Morgan, *Budget of Paradoxes*, 1872, p. 4, *sqq.*). Such an established system has sometimes fallen slowly and gradually, upset by the rising influence of some one man or undermined by gradual change of opinion in the many. It must be admitted that an opinion being "generally received" implies a preoccupation of the ground which must hold good until sufficient reason is adduced against it. To this extent there is a presumption against anything "heretical"; the burden of proof lies with him who maintains it. Nevertheless, the history of science is partly the history of paradoxes becoming commonplaces and heresies becoming orthodoxies, *e.g.*, the motion of the earth, the possibility of the antipodes, the pressure

of the atmosphere (as against the dogma "Nature abhors a vacuum"), the circulation of the blood, the facts of hypnotism, the electrical phenomena produced by Galvani's experiments—to mention only a few of the cases now utterly beyond the reach of controversy. Contemporary science is enlarging indefinitely its conception of natural possibility; and hitherto unknown and unsuspected facts have emerged in regions of enquiry which might have been supposed exhaustively explored, *e.g.*, the constituent gases of the atmosphere. "Such experiences indicate the need of a spirit of caution in those who may be tempted to condemn avenues of scientific enquiry as bound in advance to be unfruitful. Yet it does not follow that the march of science is impeded by such premature judgments. Rather they may be regarded as sheep-dogs, which keep the scientific flock together in its progress to those fields of thought which for the moment offer the richest pasture" (H. A. L. Fisher, *Orthodoxy*, p. 37, 1922).

Heresy in Religion.—In the history of religion, and above all in the history of Christianity, "heresy" implies "orthodoxy." It is beyond dispute that the system of dogma, the essentials of which are formulated in the Apostles', Nicene, and Athanasian creeds, emerged gradually in a development which can be historically traced (*see* the standard *Histories of Dogma*, especially Seeberg, Harnack and Loofs). This developing orthodoxy forms the *main stream* in the history of Christian thought; and the various heresies which emerged during the first four centuries were dealt with as "heresies" because in every case they endeavoured to open up a more or less dangerous divergence from the main stream. The significance of heresy reached its height when the Church was regarded as the divinely ordained depository of saving truth (*cf.* Cyprian, *De Unitate Ecclesiae*, sec. 3; Augustine, *Epistle* 185, and many other passages). The simple primitive creed which can be traced in the N.T.—"Jesus Christ is Lord (κύριος)"—was found insufficient as the movement spread; and even before systematic theology (with the aid of contemporary philosophic speculation) began to take shape, a "Rule of Faith" established itself, bringing together those elements (στοιχεῖα) of Christian faith which were accounted essential. The Rule of Faith (κῆρυγμα ἀποστολικόν, or παράδοσις ἀποστολική) was not directly derived from the Scriptures, but was from the apostolic tradition current in the congregations which looked to apostles as their founders. Growing at first by oral tradition, it afterwards appeared in written forms, varying in statement rather than substance, and can be traced in the early fathers (*cf.* A. E. Burn, *Introduction to the Creeds*, 1899, and *The Apostles' Creed*, 1912). The final form of this early Rule of Faith is found in what is now known as the Apostles' Creed. The acceptance of the Rule of Faith explains the ancient conception of heresy. Every serious departure from this Rule was attacked as heresy, with much argument and often with much abuse (*cf.* Bethune-Baker, *Introduction to the Early History of Christian Doctrine*, 1903, pp. 2, *seq.*). The heretical movements emerging in the 1st and 2nd centuries constituted a serious danger to the Christian movement. If the main stream had been diverted into any one of these channels, it would have lost itself and historical Christianity (so far as we can see) would have disappeared. In the 1st century the Jewish-Christian tendency formed such a channel. The primitive Christian communities in Palestine were Jewish Christians because they had not realized the universal character of the gospel. The historic Jewish Christian tendency was left behind and survived for a period in the form of heretical sects (*see* EBIONITES). In the 2nd century another channel, deeper and more dangerous, was opened up by the Gnostic schools (*see* GNOSTICISM; MARCION AND THE MARCION CHURCHES; DOCETISM). The controversy with the Gnostics largely created the Rule of Faith. The appeal to Scripture was not sufficient (apart from the fact that the N.T. Canon was only in process of formation); because the heretics had their own methods of interpreting Scripture. Hence the fathers stepped back from the written word to tradition. Another group of important heretical movements arose within the Church itself in the same century. Some theologians (especially in Rome) found insuperable difficulties in the current trinitarian terminology and

were led to surrender either one or the other of the two factors which the leaders of the Church were determined to hold together—the *human* and the *divine* in Christ (see ADOPTIANISM; MON-ARCHIANISM). And at the end of the century we find an enthusiastic reaction against the Church as an organized institution, with authoritative doctrine, ritual and officials appearing to enter into alliance with the world (see MONTANISM). A kindred movement afterwards appeared in the time of Augustine in a different form (see DONATISM).

The influence of these controversies continued in the 3rd century, when new divergent tendencies emerged. A revised Adoptianism, embodied in a more elaborate theology, was taught by Paul of Samosata and by Lucian at Antioch (see PAULICIANS). It spread widely and Arius was influenced by it. During the latter part of the 3rd and part of the 4th century, the movement said to have been founded by Mani, the Mesopotamian (see MANICHAISM), at first sight looking like a revived Gnosticism, invaded the Church; Augustine adopted it for a time, and its influence is probably found in some of the enthusiastic movements characteristic of the early mediaeval period (see below). Manichaeism, however, was not a serious danger to the Church; and the controversies characteristic of the 4th century were those arising from the Adoptianist Christology as it spread in the East through Paul of Samosata and through Origen's doctrine of the subordination of Christ to the Father (see ORIGEN). The doctrinal struggle came to a head in the contest between the followers of Arius and their opponents, afterwards led by Athanasius, at the Council of Nicaea in 325 (see ARIUS; ATHANASIUS). Arianism became a heresy, but it found defenders down to modern times. The Nicene Council is a turning-point in the history of heresy. The earlier heresies (as indicated above) threatened to mingle with the gospel Jewish or pagan elements fatal to its essence; while many of the later heresies were differences in the interpretation of Christian truth which did not in the same way threaten the essence of Christianity. No vital interest of Christian truth justified the extravagant denunciations in which theological partisanship so recklessly and ruthlessly indulged. Again, in the ante-Nicene period only ecclesiastical penalties, such as reproof, deposition or excommunication, could be imposed; but in the post-Nicene the union of Church and State transformed theological error into legal offence. This greatly embittered the Christological controversies which sprang from the Council of Nicaea (see NESTORIANS; MONOPHYSITES; MONOTHELITES). From the end of the 4th century the emperors accepted the view that they were bound to use their secular power against heretics for the maintenance of orthodox doctrine.

The heresies of the middle ages were not matters of doctrine merely (however important), but were symptoms of spiritual movements, common to people of many lands, and in one way or another threatening the foundations of the Roman Catholic system (see ALBIGENSES; BOGOMILS; CATHARS; WALDENSES). Such movements led to active ecclesiastical legislation against heresy; and several councils in the 12th and 13th centuries declared that the secular arm was bound to punish heretics. But it was maintained that heretics must in the first instance be brought before ecclesiastical courts, and this led to the erection of special Church courts with a procedure of their own (see INQUISITION). In evangelical Protestantism the older attitude survived in some of the earlier Protestant constitutions, where heresy is regarded as a crime punishable by the State. Logically, evangelical Protestantism, which declines to force the consciences of its members and appeals only to Scripture for the confirmation of its doctrines, can only denounce erroneous doctrine as erroneous, and deal with them by persuasion and argument; although this consideration does not prevent or invalidate disciplinary action in reference to ministers or lay members who defy the official standards of the organized Church to which they claim to belong.

HEREWARD, styled "THE WAKE" (an addition of later days), an Englishman famous for his resistance to William the Conqueror. An account of his possessions given in the Domesday book proves that he was a tenant of Peterborough abbey, from which he held lands at Witham-on-the-Hill and Barholme-with-Stow in the south-west of Lincolnshire, and of Crowland abbey at Rippingale in the neighbouring fenland. In 1070 he joined the Danes, with whom William had signed a treaty allowing them to pass the winter in England, in an attack on Peterborough abbey (June 2) which they sacked. Driven back by Turolf, they retired to Ely, which Hereward and his company of outlaws appear to have held, in spite of the desertion of the Danes, until the next year. He was joined there by Morkere and Siward Barn, and Ely became so notorious as a refuge for rebels that the king was forced to organise an attack on it from Cambridge. The outlaws were overcome by the superior strength of the king's force, and most of them, including Morkere, surrendered. Hereward escaped through the marshes with a few of his men. The references to Hereward in the chronicles, where the only authentic information about his life appears, end with this incident, but according to popular legend he lived to carry out further attacks on the Normans, but finally obtained a pardon from William.

See E. A. Freeman, "The Legend of Hereward" in *History of the Norman Conquest*, vol. iv.; J. H. Round, *Feudal England*; H. W. C. Davies, *England under the Normans and Angevins*; and C. Kingsley's romance *Hereward the Wake*.

HERFORD, a town in the Prussian province of Westphalia, situated at the confluence of the Werre and Aa, on the Minden and Cologne railway, 9 m. N.E. of Bielefeld, and at the junction of the railway to Detmold. Pop. (1925) 36,106. It owes its origin to a Benedictine nunnery, said to have been founded in 832, and confirmed by the emperor Louis the Pious in 839. From the emperor Frederick I. the abbess obtained princely rank and a seat in the imperial diet. The foundation was secularized in 1803. Herford was a member of the Hanseatic League, and in 1631 it became a free imperial town, but in 1647 it was subjugated by the elector of Brandenburg. It came into the possession of Westphalia in 1807, and in 1813 into that of Prussia.

Herford possesses a gymnasium founded in 1540, while its churches include the Münsterkirche, a Romanesque building with a Gothic apse of the 15th century and the Marienkirche, in the Gothic style. The industries include cotton and flax-spinning, and the manufacture of linen cloth, carpets, furniture, machinery, sugar, chocolate, tobacco and margarine.

HERGENRÖTHER, JOSEPH VON (1824–1890), German Catholic theologian, was born at Würzburg, Bavaria, on Sept. 15, 1824. He studied at Würzburg, at Rome, and at Munich where he became instructor in theology. In 1852 he was recalled to Würzburg as professor of ecclesiastical law and history. He was one of the most learned theologians on the Ultramontane side of the Infallibility question, and in 1868 was sent to Rome to arrange the proceedings of the Vatican Council. In 1870 he wrote *Antijanus*, an answer to *The Pope and the Council*, by "Janus" (Döllinger and J. Friedrich), which made a great sensation at the time. In 1877 he was made prelate of the papal household, in 1879 cardinal deacon, and afterwards curator of the Vatican archives. He died in Rome on Oct. 3, 1890. His works include *Photius, Patriarch von Constantinopel. Sein Leben, seine Schriften und das griechische Schisma* (3 vols., Regensburg, 1867–69) and an additional volume (1869) *Monumenta Graeca ad Photium . . . pertinentia*.

HERGESHEIMER, JOSEPH (1880–), American author, was born at Philadelphia, Pennsylvania, U.S.A., Feb. 15, 1880, and was educated at a Quaker school there and at the Pennsylvania Academy of Fine Arts. As a writer of fiction he is distinguished by the warmth and colour of his descriptive passages and by his psychological insight.

His publications include: *The Lay Anihony* (1914); *Mountain Blood* (1915); *The Three Black Pennys* (1917); *Gold and Iron* (1918); *Java Head* (1919); *Linda Condon* (1919); *San Cristóbal de la Habana* (1920); *Cytherea* (1922); *The Bright Shawl* (1922); *Balisand* (1924); *Tampico* (1926); and *Quiet Cities* (1928).

HERING, EWALD (1834–1918), German physiologist and psychologist, was born at Alt-Gersdorf, Saxony, on Aug. 5, 1834. He practised medicine in Leipzig, where in 1862 he became lecturer in physiology at the university. He was professor of physiology at the medico-surgical Josephs-Akademie in Vienna (1865–70); at Prague (1870–95) and then again at Leipzig. Hering's chief work was in physiological optics and more especially the perception of colour. He gave the four-colour theory authoritative form by making it a theory of antagonistic colour-pairs (black and white, blue and yellow, red and green); and formulated the logical conclusion of the principle of the nativistic theory of the visual perception of space against the "empiristic" doctrine of Helmholtz.

His chief works are: *Beiträge zur Physiologie* (1861); *Über das Gedächtnis als eine allgemeine Funktion der organisierten Materie* (1870, 4th ed., 1913; Eng. trans. 1897); *Grundzüge einer Theorie des Temperatursinnes* (1877); *Zur Lehre vom Lichtsinne* (1878); *Temperatursinn* (1880); *Zur Theorie der Nerventhätigkeit* (1899); *Grundzüge der Lehre vom Lichtsinn* (1905–11). See O. Klemm, *A History of Psychology* (1914); F. Hillebrand, *E. Hering* (1918); G. S. Brett, *A History of Psychology* (vol. 3, 1921).

HERINGSdorf, a popular seaside resort in the Prussian province of Pomerania, on the north coast of the island of Usedom, 5 m. by rail N.W. of Swinemünde. It is surrounded by beech woods. Pop. (1925) 2,022.

HERINGTON, a city of Dickinson county, Kan., U.S.A., 75 m. S.W. of Topeka, on Federal highways 50N and 77, and served by the Missouri Pacific and the Rock Island railways. The population in 1927 (local census) was 5,100. The city was settled about 1885 and incorporated in 1887.

HERIOT, GEORGE (1563–1624), the founder of Heriot's hospital, Edinburgh, was descended from an old Haddington family; his father, a goldsmith in Edinburgh, represented the city in the Scottish parliament. In 1597 George Heriot became goldsmith (and money-lender) to Anne of Denmark, consort of James VI. In 1601 he became jeweller to the king, and followed him to London, occupying a shop opposite the Exchange. He died in London on Feb. 10, 1624. The surplus of his estate was bequeathed to found a hospital for the education of freemen's sons of the town of Edinburgh; the increment of this bequest supplied funds for the erection of several Heriot foundation schools in different parts of the city.

HERIOT, originally the arms and equipment (*O. E. gearwa*) of a soldier or army (*here*). The lord of a fee provided his tenant with arms and a horse, either as a gift or loan, which he was to use in the military service paid by him. On the death of the tenant the lord claimed the return of the equipment. When by the 10th century land was being given instead of arms, the heriot was still paid, but more in the nature of a "relief" (*q.v.*). By the 13th century the payment was made either in money or in kind by the handing over of the best beast or of the best other chattel of the tenant (see Pollock and Maitland, *History of English Law*). For the manorial law relating to heriots, see **COPYHOLD**.

HERISAU, the largest town in the Swiss canton of Appenzell, built on the Glatt torrent, and by rail 7 m. S.W. of St. Gall or 13½ m. N.W. of Appenzell. Pop. (1920) 15,015. The lower portion of the tower of the parish church dates from the 11th century or even earlier. About 5 m. to the south-east is Hundwil, where the *Landsgemeinde* of Ausser Rhoden meets in the odd years (in other years at Trogen) on the last Sunday in April. Some of the finest embroideries are manufactured in Herisau.

HERITABLE JURISDICTIONS, in the law of Scotland, grants of jurisdiction made to a man and his heirs. They included civil and criminal jurisdictions, and were a usual accompaniment of feudal tenures. The power which they conferred on great families was recognized as a source of danger to the State, and led to frequent attempts being made by statute to restrict them, both before and after the Union. They were abolished in 1746, in consequence of the rising of '45.

HERKIMER, NICHOLAS (c. 1728–1777), American Revolutionary soldier, was born near Fort Herkimer, N. Y., probably about 1728. He was the son of Johan Host Herkimer who came to America from the Palatinate about 1725. Nicholas was commissioned lieutenant of militia under provincial authority in 1758, and was made brigadier general of the Tryon county militia, N.Y., in 1776. In 1777 he marched to relieve Col. Peter Gansevoort at Ft. Stanwix who was besieged by Gen. St. Leger of the British forces. Herkimer was ambushed at Oriskany, but fought so well that the British were forced to fall back into Canada. Herkimer was mortally wounded and died Aug. 17, 1777.

See *Dedication of the Oriskany Monument* by the Oneida Historical Society (1884); Eugene W. Lyttle, "Nicholas Herkimer," *Proc. of N.Y. State Hist. Assoc.* (1904).

HERKIMER, a village of New York, on the Mohawk river, 15 m. S.E. of Utica; the county seat of Herkimer county. It is served by the New York Central railroad. The population was 10,450 in 1920 (22.8% foreign-born white) and was estimated locally at 12,000 in 1928. It is the trade centre of a rich dairying region, and has important manufactures, especially of office furniture and equipment, with an output in 1925 valued at \$5,726,713. The village was named after Gen. Nicholas Herkimer, who was mortally wounded at the battle of Oriskany (Aug. 6, 1777). It was founded about 1725 by Palatine Germans, who bought a large tract from the Mohawk Indians and established several settlements, known as the German Flats. In 1756 a stone house built in 1740 by John Jost Herkimer (father of the general and one of the original colonists), a stone church and other buildings, were fortified by Sir William Johnson.

HERKOMER, SIR HUBERT VON (1849–1914), British painter, was born at Waal, in Bavaria on May 26, 1849, and eight years later was brought to England by his father, a wood-carver of great ability. He lived for some time at Southampton and in the school of art there began his art training; in 1866 he entered upon a course of study at the South Kensington Schools, and in 1869 exhibited for the first time at the Royal Academy. By his picture, "The Last Muster," at the Academy in 1875, he established his position as an artist of high distinction. He was elected A.R.A. in 1879, and R.A. in 1890; an associate of the Royal Society of Painters in Water Colours in 1893, and a full member in 1894; and in 1885 he was appointed Slade professor at Oxford. He achieved marked success as a worker in enamel, as an etcher, mezzotint engraver and illustrative draughtsman; and he exercised wide influence upon art education by means of the Herkomer School (Incorporated), at Bushey, which he founded in 1883 and directed gratuitously until 1904, when he retired. Three of his pictures, "Found" (1885), "The Chapel of the Charterhouse" (1889) and "The Council of the Royal Academy, 1907" are in the National Gallery of British Art. In the year 1907 he received the honorary degree of D.C.L. at Oxford, and a knighthood was conferred upon him by the king in addition to the commandership of the Royal Victorian Order. He died at Budleigh Salterton on March 31, 1914.

See A. L. Baldry, *Hubert von Herkomer, R.A.* (1901); W. L. Courtney, *Professor Hubert Herkomer, Royal Academician, His Life and Work* (1892); J. Saxon Mills, *Life and Letters of Sir H. Herkomer* (1923); and his autobiographical writings: *My School and My Gospel* (1908), and *The Herkomers* (1910).

HERLIN (or HERLEN), FRIEDRICH, of Nördlingen, German artist, the most distinguished member of a family of painters of the Swabian school, in the 15th century. His name occurs in the archives of Nördlingen from 1461 until his death in 1491. In 1467 he was made citizen and town painter at Nördlingen, "because of his acquaintance with Flemish methods of painting." One of the first of his acknowledged productions is a shrine on one of the altars of the church of Rothenburg on the Tauber, the wings of which were finished in 1466, with seven scenes from the lives of Christ and the Virgin Mary. In the town-hall of Rothenburg is a Madonna and St. Catherine of 1467. In the church of Bopfingen portions of an altarpiece of 1472 representing the "Nativity" and the "Adoration of the Magi" and "Scenes from the life of St. Blasius"; and in the town hall of Nördlingen a triptych of 1488, representing the "Nativity" and

"Christ amidst the Doctors," at the side of a votive Madonna attended by St. Luke and St. Margaret as patrons of the painter's family. In each of these works the painter's name certifies the picture, and the manner is that of a pupil of van der Weyden. Herlin's epitaph, preserved by Rathgeber, states that he died on Oct. 12, 1491, and was buried at Nördlingen.

See F. Haack, *Friedrich Herlin* (1900); G. Burckhardt, *Herlin Forschungen* (1911).

HERMAE, properly the plural of the name Hermes (*q.v.*). The adoration of *baetyli* (*q.v.*) was and continued to be a fairly common feature of Greek cult, particularly in the more backward districts, such as Laconia, where, for instance, a meteoric stone received worship as *Zeus Kappotas* (Zeus the Descender, *i.e.*, Thunderbolt; see *Pausanias*, III., 22, 1.). Not dissimilar objects were the posts, pillars or heaps of rough stones set up along roads or to mark boundaries. These, like the Latin *Terminus* (*q.v.*), were sacred things, and connected with the cult of Hermes; indeed, some go so far as to derive his name from *ερμα* (stone, rock, piece of ballast; so Preller, and, more recently, Nilsson and Miss J. E. Harrison). With the development of artistic taste and the conception of the gods as having human form (anthropomorphism), these somewhat unsightly objects tended to be replaced, often by statues, frequently also by pillars, generally square and tapering towards the bottom, so as to suggest the human figure. These were surmounted by a head, usually that of Hermes (hence the name), and had a phallus in front, half-way up. They were used, not only as cult-objects, but for all manner of purposes, as mile-stones (see pseudo-Plato, *Hipparchus*, 228 D *et seq.*), boundary-marks, and so forth. But that most if not all of them were regarded with respect, if not actually worshipped, is clear from the famous mutilation of the *Hermae*. Just before the ill-fated expedition to Sicily sailed from Athens (415 B.C.), "all the stone *Hermae* in the city of Athens . . . or most of them, had their faces smashed" (*τερικρότησαν τὰ πρόσωπα*, Thucydides vi., 27, 1). The whole city was in an uproar of superstitious panic at this impiety, and numerous trials for sacrilege resulted.

Hermes are not infrequent in Roman sculpture, for example with heads of Silvanus or Iuppiter *Terminus*. In later times, all manner of fanciful *herms* were made and used as ornaments; these are commonly known by compound names, as *Hermathena* (Cicero, *ad Att.* I. 1, 5), *Hermanubis*, and the like; but it is not clear whether this means a *herm* with the head of Athena, Anubis, etc., instead of that of Hermes, or a double *herm* having the heads of both deities, Janus-fashion. Certainly both types existed, and the heads were by no means always those of gods.

See the classical dictionaries, and especially P. Paris in *Daremberg-Saglio* (*s.v.*). For the mutilation of the *Hermae*, see the histories of Greece; for stone-heaps, J. G. Frazer, *Golden Bough*, (3rd ed.), ix. chap. 1.

HERMAGORAS, of Temnos, Greek rhetorician of the Rhodian school and teacher of oratory in Rome, flourished during the first half of the 1st century B.C. He founded a special school, the members of which called themselves *Hermagorei*. His chief opponent was Poseidonius of Rhodes (Plutarch, *Pompey* 42). According to Suidas and Strabo, he was the author of rhetorical manuals and of other works, which should perhaps be attributed to his younger namesake, surnamed Carion, the pupil of Theodorus of Gadara.

See Strabo xiii. p. 621; Cicero, *De inventione*, i. 6, 8; Brutus, 76, 263; 78, 271; Quintilian, *Instit.* iii. 1. 16, 3, 9, 11, 22; C. W. Piderit, *De Hermagora rhetore* (1839); G. Thiele, *Hermagoras: Ein Beitrag zur Geschichte der Rhetorik* (1893).

HERMANDAD, a Castilian word meaning, strictly speaking, a brotherhood. In the Romance language spoken on the east coast of Spain in Catalonia it is written *germandat* or *germania* (Lat. *germanus*, full brother). In the form *germania* it has acquired the significance of "thieves' Latin" or "thieves' cant," and is applied to any jargon supposed to be understood only by the initiated. But the typical "*germania*" is a mixture of slang and of the gipsy language. The *hermandades* have played a conspicuous part in the history of Spain. The first recorded case of the formation of an *hermandad* occurred in the

12th century when the towns and the peasantry of the north united to police the pilgrim road to Santiago in Galicia, and protect the pilgrims against robber knights. Throughout the middle ages such alliances were frequently formed by combinations of towns to protect the roads connecting them, and were occasionally extended to political purposes. They acted to some extent like the *Fehm* courts of Germany. The Catholic sovereigns, Ferdinand and Isabella, adapted an existing *hermandad* to the purpose of a general police acting under officials appointed by themselves, and endowed with large powers of summary jurisdiction even in capital cases. In Catalonia and Valencia the "*germanias*" were combinations of the peasantry to resist the exactions of the feudal lords.

HERMAN DE VALENCIENNES, 12th-century French poet, was born at Valenciennes, of good parentage. He became a priest and wrote the *Histoire de la Bible*, which includes a separate poem on the Assumption of the Virgin. The work is generally known as *Le Roman de sapience*, the name arising from a copyist's error in the first line of the poem:

"Comens de sapiense, ce est la cremors de Deu"

the first word being miswritten in one ms. *Romans*, and in another *Romanz*. Indeed, the work has the form of an ordinary romance, and cannot be regarded as a translation. He selects Biblical stories to suit his purpose, and adds freely from legendary sources, displaying considerable art in the use of his materials. This scriptural poem, very popular in its day, mentions Henry II. of England as already dead, and must therefore be posterior to 1189.

See *Notices et extraits des manuscrits* (vol. 34), and J. Bonnard, *Les Traductions de la Bible en vers français au moyen âge* (1884).

HERMANN I. (d. 1217), landgrave of Thuringia and count palatine of Saxony, was the second son of Louis II. the Hard, landgrave of Thuringia, and Judith of Hohenstaufen, sister of the emperor Frederick I. About 1180 he received from his brother Louis the Saxon palatinate, and married Sophia, sister of a former count palatine. In 1190 Louis died and Hermann frustrated the attempt of the emperor Henry VI. to seize Thuringia as a vacant fief of the Empire, and established himself as landgrave. In 1197 he went on crusade. When Henry VI. died in 1198 Hermann's support was purchased by the late emperor's brother Philip, duke of Swabia, but as soon as Philip's cause appeared to be weakening he transferred his allegiance to Otto of Brunswick, afterwards the emperor Otto IV. Philip accordingly invaded Thuringia in 1204 and compelled Hermann to come to terms by which he surrendered the lands he had obtained in 1198. After the death of Philip and the recognition of Otto he was among the princes who invited Frederick of Hohenstaufen, afterwards the emperor Frederick II., to come to Germany and assume the crown. The Saxons consequently attacked Thuringia, but the landgrave was saved by Frederick's arrival in Germany in 1212. After the death of his first wife in 1195 Hermann married Sophia, daughter of Otto I., duke of Bavaria. By her he had four sons, two of whom, Louis and Henry Raspe, succeeded their father in turn as landgrave. Hermann died at Gotha on April 25, 1217. Walther von der Vogelweide and other Minnesingers were welcomed to his castle, and Hermann figures in story and in opera as the promoter of the famous singing contest at the Wartburg.

See E. Winkelmann, *Philipp von Schwaben und Otto IV. von Braunschweig* (Leipzig, 1873-78); T. Knochenhauer, *Geschichte Thüringens* (Gotha, 1871); and F. Wachter, *Thüringische und obersächsische Geschichte* (Leipzig, 1826).

HERMANN, JOHANN GOTTFRIED JAKOB (1772-1848), German classical scholar and philologist, was born at Leipzig on Nov. 28, 1772. He studied at Leipzig university, and spent his life there as lecturer and professor, dying on Dec. 31, 1848. As leader of the school that held linguistic studies to be the sole aim of philology, he was opposed by A. Böckh and Otfried Müller, the representatives of the historico-antiquarian school, which regarded Hermann's view of philology as inadequate and one-sided.

His early work was done in grammar and metre, his most important books being *Elementa doctrinae metricae* (1816) and

De emendanda ratione Graecae grammaticae (1801).

See monographs by O. Jahn (1849) and H. Köchly (1874); C. Bursian, *Geschichte der klassischen Philologie in Deutschland* (1883); art. in *Allgem. deutsche Biog.*; Sandys, *Hist. Class. Schol.* (1908) iii.

HERMANN, KARL FRIEDRICH (1804-1855), German classical scholar and antiquary, was born on Aug. 4, 1804, at Frankfurt-on-Main, and died at Göttingen on Dec. 31, 1855, having been professor at Marburg and Göttingen, where he succeeded Müller. He was chiefly distinguished for his works on Greek antiquities and ancient philosophy. Among these may be mentioned the *Lehrbuch der griechischen Antiquitäten* (new ed., 1889); and *Culturgeschichte der Griechen und Römer* (1857-58), published after his death by C. G. Schmidt.

See M. Lechner, *Zur Erinnerung an K. F. Hermann* (1864), and article by C. Halm in *Allgemeine deutsche Biographie*, xii. (1880).

HERMANN OF REICHENAU (HERIMANNUS AUGIENSIS), commonly distinguished as Hermannus Contractus, i.e., the Lame (1013-1054), German scholar and chronicler, was the son of Count Wolferad of Alshausen, Swabia. Hermann became a monk of the famous abbey of Reichenau and exercised a great personal and intellectual influence on the scholars that gathered round him. He died on Sept. 24, 1054, at the family castle. Besides the ordinary monastic studies, he devoted himself to mathematics, astronomy and music, and constructed watches and various instruments.

His chief work is a *Chronicon ad annum 1054* (continued down to 1066 by his pupil Bertold) which furnishes important original material for the history of the emperor Henry III. The first edition, from a MS. no longer extant, was printed by J. Sichard at Basel in 1529. A critical edition is given in Pertz's *Monumenta Germaniae historica* (vol. v.), and a German translation by K. F. A. Nobbe in *Die Geschichtsschreiber der deutschen Vorzeit* (2nd ed., Leipzig, 1893). The separate lives of Conrad II. and Henry III., often ascribed to Hermann, appear to have perished. His *De mensura astrolabii* and *De utilitatibus astrolabii* (to be found, on the authority of Salzburg MSS., in Pez, *Thesaurus anecdotorum novissimus*, iii.) being the first important European contributions to this subject, Hermann was for a time considered the inventor of the astrolabe. A didactic poem by him, *De octo vitiis principalibus*, is printed in Haupt's *Zeitschrift für deutsches Alterthum* (vol. xiii.); and he is sometimes credited with the composition of the Latin hymns *Veni Sancte Spiritus*, *Salve Regina*, and *Alma Redemptoris*. A *martyrologium* by Hermann, discovered by E. Dümmler in a MS. at Stuttgart, was published by him in "Das Martyrologium Notkers und seine Verwandten" in *Forschungen zur deutschen Geschichte*, xxv. (Göttingen, 1885).

See H. Hansjakob, *Herimann der Lahme* (Mainz, 1875); Potthast, *Bibliotheca med. aev.*; and J. R. Dieterich, *Die Geschichtsschreibung der Abtei Reichenau* (1926).

HERMANN OF WIED (1477-1552), elector and archbishop of Cologne, was the fourth son of Frederick, count of Wied (d. 1487), and was born on Jan. 14, 1477. He became elector and archbishop of Cologne in 1515. With the aid of his friend John Gropper (1503-1559), he began, about 1536, to institute certain reforms in his own diocese. One step led to another, and as all efforts at union failed the elector invited Martin Bucer to Cologne in 1542. Supported by the estates of the electorate, and relying upon the recess of the diet of Regensburg in 1541, he encouraged Bucer to press on with the work of reform, and in 1543 invited Melancthon to his assistance. Summoned both before the emperor and the pope, the elector was deposed and excommunicated by Paul III. in 1546. He resigned his office in 1547, and retired to Wied. Hermann, who was also a bishop of Paderborn from 1532 to 1547, died on Aug. 15, 1552.

See C. Varrentrapp, *Hermann von Wied* (Leipzig, 1878).

HERMANT, ABEL (1862-), French author and dramatist, was born in Paris on Feb. 3, 1862. A brilliant wit and an exquisite stylist, he consistently devoted his abundant talents to describing the lighter side of life. His most characteristic works are those grouped under the general title, *Mémoires pour servir à l'histoire de la société* (1905), in which with unfaltering gaiety and a humour saved only by the delicacy of its expression from appearing scabrous, he mocks the aristocracy and wealthy bourgeoisie of France. He excels, too, in long series of amusing dialogues. *Le Caravansérail* (1917), a study of rich foreigners plunged into the cosmopolitan circles of Paris, is perhaps his best-known work, but the series of *Scènes de la vie des cours et des*

ambassades, which includes *La carrière* (1894) and *Le sceptre* (1900), no less pungently portrays the complications of diplomacy in a dignified central European court. Among his plays may be noted *La meute* (1896), a comedy of parasites, and *Sylvie, ou la curieuse d'amour* (1900), which with infinite grace displays the reactions of a light-headed woman to the successive phases of revolutionary and imperial France. A more ambitious work is the long novel, *Le cycle de lord Chelsea*, 4 vols. (1923). See Peltier, *Abel Hermant* (1924).

HERMAPHRODITE is the term used to describe an individual which elaborates both male and female germ-cells, synchronously or at different times. Non-functional hermaphroditism (the condition in which, though both male and female germ-cells are elaborated transiently or permanently, only one kind is functional), exists in three forms. In accessory hermaphroditism there is in addition to the testis a rudimentary ovary which, however, does not produce ova, e.g., Bidder's organ in the male toad, and the ovary in the male of the stone-fly *Perla marginata*. In accidental hermaphroditism ova occur sporadically in the testis and spermatid tissues in the ovary. The condition is not uncommon among the Crustacea: it is of importance in that it shows that a primordial germ-cell can, under different circumstances, develop into a spermatozoon or into an ovum. In teratological hermaphroditism, commonly encountered in birds and mammals, the reproductive system consists of an intimate mixture of male and female structures. Its nature is as yet not understood.

Functional hermaphroditism, the condition in which both male and female gametes are produced by one and the same individual, both kinds being functional, also exists in three forms. In unisexual monoecism a genetic female (or male) develops at certain times spermatozoa in the ovary (or ova in the testis), and the individual previously functioning as a female (male) now functions as a male (female), e.g., *Angiostomum nigrovenosum* and other nematodes and probably the hermaphrodite molluscs. In other words, one sex has become hermaphroditic. Gynomoecism, in which the female temporarily produces sperm, is more common than andromonoecism. In consecutive monoecism every individual is first a male and then a female (or less commonly, first a female and then a male). Genetically the organisms are either males or neutrals. The condition is associated with parasitism and sedentary modes of life, e.g., *Danalia*, one of the Liriopsidae, which is parasitic on a parasitic Rhizocephalan Crustacean. In spatial monoecism both male and female reproductive organs are present and the condition is a real functional hermaphroditism, e.g. certain Oligochaetes, Cestoda, Trematoda. The genetic basis of the condition is unknown. (See SEX; also MONSTER.)

BIBLIOGRAPHY.—T. H. Morgan, *Heredity and Sex* (1914); R. Goldschmidt, *The Physiology and Mechanism of Sex-determination* (1923); and F. A. E. Crew, *The Genetics of Sexuality in Animals* (1927).

(F. A. E. C.)

HERMAPHRODITUS, in Greek mythology a being, partly male, partly female, of little importance in cult (first named in Theophrastus, *Charact.* 28 [16]); the Superstitious Man garlands the *Hermaphroditi* (see Jebb-Sandys l.c.). The conception undoubtedly had its origin in the East, where deities of a similar dual nature frequently occur. Within the Greek area, it is found in Cyprus. Here, according to Macrobius (*Saturnalia*, iii. 8,2) there was a bearded statue of a male Aphrodite, called *Aphroditos* by Aristophanes. The legend is a product of the Hellenistic period. In accordance with this, Hermaphroditus is the son of Hermes and Aphrodite, of whom the nymph of the fountain of Salmacis in Caria became enamoured. When he bathed in her fountain, she entreated the gods that she might be forever united with him. The result was the formation of a being half man, half woman. This story is told by Ovid (*Metam.* iv. 285 *et seq.*) to explain the peculiarly enervating qualities of the water of the fountain. Hermaphroditus was a favourite subject in later Greek art.

See articles in Daremberg and Saglio, *Dictionnaire des antiquités*, and Roscher's *Lexikon der Mythologie*; and for art, A. Baumeister, *Denkmäler des klassischen Altertums* (1884-88).

HERMAS, SHEPHERD OF, one of the works representing the Apostolic Fathers (*q.v.*), a hortatory writing which "holds the mirror up" to the Church in Rome during the 3rd Christian generation. This is the period indicated by the evidence of the Muratorian Canon, which assigns it to the brother of Pius, Roman bishop c. 139-154. Probably it was not the fruit of a single effort of its author. Rather its contents came to him piecemeal and at various stages in his ministry as a Christian "prophet," extending over a period of years.

In its present form it falls under three heads: *Visions, Mandates, Similitudes*. These titles are somewhat misleading. In the four "Visions" the author appears to be transforming his personal religious history into a type (as Bunyan did in the *Pilgrim's Progress*). He is deeply impressed by the sad state of religion among professing Christians in Rome, and the "Visions" set forth his personal call to a mission of repentance and the awakened conscience. But before Hermas announces his message to the Roman Church, and thence to the churches abroad, there are added two *Visions* (iii. iv.) tending to heighten its impressiveness. He is shown the "holy church" under the similitude of a tower in building, and the great and final tribulation under that of a devouring beast, which yet is innocuous to undoubting faith.

The personal revelation given in the "Visions" is then elaborated in a fresh series of revelations through an angel in the guise of a Shepherd, who in a preliminary interview announces himself as the Angel of Repentance, sent to administer the special "repentance" which it was Hermas's mission to declare: "I was sent, quoth he, to show thee *again* all that thou sawest before, to wit the sum of the things profitable for thee. First of all write thou my mandates and similitudes; and the rest, as I will show thee, so shalt thou write." This programme is fulfilled in the xii. *Mandates* and *Similitudes* i.-viii., while *Simil.* ix. is "the rest" and constitutes a distinct "book"; while *Sim.* x. is really an epilogue in which Hermas is "delivered" afresh to the Shepherd, for the rest of his days. He is "to continue in this ministry" of proclaiming the Shepherd's teaching, "so that they who have repented or are about to repent may have the same mind with thee," and so receive a good report before God (*Sim.* x. 2-4). Only they must "make haste to do aright," lest while they delay the tower be finished (4. 4), and the new aeon dawn (after the final tribulation: cf. *Vis.* iv. 3. 5). Hermas sees that mere repentance is not enough to meet the backsliding condition in which so many Christians then were, owing to the recoil of inveterate habits of worldliness entrenched in society around and within. It is, after all, too negative a thing to stand by itself or to satisfy God. "Cease, Hermas," says the Church, "to pray all about thy sins. Ask for righteousness also" (*Vis.* iii. 1. 6).

Value of the Work.—Here lies a great merit of Hermas's book, his insight into experimental religion and the secret of failure in Christians about him, to many of whom Christianity had come by birth rather than personal conviction. Thus they were divided in soul between spiritual goods and worldly pleasures, and were apt to doubt whether the rewards promised by God to the life of "simplicity" (all Christ meant by the childlike spirit, including generosity in giving and forgiving) and self-restraint, were real or not. For while the expected "end of the age" delayed, persecutions abounded. Such "doubled-souled" persons, like Mr. Facing-both-ways, inclined to say, "The Christian ideal may be glorious, but is it practicable?" It is this most fatal doubt which evokes the Shepherd's sternest rebuke; and, he meets it with the ultimate religious appeal, viz., to "the glory of God." He who made man "to rule over all things under heaven," could He have given behests beyond man's ability? If only a man "hath the Lord in his heart," he "shall know that there is nothing easier nor sweeter nor gentler than these mandates" (*Mand.* xii. 3-4). So in the forefront of the *Mandates* stands the secret of all: "First of all believe that there is one God. . . . Believe therefore in Him, and fear Him, and fearing Him have self-mastery. For the fear of the Lord dwelleth in the good desire," and to "put on" this master-desire is to possess power to curb "evil desire" in all its shapes (*Mand.* xii. 1-2).

Elsewhere "good desire" is analysed into the "spirits" of the several virtues, which yet are organically related, Faith being mother, and Self-mastery her daughter, and so on (*Vis.* iii. 8. 3. *seq.*; cf. *Sim.* ix. 15). These are the specific forms of the Holy Spirit power, without whose indwelling the mandates cannot be kept (*Sim.* x. 3; cf. ix. 13. 2, 24, 2).

The absence of the historic names, "Jesus" and "Christ," may be due to the form of the book as purporting to quote angelic communications. This would also explain the absence of explicit scriptural citations generally, though knowledge both of the Old Testament and of several New Testament books—including the congenially symbolic Gospel of John—is clear.

Hermas faithfully reflects the Roman Church of the early 2nd century (cf. E. von Dobschütz, "*Christian Life in the Primitive Church*," 1904). Indeed the prime value of the *Shepherd* is the light it casts on Christianity at Rome in the otherwise obscure period c. 110-140, when it had as yet hardly felt the influences converging on it from other centres of tradition and thought. Thus Hermas's comparatively mild censures on Gnostic teachers in *Sim.* ix. suggest that the greater systems, like the Valentinian and Marcionite, had not yet made an impression there, as Harnack argues that they must have done by c. 145. This date, then, is a likely lower limit for Hermas's revision of his earlier prophetic memoranda, and their publication in a single homogeneous work, such as the *Shepherd* appears to be.

BIBLIOGRAPHY.—The chief modern edition is by O. von Gebhardt and A. Harnack, in Fasc. iii. of their *Patr. apost. opera* (Leipzig, 1877); it is edited less fully by F. X. Funk, *Patr. apost.* (Tübingen, 1901). A convenient edition, with text and translation, is contained in *The Apostolic Fathers*, vol. ii., by Kirsopp Lake (Loeb Classical Library). For the wide literature of the subject see the two former editions, also Harnack's *Chronologie der altchr. Lit.* i. 257 *seq.*, and O. Bardenheuer, *Gesch. der altkirchl. Lit.* i. 557, *seq.*

HERMENEUTICS, the science or art of interpretation or explanation, especially of the Holy Scriptures. (Gr. ἐρμηνευτική *sc. τέχνη*, Lat. *ars hermeneutica*, from ἐρμηνεύειν to interpret, from Hermes, the messenger of the gods.)

HERMES, a Greek god, son of Zeus and Maia, daughter of Atlas, and often identified with Mercury (*q.v.*) and with Cadmilus or Cadmilus, one of the Cabeiri (*q.v.*). The derivation of his name and his primitive character are very uncertain. The earliest centre of his cult was probably Arcadia, where Mt. Cyllene was reputed to be his birthplace. Here he was specially worshipped as the god of fertility, and his images were ithyphallic, as also were the "Hermæ" (*q.v.*) at Athens. At Cyllene in Elis a mere phallus served as his emblem, and was highly venerated in the time of Pausanias (vi. 26, 3).

Both in literature and cult Hermes was constantly associated with the protection of cattle and sheep; at Tanagra and elsewhere his title was κριοφόρος, the ram-bearer. As a pastoral god he was often closely connected with deities of vegetation, especially Pan and the nymphs. His pastoral character is recognized in the *Iliad* (xiv. 490) and the later epic hymn to Hermes; and his Homeric titles ἀκάκητα, ἐριόβριος, δώτωρ ἐάων ("gracious," "the ready helper," "giver of good things") probably refer to him as the giver of fertility. In the *Odyssey*, however, he appears mainly as the messenger of the gods, and the conductor of the dead to Hades. Hence, in later times he is often represented in art and mythology as a herald. The conductor of souls was naturally a chthonian god; at Athens there was a festival in honour of Hermes and the souls of the dead, and Aeschylus (*Persae*, 628) invokes Hermes, with Earth and Hades, in summoning a spirit from the underworld. With this go his functions as a dream-god; he is called the "conductor of dreams" and the Greeks offered to him the last libation before sleep. As a messenger he may also have become the god of roads and doorways; he was the protector of travellers and his images were used for boundary-marks (see HERMAE). Treasure casually found was the gift of Hermes (ἐρμαιον), and any stroke of good luck was attributed to him; this and his function as a deity of gain, honest or dishonest (κερδῶος) are natural derivatives of his character as god of fertility. The trickery and cunning of Hermes is a prominent theme in literature from Homer downwards, al-

though it is very rarely recognized in official cult. In the hymn to Hermes the god figures as a precocious child (a type familiar in folk-lore), who, when a new-born babe, steals the cows of Apollo. In many respects he was a counterpart of Apollo, less dignified and powerful, but more human than his greater brother. Hermes was a patron of music, like Apollo, and invented the cithara; he presided over the games with Apollo and Heracles, and his statues were common in the stadia and gymnasia. He is god of eloquence also; like Apollo he is something of a prophet, though a much inferior one, presiding over some kinds of popular divination. For his oracle at Pharae, see ORACLES.

The sacred number of Hermes was 4, and the 4th of the month his birthday. Apart from the Hermae, in archaic art he was portrayed as a full-grown and bearded man, clothed in a long chiton, and often wearing a cap (κυνῆ) or a broad-brimmed hat (πέταρος), and winged boots. Sometimes he was represented in his pastoral character, as when he bears a sheep on his shoulders; at other times he appears as the messenger or herald of the gods with the κηρυκεῖον, or herald's staff, which is his most frequent attribute. From the latter part of the 5th century his art-type was changed in conformity with the general development of Greek sculpture. He now became a nude and beardless youth, the type of the young athlete. In the 4th century this type was probably fixed by Praxiteles in his statue of Hermes at Olympia.

HERMES, GEORG (1775–1831), German Roman Catholic theologian, was born on April 22, 1775, at Dreyerwalde, in Westphalia, and was educated at the gymnasium and university of Münster. He was ordained in 1799 and two years after the publication of his *Untersuchungen über die innere Wahrheit des Christenthums* (Münster, 1805), became professor of theology at Münster. There his rationalistic mode of teaching and his disagreements with the Vicar-General von Droste-Vischering did little to smooth the way for his *Einleitung in die christkatholische Theologie* (1819–29), a work which shows the influence of Kant and Fichte, though in the first part the author severely criticizes these thinkers, especially for their views on the existence of God and on revelation. In 1820 Hermes was appointed professor of theology at Bonn where he died on May 26, 1831. His *Christkatholische Dogmatik* was published posthumously (3 vols., 1831–34). After his death, the contests between his followers and their opponents grew so bitter that the dispute was referred to Rome. The judgment was adverse, and in 1835 a papal bull condemned the *Einleitung* and the *Dogmatik*. In 1847 the condemnation of 1835 was confirmed by Pius IX.

See K. Werner, *Geschichte der katholischen Theologie* (1866), and *Dict. de Théol. catholique*.

HERMESIANAX, of Colophon, elegiac poet of the Alexandrian school, flourished about 330 B.C. Of his chief work, a poem in three books, dedicated to his mistress Leontion, Athenaeus (xiii. 597) has preserved about 100 lines, containing instances of the power of love. Hermesianax, whose style is characterized by alternate force and tenderness, was popular in his own times, and was esteemed even in the Augustan period.

Many separate editions have been published of the fragment, the text of which is in a very unsatisfactory condition: by F. W. Schneidewin (1838), J. Bailey (1839, with notes, glossary, and Latin and English versions), and others; R. Schulze's *Quaestiones Hermesianactaeae* (1858), contains an account of the life and writings of the poet and a section on the identity of Leontion.

HERMES TRISMEGISTUS [Lat. "the thrice greatest Hermes"], an honorific designation of the Egyptian Hermes; i.e., Thoth (q.v.), the god of wisdom. In late hieroglyphic the name of Thoth often has the epithet "the twice very great," sometimes "the thrice very great"; in the popular language (demotic) the corresponding epithet is "the five times very great," found as early as the 3rd century B.C. Greek translations give *ὁ μέγας καὶ μέγας* and *μέγιστος*; *τρίσμεγας* occurs in a late magical text:

ὁ τρισμέγιστος has not yet been found earlier than the 2nd century A.D., but there can now be no doubt of its origin in the Egyptian epithets.

Thoth was "the scribe of the gods," "Lord of divine words," and to Hermes was attributed the authorship of all the strictly sacred books generally called by Greek authors *Hermetic*. These, according to Clemens Alexandrinus, our sole ancient authority (*Strom.* vi. p. 268 et seq.) were 42 in number, and dealt with a variety of subjects, mostly ritual. Works are extant in papyri and on temple walls, treating of geography, astronomy, ritual, myths, medicine, etc. It is probable that the native priests would have been ready to ascribe the authorship or inspiration, as well as the care and protection of all their books of sacred lore to Thoth, although there were a goddess of writing (*Seshit*), and the ancient deified scribes Imuthes and Amenophis, and later inspired doctors Petosiris, Nechepso, etc., to be reckoned with; there are indeed some definite traces of such an attribution extant in individual cases.

Whether a canon of such books was ever established, even in the latest times, may be seriously doubted. Forty-two was the number of divine assessors at the judgment of the dead before Osiris, and was the standard number of the nomes or counties in Egypt. The name of Hermes was at various dates, but especially in the 3rd century A.D. placed at the head of numerous syncretistic writings. These are partly of an Oriental tendency, partly an offshoot of popular Greek philosophy, particularly Stoic. They are all more or less mystical and gnostic in tone, but represent no single dogmatic system. At an unknown, but probably post-classical date, a number of these pieces were put together into what is called the *Corpus Hermeticum*, which still survives. The first of this collection the *Poimandres*, is the best known. Many other works, now lost, are represented by quotations in Stobaeus and other authors, and a few survive in translations, Latin or Arabic. There is no satisfactory edition or translation; the most elaborate is Scott's (see below).

Besides Thoth, Anubis (q.v.) was constantly identified with Hermes; see also HORUS.

Mead, *Thrice Greatest Hermes* (1907), introduction and translation; W. Scott, *Hermetica* (text, translation and notes) (Oxford, 1924); F. Bräuninger, *Untersuchungen zu den Schriften des Hermes Trismegistos*, Gräfenhainichen, 1926.

HERMIAS. (1) A Greek philosopher of the Alexandrian school and a disciple of Proclus. His chief works were a study of the *Isagoge* of Porphyry and a commentary on Plato's *Phaedrus* (ed. P. Couvreur, Paris, 1901). Unlike the majority of logicians of the time, he admitted the absolute validity of the second and third figures of the syllogism.

(2) A Christian apologist and philosopher who flourished about the end of the 4th century. Nothing is known about his life, but a small thesis *Διασχυρμὸς τῶν ἐξω φιλοσόφων* has been preserved. In it he attacked pagan philosophy for its lack of logic in dealing with the root problems of life, the soul, the cosmos and the first cause. There is an edition by von Otto in the *Corpus apologetarum* (Jena, 1872).

HERMIPPUS, "the one-eyed," Athenian writer of the Old Comedy, flourished during the Peloponnesian War. He is said to have written 40 plays, of which the titles and fragments of nine are preserved. He was a bitter opponent of Pericles, whom he accused (probably in the *Μοῖραι*) of being a bully and a coward, and of carousing with his boon companions while the Lacedaemonians were invading Attica. He is said to have prosecuted Aspasia for impiety and offences against morality (Plutarch, *Pericles*, 32). In the *Ἀρτοπωλίδες* ("Bakeresses") he attacked the demagogue Hyperbolus.

Fragments in T. Kock, *Comicorum Atticorum fragmenta*, i. (1880), and A. Meineke, *Poëtarum Graecorum comicorum fragmenta* (1855).

HERMIT (Gr. *ἐρημίτης*, from *ἐρημος*, a desert) one who withdraws from intercourse with human beings to live a life of religious contemplation, and so distinguished from a "coenobite" (Gr. *κοινός*, common, and *βίος*, life), one who shares a life of

withdrawal with others in a community (see ASCETICISM and MONASTICISM). Strictly speaking, the hermit or eremite was a solitary who, like the hermits of the Thebaid, chose desert and remote places for his habitation, and was thus distinct from the anchorite (Gr. *ἀναχωρητής* from *ἀναχωρεῖν*, to withdraw), whose cell or enclosed dwelling was often attached to a church or in the neighbourhood of some place of public resort.

HERMIT CRAB, a genus of crusteans (*Paguridea*) commonly found on the coasts of Europe, America and the West Indies. In the adult stage it occupies the shells of gastropod molluscs, thrusting its abdomen inside the shell, the curve of which it follows; this part of the body is not encased as in other species of the same order. It lives under commensal conditions by association with sponges, sea anemones and other animals. See CRUSTACEA, SYMBIOSIS and MALACOSTRACA.

HERMOGENES, of Tarsus, Greek rhetorician, surnamed *Ευστήρ* (the polisher), flourished in the reign of Marcus Aurelius (A.D. 161–180). His precocity secured him a public appointment as teacher of his art while he was still a boy, but at the age of 25 his faculties gave way. He had, however, composed a series of rhetorical treatises, which became popular text-books, and the subject of commentaries. Of his *Art of Speaking* we still possess the sections *Περὶ τῶν στάσεων* (on legal issues), *Περὶ εὐρέσεως* (on the invention of arguments), *Περὶ ἰδεῶν* (on the various kinds of style), *Περὶ μεθόδου δεινότητος* (on the method of speaking effectively), and *Προγυμνάσματα* (rhetorical exercises).

Editions by C. Walz (1832), and by L. Spengel (1854), in their *Rhetores Graeci*; H. Rabe (Leipzig, 1913); bibliographical note on the commentaries in W. Christ, *Geschichte der griechischen Literatur* (1898).

HERMON, the most imposing, if not the highest, mountain in Syria, and visible far and wide. It is attached to the southern end of Anti-Lebanon. Its snowy top and the beauty of its outline inspired many images of Hebrew poetry. The Sidonians named it Sirion and it was Senir to the Amorites (Deut. iii. 9). According to one view it was the Mount of Transfiguration. To the modern Arab it is *Jebel esh-Sheikh* ("old man mountain") or *Jebel eth-Thelj* ("snow mountain"). Conder explained the former name as given because the "sheikh" of the Druses sought retirement there in the tenth century, but the hoary appearance of the mountain itself may have determined the name.

The ridge of Hermon which rises to a sharp peak is 20 m. long. "The formation of the lower part is Nubian sandstone, that of the upper part is a hard dark-grey crystalline limestone belonging to the Neocomian period, and full of fossils." The view from the summit is very extensive and a summer sunrise over Damascus viewed from that point of vantage is an awe-inspiring sight. Hermon is covered in the spring with snow which never entirely disappears and in autumn there is always some snow left piled up in great drifts to 20 or 30 ft. in the gullies and ravines on the mountain top. The ravines and gorges which pierce its lower slopes to the west and south-west are fertile and the vegetation is luxuriant. To a height of 500 ft. oaks, poplars, and brush are met. Foxes, wolves, and Syrian bears still haunt its fastnesses, if in decreasing numbers. The summit splits into three peaks the highest of which is 9,700 ft. above sea-level. On the southern are the ruins of a temple dedicated probably to Baal. This peak, too, is enclosed with a wall. On the plateau separating the peaks is a cave about 8 yd. square. Twelve other small temples, oriented east, are found on the slopes of the mountain. They are dated by archaeologists at c. A.D. 200 and from them several Greek inscriptions have been recovered. (E. Ro.)

HERMSDORF, a village in the Prussian province of Silesia near Waldenburg. Pop. (1925) 11,713. There are coal mines in the vicinity, and matches are manufactured. Hermsdorf is known as Niederhermsdorf to distinguish it from other places of the same name. Perhaps the most noteworthy of these is a village (Pop. [1925] 3,099) in Silesia at the foot of the Riesengebirge, chiefly famous for the ruins of the castle of Kynast. This castle, formerly the seat of the Schaffgotsch family, was destroyed by lightning in 1675. A third Hermsdorf is a village in Thuringia, where porcelain is made. Pop. (1925) 3,452.

HERNANDES or FERNANDES, GREGORIO (c. 1576–1636), Spanish sculptor, was born in Galicia about 1576. He was a pupil of Francisco del Rincon at Valladolid and became a famous sculptor of altarpieces and religious subjects. The figures on the high altar of San Miguel are his work and he also executed the altar of the Nuestra Señora de la Concepcion monastery at Vittoria (1618–21). An early figure of Christ (1605) is in the monastery of the Sacrament in Madrid, and the museum at Valladolid contains among other pieces a *Pieta* and a relief, "The Baptism of Christ." One of his finest works is the "Virgin of Sorrows" at Santa Cruz. He died at Valladolid on Jan. 22, 1636.

See Marti and Monso, *Estudios historicos artisticos relativos a Valladolid* (1898); Merlet, *L'Art et les artistes*, vol. xvii. (1913).

HERNÁNDEZ, JOSÉ (1834–1886), Argentine poet, was born near Buenos Aires, on Nov. 10, 1834, of distinguished lineage. His youth was spent on the pampas, but after the overthrow of Rosas in 1852, he took an active interest in the national rehabilitation and held numerous posts in the provincial Governments. In the struggle between Buenos Aires and the other provinces, he sided with Urquiza against Mitre, and with López Jordán against Sarmiento, and upon the complete collapse of the provincial cause in 1872, was forced to seek refuge out of the country. Returning to Buenos Aires soon afterwards, he resumed his position of influence, founded the *Revista de la Plata*, and was conspicuous in establishing the new provincial capital at La Plata. He died at Belgrano on Oct. 21, 1886. He is remembered chiefly for his poem *Martín Fierro*, the first epic in Spanish-American literature since Ercilla's *Araucana*, and the finest example we have of the so-called *gauchesca* literature. It appeared in two parts, the first, *La Ida*, in 1872, and in 1878, the second, *La Vuelta de Martín Fierro*. This poem is not Hernández's only literary effort, but it is the only one to win the confirmation of time.

See Henry A. Holmes, *Martín Fierro, an Epic of the Argentine* (New York, 1923); Carlos O. Bunge, *Martín Fierro* (Buenos Aires, 1915); Ricardo Rojas, *La literatura argentina* (vol. i., Buenos Aires, 1917); José M. Salaverría, *El Poema de la Pampa* (Madrid, 1918); for a complete bibliography see S. E. Leavitt, *Argentine Literature, a bibliography* (1924). (W. B. P.)

HERNE, JAMES A. (originally AHERNE) (1840–1901), American actor and playwright, was born in Troy (N.Y.), and after theatrical experiences in various companies produced his own first play, *Hearts of Oak*, in 1878, and his great success, *Shore Acres*, in 1882. His humour and pathos found their proper setting in rural drama, and *Shore Acres* was seen throughout the United States almost continuously for six seasons, being followed by the less successful *Sag Harbor*, 1900.

HERNE, a town in the Prussian province of Westphalia, 15 m. by rail N.N.W. of Dortmund. Pop. (1925) 66,542. It has coal mines, boiler-works, ammonia works, etc. Herne was made a town in 1897.

HERNE BAY, a seaside resort of Kent, England, 8 m. N. by E. of Canterbury, on the S.R. Pop. of urban district (1921) 11,872. It has grown up since 1830, above a sandy and pebbly shore. The church of St. Martin in the village of Herne, 1½ m. inland, is Early English and later; the living was held by Nicholas Ridley (1538), afterwards Bishop of London. At Reculver, 3 m. E. of Herne Bay, is the site of the Roman station of *Regulbium*. The fortress occupied about 8 ac., but only traces of the south and east walls remain. In Saxon times it was converted into a palace by King Ethelbert, and in 669 a monastery was founded here by Egbert. Parts of the Early English church, taken down early in the 19th century owing to the encroachment of the sea, are preserved in the modern church of St. Mary, but its twin towers, known as the Sisters, from the tradition that they were built by a Benedictine abbess of Faversham in memory of her sister, were preserved by Trinity House as a conspicuous landmark.

HERNE THE HUNTER, a legendary huntsman believed to haunt Windsor Great Park at night, especially near an aged tree, "Herne's oak." This was blown down in 1863, and a young oak was planted by Queen Victoria on the spot. Herne's French counterpart is the *Grand Veneur* of Fontainebleau. Herne is

mentioned in *The Merry Wives of Windsor* and in Harrison Ainsworth's *Windsor Castle*. The Herne legend is probably a variant of the "Wild Huntsman" myth, descended (E. B. Tylor, *Primitive Culture*, 4th ed. pp. 361-362) from a prehistoric storm-myth.

HERNIA, in surgery, the protrusion of a part from its normal cavity; thus, *hernia cerebri* is a protrusion of brain-substance, *hernia pulmonum*, a protrusion of a portion of lung, and *hernia iridis*, a protrusion of some of the iris through an aperture in the cornea. As a result of X-ray examinations herniae of abdominal viscera into the thorax through a defect in the diaphragm have been recognized with some frequency. But, used by itself, *hernia* implies, in common language, a "rupture." A rupture may occur at any weak point in the abdominal wall. The common situations are the groin (*inguinal*), the upper part of the thigh (*femoral*), and the navel (*umbilical*). The hernia may contain intestine alone, omentum alone, or both. The predisposing cause of rupture is abnormal length of the mesentery or of the omentum, together with some weak spot in the abdominal wall, as in an inguinal hernia, which descends along the canal in which the spermatic cord lies in the male and the round ligament of the womb in the female. A femoral hernia comes through a weak spot in the abdomen to the inner side of the great femoral vessels; a ventral hernia takes place by the yielding of the scar tissue left after an abdominal operation. The exciting cause of hernia is generally over-exertion, as in lifting a heavy weight, jumping off a high wall, straining, constipation, or excessive coughing. The pressure of the diaphragm above and the abdominal wall in front acting on the abdominal viscera causes a protrusion at the weakest point.

Rupture is either congenital or acquired. A child may be born with a hernia in the inguinal or umbilical region, owing to defective development in those parts; or the rupture may first appear, perhaps, in adult life as the result of a strain or hurt. Men suffer more often than women, because of their physical labours and greater liability to accidents, and because the canal for the spermatic cord out of the abdomen is wider than that for the round ligament of the womb.

At first a rupture is small but it gradually increases in bulk. It varies in size from a marble to a child's head. The swelling consists of three parts—the coverings, sac, and contents. The "coverings" are the structures which form the abdominal wall at the part where the rupture occurs, thinned and matted together as the result of pressure or thickened from repeated attacks of inflammation. The "sac" is composed of the peritoneum or membrane lining the abdominal cavity; in some rare cases the sac is wanting. The neck of the sac is the narrowed portion where the peritoneum forming the sac becomes continuous with the general peritoneal cavity. The neck of the sac is often thickened, indurated, and adherent to surrounding parts, the result of chronic inflammation. The "contents" are bowel, omental fat, or, in children, an ovary.

The hernia may be reducible, irreducible, or strangulated. A "reducible" hernia is one in which the contents can be pushed back into the abdomen. In some cases reduction is easy, in others, a matter of great difficulty. At any moment a reducible hernia may become "irreducible," perhaps from inflammatory adhesions in and around the fatty contents, or from extra fullness of the bowel in the sac. A "strangulated" hernia is one in which the circulation of blood through the hernial contents is impeded by the pinching at the narrowest part of the passage. The interference is at first slight, but quickly becomes pronounced; the pinched bowel in the hernial sac swells as a finger does when a string is tightly wound round its base. Congestion is followed by inflammation, infection by micro-organisms and mortification. The rapidity with which these changes take place depends on the tightness of the constriction. As a rule, the more rapidly a hernia forms the greater the rapidity of serious change in the conditions of the bowel or omentum, and the more urgent are the symptoms. The constricting band may be one of the structures which form the boundaries of the openings through which the hernia has travelled, or it may be the neck of the sac, which has become thickened in consequence of inflammation—especially is this the case in an inguinal hernia.

Reducible Hernia.—With a reducible hernia there is a soft

compressible tumour (elastic when it contains intestine, doughy when it contains omentum), its size increasing in the erect, and diminishing in the horizontal posture. As a rule, it causes no trouble during the night. It gives an impulse on coughing, and when the intestinal contents are pushed back into the abdomen a gurgling sensation is perceptible by the fingers. Such a tumour may be met with in any part of the abdominal wall, but the chief situations are as already given. Inguinal hernia is commoner in men, femoral, in women. As an inguinal hernia increases in size it passes into the scrotum in the male, into the labium in the female; while a femoral hernia gradually pushes upwards to the abdomen.

The palliative treatment of a reducible hernia consists in pushing back the contents of the tumour into the abdomen and applying a truss or elastic bandage to prevent their again escaping. The younger the patient the more chance there is of the truss acting as a curative agent. The truss may generally be left off at night, but it should be put on in the morning before the patient leaves his bed. If, after the hernia has been once returned, it is not allowed again to come down, there is a probability of an actual cure taking place; but if it is allowed to come down occasionally, as it may do, even during the night, in consequence of a cough, or from the patient turning suddenly in bed, the weak spot is again opened out, and the improvement which might have been going on for weeks is undone. It is sometimes found impossible to keep up a hernia by means of a truss, and an operation becomes necessary. The operation is spoken of as "the radical treatment of hernia," in contradistinction to the so-called "palliative treatment" by means of a truss. The principles involved in the operation are the emptying of the sac and its entire removal, and the closure of the opening into the abdomen by strong sutures: and, in this way, great advance has been made by modern surgery. Experience has shown that very few ruptures are unsuited for radical treatment by operation.

Irreducible Hernia.—The main symptom is a swelling in one of the situations already referred to, of long standing and perhaps of large size, in which the contents of the tumour, in whole or in part, cannot be pushed back into the abdomen. The irreducibility is due either to its large size or to changes which have taken place by indurations or adhesions. Such a hernia is a constant source of danger; its contents are liable to injury from external violence; it may at any time become strangulated, or the contents may inflame, and strangulation may occur secondarily to the inflammation. It gives rise to dragging sensations (referred to the abdomen), colic, dyspepsia, and constipation, which may lead to stoppage of the passage of the contents through that portion of the intestinal canal which lies in the hernia. When an irreducible hernia becomes painful and tender a local peritonitis has occurred, which resembles in many of its symptoms a case of strangulation, and must be regarded with suspicion and anxiety. Indeed, the only safe treatment is by operation.

The treatment of irreducible hernia may be palliative; a "bag truss" may be worn in the hope of preventing the hernia getting larger; the bowels must be kept open, and all irregularities of diet avoided. But it must be repeated that a person with such a hernia is in constant danger, and if possible a radical operation should be done.

In *Strangulated Hernia* the bowel or omentum is being nipped at the neck of the sac, and the flow of blood into and from the delicate tissues is stopped. The symptoms are nausea, vomiting of bilious matter, and, after a time, of faecal-smelling matter; a twisting, burning pain generally referred to the region of the navel, intestinal obstruction; a quick, wiry pulse and pain on pressure over the tumour; the expression grows anxious, the abdomen becomes tense and drum-like, and there is no impulse in the tumour on coughing, because its contents are practically pinched off from the general abdominal cavity. Sometimes there is complete absence of pain and tenderness in the hernia itself, and in an aged person all the symptoms may be very slight. Sooner or later, from eight hours to eight days, if the strangulation is unrelieved, the tumour becomes livid, crackling with gas, mortification of the bowel at the neck of the sac takes place, followed by

extravasation of the intestinal contents into the abdominal cavity; the patient has hiccough; he becomes collapsed, and dies comatose from blood-poisoning.

The treatment of a strangulated hernia admits of no delay; it must be operated on at once. There should be no attempt at treatment by hot-bath or ice-bag: operation is urgently needed. An anaesthetic should be administered, and perhaps one gentle attempt to return the contents by pressure may be made, but no prolonged attempts are justifiable, because the condition of the hernial contents may be such that they cannot bear the pressure of the fingers.

Attempts at replacement to be successful should be made in a direction opposite to the one in which the hernia has come down. The inguinal hernia should be pressed upwards, outwards, and backwards, the femoral hernia downwards, backwards, and upwards. The larger the hernia the greater is the chance of success, and the smaller the hernia the greater the risk of its being injured by manipulation and delay. In every case the handling must be absolutely gentle. If it does not succeed the surgeon must at once cut down on the swelling, carefully dividing the different coverings until he reaches the sac. The sac is then opened, the constriction divided, care being taken not to injure the bowel. The bowel must be examined before it is returned into the abdomen, and if its lustreless appearance, its dusky colour, or its smell, suggests that it is mortified, or is on the point of mortifying, it must not be put back or perforation would give rise to septic peritonitis, which probably would have a fatal ending. In such a case the damaged piece of bowel must be resected and the healthy ends of the bowel joined together by fine suturing. Matted or diseased omentum must be tied off and removed.

HERNICI, an ancient people of Italy, whose territory was in Latium between the Fucine lake and the Trerus, bounded by the Volsci on the south, and by the Aequi and the Marsi on the north. In 486 B.C. they were still strong enough to conclude an equal treaty with the Latins (Dion. Hal. viii. 64 and 68). They broke away from Rome in 362 (Livy. vii. 6 ff.) and in 306 (Livy iv. 42), when their chief town Anagnia (*q.v.*) was taken and reduced to a praefecture, but Ferentinum, Aletrium and Verulae were allowed to remain free *municipia*. By 225 B.C. their territory was not distinguished from Latium generally, and it seems probable that they had then received the full Roman citizenship. The oldest Latin inscriptions of the district (from Ferentinum, C.I.L. x. 5837-40) are earlier than the Social War, and present no local characteristic.

For further details of their history see C.I.L. x. 572.

See also R. S. Conway, *Italic Dialects* (1897), p. 306 ff., where the glosses and the local and personal names of the district will be found.

HERNÖSAND, a seaport of Sweden, chief town of the district (*län*) of Västernorrland on the Gulf of Bothnia. Pop. (1928) 11,692. Hernösand was founded in 1584, and received its first town-privileges from John III. in 1587. It stands on the island of Hernö (which is connected with the mainland by bridges) near the mouth of the Ängerman river, 423 m. N. of Stockholm by rail. It is the seat of a bishop and possesses a cathedral. There are engine-works, timber-yards and saw-mills. The harbour is good, but generally icebound from mid-January to May. Timber, cellulose and wood-pulp are exported.

HERO, a Greek word (*ἥρως*) of varying meaning whose etymology is unknown.

(1) **In Homer**: a complimentary term (roughly—"gentleman," "noble"), applied to the chief characters of the poems, or even to persons of lower rank, or the free warriors generally. Hence in Hellenistic Greek, a great or noble man, a hero; sometimes also a great classical writer.

(2) **Hero-Cult**. After Homer we hear of what had probably existed before him, the cult of the distinguished dead (see ANCESTOR-WORSHIP). The heroes, as the objects of this cult are called, are not disembodied spirits, nor demi-gods; their position is not intermediate between gods and men, but by the side of these they exist as a separate class, though minor divine figures are often confused with them. Even in Homer, traces of an earlier ancestor-worship appear; e.g., in funeral games in honour of Pa-

troclus and other heroes, while the Hesiodic account of the five ages of man is a reminiscence of the belief in the continued existence of souls in a higher life. This agrees with the clear traces in Mycenaean graves of a cult of the dead. This pre-historic worship and belief, for a time obscured, were subsequently revived. According to Porphyry (*De abstinentia*, iv. 22), Draco ordered the inhabitants of Attica to honour the gods and heroes of their country "in accordance with the usage of their fathers" with offerings of first fruits and sacrificial cakes every year, thereby clearly pointing to a custom of high antiquity. Heroic honours were bestowed upon the founders of a colony or city, and the ancestors of families; if their name was not known, one was adopted from legend, or invented, as the supposed ancestors of the noble and priestly families of Attica and elsewhere. Again, side by side with gods of superior rank, certain heroes were worshipped as protecting spirits of the country or state; such were the Aeacidae amongst the Aeginetans, Ajax son of Oileus amongst the Epizephyrian Locrians and Hector at Thebes.

Neglect of the worship of these heroes was held to be responsible for pestilence, bad crops, and other misfortunes, while, on the other hand, if duly honoured, their influence was equally beneficent. This belief was supported by the Delphic oracle, which was largely instrumental in promoting hero-worship and keeping alive its due observance. Special importance was attached to the grave of the hero and to his bodily remains. The grave was regarded as his place of abode, from which he could be absent only for a brief period; hence his bones were fetched from abroad (e.g., Cimon brought those of Theseus from Scyros), or if they could not be procured, at least a cenotaph was erected in his honour. Their relics, the house of Cadmus at Thebes, the hut of Orestes at Tegea, the stone on which Telamon had sat at Salamis (in Cyprus) also were carefully preserved. Special shrines (*ἥρῶα*) were also erected in their honour, usually over their graves. Like the gods, the cult heroes were supposed to exercise an influence on human affairs, though not to the same extent, their sphere of action being confined to their own localities. Among the earliest known historical examples of the elevation of the dead to the ranks of heroes are Timesius, the founder of Abdera, Miltiades, son of Cypselus, Harmodius and Aristogeiton and Brasidas, the victor of Amphipolis, who ousted the local Athenian hero Hagnon. In course of time admission to the rank of a hero became far more common, and was even accorded to the living, such as Lysimachus in Samothrace and the tyrant Nicias of Cos. This is one of the sources of the Hellenistic and Roman cult of kings and emperors. In addition to persons of high rank, poets, legendary and others, legislators and physicians, the patrons of various trades or handicrafts, the heads of philosophical schools received the honours of a cult. Finally, hero sank into a mere complimentary term for any dead man.

The cult of the heroes exhibits points of resemblance with that of the chthonian divinities, but differs from that of the ordinary gods. Normally, sacrifice was offered at night, on a hearth (*ἑσχαρα*), not an altar: the blood of the victim, which was black and sacrificed with its head turned earthwards, was allowed to trickle on the ground or into a trench or tube leading to the grave to appease the departed; the technical expression for the sacrifice was not *thuein*, but *enagizein* (less commonly *entemnein*) and generally the flesh was not eaten but burned. The chthonian aspect of the hero is further shown by his attribute the snake, and in many cases he appears under that form himself. On special occasions a sacrificial meal of cooked food was set out for the heroes, of which they were solemnly invited to partake. The fullest description of such a festival is the account given by Plutarch (*Aristides*, 21) of the festival celebrated by the Plataeans in honour of their countrymen who had fallen at the battle of Plataea. Later theologians (see Plutarch, *de defectu oraculorum*, 10, 415B) arranged an ascending scale of heroes (beatified human souls), daemones and gods, and held that promotion from one grade to another was possible.

Teutonic Legend.—Many of the chief characteristics of the ancient Greek heroes are reproduced in those of the Teutonic North. Superhuman qualities and powers are commonly ascribed to both, an important difference being that whatever worship may have been paid to the Teutonic heroes never crystallized into a cult. This applies equally to those who have a recognized historical origin and to those who are regarded as purely mythical.

During the 19th century the "degraded gods" theory was applied not only to such conspicuous heroes as Siegfried, Dietrich and Beowulf, but to a host of minor characters. (See also Henri de Tourville, *Histoire de la formation particulariste*, 1903.) It is now, however, admitted that, whatever influence the one may have from time to time exercised on the other, Teutonic myth and Teutonic heroic legend were developed independently. The Teutonic heroes are, in the main, historical personages; though, like the Greek heroes, they are sometimes endowed with semi-divine attributes or interpreted as symbolical representations of natural forces.

The origin of Teutonic heroic saga, which includes that of the Germans, Goths, Anglo-Saxons and Scandinavians, is to be looked for in the traditions connected with the period of the so-called migration of nations (A.D. 350–650), the earliest traces of which are found in the works of historical writers such as Ammianus Marcellinus and Cassiodorus. It consequently rests upon a distinct basis of fact, the saga being the oldest form of historical tradition. (See also Tacitus, *Annals*, ii. 88.) The next step in the development of epic narrative was the single lay of an episodic character, sung by a single individual, who was frequently a member of a distinguished family, not merely a professional minstrel. Then, as different stories grew up round the person of a particular hero, they formed a connected cycle of legend, the centre of which was the person of the hero (e.g., Dietrich of Bern). The most important figures of these cycles are the following.

(1) Beowulf, king of the Geatas (Jutland), whose story is an amalgamation of the myth of Beowa, the slayer of the water-demon and the dragon, with the historical legend of Beowulf, nephew and successor of Hygelac (Cochilaicus), king of the Geatas, who was defeated and slain (c. 520) while ravaging the Frisian coast. Beowulf is the hero of spring and light who, after overcoming the spirit of the raging waters, finally succumbs to the dragon of approaching winter. Others regard him as a wind-hero, who disperses the pestilential vapours of the fens. Beowulf is also a culture-hero, indicating the blessings of a fixed habitation, secured against the attacks of the sea. (2) Hildebrand, the hero of the oldest German epic. He follows his master Theodoric to the court of Attila. After 30 years' absence, he returns to his home in Italy; his son Hadubrand, believing his father to be dead, suspects treachery, and a fight takes place, in which the son is slain by the father. (3) Ermanaric, the king of the East Goths, who according to Ammianus Marcellinus slew himself (c. 375) in terror at the invasion of the Huns. With him is connected the old German Dioscuri myth of the Hartungen. (4) Dietrich of Bern (Verona), the legendary name of Theodoric the Great. Attempts have been made to identify him as a kind of Donar or god of thunder. (5) Siegfried (M.H. Ger. Sîvrit), the hero of the *Nibelungenlied*, the Sigurd of the related northern sagas, is usually regarded as a purely mythical figure, a hero of light who is ultimately overcome by the powers of darkness, the mist-people (Nibelungen). He is, however, closely associated with historical characters and events, e.g., with the Burgundian king Gundahari (Gunter, Gunnar) and the overthrow of his house and nation by the Huns. Theodor Abeling (*Das Nibelungenlied*, Leipzig, 1907) traces the Nibelung sagas to three groups of Burgundian legends, each based on fact. (See also the articles KRIEMHILD, NIBELUNGENLIED.) (6) Hugdietrich, Wolf-dietrich and Ortnit, whose legend, like that of Siegfried, is of Frankish origin. It is preserved in four versions, the best of

which is the oldest, and has an historical foundation. Hugdietrich is the "Frankish Dietrich" (=Hugo Theodoric) king of Austrasia (d. 534), who was illegitimate, and had to fight for his inheritance with his relatives. As the myth of the Hartungen is connected with Ermanaric, so another Dioscuri myth (of the Hartungen) is combined with the Ortnit-Wolfdietrich legend. The Hartungen are probably identical with the divine youths (mentioned in Tacitus as worshipped by the Vandal Naharvali or Nahanarvali), from whom the Vandal royal family, the Asdingi, claimed descent. Asdingi would be represented in Gothic by Hazdiggos "men with women's hair" (cf. *muliebri ornatu* in Tacitus), and in Middle High German by Hartungen. (7) Rother, king of Lombardy. Desiring to wed the daughter of Constantine, king of Constantinople, he sends envoys to ask her in marriage. They are thrown into prison by the king. Rother, who appears under the name of Dietrich, sets out with an army, liberates the envoys and carries off the princess. The slaying of a tame lion by one of the followers of Rother is founded in an incident which actually took place at the court of Alexius during the crusade of 1101 under Duke Welf of Bavaria, while *King Rother* was composed about 1160 by a Rhenish minstrel. Rother may be the Lombard king, Rothari (636–650), transferred to the period of the Crusades. (8) Walther of Aquitaine, chiefly known from the Latin poem *Waltharius*, written by Ekkehard of St. Gall at the beginning of the 10th century, and fragments of an 8th century Anglo-Saxon epic *Waldere*. Walther is not an historical figure. (9) Wieland (Volundr), Wayland the Smith, the only Teutonic hero (his original home was Lower Saxony) who firmly established himself in England. There is no historical background for his legend. He typifies the advance from the stone age to a higher stage of civilization (working in metals). (10) Högni (Hagen) and Hedin (Hétel), whose personalities are overshadowed by the heroines Hilde and Gudrun (Kudrun, Kutrun). In one version occurs the incident of the never-ending battle between the forces of Hagen and Hedin. The battle represents the eternal conflict between light and darkness, the alternation of day and night. The historical background is the raids of the Teutonic maritime tribes on the coasts of England and Ireland.

Famous heroes who are specially connected with England are Alfred the Great, Richard Coeur-de-Lion, King Horn, Havelok the Dane, Guy of Warwick, Sir Bevis of Hampton (or Southampton), Robin Hood and his companions.

Celtic Heroes.—The Celtic heroic saga in the British islands may be divided into the two principal groups of Gaelic (Irish) and Brython (Welsh), the first, excluding the purely mythological, into the Ultonian (connected with Ulster) and the Ossianic. The Ultonian is grouped round the names of King Conchobar and the hero Cuchulainn, the defender of Ulster against all Ireland, regarded by some as a solar hero. The second cycle contains the epics of Finn (Fionn, Fingal) mac Cumhail and his son Oisín (Ossian), the bard and warrior. (See CELT; CELTIC LITERATURE.)

Of Brython origin is the cycle of King Arthur (Artus), the adopted national hero of the mixed nationalities of whom the "English" people was composed. The original Welsh legend was spread by British refugees in Brittany, and was thus celebrated by both English and French Celts. From a literary point of view, however, it is chiefly French and forms "the matter of Brittany." Arthur, the leader (*comes Britanniae dux bellorum*) of the Siluri or Dumnonii against the Saxons, flourished at the beginning of the 6th century. He is first spoken of in Nennius's *History of the Britons* (9th century), and at greater length in Geoffrey of Monmouth's *History of the Kings of Britain* (12th century), at the end of which the French Breton cycle attained its fullest development in the poems of Chrétien de Troyes and others.

Speaking generally, the Celtic heroes are differentiated from the Teutonic by the extreme exaggeration of their superhuman, or rather extra-human, qualities. Take, for instance, the description of some of Arthur's knights in the Welsh tale of *Kilhwch and Olwen* (in the *Mabinogion*); Sgilti Yscandroed, whose tread was so light that no blade of grass bent beneath his weight; Sol who could stand all day upon one leg; Sugyn who was so "broad-chested" that he could suck up the sea on which were 300

ships and leave nothing but dry land. Such figures as these make no human impression, and criticism has busied itself in tracing them to one or other of the shadowy divinities of the Celtic pantheon. Remnants of their primitive superhuman qualities cling to the Celtic heroes long after they have been transfigured, under the influence of Christianity and chivalry, into the heroes of the mediaeval Arthurian romance; while memories of early myths live on, strangely disguised, in certain of the episodes repeated uncritically by the mediaeval poets. So Merlin preserves his diabolic origin; Arthur his mystic coming and his mystic passing.

The chief heroes of the mediaeval Arthurian romances are Arthur himself, who tends however to become completely overshadowed by his knights; Merlin (Myrddin) the famous wizard, bard and warrior, first introduced by Geoffrey of Monmouth, originally called Ambrose from the British leader, Ambrosius Aurelianus, under whom he is said to have first served; Perceval (Parzival, Parsifal), the Welsh Peredur, the most intimately connected with the quest of the Grail (*q.v.*); Tristan (Tristram), the ideal lover of the middle ages, whose name is inseparably associated with that of Iseult; Lancelot, son of Ban, king of Brittany, known chiefly from his amour with Guinevere; Gawain (Welwain, Welsh Gwalchmai), Arthur's nephew, the type of knightly courage and chivalry. Among less important figures may be mentioned Kay (Kai of the *Mabinogion*), Arthur's foster-brother and seneschal, the type of the bluff and boastful warrior, and Bedivere (Bedwyr), the type of brave knight and faithful retainer, who alone is with Arthur at his passing, and afterwards becomes "a hermit and a holy man." (See ARTHUR, MERLIN, PERCEVAL, TRISTAN, LANCELOT, GAWAIN.)

Heroes of Romance.—Another series of heroes, forming the central figures of stories variously derived but developed in Europe by the Latin-speaking peoples, may be conveniently grouped under the heading of "romance." Of these the most important are Alexander of Macedon and Charlemagne. Alexander's name, in the form of Iskander, is familiar in legend and story all over the East to this day; to the West he was introduced through a Latin translation of the original Greek romance (by the pseudo-Callisthenes) to which the innumerable oriental versions are likewise traceable. (See ALEXANDER III., KING OF MACEDON: *The Romance of Alexander*.) More important in the West, however, was the cycle of legends gathering round the figure of Charlemagne, forming what was known as "the matter of France." The romances of this cycle, of Germanic (Frankish) origin and developed probably in the north of France by the French, contain reminiscences of the heroes of the Merovingian period, and were influenced later by the Arthurian cycle. Charlemagne is chiefly venerated as the champion of Christianity against the heathen and the Saracens. (See CHARLEMAGNE, *ad fin.* "The Charlemagne Legends.")

The most famous heroes who are associated with him are Roland, praefect of the marches of Brittany, the Orlando of Ariosto, slain at Roncevaux (Roncevalles) in the Pyrenees and his friend and rival, Oliver (Olivier); Ogier the Dane, the Holger Danske of Hans Andersen, and Huon of Bordeaux, probably both introduced from the Arthurian cycle; Renaud (Rinaldo) of Montauban, one of the four sons of Aymon; the traitor, Doon of Mayence; Gamelon, responsible for the treachery that led to the death of Roland; Archbishop Turpin, a typical specimen of muscular Christianity; William Fierabras, William au court nez, William of Toulouse and William of Orange (all probably identical), and Vivien, the nephew of the latter and the hero of Aliscans. The late Charlemagne romances originated the legends in English form, of *Sowdone of Babylone*, *Sir Otnel*, *Sir Fierabras* and *Huon of Bordeaux*. (See OBERON.)

The chief remains of the Spanish heroic epic are some poems on the Cid, on the seven Infantes of Lara and on Fernán González, count of Castile. The legend of Charlemagne, as told in the *Crónica general* of Alfonso X., created the desire for a national hero distinguished for his exploits against the Moors, and Roland was thus supplanted by Bernardo del Carpio. Another hero of a 14th century cycle of romance was Amadis of Gaul; its earliest

form is Spanish, although the Portuguese have claimed it as a translation from their own language. There is no trace of a French original.

Slavonic Heroes.—The Slavonic heroic saga of Russia centres round Vladimir of Kiev (980–1015), the first Christian ruler of that country, whose personality is eclipsed by that of Ilya (Elias) of Mourom, the son of a peasant, who was said to have saved the empire from the Tatars. It is not known whether he was an historical personage. A much-discussed work is the *Tale of Igor*, the oldest of the Russian mediaeval epics. Mention may here be made of Wainamoinen, the great magician and hero of the Finnish epic *Kalevala*. The popular hero of the Serbians and Bulgarians is Marko Kralyevich, son of Vukashin, characterized by Goethe as a counterpart of the Greek Heracles. For the Persian, Indian, etc., heroes see the articles on the literature and religions of the various countries.

HERO in Greek Ἡρώ, and **LEANDER** in Greek Λέανδρος, the characters in a pretty Hellenistic love-story, preserved in Ovid (*Heroides* 18 and 10; authorship of both disputed) and Musaeus (5th century A.D.), besides references elsewhere, none earlier than Virgil; much handled in modern times, e.g., by Marlowe, Chapman and Byron. Hero, virgin priestess of Aphrodite at Sestos, was seen at a festival by Leander of Abydos; they fell in love with each other, and he used to swim the Hellespont at night to visit her; guided by a light from her tower. One stormy night this was extinguished, and Leander was drowned; Hero, seeing his body, drowned herself likewise.

See the editions of the *Heroides* by Palmer-Purser (Oxford, 1898); of Mousaios, by A. Ludwich (Bonn, 1912); bibl. in both.

HEROD, the name borne by the princes of a dynasty which reigned in Judaea from 40 B.C.

HEROD THE GREAT (c. 73 B.C.–4 B.C.), the son of Antipater and king of Judaea (40–4 B.C.), was descended from a family of Idumaeans. When he was 25, his father, who had served in Caesar's campaign against Egypt, appointed him ruler of Galilee. He at once arrested Hezekiah the arch-brigand, who had overrun the Syrian border, and put him to death. For this he was cited in the name of Hyrcanus to appear before the Sanhedrin, whose prerogative he had usurped in executing Hezekiah. He appeared with a bodyguard, and the Sanhedrin was overawed. Only Sameas, a Pharisee, dared to insist upon the legal verdict of condemnation. But the governor of Syria had sent a demand for Herod's acquittal, and so Hyrcanus adjourned the trial and persuaded the accused to abscond. Herod returned with an army, but his father dissuaded him from wreaking vengeance upon his enemies.

About this time (47–46 B.C.) he was created *strategus* of Coele Syria by the provincial governor. In 43 B.C. Antipater was poisoned at the instigation of one Malichus, who was perhaps a Jewish patriot. Herod, with the connivance of Cassius, who was in Syria to collect war-tax, had Malichus assassinated. The country was now in a state of anarchy, owing to the extortions of Cassius and the encroachments of neighbouring powers. Antony, who became master of the East after Philippi, was ready to support the

sons of his friend Antipater; but he was absent in Egypt when the Parthians invaded Palestine to restore Antigonus to the throne of his father Aristobolus (40 B.C.). Herod escaped to Rome, where Antony, who had made him tetrarch, now persuaded the Senate to declare him king of Judaea.

In 39 B.C. Herod returned to Palestine and, when the presence of Antony put the reluctant Roman troops entirely at his disposal, he was able to lay siege to Jerusalem two years later. Secure of the support of Rome he endeavoured to legitimize his position in the eyes of the Jews by taking the Hasmonaean princess Mariamne to be his second wife. Jerusalem was taken by storm; the Roman troops withdrew to behead Antigonus the usurper at Antioch. In 37 B.C. Herod was king of Judaea, being the client of Antony and the husband of Mariamne.

The Pharisees, who dominated the bulk of the Jews, were content to accept Herod's rule as a judgment of God. Hyrcanus returned from his prison, and though his mutilation prevented him from holding office as high priest, he was able to exercise an influence favourable to the new dynasty. On the other hand, Herod's marriage with Mariamne brought some of his enemies into his own household. He had scotched the faction of Hasmonaean sympathizers by killing 45 members of the Sanhedrin and confiscating their possessions. But so long as there were representatives of the family alive, there was always a possible pretender to the throne which he occupied. Mariamne's mother used her position to further the overthrow of her son-in-law; and she found an ally in Cleopatra of Egypt, who was unwilling to be spurned by him.

The events of Herod's reign indicate the temporary triumphs of his different adversaries. His high-priest, a Babylonian, was deposed in order that Aristobolus III., Mariamne's brother, might hold the place to which he had some ancestral right. But the enthusiasm with which the people received him at the Feast of Tabernacles convinced Herod of the danger, and the youth was drowned by his order at Jericho. Cleopatra had obtained from Antony a grant of territory adjacent to Herod's domain and even part of it. She required Herod to collect arrears of tribute. So it fell out that, when Octavian and the Senate declared war against Antony and Cleopatra, Herod, preoccupied in obedience to her commands, was prevented from fighting against the future emperor of Rome.

After the battle of Actium (31 B.C.) Herod executed Hyrcanus. He took in hand to deal with the Hasmonaeans, and in 25 B.C. the old intriguers, their victims like Mariamne, and all pretenders were dead. From this time onwards Herod was free to govern Palestine as a client-prince of the Roman empire should govern his kingdom. To put down the brigands and to check the raids of the Arabs on the frontier, he built or rebuilt fortresses, which were of assistance to the Jews in the great revolt against Rome. He restored the temple at Jerusalem, erected magnificent buildings, founded cities, and established games in honour of the emperor, who recognized his successful government by putting the districts of Ullatha and Panias under him in 20 B.C.

But Herod found new enemies in his household. His brother Pheroras and sister Salome plotted for their own advantage and against the two sons of Mariamne. The people still cherished a loyalty to the Hasmonaean lineage, although the young princes were also the sons of Herod. The enthusiasm with which they were received aroused suspicion in their father's mind, and they were strangled at Sebaste. On his deathbed Herod discovered that his eldest son, Antipater, had been plotting against him. He accused him before the governor of Syria and obtained leave from Augustus to put him to death. The father died five days after his son in 4 B.C. He had done much for the Jews, thanks to the favour he had won from the successive heads of the Roman State; and he had observed the Law publicly.

See Josephus, *Ant.* xv., xvi., xvii. 1-8, *B.J.* i. 18-33; Schürer, *Gesch. d. jüd. Völk.* (4th ed., 1901-09) i., and bibliography in Herzog's *Realencyklopädie*.

HEROD ANTIPAS, son of Herod the Great by the Samaritan Malthace, and full brother of Archelaus, received as his share of his father's dominions the provinces of Galilee and Peraea,

with the title of tetrarch. He fortified Sepphoris in Galilee and Betharamphtha in Peraea, and founded the important town of Tiberias on the west shore of the Sea of Galilee. He reigned 4 B.C.-A.D. 39. In the gospels he is mentioned as Herod, and he it was who was called a "fox" by Christ (Luke xiii. 32). He is erroneously spoken of as a king in Mark vi. 14. It was to him that Jesus was sent by Pilate to be tried. But it is in connection with his wife Herodias that he is best known. He was married first to a daughter of Aretas, the Arabian king; but, making the acquaintance of Herodias, the wife of his brother Philip (not the tetrarch), during a visit to Rome, he arranged to marry her. Meantime his Arabian wife discovered the plan and escaped to her father, who completely defeated Herod's army. John the Baptist condemned his marriage with Herodias, and in consequence was put to death. Encouraged by his wife, Herod journeyed to Rome to crave a crown from the emperor. Agrippa, his brother-in-law, managed to influence Caligula against him, and he was deprived of his dominions and banished to Lyons, Herodias voluntarily sharing his exile.

HEROD PHILIP, son of Herod the Great by Cleopatra of Jerusalem, received the tetrarchate of Ituraea and other districts east and north-east of the Lake of Galilee. His subjects were mainly Greeks or Syrians. He is described as an excellent ruler, who loved peace and was careful to maintain justice, and spent his time in his own territories. The cities he built include Caesarea Philippi and Bethsaida, which he called Julias. He died after a reign of 37 years (4 B.C.-A.D. 34).

HERODAS or HERONDAS (Gr. Ἡρόδας or Ἡρόνδας) (the name is spelt differently in the few places where he is mentioned), Greek poet, the author of short humorous dramatic scenes in verse, written under the Alexandrian empire in the 3rd century B.C. Apart from the intrinsic merit of these pieces, they are interesting in the history of Greek literature as being a new species illustrating Alexandrian methods. They are called *Μῦμιαι-βου* "Mime-iambics." Mimes were the Dorian product of southern Italy and Sicily—scenes in popular life written in the language of the people. Two of the best known and the most vital among the *Idylls* of Theocritus, the 2nd and the 15th, we know to have been derived from mimes of Sophron. What Theocritus is doing there Herodas, his younger contemporary, is doing in another manner—casting old material into novel form, upon a small scale, under strict conditions of technique. The method is entirely Alexandrian: Sophron had written in a peculiar kind of rhythmical prose; Theocritus uses the hexameter and Doric, Herodas the *scazon* or "lame" iambic (with a dragging spondee at the end) and the old Ionic dialect with which that curious metre was associated. That, however, hardly goes beyond the choice and form of words; the structure of the sentences is close-knit Attic. But the grumbling metre and quaint language suit the tone of common life which Herodas aims at realizing; for Herodas is a realist. His persons talk in vehement exclamations and emphatic turns of speech, with proverbs and fixed phrases; and occasionally, where it is designed as proper to the part, with the most naked coarseness of expression.

The scene of the second and the fourth is laid at Cos, and the speaking characters in each are never more than three. In Mime I. the old nurse calls on Metriche, whose husband has been long away in Egypt, and endeavours to excite her interest in a young man, fallen deeply in love with her at first sight. Metriche declines with dignity, but consoles the old woman with an ample glass of wine. II. is a monologue by the Πονροβοσκός ("Whoremonger") prosecuting a merchant-trader for breaking into his establishment at night and attempting to carry off one of the inmates, who is produced in court. The whole oration is also a burlesque in every detail of an Attic speech at law. In III. a desperate mother brings to the schoolmaster a truant urchin. In a voluble stream of interminable sentences she narrates his misdeeds and implores the schoolmaster to flog him. The boy accordingly is hoisted on another's back and flogged; but his spirit does not appear to be subdued. IV. is a visit of two poor women with an offering to the temple of Asclepius at Cos. While the humble cock is being sacrificed they admire

the works of art; among them a small boy strangling a vulpanser—doubtless the work of Boëthus that we know—and a procession by Apelles, “the Ephesian,” of whom we have an interesting piece of contemporary eulogy. The oily sacristan is admirably painted in a few slight strokes. In V. a jealous woman accuses one of her slaves, whom she has made her favourite, of infidelity; has him bound and sent to receive 2,000 lashes. The only pleasing person in the piece is the little maid-servant—whose tact suggests to her mistress an excuse for postponing execution of a threat made in ungovernable fury. VI. is a friendly chat or a private conversation. The subject is an ugly one, but the dialogue is clever with some delicious touches. Our interest is engaged here in a certain Cerdon, the artistic shoemaker, to whom we are introduced in VII. (the name had already become generic for the shoemaker as the typical representative of retail trade), a little bald man with a fluent tongue, complaining of hard times, who bluffs and wheedles by turns. VII. opens with a mistress waking up her maids to listen to her dream; but we have only the beginning, and the other fragments are very short.

Within the limits of 100 lines or less Herodas presents us with an entertaining scene and with characters definitely drawn. Some of these had been perfected no doubt upon the Attic stage, where the tendency in the 4th century had been gradually to evolve accepted types. The execution has the qualities of first-rate Alexandrian work in miniature, the finish and firm outlines; and these little pictures bear the test of all artistic work—they do not lose their freshness with familiarity but gain in interest as one learns to appreciate their subtle points.

The papyrus ms., obtained from the Fayum, is in the possession of the British Museum, and was first printed by F. G. Kenyon in 1891. Editions by O. Crusius (1905, text only, in Teubner series) and J. A. Nairn (1904), with introduction, notes and bibliography; W. Headlam and A. D. Knox, with introduction, notes, and Eng. translation (Camb. 1922); Text (I. VI.), with French commentary by P. Gnoemboom (Gnomique, 1922); other translations by H. Sharp-ley, *A Realist of the Aegean* (1906) (verse); R. T. Clark (1909), prose.

HERODIANS (Ἡρώδιανος) mentioned in the Gospels as taking up a hostile attitude to Jesus (once in Galilee and again in Jerusalem); cf. Mark iii. 6, xii. 13; Matt. xxii. 16; cf. also Mark viii. 15. In every case they are coupled with the Pharisees. The formation of the word (cf. “Caesariani” and “Pompeiani”) favours the view that what is meant is a party among the Jews who favoured the Herodian dynasty, and were its political partisans. Another view is that they represented a religious party known in Rabbinical Literature as “Boethusians” i.e., adherents of the family of Boëthus, whose daughter Mariamne was one of the wives of Herod the Great, and whose sons were raised by him to the High Priesthood.

HERODIANUS, Greek historian, flourished during the third century A.D. He is supposed to have been a Syrian Greek. In 203 he was in Rome, where he held some minor posts; the statement that he was imperial procurator and legate of the Sicilian provinces rests upon conjecture only. His historical work (Ἡρωδιάνου τῆς μετὰ Μάρκον βασιλείας ἱστοριῶν βιβλία ὀκτώ) deals with the years between the death of Marcus Aurelius and the proclamation of Gordianus III. (180–238). His work supplements Dion Cassius and has the value that attaches to a contemporary record written with candour and independence of view. But while he gives a lively account of external events—such as the death of Commodus and the assassination of Pertinax—the barbarian invasions, the spread of Christianity, the extension of the franchise by Caracalla are unnoticed. The dates are often wrong, and little attention is paid to geographical details, which makes the narrative of military expeditions beyond the borders of the empire difficult to understand.

Extensive use has been made of Herodianus by later chroniclers, especially the “Scriptores historiae Augustae” and John of Antioch. His history was first translated into Latin at the end of the 15th century by Politian. The most complete edition is by G. W. Irmisch (1789–1805), with elaborate indices, but the notes are very diffuse; critical editions by I. Bekker (1855), L. Mendelssohn (1883) and K. Stavenhagen (Teubner, 1922).

HERODIANUS, AELIUS, called ὁ τεχνικός, Alexandrian grammarian. He settled at Rome, under the patronage of Marcus Aurelius (161–180), to whom he dedicated his treatise on prosody (Καθολικὴ προσῳδία) in 21 books. Several epitomes of this work have been preserved. His Ἐπιμερισμοί dealt with difficult words and peculiar forms in Homer. Of his many grammatical treatises, only one has come down to us in a complete form (Περὶ μονήρων λέξεως), on exceptional or anomalous words.

The best edition is by A. Lentz, *Herodiani Technici reliquiae* (1867–70); a supplementary volume is included in Uhling's *Corpus grammaticorum Graecorum*; for further bibliographical information see W. Christ, *Geschichte der griechischen Literatur* (1898).

HERODOTUS (c. 484–425 B.C.), Greek historian, called the “Father of History,” was born at Halicarnassus in Asia Minor, then dependent upon the Persians, in or about the year 484 B.C. Herodotus was thus born a Persian subject, and such he continued until he was 30 or 35 years of age. At the time of his birth Halicarnassus was under the rule of a Queen Artemisia (q.v.). The family of Herodotus belonged to the upper rank of the citizens. His father was named Lyxes, and his mother Rhæo, or Dryo. He had a brother, Theodore, and an uncle or cousin, Panyasis (q.v.), the epic poet—a personage of so much importance that Artemisia's grandson, Lygdamis, suspecting him of treasonable projects, put him to death. It is probable that Herodotus shared his relative's political opinions, and either was exiled from Halicarnassus or quitted it voluntarily at the time of his execution. At any rate it is clear from the extant work of Herodotus that he must have devoted himself early to the literary life, and commenced that extensive course of reading which renders him one of the most instructive as well as one of the most charming of ancient writers. The poetical literature of Greece was already large; the prose literature was more extensive than is generally supposed; yet Herodotus shows an intimate acquaintance with the whole of it. The *Iliad* and the *Odyssey* are as familiar to him as Shakespeare to the educated Englishman. He is acquainted with the poems of the epic cycle, the *Cypria*, the *Epigoni*, etc. He quotes or otherwise shows familiarity with the writings of Hesiod, Olen, Musaeus, Bacis, Lysistratus, Archilochus of Paros, Alcaeus, Sappho, Solon, Aesop, Aristæas of Proconnesus, Simonides of Ceos, Phrynichus, Aeschylus and Pindar. He quotes and criticizes Hecataeus, the best of the prose writers who had preceded him, and makes numerous allusions to other authors of the same class.

It must not, however, be supposed that he was at any time a mere student. It is probable that from an early age his inquiring disposition led him to engage in travels, both in Greece and in foreign countries. He traversed Asia Minor and European Greece probably more than once; he visited all the most important islands of the Archipelago—Rhodes, Cyprus, Delos, Paros, Thasos, Samothrace, Crete, Samos, Cythera and Aegina. He undertook the long and perilous journey from Sardis to the Persian capital, Susa, visited Babylon, Colchis, and the western shores of the Black sea as far as the estuary of the Dnieper; he travelled in Scythia and in Thrace, visited Zante and Magna Graecia, explored the antiquities of Tyre, coasted along the shores of Palestine, saw Gaza and made a long stay in Egypt. At the most moderate estimate, his travels covered a space of 31 degrees of longitude, or 1,700 miles, and 24 of latitude, or nearly the same distance. At all the more interesting sites he took up his abode for a time; he examined, he enquired, he made measurements, he accumulated materials. Having in his mind the scheme of his great work, he gave ample time to the elaboration of all its parts, and took care to obtain by personal observation a full knowledge of the various countries. The travels of Herodotus seem to have been chiefly accomplished between his 20th and his 37th years (464–447 B.C.) but the dates are difficult to determine.

After Herodotus had resided for some seven or eight years in Samos, events occurred in his native city which induced him to return thither. The tyranny of Lygdamis had gone from bad to worse, and at last he was expelled. According to Suidas, Herodotus was himself an actor, and indeed the chief actor, in the rebellion against him; but no other author confirms this statement. Halicarnassus became henceforward a voluntary member of the

Athenian confederacy. Herodotus would now naturally return to his native city, and enter upon the enjoyment of those rights of free citizenship on which every Greek set a high value. But soon, owing either to political causes or, according to ancient anecdote, to lack of literary appreciation he withdrew (about 447 B.C.) to Athens, where his work won such approval that in the year 445 B.C., on the proposition of a certain Anytus, he was voted a sum of ten talents (£2,400) by decree of the people. But he did not possess the status of a citizen, and at Athens the franchise, jealously guarded at this period, was not to be attained without great expense and difficulty. Accordingly, in the spring of the following year he sailed from Athens with the colonists who went out to found the colony of Thurii (see PERICLES), and became a citizen of the new town.

From this point of his career, when he had reached the age of 40, we lose sight of him almost wholly. He seems to have made but few journeys—one to Crotona, one to Metapontum, and possibly one to Athens (about 430 B.C.) being all that his work indicates. No doubt he was employed mainly, as Pliny testifies, in retouching and elaborating his general history. He may also have composed at Thurii that special work on the history of Assyria to which he twice refers in his first book, and which is quoted by Aristotle. It is not probable that he much outlived 424 B.C. The predominant voice of antiquity tells us that he died at Thurii, where his tomb was shown in later ages.

The History.—In estimating the great work of Herodotus, and his genius as its author, it is above all things necessary to conceive aright what that work was intended to be. It has been called “a universal history,” “a history of the wars between the Greeks and the barbarians,” and “a history of the struggle between Greece and Persia.” But these titles are, all of them, too comprehensive. Herodotus, who omits wholly the histories of Phoenicia, Carthage and Etruria—three of the most important among the States existing in his day—cannot have intended to compose a “universal history,” the very idea of which belongs to a later age. He speaks in places as if his object was to record the wars between the Greeks and the barbarians; but as he omits the Trojan War, in which he fully believes, the expedition of the Teucrians and Mysians against Thrace and Thessaly, the wars connected with the Ionian colonization of Asia Minor and others, it is evident that he does not really aim at embracing in his narrative all the wars between Greeks and barbarians with which he was acquainted. Nor does it ever seem to have been his object to give an account of the entire struggle between Greece and Persia. That struggle was not terminated by the battle of Mycale and the capture of Sestos in 479 B.C. His intention was not to give an account of the entire long contest between the two countries but to write the history of a particular war—the great Persian war of invasion. His aim was as definite as that of Thucydides or Schiller or Napier or any other writer who has made his subject a particular war; only he determined to treat it in a certain way. Every partial history requires an “introduction”; Herodotus, untrammelled by examples, resolved to give his history a magnificent introduction. Thucydides is content with a single introductory book, forming little more than one-eighth of his work; Herodotus has six such books, forming two-thirds of the entire composition.

By this arrangement he is enabled to treat his subject in the *grand* way, which is so characteristic of him. Making it his main object in his “introduction” to set before his readers the previous history of the two nations who were the actors in the great war, he is able in tracing their history to bring into his narrative some account of almost all the nations of the known world, and has room to expatiate freely upon their geography, antiquities, manners and customs, and the like, thus giving his work a “universal” character, and securing for it, without trenching upon unity, that variety, richness and fullness which are a principal charm of the best histories, and of none more than his. In tracing the growth of Persia from a petty subject kingdom to a vast dominant empire, he has occasion to set out the histories of Lydia, Media, Assyria, Babylon, Egypt, Scythia, Thrace; and to describe the countries and the peoples inhabiting them, their natural productions, climate, geographical position, monuments, etc.; while, in noting the contem-

poraneous changes in Greece, he is led to tell of the various migrations of the Greek race, their colonies, commerce, progress in the arts, revolutions, internal struggles, wars with one another, legislation, religious tenets and the like. The greatest variety of episodic matter is thus introduced; but the propriety of the occasion and the mode of introduction are such that no complaint can be made; the episodes never entangle, encumber or even unpleasantly interrupt the main narrative. Of his trustworthiness as a historian varying opinions have been entertained, which are dealt with under GREECE (*History* “Authorities”). But of his merits as a writer there can be no dispute. “O that I were in a condition,” says Lucian, “to resemble Herodotus, if only in some measure! I by no means say in all his gifts, but only in some single point; as, for instance, the beauty of his language, or its harmony, or the natural and peculiar grace of the Ionic dialect, or his fullness of thought, or by whatever name those thousand beauties are called which to the despair of his imitator are united in him.” Cicero calls his style “copious and polished,” Quintilian, “sweet, pure and flowing”; Longinus says he was “the most Homeric of historians”; Dionysius, his countryman, prefers him to Thucydides, and regards him as combining in an extraordinary degree the excellences of sublimity, beauty and the true historical method of composition.

BIBLIOGRAPHY.—About 1450 a Latin version of the history of Herodotus was made and published by Laurentius Valla. This was revised in 1536 by Heusbach, and accompanies the Greek text in many editions. The first complete translation into a modern language was the English one of Littlebury (1737), followed (1786) by the French translation of Larcher, a valuable work with copious notes. A good German translation, without note or comment, was brought out by F. Lange (1811). A. Mustoxidi published an Italian version (1820); A. Schöll, German translation with notes (1828–32, new ed. 1855); Isaac Taylor, English version (1829); G. Rawlinson, English version (1853–60); G. C. Macauley (1890). Translations have been made into many languages.

The best of the older editions of the Greek text are: *Herodoti historiae* (edit. Schweighäuser, Strasbourg, 1816); *Herodoti Halicarnassei historiarum libri IX.* (edit. Gaisford, 1840); *Herodotus, with a Commentary* (J. W. Balkesley, 1854); *Herodoti musae* (edit. Bähr, Leipzig, 1856–61), and *Herodoti historiae* (edit. Abicht, Leipzig, 1869). The most recent editions are the following: H. Stein, *Herodoti Historiae* (edit. Major, 1869–71, with *apparatus criticus*); H. Kellenberg, *Historiarum libri IX.* (Leipzig, 1887); Van Herwerden, *Isotopia* (Leyden, 1885), H. Stein, *Herodotus erklärt* (1883); A. H. Sayce, *The Ancient Empires of the East, Herodotus I–III., with introductions and appendices* (1883); R. W. Macan, *Herodotus IV–VI.* (1895) and *Herodotus VII–IX.* (1908); E. Abbott, *Herodotus V. and VI.* (1893); A. Wiedemann, *Herodots zweites Buch mit sachlichen Bemerkungen* (Leipzig, 1890); W. W. How and J. Wells, *Commentary upon Herodotus* (1912).

Among works illustrative of Herodotus are: Niebuhr, *Geography of Herodotus and Scythia* (Eng. trans. 1830); Abicht, *Übersicht über den Herodoteischen Dialekt* (Leipzig, 3rd ed. 1874); and *De codicum Herodoti fide ac auctoritate* (Naumburg, 1869); Melander, *De anacoluthis Herodoteis* (Lund, 1869); Merzdorf, *Quaestiones grammaticae de dialecto Herodotea* (Leipzig, 1875); H. Delbrück, *Perser und Bergvölkerkriege* (1887); N. Wecklein, *Über die Tradition der Perserkriege* (Munich, 1876); J. A. R. Munro, “Some Observations on the Persian Wars” (in various vols. of *The Journal of Hellenic Studies*); G. B. Grundy, *The Great Persian War* (1901); J. B. Bury, *Ancient Greek Historians* (1908); P. Kropp, *Die minoisch-mykenische Kultur im Lichte der Überlieferung bei Herodot* (Leipzig, 1905); C. Sourdis, *La Durée et l'Étendue du Voyage d'Herodote en Égypte* (1910), and *Herodote et la Religion de l'Égypte* (1910); W. Aly, *Volksmärchen, Sage und Novelle bei Herodot* (Göttingen, 1921); J. Wells, *Studies in Herodotus* (1923); R. Glover, *Herodotus* (1924); L. Whibley, *The Famous History of Herodotus* (Eng. trans. of Bks. I. and II. by B.R., 1584; New York, 1924); G. Rawlinson, *The Egypt of Herodotus* (1924); H. Tiedler, *Herodot; Reisen und Forschungen in Afrika* (Leipzig, 1926); W. Sprengelberg, *The Credibility of Herodotus' Account of Egypt* (Eng. trans. 1927).

HÉROËT, ANTOINE, surnamed LA MAISON-NEUVE (d. 1568), French poet, bishop of Digne, was born in Paris of a family connected with the chancellor Olivier. His poetry belongs to his early years, for after he had taken orders he ceased to write profane poetry. His chief work is *La Parfaicte Amye* (Lyons, 1542) in which he developed the idea of a purely spiritual love, based chiefly on the reading of the Italian Neo-Platonists. The book aroused great controversy. La Borderie replied in *L'Amye de cour* with a description of a very much more human woman, and Charles Fontaine contributed a *Contr' amyé de cour* to the

dispute. Héroet, in addition to some translations from the classics, wrote the *Complainte d'une dame nouvellement surprise d'amour*, an *Epistre a François I^{er}*, and some pieces included in the now very rare *Opuscules d'amour par Héroet, La Borderie et autres divins poètes* (Lyons, 1547). Héroet belongs to the Lyonnese school of which Maurice Scève may be regarded as the leader.

See H. F. Cary, *The Early French Poets* (1846).

HEROIC ROMANCES, the name of a class of imaginative literature which flourished in the 17th century, principally in France. The beginnings of fiction in that country took a pseudo-bucolic form with the celebrated *Astrée* (1610) of Honoré d'Urfé (1568-1625); but this ingenious and diffuse production was the source of a vast literature, which took many and diverse forms. Although its action was, in the main, languid and sentimental, there was a side of the *Astrée* which encouraged that extravagant love of glory, that spirit of "panache," which was now rising to its height in France. That spirit it was which animated Marin le Roy, sieur de Gomberville (1600-74), the inventor of the Heroic Romances. In these there was experienced a violent recrudescence of the mediaeval elements of romance, the impossible valour devoted to a pursuit of the impossible beauty, but the whole clothed in the language and feeling and atmosphere of a later age. In the *Carithée* of Gomberville (1621) we have a pastoral which is already beginning to be a heroic romance, and a book in which, under a travesty of Roman history, an appeal is made to an extravagantly chivalrous enthusiasm. A further development was seen in the *Polyxène* (1623) of François de Molière, and the *Endymion* (1624) of Gombauld; in the latter the elderly queen, Marie de' Medici, was celebrated under the disguise of Diana, for whom a beautiful shepherd of Caria nourishes a hopeless passion. The earliest of the Heroic Romances, pure and simple, is, however, the celebrated *Polexandre* (1629) of Gomberville. The author began by intending his hero to represent Louis XIII., but he changed his mind, and drew a portrait of Cardinal Richelieu. The story deals with the adventures of a hero who visits all the sea-coasts of the world, the most remote as well as the most fabulous, in search of an ineffable princess, Alcidiene. This absurd, yet very original piece of invention enjoyed an immense success. There was an equal amount of geography and more of ancient history in the *Ariane* (1632) of Desmarets de Saint-Sorlin (1595-1676), which has been greeted by Paul Morillot as the most readable of all the Heroic Romances.

Calprenède and Scudéry.—The type of that class of literature, however, has always been found in the highly elaborate writings of Gauthier de Coste de la Calprenède (1609-63), which enjoyed for a time a prodigious celebrity. His *Cassandre*, which appeared in ten volumes between 1642 and 1645, is perhaps the most characteristic of all the Heroic Romances. It deals with the decline of the empire of Alexander the Great. It must not be supposed, however, that la Calprenède makes the smallest effort to deal with the subject accurately or realistically. The figures are seigneurs and great ladies of the court of Louis XIII., masquerading in Macedonian raiment. The passion of love is dominant, and it is treated in the most exalted and hyperbolic spirit. La Calprenède followed up the success of his *Cassandre* with a *Cléopâtre* (1647) in 12 volumes, and a *Faramond* (1661) which he did not live to finish. It should be said that la Calprenède objected to his books being styled romances, and insisted that they were specimens of "history embellished with certain inventions." He may, in opposition to his wishes, claim the doubtful praise of being, in reality, the creator of the modern historical novel.

The vogue of the historical romance was carried to its height by a brother and a sister, Georges de Scudéry (1601-67) and Madeleine de Scudéry (1608-1701), whose elephantine romances remain as portents in the history of literature. These novels—there are five of them—were signed by Georges de Scudéry, but it is believed that all were in the main written by Madeleine. The earliest was *Ibrahim, ou l'Illustre Bassa* (1641); it was followed by *Le Grand Cyrus* (1648-53) and the final, and most preposterous member of the series was *Clélie* (1649-54). The romances of Mlle. de Scudéry (for to her we may safely attribute them) are

much inferior in style to those of la Calprenède. They are pretentious, affected and sickly. The author abuses the element of analysis, and pushes a psychology, which was beyond the age in penetration, to a wearisome and excessive extent.

Vogue in England.—In England the Heroic Romance had a period of flourishing popularity. All the principal French examples were translated, and "he was not to be admitted into the academy of wit who had not read *Astrea* and *The Grand Cyrus*." The vogue of these books in England lasted from about 1645 to 1660, and led to the composition of original works in imitation of the French. The most remarkable of these was *Parthenissa*, published in 1654 by Roger Boyle, Lord Broghill and afterwards earl of Orrery (1621-79). Addison speaks in the *Spectator* of the popularity of all these huge books, "the *Grand Cyrus*, with a pin stuck in one of the middle leaves, *Clélie*, which opened of itself in the place that describes two lovers in a bower." M. Jusserand has analysed what may be considered the very latest of the race, *Pandion and Amphigenia*, published in 1665 by the dramatist, John Crowne.

See G. de Percel, *De l'usage des romans* (1734); J. J. Jusserand, *Le Roman anglais au XVII^e siècle* (1888); André Le Breton, *Le Roman au XVII^e siècle* (1890); P. Morillot, *Le Roman en France depuis 1610* (1894). (E. G.; X.)

HEROIC VERSE, a term exclusively used in English to indicate the rhymed iambic line or **HEROIC COUPLET**. In ancient literature the heroic verse was the hexameter. It was in this measure that the *Iliad* and *Odyssey* and the *Aeneid* were written. In English, however, it is not enough to designate a single iambic line of five beats as heroic verse because it is necessary to distinguish blank verse from the distich, consisting of two rhymed lines, each of ten syllables. In French the Alexandrine has always been regarded as the heroic measure of that language. The current form of English heroic verse appears to be the invention of Chaucer, who used it in his *Legend of Good Women*, and afterwards, with still greater freedom, in the *Canterbury Tales*. He was followed nearly a century later by the Scottish poet, called Blind Harry (c. 1475), whose *Wallace* holds an important place in the history of versification as having passed on the tradition of the heroic couplet. Another Scottish poet, Gavin Douglas, selected heroic verse for his translation of the *Aeneid* (1513) and displayed, in such examples as the following, a skill which left little room for improvement at the hands of later poets:—

"One sang, 'The ship sails over the salt foam,
Will bring the merchants and my leman home';
Some other sings, 'I will be blithe and light,
Mine heart is leant upon so goodly wight.'"

The verse so successfully mastered was, however, not very generally used for heroic purposes in Tudor literature. The early poets of the revival, and Spenser and Shakespeare after them, greatly preferred stanzaic forms. For dramatic purposes blank verse was almost exclusively used, although the French had adopted the rhymed Alexandrine for their plays. In Elizabethan England heroic verse was often put to somewhat unheroic purposes, mainly in prologues and epilogues, or other short poems of occasion; but it was nobly redeemed by Marlowe in his *Hero and Leander* and respectably by Browne in his *Britannia's Pastorals*. It is to be noted, however, that those Elizabethans who, like Chapman and Drayton, aimed at producing a warlike and Homeric effect, did so in shambling 14-syllable couplets. The one heroic poem of that age written at considerable length in the appropriate national metre is the *Bosworth Field* of Sir John Beaumont (1582-1628). Since the middle of the 17th century, when heroic verse became the typical and for a while almost the solitary form in which serious English poetry was written, its history has known many vicissitudes. After having been the principal instrument of Dryden and Pope it was almost entirely rejected by Wordsworth and Coleridge, but revised, with various modifications, by Byron, Shelley (in *Julian and Maddalo*), and Keats (in *Lamia*). In the second half of the 19th century its prestige was restored by the brilliant work of Swinburne in *Tristram* and elsewhere. Alfred Noyes, in *Drake*, has given a contribution in this vein in recent times.

HEROIN. The trade name for a derivative of morphine (diacetylmorphine hydrochloride) which resembles morphine in its action but according to Ott is depressant to the spinal cord and about twice as depressant to the respiratory centre. For these reasons it is inferior to morphine as an analgesic. Its manufacture or importation is forbidden in the United States. Heroin is a white crystalline powder of bitter taste soluble in 3 parts of water and in 11 parts of 90% alcohol. Its most important medical use is as a respiratory sedative to allay cough in doses of one-sixteenth to one-sixth of a grain. At first it was used in place of morphine to avoid the danger of addiction characteristic of morphine but later experience showed that it is fully as dangerous in this respect. It makes addicts quickly; its victims are often mere children in years and experience; through insufflation, ingestion or subcutaneous injection its effect is practically instantaneous. According to the prison and police statistics "heroin is the drug used by addicts of over 95% of New York's underworld (criminal classes)" (Hubbard, New York State In. Med., 1924, 24, 62).

HÉROLD, LOUIS JOSEPH FERDINAND (1791-1833), French composer, the son of François Joseph Hérold, an accomplished pianist, was born in Paris, on Jan. 28, 1791. In 1806 Hérold entered the Paris Conservatoire, where he studied under Catal and Méhul. In 1812 he gained the Grand Prix de Rome with the cantata *La Duchesse de la Vallière*, and started for Italy, where he remained till 1815 and composed a symphony, a cantata and several pieces of chamber music. His first opera *La Gioventù di Enrico V.*, was performed at Naples in 1815. After his return to Paris Hérold produced numerous works for the stage in rapid succession including the opera *La Clochette* (1817), *L'Auteur mort et vivant* (1820), *Marie* (1826), and the ballets *La Fille mal gardée* (1828) and *La Belle au bois dormant* (1829). In 1831 he produced the romantic opera *Zampa* and in the following year *Le Pré aux clercs*, both of which contain many fine pages and had great success. These two operas secured immortality for the name of the composer, who died on Jan. 18, 1833 of the lung disease from which he had suffered for many years. His unfinished opera *Ludovic* was afterwards printed by J. F. F. Halévy.

See monographs by Jouvin (1868), Berthelot (1882) and Pougin.

HERON, a long-necked, long-legged bird, the type of the group *Ardeidae*. This group may be divided into herons, bitterns, (*q.v.*), egrets (*q.v.*) night-herons, and boatbills.

The common heron of Europe, *Ardea cinerea*, is one of the few large birds now inhabiting England. In olden times it afforded great sport to the hawkers. Its flight is lofty and leisurely, but swift. Its food consists of fish, amphibians, and other small animals, which it strikes, while wading or standing in water, with its dagger-shaped beak. Herons, where sufficiently numerous, breed in colonies called heronries; the nest consists of a huge mass of sticks, lined with twigs, and is usually, though not invariably, placed on a tree. The light blue eggs number four to six and the young are at first clothed in flax-coloured "powder-down." The

adult is recognized by its long neck, beak, and legs, its broad, slate-coloured wings, and the black plumes on its head. It measures 3 ft. from bill to tail and may have a wing-spread of 6 ft., but it rarely exceeds 4 lb. in weight. The sexes are not very dissimilar. Many herons have adornments in the shape of long plumes springing from the shoulder. These correspond to the aigrettes of the egrets, but retain their barbules.

In America the European heron is replaced by the great blue heron (*A. herodias*) which is larger. *A. goliath* of Africa and Asia

is, however, the largest of the group. The Old World purple heron (*A. purpurea*) must also be mentioned. The Louisiana heron (*Hydranassa tricolor*) is an abundant form from North Carolina southwards; it is recognized on the wing by the conspicuous white abdomen. The little blue heron (*Florida coerulea*) breeds locally, but in large numbers, from the Gulf State to South Carolina. It is white when immature.

Of the night herons (*Nycticorax*), *N. nycticorax* is widely spread over the Old World, and is replaced by a subspecies in America. Other species are found in America, Asia, West Africa, Australia, and the Galapagos, and a species inhabited Rodriguez at the time of its colonization, but is now extinct.

The boatbill (*Cancroma cochlearia*) is remarkable for its huge bill. It is a native of tropical America.

Heron has been found in a fossil state in the Miocene and London clay of Europe.

HERON OF ALEXANDRIA, Greek geometer and writer on mechanical and physical subjects. Heron's date is still a matter of controversy. The possible limits are 150 B.C. (for he was later than Apollonius of Perga and Hipparchus) and 250 A.D. (since he preceded Pappus). The latest discussions by scholars have tended to place him as late as the 3rd century A.D. (after Ptolemy), but there are those who still adhere to 150-100 B.C. as the probable date of his activity.

Of Heron's mechanical works, the *Pneumatica*, *Automatopoietice*, *Belopoeica* and *Cheiroballistra* survive in Greek. The *Pneumatica*, in two books, describes many interesting contrivances such as siphons, "Heron's fountain," "penny-in-the-slot" machines, a fire-engine, a water-organ and arrangements employing the force of steam. The *Belopoeica* (on engines of war) purports by its title ("Ἡρώων Κτησιβίου βελοποιικά") to be based on a work by Ctesibius, who was most probably the Ctesibius who lived under Ptolemy II. Philadelphus (285-247 B.C.). Heron's *Mechanics*, in three books, is extant in Arabic, though not in its original form. This work is cited by Pappus, as is also the *Barulcus*, "weight-lifter," probably the same treatise under a different name. Book II. of the *Mechanics* deals with the five mechanical powers and mechanical problems of daily life, and Book III. with the construction of engines of all sorts. Both the *Belopoeica* and the *Mechanics* contain Heron's solution of the problem of the two mean proportionals.

The geometrical works attributed to Heron which survive in Greek bear the titles *Metrica*, *Definitiones*, *Geometria*, *Geodaesia*, *Stereometrica* (i., ii.), *Mensurae* and *Liber Geōponicus*. The *Metrica* was discovered as recently as 1896 by R. Schöne in a ms. at Constantinople. It is by far the most important, as it is the most genuine, of the geometrical works of Heron, and proves him to have been an accomplished mathematician. The other works containing, like the *Metrica*, problems of mensuration are not Heron's in their present form. A remarkable feature is the statement of a variety of close approximations to the square roots of numbers which are not complete squares; the *Metrica* describes a general method of finding successive approximations to the values of such surds, as well as a method of approximating to the cube root of a non-cube number; the former throws light on similar approximations to surds stated in Archimedes and elsewhere. Book I. of the *Metrica* includes the mensuration of triangles, quadrilaterals, regular polygons from the equilateral triangle to the regular dodecagon, circles and segments thereof, an ellipse, a parabolic segment, and of the surfaces of cylinders, right cones, spheres and segments thereof. Book II. shows how to measure the content of solid figures, including cones, pyramids, frusta of such solids, a sphere and a segment thereof, the five regular solids, besides the two remarkable solid figures measured by Archimedes in his *Method* (a solid like a hoof cut off by a plane from the end of a cylinder, and a solid made up of eight such "hoofs"). Book III. gives some problems of the same type as those in Euclid's treatise *On Divisions* (of figures). Akin to the geometrical works is that *On the Dioptra*, a remarkable book on land-surveying, so called from the instrument described in it, which was used for the same purposes as the modern theodolite; this treatise contains (as does the *Metrica*) a remarkable geometrical proof of the

BY COURTESY OF THE NATIONAL ASSOCIATION OF AUDUBON SOCIETIES
THE GREEN HERON (BUTORIDES VIRESCENS), COMMON THROUGHOUT THE UNITED STATES

expression for the area of a triangle in terms of its sides,

$$\Delta = \sqrt{s(s-a)(s-b)(s-c)}$$

Heron also wrote *Catoptrica* (on reflecting surfaces); and it seems certain that we possess this in a Latin translation by William of Moerbeke of a work which was formerly thought to be a fragment of Ptolemy's *Optics*. Of other treatises by Heron only fragments remain. One on *Water-Clocks* in four books is referred to by Pappus and Proclus. Another was a commentary on Euclid's *Elements*, quotations from which are found in the extant Arabian commentary by an-Nairizi.

BIBLIOGRAPHY.—The *Pneumatica*, *Automatopoietice*, *Belopoeica* and *Cheiroballistra* of Heron were edited in Greek and Latin by Thévenot, (*Veterum mathematicorum opera*, Paris, 1693). The "geometrical" works (other than the *Metrica*), in Greek only, were edited by F. Hultsch (*Heronis Alexandrini geometricorum et stereometricorum reliquiae*, 1864). Except for the treatises on *Engines of War* (also edited by C. Wescher, *Polyorchétique des Grecs*, Paris, 1867), the authoritative edition is now *Heronis Alexandrini opera quae supersunt omnia*, included in Teubner's series; vol. i. and Supplement (by W. Schmidt) contains the *Pneumatica* and *Automata*, the fragment on *Water-Clocks*, etc.; vol. ii. pt. i. (L. Nix and W. Schmidt), the *Mechanics*, *Catoptrica*, etc.; vol. iii. (H. Schöne), the *Metrica* and *Dioptra*; vols. iv. and v. (J. L. Heiberg), the geometrical works.

For fuller accounts of Heron's works see G. Loria, *Le scienze esatte nell' antica Grecia*, 1914; Sir T. L. Heath, *History of Greek Mathematics*, vol. ii., pp. 298–354; Pauly-Wissowa's *Real-Encyclopädie s.v.* (T. L. H.)

HEROPHILUS (fl. 300 B.C.), Alexandrian anatomist, was born at Chaludon, and was one of the founders of a school of anatomy at Alexandria. Being one of the first to perform post-mortem examinations, he studied the eye and cataract, traced the sinuses of the dura mater to their meeting point, still called the torcular herophili, and described the ventricles of the brain, an organ which he regarded as the centre of the nervous system. The nerve trunks he distinguished into sensory and motor branches. He also gave careful accounts of the liver, salivary glands, pancreas and the genital tracts of both sexes, and emphasized the curative powers of drugs, dietetics and gymnastics. Herophilus wrote commentaries on the works of Hippocrates, a book for midwives, and a treatise on the causes of sudden death.

HERPES, an inflammation of the true skin, attended with the formation of isolated or grouped vesicles of various sizes upon a reddened base. They contain a clear fluid, and either rupture or dry up. Two well-marked varieties of herpes are frequently met with. (a) In *herpes labialis et nasalis* the eruption occurs about the lips and nose. It is seen in cases of certain acute febrile ailments, such as fevers, inflammation of the lungs or even in a severe cold. It soon passes off. (b) In *herpes zoster*, *zona* or "shingles" the eruption occurs in the course of one or more cutaneous nerves, often on one side of the trunk, but it may be on the face, limbs or other parts. It may occur at any age, but is more frequent in elderly people. The appearance of the eruption is usually preceded by severe, stinging, neuralgic pains, and, not only during the continuance of the herpetic spots, but long after they have disappeared, these pains may continue. The disease seldom recurs. The most that can be done for its relief is to protect the parts with cotton wool or some dusting powder, while the pain may be allayed by aspirin or bromide of potassium. Quinine internally is often of service. Though the lesions are identical in appearance the two types differ in causation. Herpes labialis is due to a filter-passing virus which is inoculable into the rabbit's cornea; herpes zoster is associated with, and probably dependent upon, changes in the large cells of the posterior root ganglia (see SPINAL CORD) supplying the part affected.

HERPETOLOGY, the study of reptiles (q.v.).

HERRERA, FERNANDO DE (c. 1534–1597), Spanish lyrical poet, was born at Seville. His *Anotaciones á las obras de Garcilaso de la Vega* (1580) involved him in a series of literary polemics, and his verbal innovations laid him open to attack. But the workmanship of his sonnets to the countess of Gelves is admirable, while his odes on the battle of Lepanto, on Don John of Austria, and the elegy on King Sebastian of Portugal entitle him to rank as the greatest of Andalusian poets and as the most important of the followers of Garcilaso de la Vega (see VEGA).

See A. Coster, *Fernando de Herrera (El Divino)*, 1534–97 (Paris, 1908).

HERRERA, FRANCISCO (1576–1656) surnamed EL VIEJO (the old), Spanish painter, was born at Seville, is said to have studied under Luis Fernandez or under Francisco Pacheco. He was a skilful engraver, an accomplishment that led to his being charged with coining base money. He had to seek sanctuary in the Jesuit college of San Hermenegildo, which he adorned with a fine picture of its patron saint, now in the museum at Seville. Philip IV. on his visit to Seville in 1624 having seen this picture and learned the position of the artist pardoned him. In 1629 Herrera painted in conjunction with Turbaran for the church of St. Bonaventura at Seville a series of pictures illustrating the life of the saint; of the four paintings which were executed by Herrera three have survived; one is now in Prado museum at Madrid. Other notable works are the "Last Judgment" in the church of San Bernerdo at Seville; the "Pentecost" (1617) in the Greco Museum at Toledo; the "Vision of St. Basil" in the Louvre; the "St. Jerome" in the museum of Rouen. His last extant work dated 1648 is the "St. Joseph with the Child," in the possession of Don T. Lazaro, Madrid. Herrera often chose humble subjects as fairs, carnivals, ale houses and the like, and these genre paintings called *bodegones* were much sought after. Three of these are still extant; one is in the Czernin collection at Vienna, one in the museum of Nantes and another in that of Avignon. There are some bold pen and ink drawings by the master representing apostles at the British Museum and at the National Library in Madrid. In 1650 Herrera moved from Seville to Madrid where he died in 1656. He was of violent temper; was amongst the strongest and most rebellious of Spanish artists; and it is said of him that he was wont to paint with heavy brushes and even with reeds. Under the influence of the painting of Juan de Ruelas, Herrera relinquished the timid Italian manner of the old Spanish school of painting and helped to initiate the free vigorous touch and style which reached such perfection in Velasquez. His pictures are marked by realism, energy of design and freedom of execution; he was a master of chiaroscuro, making his figures stand out in strong relief; his colour is vibrating. Among his pupils were Ignacio Iriarte, a landscape painter; and Velasquez, who as a boy of 13 worked in his studio for six months.

His son, FRANCISCO HERRERA (1622–1685), surnamed el Mozo (the young), was a painter and architect. Unable to endure his father's temper, the younger Herrera fled from Seville to Rome, where he became renowned for his pictures of still-life, flowers and fruit, and from his skill in painting fish was called by the Italians *lo Spagnuolo degli pesci*. In later life he painted portraits with great success. He returned to Seville at his father's death, and in 1660 was employed on two pictures in the cathedral; in 1660 he was appointed sub-director of the new academy there, under Murillo. Soon after he went to Madrid, where he was employed to paint a San Hermenegildo (now in the Prado Museum), for the barefooted Carmelites, and to decorate in fresco the roof of the choir of San Felipe el Real. The success of this last work procured for him a commission from Philip IV. to paint in fresco the roof of the Atocha church. He chose as his subject the Assumption of the Virgin. He was rewarded with the title of painter to the king, and was appointed superintendent of the royal buildings. Other notable works painted in Madrid are the "Ecce Homo," and "Christ bearing the Cross," in the Cervaldo collection in Madrid. His pictures are inferior to the older Herrera's both in design and in execution. As architect he is said to have designed the plans for the Pilas cathedral at Saragossa, the first important Baroque church in Spain. His youngest brother, known as Herrera el Rubio (the ruddy), who died very young, gave great promise as a painter.

HERRERA Y TORDESILLAS, ANTONIO DE (1559–1625), Spanish historian, secretary to Vespasian Gonzago and first historiographer of the Indies. His *Historia general de los hechos de los Castellanos en las islas y tierra firme del Mar Oceano* (1601) is borrowed largely from other mss., especially from those of Bartolomé de Las Casas and of Cervantes de Salazar. The work is, on the whole, accurate and unprejudiced, though confused. It was translated into English in 1740.

HERRICK, MYRON T. (1854-1929), American diplomat, was born at Huntington, O., Oct. 9, 1854. He studied law in Cleveland and was admitted to the bar in 1878. He practised in Cleveland from 1878 to 1886 and then turned his attention to banking and manufacturing. He also became interested in politics and held many local and State offices in the Republican organizations, serving six times as delegate to the Republican national convention and once (1892) as presidential elector from Ohio. From 1903-06 he was governor of Ohio, having been elected by the largest majority that had been given to an Ohio governor up to that time. He was forced by his business interests to decline appointments as secretary of the Treasury under McKinley and again under Taft, but in 1912 accepted the latter's appointment as ambassador to France. He continued to serve under Wilson, and at the outbreak of the World War also assumed charge of the German and Austrian embassies and later those of Turkey and minor nations. During the Marne offensive of 1914 when the French Government moved to Bordeaux, Herrick maintained headquarters in Paris. He formed the American Committee, which gave help to Americans and others travelling in Europe at the outbreak of the war. With Mrs. Herrick he established the American Ambulance hospital at Neuilly, staffed and managed by Americans. After his return to America in Dec. 1914, he continued to devote much of his time to war relief activities and in recognition of his services France conferred upon him the cross of the Legion of Honour. Herrick was one of the initiators of the rural credit movement in the United States; he published *Rural Credits* (1914). In April 1921 he was again appointed ambassador to France and served in this post until his death in Paris on March 31, 1929.

See T. Bentley Mott, *Myron T. Herrick* (1929).

HERRICK, ROBERT (1591-1674), English poet, was born at Cheapside, London, and baptized on Aug. 24, 1591. He belonged to an old Leicestershire family which had settled in London. He was the seventh child of Nicholas Herrick, goldsmith, of the City of London, who died in 1592, under suspicion of suicide. The children were brought up by their uncle, Sir William Herrick, one of the richest goldsmiths of the day, to whom in 1607 Robert was bound apprentice. He had probably been educated at Westminster school, and in 1614 he proceeded to Cambridge; and it was no doubt during his apprenticeship that the young poet was introduced to that circle of wits which he was afterwards to adorn. He seems to have been present at the first performance of *The Alchemist* in 1610, and it was probably about this time that Ben Jonson adopted him as his poetical "son." He entered the university as fellow-commoner of St. John's college, and he remained there until, in 1616, upon taking his degree, he removed to Trinity Hall. A lively series of 14 letters to his uncle, mainly begging for money, exists at Beau-manor, and shows that Herrick suffered much from poverty at the university. He took his B.A. in 1617, and in 1620 he became master of arts. From this date until 1627 we entirely lose sight of him; it has been variously conjectured that he spent these years preparing for the ministry at Cambridge, or in much looser pursuits in London. In 1629 (Sept. 30) he was presented by the king to the vicarage of Dean Prior, not far from Totnes in Devonshire. At Dean Prior he resided quietly until 1648, when he was ejected by the Puritans. The solitude there oppressed him at first; the village was dull and remote, and he felt very bitterly that he was cut off from all literary and social associations; but soon he was pleased with the rural and semi-pagan customs that survived in the village, and in some of his most charming verses he has immortalized the morris-dances, wakes and quintains, the Christmas mummers and the Twelfth Night revellings, that diversified the quiet of Dean Prior. Herrick never married, but lived at the vicarage surrounded by a happy family of pets, and tended by an excellent old servant named Prudence Baldwin. His first appearance in print was in some verses he contributed to *A Description of the King and Queen of Fairies* (1635). In 1650 a volume of *Wit's Recreations* contained 62 small poems afterwards acknowledged by Herrick in the *Hesperides*, and one not reprinted until our own day. These partial appearances make it probable that he visited London from time to

time. We have few hints of his life as a clergyman. Anthony Wood says that Herrick's sermons were florid and witty, and that he was "beloved by the neighbouring gentry." A very aged woman, one Dorothy King, stated that the poet once threw his sermon at his congregation, cursing them for their inattention. The same old woman recollected his favourite pig, which he taught to drink out of a tankard. He was a devotedly loyal supporter of the king during the Civil War, and immediately upon his ejection in 1648 he published his celebrated collection of lyrical poems, entitled *Hesperides; or the Works both Human and Divine of Robert Herrick*. The "divine works" bore the title of *Noble Numbers* and the date 1647. That he was reduced to great poverty in London has been stated, but there is no evidence to that effect. In Aug. 1662 Herrick returned to Dean Prior, supplanting his own supplanter, Dr. John Symes. He died in his 84th year, and was buried at Dean Prior, Oct. 15, 1674. A monument was erected to his memory in the parish church in 1857, by Mr. Perry Herrick, a descendant of a collateral branch of the family. The *Hesperides* (and *Noble Numbers*) is the only volume which Herrick published, but he contributed poems to *Lachrymae Musarum* (1649) and to *Wit's Recreations*.

As a pastoral lyricist Herrick stands first among English poets. His genius is limited in scope, and comparatively unambitious, but in its own field it is unrivalled. His tiny poems—and of the 1,300 that he has left behind him not one is long—are like jewels of various value, heaped together in a casket. Herrick has himself summed up, very correctly, the themes of his sylvan muse when he says:—

"I sing of brooks, of blossoms, birds and bowers,
Of April, May, of June and July flowers,
I sing of May-poles, hock-carts, wassails, wakes,
Of bridegrooms, brides and of their bridal-cakes."

He saw the picturesqueness of English homely life as no one before him had seen it, and he described it in his verse with a certain purple glow of Arcadian romance over it, in tones of immortal vigour and freshness. His love poems are still more beautiful; the best of them have an ardour and tender sweetness which give them a place in the forefront of modern lyrical poetry, and remind us of what was best in Horace and in the poets of the Greek anthology. (E. G.)

After suffering complete extinction for more than a century, the fame of Herrick was revived by John Nichols, who introduced his poems to the readers of the *Gentleman's Magazine* of 1796 and 1797. Dr. Drake followed in 1798 with considerable enthusiasm. By 1810 interest had so far revived in the forgotten poet that Dr. Nott ventured to print a selection from his poems, which attracted the favourable notice of the *Quarterly Review*. In 1823 the *Hesperides* and the *Noble Numbers* were for the first time edited by Mr. T. Maitland, afterwards Lord Dundrennan. Since then the reprints of Herrick have been numerous. They were edited by A. W. Pollard, with preface by Swinburne, for the Muses' Library (2 vols., 1891); by G. Saintsbury for the Aldine Poets (2 vols., 1893); by E. Rhys for "Everyman" (1908); and by F. W. Moorman (1921). See F. W. Moorman, *Robert Herrick* (1910); and F. Delattre, *Contribution à l'étude de la poésie anglaise au XVII^e siècle* (1910).

HERRICK, ROBERT (1868—), American author, was born at Cambridge (Mass.), April 26, 1868. He was educated at the Cambridge Latin school and at Harvard university, where he graduated in 1890. He became instructor in rhetoric at the Massachusetts Institute of Technology in 1890; in 1893 he accepted a similar position at the University of Chicago, where he was made professor of English (1905-23). His novels and short stories, as a rule, deal with problems of modern life; his style is realistic. He has published *The Web of Life* (1900); *The Real World* (1901); *The Common Lot* (1904); *The Memoirs of an American Citizen* (1905); *The Master of the Inn* (1908); *The Healer* (1911); *One Woman's Life* (1913); *Clark's Field* (1914); *The Conscript Mother* (1916); *Homely Lilla* (1923); *Waste* (1924); *Wanderings* (1925); and *Chimes* (1926).

See "Robert Herrick and Edgar Lee Masters, Interpreters of Our Modern World," in Harry Hansen's *Mid-West Portraits* (1923).

HERRIES, JOHN MAXWELL, 4TH LORD (c. 1512-1583), Scottish politician, was the second son of Robert Maxwell, 4th Lord Maxwell (d. 1546). In 1547 he married Agnes (d. 1594), daughter of William Herries, 3rd Lord Herries (d. 1543), and in

1567 he obtained the title of Lord Herries. Maxwell had become prominent among the men who rallied round Mary queen of Scots, although during the earlier part of his public life he had been associated with the religious reformers and had been imprisoned by the regent, Mary of Lorraine. From March 1566, when Maxwell joined Mary at Dunbar after the murder of David Rizzio and her escape from Holyrood, he remained one of her staunchest friends, although he disliked her marriage with Bothwell. He led her cavalry at Langside, and after this battle she committed herself to his care. Herries rode with the queen into England in May 1568, and he and John Lesley, bishop of Ross, were her chief commissioners at the conferences at York. After returning to Scotland, Herries was imprisoned by the regent Murray. He was among the supporters of the regent Lennox until his death on Jan. 20, 1583. His son William, 5th Lord Herries (d. 1604), was warden of the west marches.

HERRIN, a coal-mining city of Williamson county, Ill., U.S.A., 90m. S.E. of Saint Louis, served by the Burlington, the Illinois Central and the Missouri Pacific railways. The population in 1920 was 10,986 (87.5% native white). There are 36 coal mines in the immediate vicinity, and the county mined over 8,000,000 tons in 1926. Such manufactures as the city has are subsidiary to the mining industry. Herrin has had its part in the feuds and disturbances which have given the county the sobriquet "Bloody Williamson." In June, 1922, local hostility to a new mining company, attempting to operate on a non-union basis, was accompanied by violence on both sides, and culminated in "the Herrin Massacre," when some 25 of the outsiders were killed.

HERRING, a fish belonging to the genus *Clupea*, which is the most widely distributed of all fish genera. The commonest members of the genus are, besides the herring (*C. harengus*), the sprat (*C. sprattus*), the pilchard (*C. pilchardus*), the Allis shad (*C. alosa*) and the Thwaite shad (*C. finia*). Herrings are caught in great numbers in the North sea, off the west coast of Norway, in all the waters off the British Isles and in the Baltic sea. In the Atlantic ocean they are found from north of Cape Cod to Greenland, around Iceland, the Faeroes, and also in the White sea, and varieties of the species occur in the Caspian sea and the Black sea. The herring of the North Pacific ocean is *C. pallasii*, but is hardly distinguishable from *C. harengus*.

To countries bordering the North sea, the herring fishery is of paramount importance, as is shown in the following table of landings for 1925:—

Norway.	Denmark.	Germany.	Holland.	England.	Scotland.	France.
Tons.	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.
187,764	4,597	48,202	53,070	170,589	99,239	17,036

The approximate value in sterling of these herrings was £5,109,350 or 33% of the total yield of the North sea fisheries.

In western European seas, herrings spawn at all seasons. The Norwegian herrings spawn along the west coast in spring, and during this time also, spawning herrings occur near the Firth of Forth, off Cape Wrath, the Hebrides, and in the Skagerrak. From August to October spawning takes place off the north and east of Scotland, and at various places from Northumberland to the Wash on the English east coast. Winter spawning grounds are found near the Sandettie Light Vessel and the Gabbards shoal in December; off Cap d'Antifer in the eastern part of the English channel, and along the Devon and Cornish coasts in January and February. In the Baltic sea there is both a spring and an autumn spawning.

Herrings deposit their eggs in masses on the sea bottom, on stones, weeds, rocks, and gravel, where they are fertilised. On hatching the larvae are carried from the spawning grounds by winds and currents to various coasts, where they appear as

BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY
BIG-EYED HERRING OR TENPOUNDER
(*Elops saurus*)

"Whitebait herring"—8-12cms. ($3\frac{1}{8}$ "-4 $\frac{1}{4}$ ")—at the end of their first year. The second year is spent in the open sea, feeding mainly on copepods, and during this time they grow rapidly to 16-19 cms. It is not until they are becoming adult that they appear in shoals off the coast. The onset of maturity, accompanied by a decrease in growth-rate, takes place at different times in the various seas where herrings are caught.

In the North sea they mature mainly in the third or fourth year, while in Norway they do so at from five to eight years of age. Size also varies in different localities, fish of oceanic waters having a larger yearly growth than those of more enclosed areas. A herring of 28cms. (11") would be large for the southern North sea, while fish of 34cms. (13 $\frac{1}{2}$ ") or more are common in Norwegian shoals.

In the Baltic sea, with its low salinity, mature herrings of 10cms. are found.

The old conception of herring migrations was that all the fish of the North Atlantic and neighbouring waters wintered within the Arctic Circle, and in spring came south in large columns to spawn. It is now known that the movements are more limited, and that Norwegian herrings and those from the North sea, the Baltic, and the western English channel all differ structurally, the differences of these "races" being shown by the numerical variations of such characters as vertebrae, fin rays, and the scales along the "keel" of the fish. The cycle of migration is in three main parts—the feeding movement, when the genital organs are developed; the movement to the spawning grounds, and the dispersal after spawning.

On the scales of the herring there are concentric annual rings (like those in trees) from which age can be determined, and investigation has shown that mature herrings visit the same grounds each year until each year-class in turn becomes extinct. Commercially, herrings are salted or pickled for export. Herrings are also cured as kippers, bloaters, or "red-herring," and the iridescent substance, guanin, from their scales, is used in the manufacture of artificial pearls. (W. C. H.)

TRADE IN HERRINGS

The United Kingdom does a very large export trade in herrings. In the years 1913 and 1925-27, the following quantities of the fish were exported (values are given f.o.b. British ports):

Year	Quantities cwt.	Value £
1913	8,795,000	5,331,000
1925	4,726,000	4,561,000
1926	5,144,000	4,636,000
1927	5,489,000	4,508,000

It will be observed that the exports have fallen greatly since the World War. That is because the Russian trade has almost ceased. In 1913 Russia took 3,566,000cwt. and in 1927 only 155,000cwt. The principal importers in 1927 were Poland, 1,492,000cwt. and Germany 1,995,000cwt. In North America the fishery is growing and may ultimately reach great magnitude, although at present it is not to be compared with the importance of the fishery in Europe. The annual haul in British Columbia is about 250,000. Although found as far south as North Carolina, the herring has only commercial importance north of Cape Cod.

(See FISH-CURING.)

HERRING-BONE, in masonry construction, the use of courses or rows in which the individual bricks or stones are set at an angle of approximately 45° to the horizontal and with alternate courses at right angles to each other. Herring-bone work is occasionally found in late Roman brick construction, and was common throughout the Romanesque period (see BYZANTINE AND ROMANESQUE ARCHITECTURE) sometimes decoratively, as in much of the brick work of north Italy, sometimes structurally, with the apparent idea that long, thin stones could be more efficiently used in this manner than if laid horizontally. In modern construction, the herring-bone is almost entirely restricted to decorative brick work and paving. A similar pattern is often used in hard wood floors.

HERRINGS, BATTLE OF THE, the name applied to the action of Rouvray, fought in 1429 between the French (and Scots) and the English, who, under Sir John Falstolfe (or Falstaff), were

convoying Lenten provisions, chiefly herrings, to the besiegers of Orleans. (See ORLEANS and HUNDRED YEARS' WAR.) Its historical interest lies not merely in the name of the commander, but in the fact that, faced by four times his own number, he used his wagons to form a "laager," with the archers firing from them and spearmen between. The French horse beat in vain against this "laager"—which may well have been an improvisation based on accounts of the recent successes of the Hussite *Wagenburg* in Bohemia. (See HUSSITES, TACTICS, ZIZKA.)

HERRIOT, EDOUARD (1872—), French politician, was born at Troyes, in Champagne, on July 5, 1872, the son of an officer. He was sent first to the Lycée of La Roche-sur-Yon, and afterwards to that of Louis-le-Grand, which bore the reputation of being the best school in France. He then entered the École Normale Supérieure, which included many eminent teachers such as Brunetière and Gaston Boissier, both of whom were men of authority and unquestioned reputation. Here he remained working assiduously for several years, and while delighting in the pursuit of learning thoroughly enjoyed the interchange of ideas with his fellow-students, on whom he left an unforgettable impression. In 1894 he graduated with high honours. Whilst undergoing his military service at Nancy, his favourite relaxation was the study of Greek literature. His book *Philon le Juif* (1897) was crowned by the Académie Française.

Having been appointed a professor at the Lycée of Nantes, he was entrusted the following year first with the Chair of rhetoric, and then of higher rhetoric at the Lycée of Lyons. He imparted to his pupils not merely the principles of knowledge but also the love of it for its own sake; a scholar of great refinement, he possessed the gift of stimulating others, and his lucid and attractive lectures captivated all hearers. On relinquishing his chair he became a popular lecturer, as well as journalist and propagandist, and his book, *Madame Récamier et ses Amis* (1905), achieved widespread popularity. His *Précis de l'histoire des lettres françaises* (1905) shows that his literary criticism was based on a minute study of the text.

In May 1904 Herriot was made a municipal councillor and deputy mayor of Lyons and the following year became mayor. Thenceforward, with the exception of three months, he guided the destinies of Lyons; for at each successive election of the municipal council he resumed office. In 1910 he became a member of the conseil général and in 1912 senator for the department of the Rhône. From Dec. 1916 to March 1917 he occupied the post of minister of public works, transport and supplies in the Briand cabinet. During this time he inaugurated a policy of restriction which enabled France to economise her resources. Having to a large extent solved the problem of supplies, he brought order into the transport service; stations, railway lines and ports were cleared, and an efficient service was maintained.

Herriot now felt that by entering the Chamber, he would be better able to carry out his cherished ideas. He therefore renounced his office as senator, and was elected in Nov. 1919 deputy for the Rhône department. He was then appointed a member of the finance Commission and reporter-general of the budget of public instruction. The Radical party now chose him as their leader, and as a defender of the principles of democracy he soon reached the front rank of French statesmen. As an orator he showed subtlety, versatility and imagination. Both in speaking as well as writing Herriot approached his subject from the loftiest standpoint—the result of his wide knowledge, culture and absolute integrity. His chief qualities might be summed up in three words: logic, wisdom and conviction; and it was the combination of these which enabled him to draw up a formula for an experimental policy.

Even before hostilities had ceased, Herriot turned his attention to post-war problems. He insisted on the necessity for the reconstruction and economic development of France. In 1916, at the moment when the victory of January seemed imminent, he organized the Lyons Fair. In 1917 he published *Agir*, a book which at a time when the fate of France was so uncertain, bore the character of an unflinching act of faith; for in it Herriot maintained that the culture and civilisation of France were too

deep-rooted and too strong to be overcome. This gospel of action soon inspired the faint-hearted with fresh hope.

After the victory, Herriot brought out a work in two volumes, *Créer* (1919), dedicated to the youth of France. It contained his programme of reconstruction, and gave his compatriots a fine example of resolution, fearlessness and patriotism. A similar example emerged from his visits to Russia, the United States of America and Canada. He was confronted with an even harder task than before, for as head of the Radical party the eyes of all French democrats were turned towards him. He inspired the opposition and acted as its mouthpiece. After the elections of May 1924 he became premier and minister of foreign affairs. During the London conferences, in the application of the Dawes plan and finally over the Geneva protocol, he displayed a rare combination of idealism and common sense, and outlined those great aims, in pursuit of which the nations of the world should unite to avoid war. By these efforts he gained the confidence of all men of good will, not only in Europe but over the whole world. Germany in consequence offered to draw up a security pact destined to be signed eight months later at Locarno. (See SECURITY.)

This achievement, however, by no means disarmed Herriot's adversaries. The financial problems which he had to face were the occasion of innumerable attacks upon him and finally a hostile vote of the Senate obliged him to resign in April 1925. (See FRANCE.) A few days later, he was elected president of the Chamber of Deputies by the deputies who desired to testify to the courage, zeal for work and talents of the leader of the Left. In June 1926 Briand invited Herriot to join him in a ministry of National Union. Herriot personally was willing, but his Radical followers objected. President Doumergue then asked Herriot to form a Government; he tried, and failed, because the moderates, whose support was necessary, feared his radical ideas on finance. Briand then formed a cabinet which was defeated on July 17 on a bill asking for full financial powers for the Government. The defeat was partly due to the unexpected action of Herriot as president of the Chamber; he left the presidential chair to speak from his place as a deputy against the action of the Government which, he thought, threatened the rights of the Chamber.

Herriot formed a ministry, but it was defeated two days later. He then joined (July 23) the ministry of National Union formed by Poincaré, as minister of public instruction. He resigned his presidency of the Radical Socialist Federation in the autumn, but of course retained his membership. In Nov. 1928 the party congress withdrew its support in terms which made it necessary for Herriot and the other Radical Socialist ministers to resign from the cabinet. (L. R.)

HERRNHUT, a town of Germany, in the republic of Saxony, 18 m. S.E. of Bautzen, and situated on the Löbau-Zittau railway. Pop. 1,664. It is the principal seat of the Moravian or Bohemian brotherhood, the members of which are called *Herrnhuter*. A colony of these people, fleeing from persecution in Moravia, settled at Herrnhut in 1722 on a site presented by Count Zinzendorf. The buildings of the society include a church, a school and houses for the brethren, the sisters and the widowed of both sexes. The town is remarkable for its ordered, regular life and its scrupulous cleanliness. Linen and various minor articles are manufactured. Berthelsdorf, a village about a mile distant, has been the seat of the directorate of the community since about 1789.

HERSCHEL, CAROLINE LUCRETIA (1750–1848), English astronomer, sister of Sir William Herschel, was born at Hanover on Mar. 16, 1750. She assisted her mother in the management of the household until 1772, when her brother fetched her to Bath, where he had established himself as a teacher of music. At once she became a valuable co-operator with him both in his professional duties and in his astronomical researches. When her brother accepted the office of astronomer to George III., she became his constant assistant in his observations, and also executed the laborious calculations which were connected with them. During her leisure hours she swept the heavens with a small Newtonian telescope and by this means she detected in 1783 three nebulae, and during the eleven years 1786–97 eight comets. In 1797 she presented to the Royal Society an Index

to Flamsteed's observations, together with a catalogue of 561 stars accidentally omitted from the *British Catalogue*, and a list of the errata in that publication. She returned to Hanover in 1822, and in 1828 completed the reduction to January 1800, of 2,500 nebulae discovered by her brother. Caroline Herschel died on Jan. 9, 1848. She had received the gold medal of the Astronomical Society in 1828, and one from the king of Prussia in 1846.

See Mrs. John Herschel, *Memoir and Correspondence of Caroline Herschel* (1876).

HERSCHEL, SIR FREDERICK WILLIAM (1738–1822), generally known as Sir William Herschel, English astronomer, was born at Hanover on Nov. 15, 1738. His father was a musician in the Hanoverian guard, and in 1757 Herschel was sent to England to earn his living as a musician.

Beginnings.—In 1766 he worked as organist in Bath. During the next five or six years he became the leading musical authority. In 1772 he revisited Hanover to bring back with him his sister Caroline, whose services he much needed, as he was already studying astronomy in the time he could spare from his musical engagements. She thus describes her brother's life soon after her arrival: "He used to retire to bed with a basin of milk or a glass of water, with Smith's *Harmonics* and Ferguson's *Astronomy*, etc., and so went to sleep buried under his favourite authors; and his first thoughts on waking were how to obtain instruments for viewing those objects himself of which he had been reading." It was in this way that he was introduced to the writings of Ferguson and Keill, and subsequently to those of Lalande, whereby he educated himself to become an astronomer of undying fame.

In those days telescopes were rare, very expensive and not very efficient, and Herschel used a small Gregorian reflector of about 2 in. aperture. Finding it impossible to obtain a reflector of larger dimensions, he decided to construct his own and, in 1774 had the satisfaction of viewing the heavens with a Newtonian telescope of 6 ft. focal length made by his own hands. He had from the very first conceived the gigantic project of surveying the entire heavens, and, if possible, of ascertaining the plan of their general structure. For this he required adequate instruments, and he, his brother and his sister toiled at the grinding and polishing of hundreds of specula. After 1774 every available hour of the night was devoted to the long-hoped-for scrutiny of the skies.

In May 1780 his first two papers on the variable star "Mira" and the mountains of the moon were communicated to the Royal Society.

The phenomena of variable stars were examined by Herschel as a guide to what might be occurring in our own sun, and the results of his investigations were communicated to the Royal Society in six memoirs (see *Phil. Trans.*, 1780–1801). It was in 1801 that these remarkable papers culminated in the enquiry whether any relation could be traced in the recurrence of sun-spots, regarded as evidences of solar activity, and the varying seasons of our planet, as exhibited by the varying price of corn.

The Rotation of Planets.—In 1781 he communicated to the Royal Society the first of a series of papers on the rotation of the planets and of their several satellites. These enquiries occupy the greater part of seven memoirs extending from 1781–97. While engaged on them he noticed the curious appearance of a white spot near to each of the poles of the planet Mars. On investigating the inclination of its axis to the plane of its orbit, and finding that it differed little from that of the earth, he concluded that its changes of climate also would resemble our own, and that these white patches were probably polar snow. He also discovered that the times of the rotations of the various satellites round their axes conform to the analogy of our moon by equalling the times of their revolution round their primaries.

In the same year (1781) Herschel made a discovery which completely altered the character of his professional life. In the course of a methodical review of the heavens he lighted on an object which averred itself to be a new planet, moving outside the orbit of Saturn. He assigned to it the name *Georgium Sidus*, but this has been laid aside in favour of *Uranus*. The object was detected with a 7-ft. reflector having an aperture of 6½ in. Seven

memoirs on the subject were communicated by him to the Royal Society, extending from the date of the discovery, in 1781–1815.

For the discovery of the planet he was awarded the Copley medal of the Royal Society, elected a fellow, and in the following year, 1782, he accepted George III.'s offer to give up music and become his private astronomer. So Herschel and his sister moved first to Datchet and in 1786 to Slough. Here he resumed his astronomical pursuits with extraordinary vigour, although for a time he had to supplement his income by making and selling telescopes. The necessity for this interruption in his observations was overcome in 1788 when he married the wealthy widow of a London merchant.

Double Stars.—A material part of the task that Herschel had set himself embraced the determination of the relative distances of the stars from our sun and from each other. This resulted in a most important series of observations. He had observed many stars in apparently very close contiguity, but often differing greatly in relative brightness. He concluded that, on the average, the brighter star would be the nearer to us, the fainter enormously more distant.

In the hope, therefore, of detecting an annual parallactic displacement of one star with respect to another, he mapped down the places and aspects of all the double stars that he met with, and communicated in 1782 and 1785 very extensive catalogues of the results. His last scientific memoir, sent to the Royal Astronomical Society in 1822, when he was its first president and already in his 84th year, related to these investigations. In the memoir of 1782 he threw out the hint that these apparently contiguous stars might be genuine pairs in mutual revolution. Eleven years afterwards (1793), he remeasured the relative positions of many such couples and his prediction was verified, for he ascertained that some of these stars circulated round each other, after the manner required by the laws of gravitation. This discovery, announced in 1802, would of itself suffice to immortalize his memory.

In 1783 he wrote his first memorable paper on the "Motion of the Solar System in Space"—a sublime speculation, yet through his genius realized by considerations of the utmost simplicity. He returned to the same subject with fuller details in 1805. In a series of papers, extending from the year 1784–1818, he used his method of star-gauging and concluded that our sun was a star situated not far from the bifurcation of the Milky Way, and that all the stars visible to us lie more or less in clusters scattered throughout a comparatively thin, but immensely extended stratum. On either side of this assemblage of stars, Herschel discovered a canopy of discrete nebulous masses, such as those from the condensation of which he supposed the whole stellar universe to have been formed.

Hitherto we have said nothing about his construction of the great reflecting telescope, of 40 ft. focal length and 4 ft. aperture. The full description of this celebrated instrument will be found in the 85th volume of the *Transactions* of the Royal Society. On the day that it was finished (Aug. 28, 1789) Herschel saw at the first view, in a grandeur not witnessed before, the Saturnian system with six satellites, five of which had been discovered long before, while the sixth he had glimpsed two years before, in his exquisite little telescope of 6½ in. aperture, but now saw in unmistakable brightness. On Sept. 17 he discovered a seventh, which proved to be the nearest to the globe of Saturn.

Herschel died at Slough on Aug. 25, 1822, a description of him given a few years before by Campbell being—"A great, simple, good old man. His simplicity, his kindness, his anecdotes, his readiness to explain his own sublime conceptions of the universe, are indescribably charming."

Hastings, *Synopsis of the Scientific Writings of Sir William Herschel* (Washington, 1881); Baron Laurier, *Eloge historique*, Paris Memoirs (1823), p. lxi.; F. Arago, *Analyse historique, Annuaire du Bureau des Longitudes* (1842), p. 249; Arago, *Biographies of Scientific Men*, p. 167; Madame d'Arblay's *Diary, passim*; *Public Characters* (1798–99), p. 384 (with portrait); J. Sime, *William Herschel and his Work* (1900). Herschel's photometric Star Catalogues were discussed and reduced by E. C. Pickering in *Harvard Annals*, vols. xiv. p. 345, xxiii., and xxiv.

HERSCHEL, SIR JOHN FREDERICK WILLIAM, BART. (1792-1871), English astronomer, the only son of Sir William Herschel, was born at Slough, Bucks, on March 7, 1792. He was educated for a short while at Eton, then by a private tutor and then at St. John's, Cambridge, where he graduated as senior wrangler in 1813. During his undergraduateship he and two of his fellow-students who subsequently attained to very high eminence, Dean Peacock and Charles Babbage, entered into a compact that they would "do their best to leave the world wiser than they found it"—a compact loyally and successfully carried out by all three to the end. As a commencement of this laudable attempt we find Herschel associated with these two friends in the production of a work on the differential calculus, and on cognate branches of mathematical science, which changed the style and aspect of mathematical learning in England, and brought it up to the level of the Continental methods. Two or three memoirs communicated to the Royal Society on new applications of mathematical analysis at once placed him in the front rank of the cultivators of this branch of knowledge. Of these his father had the gratification of introducing the first, but the others were presented in his own right as a fellow.

With the intention of being called to the bar, he entered his name at Lincoln's Inn on January 24, 1814 and placed himself under the guidance of an eminent special pleader. Probably this temporary choice of a profession was inspired by the extraordinary success in legal pursuits which had attended the efforts of some noted Cambridge mathematicians. Be that as it may, an early acquaintance with D. Wollaston in London soon changed the direction of his studies.

He took up astronomy in 1816; and in 1820, assisted by his father, he completed for a reflecting telescope a mirror of 18 in. diameter and 20 ft. focal length. This, subsequently improved by his own hands, became the instrument which enabled him to effect the astronomical observations forming the chief basis of his fame. In 1821-23 we find him associated with Sir James South in the re-examination of his father's double stars. For this work he was presented in 1826 with the Astronomical Society's gold medal; and with the Lalande medal of the French Institute in 1825; while the Royal Society had in 1821 bestowed upon him the Copley medal for his mathematical contributions to their *Transactions*. From 1824 to 1827 he was secretary to that society; and was in 1827 elected to the chair of the Astronomical Society, which office he also filled on two subsequent occasions. In the discharge of his duties to the last named society he delivered presidential addresses and wrote obituary notices of deceased fellows, memorable for their combination of eloquence and wisdom. In 1831 the honour of knighthood was conferred on him by William IV., and two years later he again received the recognition of the Royal Society by the award of one of their medals for his memoir "On the Investigation of the Orbits of Revolving Double Stars."

Before the end of the year 1833, Sir John Herschel had re-examined all his father's double stars and nebulae, and had added many similar bodies to his own lists; thus accomplishing, under the conditions then prevailing, the full work of a lifetime. For it should be remembered that astronomers were not as yet provided with those valuable automatic contrivances which at present materially abridge the labour and increase the accuracy of their determinations. John Herschel then determined to explore the southern, besides re-exploring northern skies. "I resolved," he said, "to attempt the completion of a survey of the whole surface of the heavens; and for this purpose to transport into the other hemisphere the same instrument which had been employed in this, so as to give a unity to the results of both portions of the survey, and to render them comparable with each other." So, he and his family embarked for the Cape on Nov. 13, 1833; they arrived in Table bay on Jan. 15, 1834; and he began regular observations on March 4.

To give an adequate description of the vast mass of labour completed during the next four busy years of his life at Feldhausen would require the transcription of a considerable portion of the *Cape Observations*, published in 1847, nine years after the author's return to England, for the cogent reason, that as he

said, "The whole of the observations, as well as the entire work of reducing, arranging and preparing them for the press, have been executed by myself." It contains catalogues and charts of southern nebulae and star-clusters, a catalogue of the relative positions and magnitudes of southern double stars and his observations on the varying and relative brightness of the stars. Herschel returned to his English home in 1838, and was welcomed with an enthusiastic greeting.

He was created a baronet by Queen Victoria at her coronation and, what to him was better than such reward, other men caught this contagion of his example and laboured in fields similar to his own, with an adequate portion of his success. He also paved the way for Sir George Stokes's discovery of fluorescence by his addition of the lavender rays to the spectrum and, by his announcement in 1845 of 'epipolic dispersion' as exhibited by sulphate of quinine.

Herschel was a highly accomplished chemist. His discovery in 1819 of the solvent power of hyposulphite of soda on the otherwise insoluble salts of silver was the prelude to its use as a fixing agent in photography; and he invented in 1839, independently of Fox Talbot, the process of photography on sensitized paper. He was the first person to apply the now well-known terms *positive* and *negative* to photographic images, and to imprint them upon glass prepared by the deposit of a sensitive film. Perhaps no man can become a truly great mathematician or philosopher if devoid of imaginative power. John Herschel possessed this endowment to a large extent; and he solaced his declining years with the translation of the *Iliad* into verse. But the main work of his later life was the collection of all his father's catalogues of nebulae and double stars combined with his own observations and those of other astronomers into a single volume. A complete list of his contributions to learned societies will be found in the Royal Society's great catalogue, and from them may be gathered most of the records of his busy scientific life. Sir John Herschel met with an amount of public recognition which was unusual in the time of his illustrious father. He was a member of almost every important learned society in both hemispheres. For five years he held the same office of master of the mint, which a century before had belonged to Sir Isaac Newton.

In private life Sir John Herschel was a firm and most active friend; he had no jealousies; he avoided all scientific feuds; he gladly lent a helping hand to those who consulted him in scientific difficulties; he was pleased by appreciation of his work without being solicitous for applause. It was truthfully said of him that his life was 'full of the serenity of a sage and the docile innocence of the child.'

He died on May 11, 1871, and his remains are interred in Westminster abbey close to the grave of Sir Isaac Newton.

Besides the laborious *Cape Observations*, Sir John Herschel was the author of several books, one of which at least, *On the Study of Natural Philosophy* (1830), possesses an interest which no future advances of the subjects on which he wrote can obliterate. In 1849 came the *Outlines of Astronomy*, a volume still replete with charm and instruction. His articles, "Meteorology," "Physical Geography," and "Telescope," contributed to the 8th edition of the *Encyclopædia Britannica*, were afterwards published separately. Less known are his volumes, *Familiar Lectures on Scientific Subjects* (1866) and *Collected Addresses* (1857), in which he is seen in his happiest and most instructive mood.

See also R. Grant, *History of Physical Astronomy* (1852); Lord Kelvin in the *Report of the British Association* (1871); T. Romney Robinson in the *Proceedings of the Royal Society* (vol. xx., 1872); M. C. Herschel, *Memoir of Caroline Herschel* (1876); J. H. Mädler, *Geschichte der Himmelskunde* (vol. ii., 1873); E. Dunkin, *Obituary Notices of Astronomers* (1879); A. M. Clerke, *The Herschels and Modern Astronomy* (1895) and *Popular History of Astronomy* (4th ed., 1902); Sir J. Herschel: *Scientific Papers* (Collected and edited under direction of Royal Society and Royal Astronomical Society, 2 vol., 1912); H. Macpherson, *Herschel* (1919).

Reductions, based on standard magnitudes of 919 southern stars, observed by Herschel in sequences of relative brightness, were published by W. Doberck in the *Astrophysical Journal* (vol. xi., 1900) and *Annals of the Astronomical Observatory of Harvard College* (vol. xli., 1902).

HERSCHELL, FARRER HERSCHELL, 1ST BARON (1837–1899), lord chancellor of England, was born on Nov. 2, 1837, the son of the Rev. Ridley Haim Herschell, a native of Strzelno, in Prussian Poland. He was educated at a private school and University college, London. He entered in Lincoln's Inn, and in 1858 he entered the chambers of Thomas Chitty, where so many of the great lawyers began their studies. His fellow-pupils included A. L. Smith and Charles. In 1860 he was called to the bar, and joined the still undivided northern circuit, where at first he did not find much work, and thought of going to practise in Shanghai. His prospects improved in 1866 when Quain, for whom he devilled, took silk.

In 1872 Herschell was made a queen's counsel. He had all the necessary qualifications for a leader—a clear, though not resonant, voice; a calm logical mind; a sound knowledge of legal principles; and (greatest gift of all) an abundance of common sense. He never wearied the judges by arguing at undue length, and he knew how to retire with dignity from a hopeless cause. His only weak point was cross-examination. In handling a hostile witness he had neither the insidious persuasiveness of a Hawkins nor the compelling, dominating power of a Russell. But he made up for all by his speech to the jury, marshalling such facts as told in his client's favour with the most consummate skill. He seldom made use of notes, but trusted to a carefully trained memory. Herschell entered parliament for Durham city in 1874. For the next six years he was assiduous in his attendance in the House of Commons. He was not a frequent speaker, but a few great efforts sufficed in his case to gain for him a reputation as a debater. The best examples of his style as a private member will be found in *Hansard* under the dates Feb. 18, 1876, May 23, 1878, May 6, 1879. In 1880 Gladstone appointed Herschell solicitor-general. Herschell's public services from 1880 to 1885 were of great value, particularly in dealing with the "cases for opinion" submitted by the Foreign Office and other departments. He helped controversial Government measures through the House, notably the Irish Land Act, 1881, the Corrupt Practices and Bankruptcy Acts, 1883, the County Franchise Act, 1884, and the Redistribution of Seats Act, 1885. This last halved the representation of Durham city and so gave him statutory notice to quit. He contested the North Lonsdale division of Lancashire unsuccessfully, and his prospects seemed in peril; but Selborne and James both refused the Woolsack, and in 1886 Herschell, by a sudden turn of fortune's wheel, found himself in his 49th year lord chancellor.

Herschell's chancellorship lasted barely six months, for in Aug. 1886 Gladstone's administration fell. Herschell was again lord chancellor in 1892–95. His judgments were distinguished for their acute and subtle reasoning, for their grasp of legal principles, and, whenever the occasion arose, for their broad treatment of constitutional and social questions. He was not a profound lawyer, but possessed extreme quickness of apprehension. In construing a real property will or any other document, his first impulse was to read it by the light of nature, and to decline to be influenced by the construction put by the judges on similar phrases occurring elsewhere. But when he discovered that certain expressions had acquired a technical meaning which could not be disturbed without fluttering the doves of the conveyancers, he would yield to the established rule, even though he did not agree with it. He was perhaps seen at his judicial best in *Vagliano v. Bank of England* (1891) and *Allen v. Flood* (1898). His public services outside his judicial work included the chancellorship of the University of London (1893), and the chairmanship of the Imperial institute, which he held from its foundation.

In 1897 Herschell was appointed, jointly with Lord Justice Collins, to represent Great Britain on the Venezuela Boundary commission, which assembled in Paris in the spring of 1899. He also sat on the joint high commission appointed to adjust certain boundary and other questions pending between Great Britain and Canada on the one hand and the United States on the other hand. He started for America in July of that year and was received most cordially at Washington. His fellow commissioners elected him their president. In Feb. 1899 he slipped in the street and frac-

tured a hip bone. His constitution, which at one time was a robust one, had been undermined by constant hard work and proved unequal to sustaining the shock. He died at the Shoreham hotel, Washington, on March 1, a *post-mortem* examination revealing disease of the heart. The body was brought to London in a British man-of-war and buried at Tincleton, Dorset.

A "reminiscence" of Herschell by Mr. Speaker Gully (Lord Selby) will be found in *The Law Quarterly Review* for April 1899. *The Journal of the Society of Comparative Legislation* (of which he had been president from its formation in 1893) contains, in its part for July of the same year, notices of him by Lord James of Hereford, Lord Davey, Victor Williamson (his executor and intimate friend), and also by Justice D. J. Brewer and Senator C. W. Fairbanks (both of the United States).

HERSFELD, a town of Germany, in the Prussian province of Hesse-Nassau, situated at the confluence of the Geis and Haun with the Fulda, on the railway from Frankfort-on-Main to Bebra, 24 m. N.N.E. of Fulda. Pop. (1925) 11,269. Some of the old fortifications of the town remain. The principal buildings are the Stadt Kirche, a beautiful Gothic building, erected about 1320 and restored in 1899; the old town hall (Rathaus), and the ruins of the abbey church. This church was erected on the site of the cathedral in the beginning of the 12th century; it was built in the Byzantine style and was burnt down by the French in 1761. Outside the town are the Frauenberg and the Johannesberg, on both of which are monastic ruins. The town has important manufactures of cloth, leather, machinery, vaseline and cordage; it has also dye-works. The Benedictine abbey of Hersfeld was founded by Lullus, afterwards archbishop of Mainz, about 769. It was richly endowed by Charlemagne and became an ecclesiastical principality in the 12th century, passing under the protection of the landgraves of Hesse in 1423. It was secularized in 1648. Hersfeld became a town in the 12th century and in 1370 the burghers, having shaken off the abbot's authority, placed themselves under the protection of the landgraves of Hesse. Hersfeld, with electoral Hesse, was united with Prussia in 1866.

HERSHEY, MILTON SNAVELY (1857–), American confectioner and philanthropist, was born in Derry Township, Dauphin county, Pa., on Sept. 13, 1857. He attended the local schools and then served for a time as a printer's devil on the *Lancaster Farmer*. After a brief period in that capacity, he turned to the manufacture of candy and at 21 years of age had his own shop in Philadelphia. He later removed to New York city. There success crowned his efforts, and within 25 years he sold his business for \$1,000,000. Returning to his native home in Pennsylvania, he again began the manufacture of chocolate bars, converting the scene of his early struggles into the model industrial town of Hershey, Pa., and developing his business along lines most beneficial to his employees. About 1903 he and his wife, Mrs. Catherine S. Hershey (d. 1915), determined to found an industrial school and home for orphan boys, the school receiving its first pupils in 1910. It is open to male orphans: (1) born in Dauphin, Lebanon and Lancaster counties; (2) born elsewhere in Pennsylvania (3) born elsewhere in the United States. Boys are accepted at four or five years of age and may remain until they reach the age of 18 years. Freedom in the selection of trades is permitted, but it is required that each boy learn to be self-supporting. In 1918 Hershey transferred his entire wealth, estimated at \$60,000,000, to the Hershey Trust company for maintenance of the Hershey Industrial school, making it probably the second richest school of its kind in the United States. He is chairman of the board of directors of the Hershey Chocolate company, Hershey, Pa., with 15 subsidiary companies in the United States and Cuba; president of the Hershey Trust company; and chairman of the board of directors of the Hershey Industrial school.

HERSTAL or **HERISTAL**, a town of Belgium, less than 2 m. N. of Liège and practically one of its suburbs. The second Pippin was born here. His grandson, Pippin the Short, died at Herstal in A.D. 768, and it disputes with Aix-la-Chapelle the honour of being the birthplace of Charlemagne. It is now a very active centre of iron and steel manufactures. The Belgian national small-arms factory and cannon foundry are here. Pop. (1925) 23,314. The name may come from *Heerstelle* (permanent camp).

HERTFORD, EARLS AND MARQUESSES OF. The English earldom of Hertford was held by members of the powerful family of Clare from about 1138, when Gilbert de Clare was created earl of Hertford, to 1314 when another earl Gilbert was killed at Bannockburn. In 1537 EDWARD SEYMOUR, viscount Beauchamp, a brother of Henry VIII's queen, Jane Seymour, was created earl of Hertford, being advanced ten years later to the dignity of duke of Somerset and becoming protector of England. His son EDWARD (c. 1540–1621) was styled earl of Hertford from 1547 until the protector's attainder and death in January 1552, when the title was forfeited; in 1559, however, he was created earl of Hertford. In 1560 he was secretly married to Lady Catherine Grey (c. 1538–1568), daughter of Henry Grey, duke of Suffolk, and a descendant of Henry VII. Queen Elizabeth greatly disliked this union, and both husband and wife were imprisoned, while the validity of their marriage was questioned. Catherine died on Jan. 27, 1568 and Hertford on April 6, 1621. Their son Edward, Lord Beauchamp (1561–1612), who inherited his mother's title to the English throne, predeceased his father; and the latter was succeeded in the earldom by his grandson WILLIAM SEYMOUR (1588–1660), who was created marquess of Hertford in 1640 and was restored to his ancestor's dukedom of Somerset in 1660. The title of marquess of Hertford became extinct when JOHN, 4th duke of Somerset, died in 1675, and the earldom when ALGERNON, the 7th duke, died in February 1750.

In August 1750 FRANCIS SEYMOUR CONWAY, 2nd baron Conway (1718–1794), a direct descendant of the protector Somerset, was created earl of Hertford. Hertford was ambassador to France from 1763 to 1765; was lord-lieutenant of Ireland in 1765 and 1766; and lord chamberlain of the household from 1766 to 1782. In 1793 he became earl of Yarmouth and marquess of Hertford, and died on June 14, 1794. His son FRANCIS INGRAM SEYMOUR CONWAY (1743–1822), known during his father's lifetime as Lord Beauchamp, was sent as ambassador to Berlin and Vienna in 1793 and from 1812 to 1821 he was lord chamberlain. His son FRANCIS CHARLES, the 3rd marquess (1777–1842), an intimate friend of the prince regent, afterwards George IV., is the original of the "Marquis of Steyne" in Thackeray's *Vanity Fair* and of "Lord Monmouth" in Disraeli's *Coningsby*. The 4th marquess was his son, RICHARD (1800–1870), whose mother was the great heiress, Maria Emily Fagniani, and whose brother was Lord Henry Seymour (1805–1859), the founder of the Jockey Club at Paris. When Richard died unmarried in Paris in August 1870 his title passed to his kinsman, FRANCIS HUGH GEORGE SEYMOUR (1812–1884), a descendant of the 1st marquess, whose son, HUGH DE GREY (1843–1912) became 6th marquess in 1884. The 4th marquess left his great wealth and his priceless collection of art treasures to Sir Richard Wallace (1818–1890), his reputed half-brother, and Wallace's widow, who died in 1897, bequeathed the collection to the British nation. It is now in Hertford House, formerly the London residence of the marquesses of Hertford.

HERTFORD, county town of Hertfordshire, England, 24 m. N. from London. Pop. (1921) 10,702. Hertford was the scene of a synod in 673. Its communication with London by way of the Lea and the Thames gave it strategic importance during the Danish occupation of East Anglia. In 1066 and later it was a royal garrison and burgh. It made separate payments for aids to the Norman and Angevin kings; and in 1331 was governed by a bailiff. A charter of incorporation (1555) was confirmed under Elizabeth and in 1606. A grant of fairs in 1226 probably originated or confirmed those held in 1331 on the feasts of the Assumption and of St. Simon and St. Jude, their vigils and morrows, which fairs were confirmed by Elizabeth and Charles II. Another on the vigil, morrow and feast of the Nativity of the Virgin was granted by Elizabeth: its date was changed to May-day under James I. Modern fairs are on the third Saturday before Easter, May 12, July 5 and Nov. 8. The modern churches of St. Andrew and of All Saints are on old sites; the castle retains the wall and part of a tower of the Norman period. The town is one of several twin-towns in eastern England (see W. Page, *Archaeologia*, vol. lxxix, 1918–19). Hertford has a considerable agricultural trade, and there are maltings and breweries. Brushes and gloves are also

manufactured. Two miles S.E. of the town is Haileybury College, founded in 1805 by the East India Company for their civil service students, who were then temporarily housed in Hertford Castle.

HERTFORDSHIRE (abbr. Herts.; pron. haht'ford-shir), a county of England, bounded N. by Cambridgeshire, N.W. by Bedfordshire, E. by Essex, S. by Middlesex, and S.W. by Buckinghamshire. The area is 634.6 sq.m., and is generally undulating. The north-west of the county consists of a line of chalk hills, an extension of the Chilterns, which sink gradually towards the north-east. Within the county they seldom exceed a height of 600 feet. The hills drop steeply to the north-west, and west of Tring in the south and Ashwell in the north the chalk is covered by gault clay. The chalk dips gently south-eastward until, south of St. Albans and Hertford, it disappears beneath the Eocene Reading beds, which consist of yellow clays and sands, and London clay. A great part of the area is covered with glacial gravels, clays and loams. The river Lea, rising near Luton, flows south-east to Hatfield, east by north to Ware, and then south to the Thames, forming part of the eastern boundary of the county. It receives a number of tributaries on the north side, one of which, the Stort, forms the boundary with Essex. In the south-west the river Colne flows past Watford on its way to join the Thames at Staines.

Finds of artefacts point to the human occupation of the open chalk uplands, with their abundance of flints from very early times. This occupation was continued through the Bronze age, as is evidenced by finds of celts, palstaves and socketed axes. Along the chalk hills from Tring to Royston ran the ancient track of the Icknield way. About the beginning of the Christian era Verulamium was the centre of one group of British tribes, and here coins were minted, numbers of which have been found in Hertfordshire. After the Roman Conquest it became an important Roman station on the Watling street from London to the north-west. The east of the county was likewise crossed from near Waltham Cross to Royston by Ermine street. From Verulamium, in the direction of Tring, ran Akeman street, while Stane street, coming from Colchester, entered the county at Bishop's Stortford, and crossed it in the direction of Baldock. The East Saxons in the 6th century settled about Hertford, which in 673 was sufficiently important to be the meeting place of a synod, while in 675 the Witenagemot assembled at a place identified with Hatfield. In 793 Offa of Mercia founded a Benedictine abbey at St. Albans. In the 9th century the district was frequently visited by the Danes; and after the peace of Wedmore the country east of the Lea was included in the Dane-law.

After the battle of Hastings William advanced on Hertfordshire and ravaged as far as Berkhamstead, where the Conquest received its formal ratification. In the confiscation of estates which followed, the church was generously endowed, the abbey of St. Albans alone holding 172 hides, while Count Eustace of Boulogne, the chief lay tenant, held a vast fief in the north-east of the county.

As a shire Hertfordshire is of purely military origin, being the district assigned to the fortress which Edward the Elder erected at Hertford. It is first mentioned in the Saxon Chronicle in 1011. At the time of the Domesday survey the boundaries were approximately those of the present day, but part of Meppershall, in Bedfordshire, formed a detached portion of the shire and is still assessed for land and income tax in Hertfordshire. Of the nine Domesday hundreds, those of Danais and Tring were consolidated about 1200 under the name of Dacorum; the modern hundred of Cashio, from being held by the abbots of St. Albans, was known as Albaneston, while the remaining six hundreds correspond with those of the present day.

Hertfordshire was originally divided between the dioceses of London and Lincoln. In 1291 that part included in the Lincoln diocese formed part of the archdeaconry of Huntingdon and comprised the deaneries of Berkhamstead, Hitchin, Hertford and Baldock, and the archdeaconry and deanery of St. Albans; while that part within the London diocese formed the deanery of Braughing within the archdeaconry of Middlesex. After the Conquest a large number of religious houses were founded; the

Benedictines established priories for monks and nuns, the Austin canons established a house at Royston in 1180 and the Gilbertines one at Hitchin two centuries later. The Hospitallers and Templars were both established in the county during the 12th century and the mendicant orders also had friaries here.

Scene of Civil Wars.—During the war between John and his barons, the king's army ravaged Hertfordshire, and in 1216 Hertford castle was captured and Berkhamstead castle besieged by Louis of France, who had come over by invitation of the barons. At the time of the rising of 1381 the abbot's tenants broke into the abbey of St. Albans and forced the abbot to grant them a charter. The county was the scene of much fighting during the Wars of the Roses. On the outbreak of the Civil War of the 17th century, Hertfordshire joined with Bedfordshire and Essex in petitioning for peace, and St. Albans was at times the headquarters of the Parliamentarians. In 1535 the jurisdiction of St. Albans had been transferred to the London diocese, the division being otherwise unchanged. In 1846 the whole county was placed within the diocese of Rochester and archdeaconry of St. Albans, and in the next year the deaneries of Welwyn, Buntingford, Bishop Stortford and Ware were created, and that of Braughing abolished. In 1864 the archdeaconries of Rochester and St. Albans were united under the name of the archdeaconry of Rochester and St. Albans. In 1878 the county, except for a few small parts in the dioceses of London, Oxford and Ely, was placed in the newly created diocese of St. Albans, and formed the archdeaconry of St. Albans, the deaneries being unchanged.

Hertfordshire was closely associated with Essex from the time of its first settlement, and the counties paid a joint fee-farm and were united under one sheriff until 1565, the shire court being held at Hertford. The hundred of St. Albans was at an early date constituted a separate liberty, with independent courts and coroners under the control of the abbot. In 1290 Hertfordshire returned two members to parliament, and in 1298 the borough of Hertford was represented. St. Albans, Bishop Stortford and Berkhamstead acquired representation in the 14th century, but from 1375 to 1553 no returns were made for the boroughs. St. Albans regained representation in 1553 and Hertford in 1623. Under the Reform Act of 1832 the county returned three members. St. Albans was disfranchised on account of bribery in 1852. Hertford lost one member in 1868, and the other by the act of 1885.

Waltham Cross marks the spot where rested the body of Eleanor, queen of Edward I., on its way to Westminster for interment. Among the churches may be mentioned those of Abbots Langley and Hemel Hempstead, both of Late Norman architecture; Baldock, a mixed Gothic building supposed to have been erected by the Knights Templars in the reign of Stephen; Royston, formerly connected with the priory of canons regular; Hitchin of the 15th century; Hatfield, dating from the 13th century but in the main later; Berkhamstead, chiefly in the Perpendicular style, with a tower of the 16th century. Sandridge church shows Norman work with the use of Roman bricks; Wheathampstead church, mainly Decorated, has pre-Norman remains. The remains of secular buildings of importance are those of Berkhamstead castle, Knebworth, the seat of the Lyttons, originally a Norman fortress, rebuilt in the time of Elizabeth in the Tudor style and restored in the 19th century and Rye House, associated with the plot to assassinate Charles II. Hatfield House is the seat of the marquis of Salisbury; Cashiobury House, of the earls of Essex; Gorhambury House was the home of the Bacons, and Panshanger House of the Cowpers.

AGRICULTURE AND TRANSPORT

Hertfordshire has always been an agricultural county, with few manufactures, and at the time of the Domesday survey its wealth was derived almost entirely from its rural manors, with their water meadows, woodlands, fisheries paying rent in eels, and water-mills, the shire on its eastern side being noticeably free from waste land. In Norman times the woollen trade was considerable, and the great corn market at Royston has been famous since the reign of Elizabeth. At the time of the Civil War the

malting industry was largely carried on, and saltpetre was produced in the county. In the 17th century Hertfordshire was famous for its horses, and the 18th century saw the introduction of several minor industries, such as straw-plaiting, paper-making and silk weaving.

In 1926 the acreage under crops and grass was 313,933, and 185,982 ac. of this was arable land. Wheat, oats and barley are, in the order named, the chief grain crops. The other plants with large acreages are root crops, potatoes and beans. The acreage of rotation grasses and clover for hay was 28,983. In the south-west large quantities of cherries, apples and strawberries are grown for the London market; and on the best soils near London vegetables are forced by the aid of manure, and more than one crop is sometimes obtained in a year. A considerable industry lies in the growth of watercresses in the pure water of the upper parts of the rivers and the smaller streams. There are several rose-gardens and nurseries. There are some very rich pastures on the banks of the Stort, and also near Rickmansworth on the Colne. Some two-thirds of the area occupied by green crops is under turnips, swedes and mangolds, many cows being kept for the supply of milk and butter to London. Of cows the most common breed is the Suffolk variety; of sheep, Southdowns, Wiltshires and a cross between Cotteswolds and Leicesters. The manufacturing industries are slight; though the great brewing establishments at Watford may be mentioned, and straw-plaiting, paper-making, tanning and brick-making are carried on in various towns. The chalk is sometimes burned for lime and the marl used for cement.

Transport Facilities.—Owing to its proximity to the metropolis, Hertfordshire is particularly well served by railways. On the eastern border there is the L.N.E. (Cambridge line) with branches to Hertford and to Buntingford, while another L.N.E. line passes through the centre by Hatfield, Stevenage and Hitchin, with branches from Hatfield to Hertford, to St. Albans and to Luton and Dunstable, and from Hitchin to Baldock, Royston and so to Cambridge. One line of the L.M.S. passes through St. Albans and Harpenden, with a branch to Hemel Hempstead; another traverses the south-west by Watford, Berkhamstead and Tring, with branches to Rickmansworth and to St. Albans. The Metropolitan and Great Central joint line serves Rickmansworth, and suburban lines of the L.N.E. the Barnet district. The existence of these communications has caused many villages to become large residential centres. Water communications are supplied from Hertford, Ware and Bishop Stortford, southward to the Thames by the Lea and Stort Navigation; and the Grand Junction canal from London to the north-west traverses the south-western corner of the county by Rickmansworth and Berkhamstead. Three great highways from London to the north traverse the county. The Holyhead road passes Chipping Barnet, South Mimms and St. Albans, quitting the county near Dunstable. The Great North road branches from the Holyhead road at Barnet, and passes Potter's Bar, Hatfield, Stevenage and Baldock, with a branch from Welwyn to Hitchin and beyond. Another road follows the Lea valley to Ware, whence it runs to Royston, coincident with the Roman Ermine street and known as the Old North road.

The area of the administrative county is 404,523 ac., with a population of 333,195. The municipal boroughs are Hemel Hempstead, Hertford, St. Albans (a city) and Watford. The county is in the home circuit and assizes are held at Hertford. It has two courts of quarter sessions. All the civil parishes within 12 m. of, or in which no portion is more than 15 m. from Charing Cross, London, are included in the Metropolitan police district. It is divided into five parliamentary divisions—Hemel Hempstead, Hertford, Hitchin, St. Albans, Watford—each returning one member.

See Sir H. Chauncy, *Historical Antiquities of Hertfordshire* (London, 1700; 2nd ed., Bishop Stortford, 1826); N. Salmon, *History of Hertfordshire* (1728); R. Clutterbuck, *History and Antiquities of the County of Hertford* (1815-27); J. E. Cussans, *History of Hertfordshire* (1870-81); *Victoria County History, Hertfordshire* (1902, etc.); see also "Visitation of Hertfordshire, 1572-1634," in *Harleian Society's Publ.*, vol. xvii.; 1st Interim Report, *Royal Commission on Ancient Monuments: Hertfordshire* (1910), and *Royal Commission on Historical Monuments: Inventory of Hertfordshire* (1910).

HERTHA or **NERTHUS**, in Teutonic mythology, the goddess of fertility, "Mother Earth," stated by Tacitus to be worshipped with orgies and mysterious rites at night by Teutonic tribes. Her veiled statue was moved from place to place by sacred cows. After the rites the image, vestments and vehicle were bathed in a lake.

HERTLING, GEORG, COUNT VON (1843-1919), German statesman, was born in Darmstadt on Aug. 31, 1843. He was appointed professor of philosophy at Bonn (1880), and at Munich (1882). From 1875 to 1890 and again from 1896 to 1912 he was a member of the Reichstag, from 1909 being for a short time the leader of the Centre (Catholic) party. In 1912 he was appointed president of the Bavarian ministry and minister for foreign affairs, and in 1914 was elevated to the rank of count by King Ludwig III. On Nov. 1, 1917 he accepted the chancellorship of the Reich, which he had refused in July of that year; and for 12 months he strove against the encroachments of the military authorities upon the political affairs of the Empire. The failure of the German offensives in 1918 finally destroyed his hopes of being able to negotiate with the Allies on anything like equal terms and feeling at last unequal to the struggle against the introduction of real parliamentary Government, he resigned on Sept. 30, 1918, and returned to his home at Ruhpolding in Upper Bavaria, where he died on Jan. 4, 1919.

In philosophy, Hertling was a Neo-Thomist. Starting from a teleological conception of the world, he elaborated a political and social philosophy, and declared the conscious furthering of the divine world plan to be a duty for man. With Baumecker, he collaborated in the production of the invaluable series, *Beiträge zur Gesch. der Phil. des Mittelalters*, himself contributing the volume, *Albertus Magnus, Beiträge zu seiner Würdigung* (1914). Hertling's other works include: *Über d. Grenzen d. mechan. Naturerklärung* (1875); *Naturrecht u. Sozialpolitik* (1893); *Kleine Schriften zur Zeitgesch. u. Politik* (1897); *Recht, Staat u. Gesellschaft* (1906) and *Erinnerungen aus meinem Leben*, 2 vols. (1919). See also K. Hertling: *Ein Jahr in der Reichskanzlei* (1919).

HERTWIG, OSCAR (1849-1922), German embryologist, was born on April 21, 1849, at Friedberg. He studied medicine and science in Jena under Haeckel, in Zürich and in Bonn. He was professor at Jena from 1878 until 1888, when he was transferred to Berlin, where he died on Oct. 26, 1922. Hertwig was the first to show that fertilization is essentially the fusion of two nuclei—that of the egg and that of the sperm. His other contributions to biology include his investigation of the foundations of the germ-layer theory, of the parallelism in gametogenesis in the two sexes of *Ascaris*, and of the malformations of vertebrate embryos called "spina bifida."

Hertwig's publications include: *Studien zur Blättertheorie* (1879-83), *Die Cölomtheorie* (1881) and *Entwicklung des mittleren Keimblattes der Wirbelthiere* (1883—all three in collaboration with his brother Richard); *Das Problem der Befruchtung und der Isotropie des Eies* (1884); *Lehrbuch der Entwicklungsgeschichte des Menschen* (1886; 9th ed. 1910; Eng. trans., 1892); *Die Zelle und die Gewebe* (2 vols., 1893-98; Eng. trans., 2nd ed., 1909); *Der Kampf um Kernfragen der Entwicklungs- und Vererbungslehre* (1909; 2nd ed., 1920); *Die Elemente der Entwicklungslehre des Menschen und der Wirbelthiere* (1900; 4th ed., 1910); *Die Radiumkrankheit tierischer Kutzellen* (1911); *Allgemeine Biologie* (5th ed., 1920); *Das Werden der Organismen* (1916); *Dokumente zur Gesch. des Zeugungslehre* (1918), and his edition of the *Handbuch der Entwicklungslehre der Wirbelthiere* (3 vols., 1901-06).

HERTZ, HEINRICH RUDOLF (1857-94), German physicist, was born at Hamburg on Feb. 22, 1857. On leaving school he studied engineering, but abandoned it in favour of physics. Hertz went to Berlin, where he studied under Helmholtz (q.v.). In 1883 he went to Kiel, becoming *Privatdozent*, and there he began the studies in Maxwell's electromagnetic theory which a few years later resulted in the discoveries that rendered his name famous. These were actually made between 1885 and 1889, when he was professor of physics in the Karlsruhe Polytechnic. Helmholtz drew Hertz's attention to a prize offered by the Berlin

Academy of Sciences for the experimental establishment of a relation between electromagnetic actions and the polarization of a dielectric, and promised him the assistance of the Institute if he decided to work on the subject. Hertz did not take it up seriously at that time, because he could not think of any procedure likely to prove effective. Later he was able to discover the progressive propagation of electromagnetic action through space, to measure the length and velocity of electromagnetic waves, and to show that in the transverse nature of their vibration and their susceptibility to reflection, refraction and polarization they are in complete correspondence with the waves of light and heat. The result was to establish beyond doubt the electromagnetic nature of light. In 1889 Hertz was appointed to succeed R. J. E. Clausius as ordinary professor of physics in the university of Bonn. There he continued his researches on the discharge of electricity in rarefied gases, only just missing the discovery of the X-rays described by W. C. Röntgen a few years later, and produced his treatise on the *Principles of Mechanics*. This was his last work, for after a long illness he died at Bonn on Jan. 1, 1894. By his premature death science lost one of her most promising disciples.

Hertz's scientific papers were translated into English by D. E. Jones, and published in three volumes: *Electric Waves* (1893), *Miscellaneous Papers* (1896), and *Principles of Mechanics* (1899). The preface contributed to the first of these by Lord Kelvin, and the introductions to the second and third by P. E. A. Lenard and Helmholtz, contain many biographical details.

HERTZ, HENRIK (?1797-1870), Danish poet, was born of Jewish parents in Copenhagen on Aug. 25, 1797 or 1798. In 1826-27 two plays of his were produced, *Mr. Burchardt and his Family* and *Love and Policy*; in 1828 followed the comedy of *Flyttedagen. Amor's Strokes of Genius*, a comedy in rhymed verse (1830), and the anonymous *Gengangerbrevene* (1830) made his reputation. These "Letters from a Ghost" purported to be written by Baggesen who had died four years before; the book was written in defence of J. L. Heiberg (q.v.) and was full of satirical humour and fine critical insight. In 1832 he published a didactic poem, *Nature and Art*, and *Four Poetical Epistles*. In 1836 his comedy of *The Savings Bank* enjoyed a great success. He gave the full measure of his genius in the romantic national drama of *Svend Dyrings Hus* (1837), a beautiful and original piece. His other important plays are the historical tragedy *Valdemar Atterdag* (1839); the lyrical drama *Kong René's Datter* (1845), which was translated into almost every European language; the tragedy of *Ninon* (1848); the romantic comedy of *Tonietta* (1849); *A Sacrifice* (1853); *The Youngest* (1854). His lyrical poems appeared in successive collections, dated 1832, 1840 and 1844. From 1858 to 1859 he edited a literary journal entitled *Weekly Leaves*. His last drama, *Three Days in Padua*, was produced in 1869. He died on Feb. 25, 1870.

Hertz is one of the first of Danish lyrical poets. His poems are full of colour and passion, his versification has more witchcraft in it than any other poet's of his age, and his style is grace itself. He has little or nothing of Scandinavian local colour, and succeeds best when he is describing the scenery or the emotions of the glowing south.

His *Dramatic Works* (18 vols.) were published at Copenhagen in 1854-73; and his *Poems* (4 vols.) in 1851-62.

HERTZ, JOSEPH HERMAN (1872-), chief rabbi of the United Hebrew Congregations of the British Empire, was born in Rebrin, Czechoslovakia, on Sept. 25, 1872. Emigrating to America as a child, he was educated at New York City college, Columbia university, where he took the degree of Ph.D., and at the Jewish theological seminary of America. He was a rabbi in Johannesburg, South Africa, from 1898 to 1911 and, during the Boer War, was expelled by President Kruger for pro-British sympathies and for advocating the removal of religious disabilities from Jews and Catholics in the South African republic. From 1906 to 1908 he was professor of philosophy at Transvaal university college. Dr. Hertz was elected to the chief rabbinate in succession to Dr. Hermann Adler, in 1913. In 1920-21 he undertook an extensive pastoral tour, visiting the Jewish communities in South Africa, Australia, New Zealand and Canada. In 1925 he was made one of the board of governors of the University of

Jerusalem.

HERTZBERG, EWALD FRIEDRICH, COUNT VON (1725-1795), Prussian statesman, was born at Lottin, Pomerania, on Sept. 2, 1725. He studied law at Halle, and entered the Prussian government service, rising rapidly until he became chief minister in 1763. For more than 40 years Hertzberg played an active part in the Prussian foreign office. In this capacity he had a decisive influence on Prussian policy, both under Frederick the Great and Frederick William II. At the beginning of the Seven Years' War (1756) he took part as a political writer in the Hohenzollern-Habsburg quarrel, both in his "Motives which have induced the king of Prussia to oppose the intentions of the court of Vienna, and to prevent them from being carried into effect" and in his *Mémoire raisonné sur la conduite des cours de Vienne et de Saxe*, based on the secret papers taken by Frederick the Great from the archives of Dresden. After the defeat at Kolin (1757) he organized the national defence in Pomerania and collected the necessary troops for the protection of the fortresses of Stettin and Colberg. In the same year he conducted the peace negotiations with Sweden, and helped to bring about the peace of Hubertsburg (1763).

In 1772, in a memoir based upon comprehensive historical studies, he defended the Prussian claims to certain provinces of Poland. He also supported by his writings the negotiations on the Bavarian succession (1778) and the peace of Teschen (1779). But in 1780 he failed to uphold Prussian interests at the election of the bishop of Münster. In 1784 appeared Hertzberg's memoir containing a thorough study of the *Fürstenbund*. He championed this creation of Frederick the Great's mainly with a view to an energetic reform of the empire, though the idea of German unity was naturally still far from his mind. In 1785 followed "An explanation of the motives which have led the king of Prussia to propose to the other high estates of the empire an association for the maintenance of the system of the empire." Though the *Fürstenbund* failed to effect a reform of the empire, it at any rate prevented the fulfilment of Joseph II.'s old desire for the incorporation of Bavaria with Austria. The last act of state in which Hertzberg took part under Frederick the Great was the commercial treaty concluded in 1785 between Prussia and the United States.

With Frederick, especially in his later years, Hertzberg stood in very intimate personal relations and was often the king's guest at Sans-Souci. Under Frederick William II. his influential position at the court of Berlin was at first unshaken. Hertzberg was raised to the rank of count in 1786; and Mirabeau would never have attacked him with such violence in his *Secret History of the Court of Berlin* (1788), if he had not seen in him the most powerful man after the king. His political system remained on the whole the same under Frederick William II. as it had been under his predecessor. It was mainly characterized by a sharp opposition to the house of Habsburg and by a desire to win for Prussia the support of England, a policy supported by him in important memoirs of the years 1786 and 1787. His diplomacy was directed also against Austria's old ally, France. Hence it was chiefly owing to Hertzberg that in 1787, in spite of the king's unwillingness at first, Prussia intervened in Holland in support of the stadtholder William V. against the democratic French party (see *HOLLAND: History*). The success of this intervention, which was the practical realization of a plan very characteristic of Hertzberg, marks the culminating point in his career.

But the opposition between him and the new king, which had already appeared at the time of the conclusion of the triple alliance between Holland, England and Prussia, became more marked in the following years, when Hertzberg, relying upon this alliance, and in conscious imitation of Frederick II.'s policy at the time of the first partition of Poland, sought to take advantage of the entanglement of Austria with Russia in the war with Turkey to secure for Prussia an extension of territory by diplomatic intervention. According to his plan, Prussia was to offer her mediation at the proper moment, and in the territorial readjustments that the peace would bring, was to receive Danzig and Thorn as her portion. Beyond this he aimed at preventing the restoration of

the hegemony of Austria in the empire, and secretly cherished the hope of restoring Frederick the Great's Russian alliance.

Deep-rooted differences between him and the king were revealed during these diplomatic campaigns. Hertzberg wished to effect everything by peaceful means, while Frederick William II. was for a time determined on war with Austria. On Polish policy, too, their ideas came into conflict, Hertzberg having always been openly opposed to the total annihilation of the Polish kingdom. The same is true of the attitude of king and minister towards Great Britain. At the conferences at Reichenbach in the summer of 1790, this opposition became more and more acute, and Hertzberg was only with difficulty persuaded to come to an agreement merely on the basis of the *status quo*, as demanded by Pitt. The king's renunciation of any extension of territory was in Hertzberg's eyes impolitic, and this view of his was later endorsed by Bismarck. A letter which came to the eyes of the king, in which Hertzberg severely criticized the king's foreign policy, and especially his plans for attacking Russia, led to his dismissal on July 5, 1791. The king showed himself more and more personally hostile to the ex-minister, and in later years pursued Hertzberg, now quite embittered, with every kind of petty persecution, even ordering his letters to be opened.

Wilhelm von Humboldt excepted, Hertzberg was the most learned of all the Prussian ministers. As a member of the Berlin Academy especially, and, from 1786 onward, as its curator, Hertzberg was active in the world of learning. His yearly reports dealt with history, statistics and political science. The most interesting is that of 1784: *Sur la forme des gouvernements, et quelle est la meilleure*. This is directed exclusively against the absolute system (following Montesquieu), upholds a limited monarchy, and is in favour of extending to the peasants the right to be represented in the diet. He spoke for the last time in 1793 on Frederick the Great and the advantages of monarchy. After 1783 these discourses caused a great sensation, since Hertzberg introduced into them a review of the financial situation, which in the days of absolutism seemed an unprecedented innovation. Hertzberg exerted himself as an academician to change the strongly French character of the Academy and make it into a truly German institution. He showed a keen interest in the old German language and literature. A special "German deputation" was set aside at the Academy and entrusted with the drawing up of a German grammar and dictionary. He also stood in very close relations with many of the German poets of the time, and in 1780 he boldly took up the defence of German literature, which had been disparaged by Frederick the Great in his famous writing *De la littérature allemande*. He died in Berlin on May 22, 1795.

BIBLIOGRAPHY.—(1) By Hertzberg himself: The *Mémoires de l'Académie* from 1780 on contain Hertzberg's discourses. The most noteworthy of them were printed in 1787. Here too is to be found: *Histoire de la dissertation [du roi] sur la littérature allemande*; see also *Recueil des déductions, etc., qui ont été rédigés . . . pour la cour de Prusse par le ministre* (3 vols., 1789-95); and an "Autobiographical Sketch" published by Höpke in Schmidt's *Zeitschrift für Geschichtswissenschaft*, i. (1843). (2) Works dealing specially with Hertzberg: Mirabeau, *Histoire secrète de la cour de Berlin* (1788); P. F. Weddigen, *Hertzbergs Leben* (Bremen, 1797); E. L. HERTZOG, JAMES BARRY MUNNIK (1866–), South African politician, was born at Wellington, Cape Colony, April 3, 1866. Educated at Victoria College, Stellenbosch and Amsterdam university, he became a judge in the Orange Free State in 1895, and served through the South African War of 1899–02. He voted against peace at Vereeniging and, frankly hostile to the British connection, he helped to keep alive this anti-British feeling after the war. On the grant of responsible government in 1907, he became attorney general and minister of education in Fischer's ministry, and forthwith began to undo the work of the Crown Colony Administration. He tried to force upon the schools in the Orange River State a system of compulsory bilingualism—Dutch and English—which was crude and impracticable. The director of education resigned, and one of the three inspectors, dismissed without enquiry, won an action for libel against Hertzog in a *cause célèbre*.

In the first Union Cabinet, in 1910, Hertzog became minister of justice under Botha, but his attitude made the position untenable. Hertzog derided Botha's work at the Imperial Conference in London, and repudiated all suggestions of state-aided immigration and of a naval contribution, which Botha was suspected to have favoured. Botha resigned in 1912, took office again, reconstructed his cabinet and left Hertzog out. Hertzog then (Dec. 1913) formed an opposition party with complete independence of Britain as its goal, and his fervid nationalism made him a power among the old Republican Boers. He made full use of the racial appeal, and fought unremittingly against the Botha-Smuts policy of South African development within the British Empire. His original five supporters in the South African parliament were increased by 1924 to 63, and a working alliance with the Labour party gave Hertzog a majority. Smuts fell, and the Coalition came to power with Hertzog as prime minister. He disclaimed any practical application of his republican policy; the British connection did not in fact weigh heavily enough, and Hertzog was not anti-British, but pro-South African. He contented himself with a pronouncement in 1926 in favour of independent Dominion states, and with the achievement in 1928 of a new national flag of South Africa. In 1925 he brought forward proposals for the settlement of the native question, keenly disputed in South Africa and in Great Britain (see also SOUTH AFRICA, UNION OF).

HERULI, a Teutonic tribe belonging either to the northern or the southern portion of the Jutish peninsula. In the reign of Gallienus (A.D. 260–68), they were with the Goths ravaging the coasts of the Black Sea and the Aegean. Soon afterwards, in A.D. 280, they appeared in the region about the mouth of the Rhine. During the 4th century they frequently served together with the Batavi in the Roman armies. In the 5th century the Heruli made piratical incursions in the western seas. At the same time they had a kingdom in central Europe, in or around the basin of the Elbe.

About the beginning of the 6th century they were completely overthrown in war by the Langobardi. Part of them migrated to Sweden, while others crossed the Danube and entered the Roman service, where they were frequently recorded later in connexion with the Gothic wars. In English, Frankish and Scandinavian works they are never mentioned, and there can be little doubt that they were known among the western Teutonic peoples by some other name. Probably they were identical either with the North Suabi or with the Iuti. The name Heruli itself is identified by many with the A.S. *Eorlas* (nobles).

The Heruli remained heathen until the overthrow of their kingdom, and retained many striking primitive customs. When threatened with death by disease or old age, they were required to call in an executioner, who stabbed them on the pyre. Suttee was also customary. Entirely devoted to warfare, they served not only in the Roman armies, but also in those of all the surrounding nations. They disdained the use of helmets and coats of mail, and protected themselves only with shields.

HERVAS Y PANDURO, LORENZO (1735–1809), Spanish philologist, was born at Horcajo (Cuenca) on May 10, 1735. He joined the Jesuits on Sept. 29, 1745, and became successively professor of philosophy and humanities at the seminaries of Madrid and Murcia. When the Jesuit order was banished from Spain in 1767, Hervás settled at Forlì, and devoted himself to the first part of his *Idea dell' Universo* (22 vols., 1778–92). Returning to Spain in 1798, he published his *Catálogo de las lenguas de las naciones conocidas* (6 vols., 1800–05), in which he collected the philological peculiarities of 300 languages and drew up grammars of 40 languages. In 1802 he was appointed librarian of the Quirinal Palace in Rome, where he died on Aug. 24, 1809. Max Müller credits him with having anticipated Humboldt, and with making "one of the most brilliant discoveries in the history of the science of language" by establishing the relation between the Malay and Polynesian family of speech.

HERVEY OF ICKWORTH, JOHN HERVEY, BARON (1696–1743), English statesman and writer, eldest son of John, 1st earl of Bristol, by his second marriage, was educated at Westminster school and at Clare Hall, Cambridge. In 1716 his father sent him to Paris, and thence to Hanover to pay his court to George I. He was a frequent visitor at the court of the prince and princess of Wales at Richmond, and in 1720 he married Mary Lepell, who was one of the princess's ladies-in-waiting, and a great court beauty. In 1723 he received the courtesy title of Lord Hervey on the death of his half-brother Carr, and in 1725 he was elected M.P. for Bury St. Edmunds. In 1730 he attached himself to Walpole. He was assumed by William Pulteney to be the author of *Sedition and Defamation display'd with a Dedication to the patrons of The Craftsman* (1731). Pulteney replied, and the quarrel resulted in a duel from which Hervey narrowly escaped with his life. Hervey's influence with the queen enabled him to render valuable service to Walpole. He was vice-chamberlain in the royal household and a member of the privy council. In 1733 he was called to the House of Lords by writ in virtue of his father's barony. He was lord privy seal when the fall of Walpole drove him from his office (July 1742). He predeceased his father, but three of his sons became successively earls of Bristol.

Hervey wrote detailed and brutally frank memoirs of the court of George II. from 1727 to 1737. He gave a most unflattering account of the king, and of Frederick, prince of Wales, and their family squabbles. For the queen and her daughter, Princess Caroline, he had a genuine respect and attachment, and the princess's affection for him was commonly said to be the reason for the close retirement in which she lived after his death. The ms. of Hervey's memoirs was preserved by the family, and published in 1848 under the editorship of J. W. Croker. The ms. had already been subjected to a certain amount of mutilation, and Croker himself softened in some cases the plainness of the original.

HERVIEU, PAUL (1857–1915), French dramatist and novelist, was born at Neuilly (Seine) on Nov. 2, 1857. He was called to the bar in 1877, and, after serving some time in the office of the president of the council, qualified for the diplomatic service, but resigned on his nomination in 1881 to a secretaryship in the French legation in Mexico. He contributed novels, tales and essays to the chief Parisian papers and reviews, and published a series of clever novels, of which the most famous are *Peints par eux-mêmes* (1893), an ironical study written in the form of letters and *L'Armature* (1895), dramatized in 1905 by Eugène Brieux. But his most important work consists of a series of plays: *Les Paroles restent* (Vaudeville, Nov. 17, 1892); *Les Tenailles* (Théâtre Français, Sept. 28, 1895); *La Loi de l'homme* (Théâtre Français, Feb. 15, 1897); *La Course du flambeau* (Vaudeville, April 17, 1901); *Point de lendemain* (Odéon, Oct. 18, 1901), a dramatic version of a story by Vivaut Denon; *L'Enigme* (Théâtre Français, Nov. 5, 1901); *Théroigne de Méricourt* (Théâtre Sarah Bernhardt, Sept. 23, 1902); *Le Dédale* (Théâtre Français, Dec. 19, 1903); and *Le Réveil* (Théâtre Français, Dec. 18, 1905). These plays, which are nearly all *pièces à thèse*, are built upon a severely logical method, the mechanism of which is sometimes so evident as to destroy the necessary sense of illusion. The closing words of *La Course du flambeau*—"Pour ma

filles, j'ai tué ma mère"—illuminate the Hervieu method. The riddle in *L'Enigme* (staged at Wyndham's Theatre, London, March 1, 1902, as *Caesar's Wife*) is, however, worked out with great art, and *Le Dédale*, dealing with the obstacles to the remarriage of a divorced woman, is reckoned among the masterpieces of the modern French stage. His last play was *Le Destin est Maître* (1914). He was elected to the French Academy in 1900, and died in Paris on Oct. 25, 1915.

See A. Binet, in *L'Année psychologique*, vol. x.; and *Portrait psychologique de Paul Hervieu* (1914); H. Burckhardt, *Studien zu Paul Hervieu* (1917).

HERWARTH VON BITTENFELD, KARL EBERHARD (1796-1884), Prussian general field-marshal, born at Grosswerther on Sept. 4, 1796, entered the Guards in 1811, and served through the War of Liberation (1813-15). In the Danish War of 1864 he succeeded to the command of the Prussians when Prince Frederick Charles became commander-in-chief of the Allies, and it was under his leadership that the Prussians forced the passage into Alsace on June 29. In the war of 1866 Herwarth commanded the "Army of the Elbe" which overran Saxony and invaded Bohemia by the valley of the Elbe and Iser. His troops won the actions of Hühnerwasser and Münchengrätz, and at Königgrätz formed the right wing of the Prussian army. Herwarth himself directed the battle against the Austrian left flank. In 1870 he was employed in the home area, and in 1871 was created field-marshal before his retirement. He died at Bonn on Sept. 2, 1884.

See G. F. M. Herwarth von Bittenfeld (Münster, 1896).

HERWEGH, GEORG (1817-1875), German revolutionary poet, was born at Stuttgart on May 31, 1817, the son of a restaurant keeper. Called out for military service, he had hardly joined his regiment when he committed an act of flagrant insubordination, and fled to Switzerland to avoid punishment. Here he published his *Gedichte eines Lebendigen* (1841), a volume of political poems expressing the fervent aspirations of the German youth of the day. Although the book was confiscated, it soon ran through several editions. The idea of the book was a refutation of the opinions of Prince Pückler-Muskau (q.v.) in his *Briefe eines Verstorbenen*. Herwegh returned to Germany in 1842, visiting Jena, Leipzig, Dresden and Berlin—a journey which was described as being a "veritable triumphal progress." His military insubordination appears to have been forgiven and forgotten, for in Berlin King Frederick William IV. received him with the memorable words: *Ich liebe eine gesinnungsvolle Opposition* ("I admire an opposition, when dictated by principle"). Herwegh published in Paris in 1844 the second volume of his *Gedichte eines Lebendigen*, which, like the first, was confiscated by the German police. At the head of a revolutionary column of German working men, recruited in Paris, Herwegh took part in the South German rising in 1848; but his raw troops were defeated on April 27 at Schopfheim in Baden. He escaped to Switzerland, where he lived by his pen. He was later (1866) permitted to return to Germany, and died at Lichtenthal near Baden-Baden on April 7, 1875. *Neue Gedichte* (1877) appeared posthumously.

Herwegh's correspondence was published by his son Marcel in 1898. See also J. Scherr, *Georg Herwegh, literarische und politische Blätter* (1843); K. Henfold, *Georg Herwegh und seine deutsche Vorbilder* (1916); Baldinger, *Georg Herwegh: Die Gedankenwelt der Gedichte eines Lebendigen* (1917).

HERZBERG, a town in the Prussian province of Hanover, situated under the south-western declivity of the Harz, on the Sieber, 25 m. N.W. from Nordhausen by the railway to Osterode-Hildesheim. Pop. (1925) 4,604. It has manufactures of machinery and art silk and weaving and dyeing works. On a hill south-west of the town lies the castle of Herzberg, which in 1157 came into the possession of Henry the Lion, duke of Saxony, and was one of the residences of a branch of the house of Brunswick.

HERZBERG, a town, in the Prussian province of Saxony, on the Schwarze Elster, 25 m. S. from Jüterbog by the railway Berlin-Rödera-Dresden. It has a church (Evangelical) dating from the 13th century and a mediaeval town hall. Its industries include the founding and turning of metal, agricultural machinery

and furniture. Pop. (1925) 3,788.

HERZEN, ALEXANDER IVANOVICH (1812-1870), Russian author, was born in Moscow on March 25, 1812, the illegitimate son of Ivan Yakovlev, a noble. A year later the family returned to Moscow, where Herzen attended the university. In 1834 he was arrested with other youths suspected of revolutionary tendencies, and in 1835 he was exiled to Viatka and worked as a clerk in the civil service. There he remained for seven years, at the end of which he was allowed to exchange to Vladimir, where he edited the official gazette. In 1840 he was allowed to return to Moscow, where he became one of the leaders of the westerners, but he was again arrested, and sent to serve in the Government offices at Növgorod until his retirement in 1842. In 1846 his father died, leaving him by his will a very large property. Early in 1847 he left Russia, never to return. From Italy, on hearing of the revolution of 1848, he hastened to Paris, whence he afterwards went to Switzerland. In 1852 he quitted Geneva for London, where he settled for some years, and established a Russian press for the publication of works which could not be printed in Russia. In 1864 he returned to Geneva, and after some time went to Paris, where he died on Jan. 9, 1870.

In 1847 appeared his novel *Kto Vinovat?* (Whose Fault?), and about the same time were published in Russian periodicals the stories which were afterwards collected and printed in London in 1854, under the title of *Prervannuie Razskazui* (Interrupted Tales). In 1850 two works appeared, translated from the Russian manuscript, *Vom anderen Ufer* (From another Shore) and *Lettres de France et d'Italie*. *Vom anderen Ufer* is perhaps his greatest work. It is the bitter fruit of disillusion after the failure of the revolution of 1848; in it he seeks to destroy the romanticism of the revolutionaries and to replace it by the will to revolution. In French appeared also his essay *Du Développement des idées révolutionnaires en Russie*, and his *Memoirs*. Herzen's *Memoirs* are indispensable in the history of the revolution in Europe for the portraits of the revolutionary leaders; and they give a true and vivid picture of his own personality and upbringing. From his "Free Russian Press" in London he issued a great number of Russian works, all levelled against the system of government prevailing in Russia. Some of these were essays, such as his *Baptized Property*, an attack on serfdom; others were periodical publications, the *Polyarnaya Zvezda* (or Polar Star), the *Kolokol* (or Bell), and the *Golos iz Rossii* (or Voices from Russia). The *Kolokol* soon obtained an immense circulation, and exercised an extraordinary influence. For three years, it is true, the founders of the "Free Press" went on printing, "not only without selling a single copy, but scarcely being able to get a single copy introduced into Russia"; but after the death of the emperor Nicholas in 1855 Herzen's writings, and the journals he edited, were smuggled wholesale into Russia, and their words resounded throughout that country, as well as all over Europe. For some years his influence in Russia was a living force; the circulation of his writings was a vocation zealously pursued. When the Polish insurrection of 1863 broke out, and he pleaded the insurgents' cause, his reputation in Russia received its death-blow. From that time it was only with the revolutionary party that he was in full accord.

In 1873 a collection of his works in French was commenced in Paris. A volume of posthumous works, in Russian, was published at Geneva in 1870. His *Memoirs* (Eng. trans. by C. Garnett, 6 vols., 1924-27, and by J. D. Duff, Yale, 1923), supply the principal information about his life, a sketch of which appears also in A. von Wurzbach's *Zeitgenossen*, pt. 7 (Vienna, 1871). See also the *Revue des deux mondes* for July 15 and Sept. 1, 1854. *Kto Vinovat?* has been translated into German under the title of *Wer ist schuld?* in Wolfsohn's *Russlands Novellendichter*, vol. iii.

HERZL, THEODOR (1860-1904), founder of modern political Zionism (q.v.), was born in Budapest on May 2, 1860, and died at Edlach on July 3, 1904. He received a legal education at Vienna, where he afterwards acquired high repute as a literary journalist and a dramatist. All his other claims to renown, however, sink into insignificance when compared with his work as the reviver of Jewish hopes for a restoration to political autonomy. The new nationalism of 1848 did not deprive the Jews of political rights, but it denied them both the amenities of friendly

intercourse and the opportunity of distinction in the university, the army and the professions. Many Jews refused to see in the new anti-Semitism (*q.v.*) which spread over Europe in 1881 any more than a temporary reaction against the cosmopolitanism of the French Revolution. In 1896 Herzl published his famous pamphlet "Der Judenstaat." Holding that the only alternatives for the Jews were complete merging by intermarriage or self-preservation by a national re-union, he boldly advocated the second course. He did not at first insist on Palestine as the new Jewish home, nor did he attach himself to religious sentiment; his solution was economic and political. The influence of his pamphlet, the progress of the movement he initiated, the subsequent modifications of his plans, are told at length in the article ZIONISM.

Herzl rallied the masses with sensational success, and unexpectedly gained the accession of many Jews by race who were indifferent to the religious aspect of Judaism, but he failed to convince the leaders of Jewish thought, who (with such conspicuous exceptions as Nordau and Zangwill) remained deaf to his pleading. He assembled several congresses at Basle (beginning in 1897), and at these congresses were enacted remarkable scenes of enthusiasm for his ideal of "establishing for the Jewish people a publicly and legally assured home in Palestine." Diplomatic interviews, exhausting journeys, impressive mass meetings, brilliant literary propaganda—all these methods were employed by him to the utmost limit of self-denial. In 1901 he was received by the sultan; the pope and many European rulers and statesmen gave him audiences. In 1903, the British Government offered land for an autonomous settlement in East Africa, but an extra-Palestinian site for the Jewish State was strongly opposed by many Zionists. This somewhat embittered "territorial" controversy told on Herzl's failing health, and he died in the summer of 1904.

See *Theodor Herzls Tagebücher* (3 vols., 1922). See also A. Friedemann, *Das Leben Theodor Herzls* (1914); B. Hagani, *Le Sionisme politique et son fondateur T. Herzl* (1918).

HERZOG, HANS (1819-1894), Swiss general, was born, and died, at Aarau. In 1870 he was commander-in-chief of the Swiss army, which guarded the Swiss frontier, in the Jura, during the Franco-German War, and in February 1871, as such, concluded the Convention of Verrières with General Clinchant for the disarming and the internment of the remains of Bourbaki's army, when it took refuge in Switzerland. In 1875 he became the commander-in-chief of the Swiss artillery.

HERZOG, JOHANN JAKOB (1805-1882), German Protestant theologian, was born at Basle on Sept. 12, 1805. He died on Sept. 30, 1882, at Erlangen, where he had been professor of church history from 1854 to 1877. He prepared the *Realencyklopädie für protestantische Theologie und Kirche* (1853-68, 22 vols.), of which he undertook a new edition with G. L. Plitt (1836-80) in 1877, and after Plitt's death with Albert Hauck (b. 1845). Hauck began the publication of the third edition in 1896 (completed in 22 vols., 1909).

His other works include *Joh. Calvin* (1843), *Leben Ökolampads* (1843), *Die romanischen Waldenser* (1853), *Abriß des gesamten Kirchengeschichte* (3 vols., 1876-82, 2nd ed., 1890-92).

HERZOGENBERG, HEINRICH VON (1843-1900), Austrian musician and friend of Brahms, was born at Graz, Styria, on June 10, 1843, and studied at the Vienna conservatoire. He settled in Leipzig in 1872, and from 1875 to 1885 was conductor of the Bach *Verein*. He was later professor at the Berlin Hochschule, and at Kiel, retiring in 1888. He wrote much chamber music and scholarly church and orchestral works, all of which bear the impress of his intimacy with Brahms.

See J. Kalbeck, *Brahms, in Briefwechsel mit Heinrich und Elisabeth Herzogenberg* (2 vols., 1907).

HESILRIGE (or HESELRIG), **SIR ARTHUR**, 2ND BART. (d. 1661), English parliamentarian, was the eldest son of Sir Thomas Hesilrige, 1st baronet (c. 1622), of Noseley, Leicestershire. He sat for Leicestershire in the Short and Long Parliaments in 1640, and took a principal part in Strafford's attainder, the Root and Branch Bill and the Militia Bill of Dec. 7, 1641, and was one of the five members impeached on Jan. 3, 1642. He raised a troop of

horse for Essex, fought at Edgehill, commanded in the West under Waller, being nicknamed his *fidus Achates*, and distinguished himself at the head of his cuirassiers, "The Lobsters," at Lansdown on July 5, 1643, at Roundway Down on July 13, at both of which battles he was wounded, and at Cheriton, March 29, 1644. On the occasion of the breach between the army and the parliament, Hesilrige supported the army, took Cromwell's part in his dispute with Manchester and Essex, and on the passing of the Self-denying Ordinance gave up his commission and became one of the leaders of the Independent party in parliament. On Dec. 30, 1647 he was appointed governor of Newcastle, which he successfully defended; he defeated the Royalists on July 2, 1648 and regained Tynemouth. In October he accompanied Cromwell to Scotland, and gave him valuable support in the Scottish expedition in 1650. Hesilrige, though he approved of the king's execution, had declined to act as judge on his trial. Cromwell's expulsion of the Long Parliament threw him into antagonism, and he opposed the Protectorate and refused to pay taxes. He was returned for Leicester to the parliaments of 1654, 1656 and 1659, but was excluded from the two former. He succeeded in again obtaining admission to the Commons in January 1658. On Cromwell's death Hesilrige refused support to Richard; after Richard's downfall he attempted to maintain a republican parliamentary administration, "to keep the sword subservient to the civil magistrate," and when Lambert expelled the parliament, Hesilrige turned to Monk for support, and helped him by securing Portsmouth on Dec. 3, 1659. He marched to London, was appointed one of the council of state, and on Feb. 11 became a commissioner for the army. He was completely outwitted by Monk, and trusting to his assurance of fidelity to "the good old cause" consented to the retirement of his regiment from London. At the Restoration his life was saved by Monk's intervention, but he died in the Tower on Jan. 7, 1661.

See article on Hesilrige by C. H. Firth in the *Dict. of Nat. Biography*, and authorities there quoted.

HESIOD, the father of Greek didactic poetry, probably flourished during the 8th century B.C. His father had migrated from the Aeolic Cyme in Asia Minor to Boeotia; and Hesiod and his brother Perses were born at Ascra, near Mount Helicon (*Works and Days*, 635). Here, as he fed his father's flocks, he received his commission from the Muses to be their prophet and poet, a commission which he recognized by dedicating to them a tripod—still in existence at Helicon in the age of Pausanias (*see Theogony*, 20-34, *W. and D.* 656; Pausanias ix. 38. 3)—won by him in a contest of song (*see below*) at some funeral games at Chalcis in Euboea. After the death of his father Hesiod is said to have left his native land in disgust at the result of a law-suit with his brother and to have migrated to Naupactus. There was a tradition that he was murdered by the sons of his host in the sacred enclosure of the Nemean Zeus at Oeneon in Locris (Thucydides iii. 96; Pausanias ix. 31); his remains were removed for burial by command of the Delphic oracle to Orchomenus in Boeotia, where the Ascraeans settled after the destruction of their town by the Thespians, and where, according to Pausanias, his grave was to be seen.

Hesiod's earliest poem, the famous *Works and Days*, and according to Boeotian testimony the only genuine one, embodies the experiences of his daily life and work, and, interwoven with episodes of fable, allegory, and personal history, forms a sort of Boeotian shepherd's calendar. The first portion is an ethical enforcement of honest labour and dissuasive of strife and idleness (1-383); the second consists of hints and rules as to husbandry (384-764); and the third is a religious calendar of the months, with remarks on the days most lucky or the contrary for rural or nautical employments. The connecting link of the whole poem is the author's advice to his brother, who appears to have bribed the corrupt judges to deprive Hesiod of his inheritance. In the *Works and Days* the episodes which rise above an even didactic level are the "Creation and Equipment of Pandora," the "Five Ages of the World" and the much-admired "Description of Winter" (by some critics judged post-Hesiodic). The poem also contains the earliest known fable in Greek literature, that of "The Hawk and the Nightingale." It is in the *Works and Days* especially that we glean indications of Hesiod's rank and condition in

life, that of a stay-at-home farmer of the lower class, whose sole experience of the sea was a single voyage of 40 yards across the Euripus, and an old-fashioned bachelor whose misogynic views and prejudice against matrimony have been conjecturally traced to his brother Perses having a wife as extravagant as himself.

The other poem attributed to Hesiod or his school which has come down in great part to modern times is the *Theogony*, a work of grander scope, inspired alike by older traditions and abundant local associations. It is an attempt to work into system, as none had essayed to do before, the floating legends of the gods and goddesses and their offspring. This task Herodotus (ii. 53) attributes to Hesiod, and he is quoted by Plato in the *Symposium* (178 B) as the author of the *Theogony*. The first to question his claim to this distinction was Pausanias, the geographer (A.D. 200). The Alexandrian grammarians had no doubt on the subject; and indications of the hand that wrote the *Works and Days* may be found in the severe strictures on women, in the high esteem for the wealth-giver Plutus and in coincidences of verbal expression. Although, no doubt, of Hesiodic origin, in its present form it is composed of different recensions and numerous later additions and interpolations. The *Theogony* consists of three divisions: (1) a cosmogony, or creation; (2) a theogony proper, recounting the history of the dynasties of Zeus and Cronus; and (3) a brief and abruptly terminated herōgony, the starting-point not improbably of the supplementary poem, the *κατάλογος* or "List of Women" who wedded immortals, of which all but a few fragments are lost.¹ The poem (1-116) addressed to the Heliconian and Pierian muses, is considered to have been variously enlarged, altered and arranged by successive rhapsodists. The poet has interwoven several episodes of rare merit, such as the contest of Zeus and the Olympian gods with the Titans, and the description of the prison-house in which the vanquished Titans are confined, with the Giants for keepers and Day and Night for janitors (735 sqq.).

The only other poem which has come down to us under Hesiod's name is the *Shield of Heracles*, the opening verses of which are attributed by a nameless grammarian to the fourth book of *Eoiai*. The theme of the piece is the expedition of Heracles and Iolaus against the robber Cynus; but its main object apparently is to describe the shield of Heracles (141-317). It is clearly an imitation of the Homeric account of the shield of Achilles (*Iliad*, xviii. 479) and is now generally considered spurious. Titles and fragments of other lost poems of Hesiod have come down to us: didactic, as the *Maxims of Cheiron*; genealogical, as the *Aegimius*, describing the contest of that mythical ancestor of the Dorians with the Lapithae; and mythical, as the *Marriage of Ceyx* and the *Descent of Theseus to Hades*.

Recent editions of Hesiod include the 'Αγών 'Ομήρου καὶ Ἡσίοδου, the *Contest* (of song) between *Homer and Hesiod*, at the funeral games held in honour of King Amphidamas at Chalcis. This little tract belongs to the time of Hadrian, who is actually mentioned as having been present during its recitation, but is founded on an earlier account by the sophist Alcidas (q.v.). Quotations (old and new) are made from the works of both poets, and, in spite of the sympathies of the audience, the judge decided in favour of Hesiod. Certain biographical details of Homer and Hesiod are also given.

A strong characteristic of Hesiod's style is his sententious and proverbial philosophy (as in *Works and Days*, 24-25, 40, 218, 345, 371). There is naturally less of this in the *Theogony*, yet there, too, not a few sentiments take the form of the saw or adage. He has undying fame as the first of didactic poets (see DIDACTIC POETRY), the accredited systematizer of Greek mythology and the rough but not unpoetical sketcher of the lines on which Virgil wrought out his exquisitely finished *Georgics*.

BIBLIOGRAPHY.—Complete works: *Editio princeps* (Milan, 1493); Götting-Flach (1878), with full bibliography up to date of publication; C. Sittl (1889), with introduction and critical and explanatory notes in Greek; F. A. Paley (1883); A. Rzach (1902), including the fragments. Separate works: *Works and Days*—Van Lennep (1847); A. Steitz, *Die Werke und Tage des Hesiodos* (1869), dealing chiefly with the composition and arrangement of the poem; G. Wlastoff,

¹Part of the poem was called *Eoiai*, because the description of each heroine began with ἑοῖα, "or like as." (See BIBLIOGRAPHY.)

Prométhée, Pandore, et la légende des siècles (1883); A. Kirchhoff (1889); *Theogony*—Van Lennep (1843); F. G. Welcker (1865), valuable edition; G. F. Schömann (1868), with text, critical notes and exhaustive commentary; H. Flach, *Die Hesiodische Theogonie* (1873), with prolegomena dealing chiefly with the digamma in Hesiod, *System der Hesiodischen Kosmogonie* (1874), and *Glossen und Scholien zur Theogonie* (1876); Meyer, *De compositione Theogoniae* (1887). *Shield of Heracles*: Wolf-Ranke (1840); Van Lennep-Hullemann (1854); F. Stegemann, *De Scuti Herculis Hesiodi poetae Homeri carminum imitatore* (1904); the fragments were published by W. Marckscheffel in 1840; for the 'Αγών 'Ομήρου (ed. A. Rzach, 1908) see F. Nietzsche in *Rheinisches Museum* (new series), xxv. p. 528. For papyrus fragments of the "Catalogue," some 50 lines on the wooing of Helen, and a shorter fragment in praise of Peleus, see Wilamowitz-Möllendorf in *Sitzungsber. der königl. preuss. Akad. der Wissenschaften*, July 26, 1900; for fragments relating to Meleager and the suitors of Helen, *Berliner Klassikertexte* (1907) v.; of the *Theogony*, *Oxyrh. Pap.* vi. (1908).

On the subject generally, consult G. F. Schömann, *Opuscula* (1857) ii.; H. Flach, *Die Hesiodischen Gedichte* (1874); A. Rzach *Der Dialekt des Hesiodos* (1876); O. Friedel, *Die Sage vom Tode Hesiods* (1879), from *Jahrbücher für klassische Philologie* (10th suppl. Band, 1879); P. O. Gruppe, *Die griechischen Kulte und Mythen*, i. (1887); J. Adam, *Religious Teachers of Greece* (1908). There is a full bibliography of the publications relating to Hesiod (1884-98) by A. Rzach in Bursian's *Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft* (1900) xxvii.

There are translations of the Hesiodic poems in English by Cooke (1728), C. A. Elton (1815), J. Banks (1856), and specially by A. W. Mair, with introduction and appendices (Oxford Library of Translations, 1908); in German (metrical version) with valuable introductions and notes by R. Peppmüller (1896), and in other modern languages.

On the date of Hesiod see T. W. Allen in *J. H. S.* (1915), xxxv., who would place his *floruit*, on astronomical and other grounds, c. 800 B.C. (J. DA.; J. H. F.)

HESPERIDES, in Greek mythology, maidens who guarded the golden apples which Earth gave Hera on the occasion of her marriage to Zeus. According to Hesiod (*Theogony*, 215) they were the daughters of Erebus and Night; in later accounts, of Atlas and Hesperis, or of Phorcys and Ceto (Schol. on Apoll. Rhod. iv. 1,399; Diod. Sic. iv. 27). They were usually supposed to be three in number—Aegle, Erytheia, Hesperis (or Hesperethusa); according to some, four, or even seven. They lived far away in the west at the borders of Ocean, where the sun sets. Hence the sun (according to Minnervus *ap. Athenaeum* xi. p. 470) sails in the golden bowl made by Hephaestus from the abode of the Hesperides to the land where he rises again. According to other accounts their home was among the Hyperboreans. The golden apples grew on a tree guarded by Ladon, the ever-watchful dragon. As this is the name of an Arcadian river, Arcadia is possibly the original site of the garden. Heracles (see HERCULES) slew the dragon and stole the apples. The golden apples, the gift of Aphrodite to Hippomenes before his race with Atalanta, were plucked from the garden of the Hesperides. (See also ERIS.)

HESPERORNIS, an extinct bird from the Mid-Cretaceous of Kansas. *Hesperornis* ("western bird") was a flightless, swimming and diving bird, nearly 4 ft. in length; the bill was long and slender, with teeth set in a continuous groove, filling the lower mandible to the tip, but confined to the basal portion of the upper mandible. Of the wing, only the humerus remained. The legs were strong, directed outward at right angles to the body, and moving together like a pair of oars. (See ODONTORNITHES; ORNITHOLOGY.)

HESPERUS, the evening star, son or brother of Atlas [Gr. Ἑσπερος; Lat. Vesper]. Although as a mythological personality he is regarded as distinct from Phosphoros or Heosphoros (Lat. Lucifer), the morning star or bringer of light, the son of Astraeus (or Cephalus) and Eos, the two stars were early identified by the Greeks.

See Diog. Laert. viii. 1. 14.; Cicero, *De nat. deorum* ii. 20; Pliny, *Nat. Hist.* ii. 6 [8].

HESS, HEINRICH HERMANN JOSEF, FREIHERR VON (1788-1870), Austrian soldier, entered the army in 1805 and after distinguished service in the Napoleonic Wars, became in 1831 chief of staff to Radetzky on his appointment to the command in Austrian Italy. An excellent organizer, he assisted his chief to make the Austrian army in Italy the best in Europe. From 1834-48 he was employed in Moravia and Vienna, but on the outbreak

of revolution returned to Italy as Radetzky's chief of staff and helped to bring the campaign to its successful close. He was promoted quartermaster-general, and in 1849 chief of staff to the Emperor. After serving on various missions abroad, he commanded the Austrian forces in the Crimean War. In 1859, he was sent to Italy after the early Austrian defeats, but could not retrieve the situation. He became field marshal in 1860, and a year later, on resigning his position as chief of staff, he was made captain of the Trabant guard. He died in Vienna in 1870.

See "General Hess" in *Lebensgeschichtlichen Hinrissen* (Vienna, 1855).

HESSE, HERMANN (1877-), German writer and poet, was born at Kalw on July 2, 1877. He wrote a long series of novels, Indian travel sketches and other works. His first volume of poems appeared in 1902, and a selection in 1922. An edition of his collected works was begun in 1925.

HESSE, a republic included in Germany, known until 1866 as Hesse-Darmstadt (*q.v.*). It consists of two main parts, separated by a narrow strip of Prussian territory. The northern part is the province of Oberhessen; the southern consists of the contiguous provinces of Starkenburg and Rheinhessen. There are also a number of small exclaves about Homburg and Wimpfen on the north-west frontier of Württemberg. Oberhessen extends over the water-parting between the basins of the Rhine and the Weser. The Vogelsberg, a volcanic mass culminating in the Taufstein (2,533 ft.), lies in the east of the province. In the west it includes spurs of the Taunus. Between these two systems lies the fertile tract watered by the Wetter, a tributary of the Main. Starkenburg occupies the angle between the Main and the Rhine, and in its south-eastern part includes some of the ranges of the Odenwald. Rheinhessen is separated from Starkenburg by the Rhine, and has that river as its northern as well as its eastern frontier, except at the north-east corner. The territory is a fertile tract of low hills, rising towards the south-west into the northern extremity of the Hardt range.

The area and population of the three provinces of Hesse are as follow:

	sq. m.	1925
Oberhessen	1269	328,490
Starkenburg	1169	634,621
Rheinhessen	530	384,168
Total	2968	1,347,279

The density per sq.m. is thus 454.

The chief towns of the grand duchy are Darmstadt (the capital) and Offenbach in Starkenburg, Mainz and Worms in Rheinhessen and Giessen in Oberhessen. More than two-thirds of the inhabitants are Protestants; the majority of the remainder are Roman Catholics, with some thousands of Jews. Education is compulsory, assisted by state grants. There is a university at Giessen and a technical high school at Darmstadt. More than three-fifths of Hesse is under cultivation. Grain crops, roots, fruit, tobacco and vines are grown. Minerals, in which Oberhessen is much richer than the two other provinces, include iron, manganese, salt and some lignite.

The constitution dates from 1919. The Landtag consists of 70 members, elected by all persons over 20 years of age who have resided three years in the province. It is elected for three years. The three provinces are divided for local administration into 18 circles and 987 communes.

HISTORY

The name of Hesse refers to a country which has had different boundaries and areas at different times. The name is derived from that of a Frankish tribe, the Hessi. The earliest known inhabitants of the country were the Chatti, who lived here during the 1st century A.D. (Tacitus, *Germania*, c. 30), and whose capital, Mattium on the Eder, was burned by the Romans about A.D. 15. "Alike both in race and language," says Walther Schultze, "the Chatti and the Hessi are identical." The Hessians were converted to Christianity after the fall of the Roman empire, mainly through the efforts of St. Boniface; their land was included in the archbishopric of Mainz; and religion and culture

were kept alive among them largely owing to the foundation of the Benedictine abbeys of Fulda and Hersfeld. After the accession of Otto in 936 the land quietly accepted the yoke of the mediaeval emperors. From 1137 to 1247 Hesse formed part of Thuringia; and its history properly begins only with the elevation of the landgrave Henry of Hesse to the rank of Prince of the Empire in 1292.

For nearly 300 years the history of Hesse is comparatively uneventful. The land, which fell into two main portions, upper Hesse round Marburg, and lower Hesse round Cassel, was twice divided between two members of the ruling family, but no permanent partition took place before the Reformation. A *Landtag* was first called together in 1387, and the landgraves were constantly at variance with the electors of Mainz, who had large temporal possessions in the country. In 1509 Philip (*q.v.*) became landgrave, and by his vigorous personality brought his country into prominence during the religious troubles of the 16th century. Following the example of his ancestors, Philip cared for education and the general welfare of his land, and the Protestant university of Marburg, founded in 1527, owes its origin to him. When he died in 1567 Hesse was divided among his four sons into Hesse-Cassel, Hesse-Darmstadt, Hesse-Marburg and Hesse-Rheinfels. The lines ruling in Hesse-Rheinfels and Hesse-Marburg, or upper Hesse, became extinct in 1583 and 1604 respectively, and these lands passed to the two remaining branches of the family. The small landgraviate of Hesse-Homburg was formed in 1622 from Hesse-Darmstadt. After the annexation of Hesse-Cassel and Hesse-Homburg by Prussia in 1866, Hesse-Darmstadt remained the only independent part of Hesse.

Hesse-Philippsthal, an offshoot of Hesse-Cassel, was founded in 1685 by Philip (d. 1721), son of the Landgrave William VI. Hesse-Barchfeld was founded in 1721 by Philip's son, William (d. 1761). Both these divisions were mediatised. Hesse-Nassau a province of Prussia was made in 1866 from part of Hesse-Cassel and part of the duchy of Nassau.

Hesse-Cassel.—The earliest ruler of Hesse-Cassel with much claim to remembrance is Charles (1670-1730) who was the first to adopt the system of hiring his soldiers out to foreign powers as mercenaries, as a means of improving the national finances. Frederick II. (1760-85) hired out 22,000 Hessian troops to England for about £3,191,000, to assist in the war against the North American colonies. The reign of the next landgrave, William IX. (1785-1821), was an important epoch in the history of Hesse-Cassel. For the loss in 1801 of his possessions on the left bank of the Rhine he was in 1803 compensated by some of the former French territory round Mainz, and at the same time was raised to the dignity of Elector (*Kurfürst*) as William I. In 1806 he made a treaty of neutrality with Napoleon, but after the battle of Jena the latter, suspecting William's designs, occupied his country, and expelled him. Hesse-Cassel was then added to Jerome Bonaparte's new kingdom of Westphalia; but after the battle of Leipzig in 1813 the French were driven out and on Nov. 21 the elector returned in triumph to his capital.

The elector signalized his restoration by abolishing with a stroke of the pen all the reforms introduced under the French régime, repudiating the Westphalian debt and declaring null and void the sale of the crown domains. Everything was set back to its condition on Nov. 1, 1806; even the officials had to descend to their former rank, and the army to revert to the old uniforms, and powdered pigtails. The estates, indeed, were summoned in March 1815 but the attempt to devise a constitution broke down; their appeal to the federal diet at Frankfurt to call the elector to order in the matter of the debt and the domains came to nothing owing to the intervention of Metternich; and in May 1816 they were dissolved, never to meet again. William I. died on Feb. 27, 1821, and was succeeded by his son, William II. Under him the constitutional crisis in Hesse-Cassel came to a head. He was arbitrary and avaricious like his father, and moreover shocked public sentiment by his treatment of his wife, a popular Prussian princess, and his relations with his mistress, one Emilie Ortlöpp, created countess of Reichenbach, whom he loaded with wealth. The July revolution in Paris gave the signal for disturbances;

the elector was forced to summon the estates; and on Jan. 5, 1831, a constitution on the ordinary Liberal basis was signed. This constitution, though repeatedly evaded by the electors, was not formally repealed till 1852, after armed Austrian and Bavarian intervention following on the general defeat of the revolutionary movements of 1848-49. Continual dissensions followed and the 1831 constitution was restored in 1862. In 1866 when the elector threw in his lot with Austria, his troops were defeated and his lands annexed by Prussia.

Hesse-Darmstadt.—The separate history of Hesse-Darmstadt begins with the partition of Hesse in 1567. In 1622 Hesse-Homburg was cut off from it to form an apanage for Frederick (d. 1638) a brother of the reigning landgrave. Hesse-Darmstadt sided with the imperialists in the Thirty Years' War, during which it suffered very severely from the ravages of the Swedes. In this struggle Hesse-Cassel took the other side, and the rivalry between the two landgraviates was increased by a dispute over Hesse-Marburg, the ruling family of which had become extinct in 1604. This quarrel was interwoven with the general thread of the Thirty Years' War, and was not finally settled until 1648, when the disputed territory was divided between the two claimants. During the 18th century the War of the Austrian Succession and the Seven Years' War dealt heavy blows at the prosperity of the landgraviate, which was always loyal to the house of Austria. Louis IX. (1719-90), who served in the Prussian army under Frederick the Great, is chiefly famous as the husband of Caroline (1721-74), "the great Landgravine," who counted Goethe, Herder and Grimm among her friends and was described by Frederick the Great as *femina sexu, ingenio vir*. In April 1790, just after the outbreak of the French Revolution, Louis X. (1753-1830), an educated prince who shared the tastes and friendships of his mother, Caroline, became landgrave. He supported Napoleon with troops from 1805 to 1813, but after the battle of Leipzig he joined the allies. In 1815 the congress of Vienna made several changes in the area and boundaries of Hesse-Darmstadt. Louis secured again a district on the left bank of the Rhine, including the cities of Mainz and Worms, but he made cessions of territory to Prussia and to Bavaria and he recognized the independence of Hesse-Homburg, which had recently been incorporated with his lands. However, his title of grand-duke taken in 1806 was confirmed, and as grand-duke of Hesse and of the Rhine he entered the Germanic confederation. Soon the growing desire for liberty made itself felt in Hesse, and in 1820 Louis gave a constitution to the land; various forms were carried through; the system of government was reorganized, and in 1828 Hesse-Darmstadt joined the Prussian *Zollverein* (q.v.). Many concessions were made to the popular will by Louis III. in the revolutionary year 1848, but during the subsequent reaction these were withdrawn, and the period between 1850 and 1871, when Karl Friedrich Reinhard, Freiherr von Dalwigk (1802-80), was chiefly responsible for the government of Hesse-Darmstadt, was one of repression, although some benefits were conferred upon the people. Dalwigk was one of Prussia's enemies, and during the war of 1866 the grand-duke fought on the Austrian side, the result being that he was compelled to pay a heavy indemnity and to cede certain districts, including Hesse-Homburg, which he had only just acquired, to Prussia. In 1871 Hesse-Darmstadt became one of the states of the new German empire. After the withdrawal of Dalwigk from public life at this time a more liberal policy was adopted in Hesse. Many reforms in ecclesiastical, educational, financial and administrative matters were introduced, and in general the grand-duchy may be said to have passed largely under the influence of Prussia. Since the annexation of Hesse-Cassel by Prussia in 1866 the grand-duchy was known simply as Hesse. The grand ducal house lost its power in the revolution of Nov. 1918 together with the rest of the reigning German princes.

Ackermann, *Bibliotheca Hessica* (Cassel, 1884-99); Hoffmeister, *Historisch-*

genealogisches Handbuch über alle Linien des Regentenhauses Hesse (Marburg, 1874); H. Bechtobheimer, J. R. Dieterich and K. Strecker, *Beiträge zur Theinhessischen Geschichte* (Mainz, 1916), and the *Zeitschrift des Vereins für hessische Geschichte* (1837-1904).

HESSE-CASSEL, a former landgraviate and electorate of Germany, now the district of Cassel in the Prussian province of Hesse-Nassau. (See HESSE.)

HESSE-DARMSTADT, a former grand duchy of Germany, after 1866 commonly known simply as Hesse (q.v.).

HESSE-HOMBURG, formerly a small landgraviate in Germany, came into separate existence in 1622, and after being mediatized or absorbed for long periods was finally incorporated in Prussia in 1866. (See HESSE.)

HESSE-NASSAU, a province of Prussia, bounded by Westphalia, Waldeck, Hanover, the province of Saxony, the Thuringian Republic, Bavaria, Hesse and the Rhine Province. There are small detached portions in Waldeck, Thuringia, etc.; on the other hand the province enclaves the province of Oberhessen belonging to the Republic of Hesse, and the circle of Wetzlar belonging to the Rhine province. Hesse-Nassau was formed in 1867-8 out of territories which accrued to Prussia after the war of 1866, namely, the landgraviate of Hesse-Cassel and the duchy of Nassau, in addition to the territory of Frankfort-on-Main, and certain other small districts. It is now divided into the *Bezirke* of Cassel (Hesse) and Wiesbaden (Nassau q.v.).

The province has an area of 6,063 sq.m., and had a population in 1925 of 2,396,871, being the fourth most densely populated province in Prussia. The south-west part is composed of primary rocks, the east of secondary. The east and north parts lie in the basin of the river Fulda, which near the north-eastern boundary joins with the Werra to form the Weser. The Fulda rises in the Wasserkuppe (3,117 ft.), on the Rhöngebirge, which consists of volcanic rocks. The Main forms part of the southern boundary, and the Rhine the south-western; the western part of the province lies mostly in the basin of the Lahn. In the south-west are the Taunus, and the Westerwald, which rise to over 2,000 ft.

The province is hilly and not rich agriculturally, but its forests, the richest in Prussia, give it a large timber trade. The chief trees are beech, oak and conifers. Cattle are bred, while the vine is cultivated chiefly on the slopes of the Taunus. Iron, coal, copper and manganese are mined. The mineral springs are important, including those at Wiesbaden and Homburg. The chief manufacturing centres are Cassel, Eschwege, Frankfort, Fulda, Hanau and Hersfeld. The province is divided for administration into 41 circles (*Kreise*).

HESSE-ROTENBURG, a German landgraviate, which was founded about the year 1700 by a descendant of Maurice, landgrave of Hesse-Cassel (d. 1632), and was broken up in 1834. (See HESSE.)

HESSIAN. A jute fabric made as a plain cloth, in various degrees of fineness, width and quality. The original or standard, hessian was 40in. wide, weighed 10½oz. per yd., and known as an 11 Porter, which, in the finished state, contained about 12 threads and 12½ picks per inch. The chief modern types are 9 Porter and 10 Porter, but others are made as low as 4 Porter and as high as 20 Porter. The name is probably of German origin, and the fabric was originally made from flax and tow. Small quantities of cloth are still made from yarns of these fibres, but the jute fibre, owing to its comparative cheapness, has almost supplanted all others.

This useful cloth is employed in countless ways, especially for packing all kinds of dry goods, while large quantities, of different qualities, are made up into bags for sugar, flour, coffee, grain, ore, manure, sand, potatoes, onions, etc. Indeed, these bags usually form the most convenient, and at the same time the cheapest covering for any kind of goods which are not damaged by being crushed.

Certain types are specially treated, dyed black, tan or other colour, or left in their natural colour, stiffened and used for padings and linings for cheap clothing, boots, shoes, bags and other articles. When dyed in art shades the cloth forms an attractive decoration for stages and platforms, and generally for any temporary erection, and in many cases it is stencilled and then used for

wall decoration. It is also used as a foundation for plaster on house walls and for similar purposes.

The great linoleum industry depends upon certain types of this fabric for the foundation of its products, while large quantities are used for the backs of fringe rugs, spring mattresses and the upholstery of furniture. The great centres for the manufacture of this fabric are Dundee and Calcutta, and every variety of the cloth, and all kinds of hand- and machine-sewn as well as seamless bags are made in the former city. The American name for hessian is burlap; this particular kind is 40 in. wide, and is now largely made in Calcutta as well as in Dundee and other places. Since 1900 the weaving of hessian cloth has been established in many countries. (T. W.)

HESSIAN FLY (*Phytophaga destructor*), a small fly native to Europe, extremely destructive to wheat crops, especially in the United States and Canada. It is dark in colour, resembling a mosquito. Its larvae, which are greenish white, attack the stems of wheat, barley and rye. There are two generations annually in most parts of the United States, but only one generation in the more northern States and Canada. The wheat crop especially is frequently damaged by the Hessian fly to an amount which has been estimated at from ten to twenty millions of dollars. The general method of control is to sow wheat late enough to escape the fly. All volunteer wheat plants should be destroyed. The popular name is derived from the fact that the insect is supposed to have been introduced into the United States in straw bedding used for the Hessian troops during the Revolutionary War. (See DIPTERA; ENTOMOLOGY; PESTS.)

HESSUS, HELIUS EOBANUS (1488–1540), German Latin poet, was born at Halgehausen in Hesse-Cassel, on Jan. 6, 1488. His family name is said to have been Koch. He entered the University of Erfurt in 1504 and became professor of Latin there in 1517. He was associated with the distinguished men of the time (Johann Reuchlin, Conrad Peutinger, Ulrich von Hutten, Conrad Mutianus), and took part in the political, religious and literary quarrels of the period, finally declaring in favour of Luther and the Reformation. Through the influence of Camerarius and Melancthon, he obtained a post at Nuremberg (1526), but, finding a regular life distasteful, he again went back to Erfurt (1533), but found his friends gone and the university deserted. In 1536 the Landgrave of Hesse made him professor of poetry and history at Marburg, where he died on Oct. 5, 1540. Hessus, who was considered the foremost Latin poet of his age, was a facile verse-maker, but not a true poet. He wrote local, historical and military poems, idylls, epigrams and occasional pieces, collected under the title of *Sylvae*. His most popular works were translations of the Psalms into Latin distichs (which reached 40 editions) and of the *Iliad* into hexameters. His most original poem was the *Heroïdes* in imitation of Ovid, consisting of letters from holy women, from the Virgin Mary down to Kunigunde, wife of the emperor Henry II.

His *Epistolae* were edited by his friend Camerarius, who also wrote his life (1553). There are later accounts of him by M. Hertz (1860), G. Schwertzell (1874) and C. Krause (1879); see also D. F. Strauss, *Ulrich von Hutten* (Eng. trans., 1874). His poems on Nuremberg and other towns have been edited with commentaries and 16th-century illustrations by J. Neff and V. von Loga in M. Herrmann and S. Szamatolski's *Lateinische Literaturdenkmäler des XV. u. XVI. Jahrhunderts* (1896).

HESTIA, in Greek mythology the hearth-goddess (see VESTA), daughter of Cronus and Rhea. She is not mentioned as a goddess in Homer, but the hearth is recognized as a place of refuge for suppliants. In post-Homeric religion she is one of the 12 Olympian deities. When Apollo and Poseidon became suitors for her hand she swore to remain a maiden forever, whereupon Zeus bestowed upon her the honour of presiding over all sacrifices. She was chiefly worshipped as goddess of the family hearth; but, as the city union is only the family union on a large scale, she had also, at least in some states, a public cult at the civic hearth in the *prytaneion* or town-hall, where the common hearth-fire round which the magistrates met was ever burning. From this fire, as the representative of the life of the city, intending colonists took the fire which was to be kindled on the hearth of the new colony.

In later philosophy Hestia became the hearth-goddess of the universe—the personification of the earth as the centre of the universe, identified with Cybele and Demeter. She is seldom represented in works of art and plays no important part in legend.

See A. Preuner, *Hestia-Vesta* (1864), the standard treatise on the subject, and his article in Roscher's *Lexikon der Mythologie*; J. G. Frazer, "The Prytaneum," etc. in *Journal of Philology*, xiv. (1885); *Homeric Hymns*, xxix., ed. T. W. Allen and E. E. Sikes (1904); L. R. Farnell, *Cults of the Greek States*, v. (1909).

HESYCHASTS, a quietistic sect which arose, during the later period of the Byzantine empire, among the monks of the Greek church, especially at Mount Athos, then at the height of its fame and influence under the reign of Andronicus the younger and the abbacy of Symeon (*ἡσυχασταί*, from *ἡσυχος*, quiet). Owing to various adventitious circumstances the sect came into great prominence politically and ecclesiastically for a few years about the middle of the 14th century. Their doctrine and practice is obviously related to certain well-known forms of Oriental mysticism, according to which in an attitude of entire bodily immobility and concentration a divine light was shed within the soul. This was maintained to be the pure and perfect essence of God Himself, that eternal light which had been manifested to the disciples on Mount Tabor at the transfiguration. The doctrine was taken to affirm two divine substances, a visible and an invisible God, and much controversy ensued until in 1351 the "uncreated light" of Mount Tabor was established as an article of faith for the Greeks, who ever since have been ready to recognize it as an additional ground of separation from the Roman Church.

See article "Hesychasten" in Herzog-Hauck, *Realencyklopädie* (3rd ed., 1900), where further references are given.

HESYCHIUS, grammarian of Alexandria, probably flourished in the 5th century A.D. He was probably a pagan; and the explanations of words from Gregory of Nazianzus and other Christian writers are later interpolations. He has left a Greek dictionary, explaining peculiar words, forms and phrases, often with a reference to the author who used them or to the district of Greece where they were current. Hence the book is of great value for the study of the Greek dialects; and in the restoration of the text of classical authors, and particularly of such writers as Aeschylus and Theocritus, who used many unusual words. Many of the explanations give important facts about the religion and social life of the ancients. Hesychius says that his lexicon is based on that of Diogenianus (itself extracted from an earlier work by Pamphilus), but that he has also used similar works by Aristarchus, Apion, Heliodorus and others.

The best edition is by M. Schmidt (1858–68); in a smaller edition (1867) he attempts to distinguish the additions made by Hesychius to the work of Diogenianus.

HESYCHIUS OF MILETUS, Greek chronicler and biographer, surnamed *Illustrius*, son of an advocate, flourished at Constantinople in the 5th century A.D. during the reign of Justinian. According to Photius, who considered him a truthful historian (cod. 69), he was the author of three important works. (1) *A Compendium of Universal History* in six books, from Belus, the reputed founder of the Assyrian empire, to Anastasius I. (d. 518). A considerable fragment has been preserved from the sixth book, a history of Byzantium from its earliest beginnings till the time of Constantine the Great. (2) *A Biographical Dictionary* (*Ὁνοματόλογος* or *Πίναξ*) of *Learned Men*, the chief sources of which were Herennius Philo and the *Μουσική ιστορία* of Aelius Dionysius. Suidas incorporated much of it in his lexicon but his words leave us uncertain whether he himself epitomized Hesychius, or used an already existing epitome. The second view is more generally held, and the epitome referred to, which substituted alphabetical order for arrangement by classes, and included articles on Christian writers, is assigned from internal indications to the years 829–837. Both it and the original work are lost, with the exception of the excerpts in Photius and Suidas. A smaller compilation, chiefly from Diogenes Laërtius and Suidas, with a similar title, is the work of an unknown author of the 11th or 12th century. (3) *A History of the Reign of Justin I.* (518–527) and the early years of Justinian, completely lost.

Editions: J. C. Orelli (1820) and J. Flach (1882); fragments in

C. W. Müller, *Frag. Hist. Graec.* iv. 143 and in T. Preger's *Scriptores originis Constantinopolitanae*, i. (1901); *Pseudo-Hesychius*, by J. Flach (1880); see generally C. Krumbacher, *Geschichte der byzantinischen Literatur* (1897).

HETERODYNE RECEPTION is the process of receiving radio waves by combining the received current with locally generated alternating current. The locally generated frequency is commonly different from the frequency of the received current, thus producing beats. This is then called beat reception.

HETEROMORPHOSIS. Not all individuals of a given species show all characters in normal form and number. Monstrosities occur which have more members or heads than usual, or fail in the development of some part (see **MONSTER**). A special class of abnormalities is characterized by the substitution of one kind of organ or region for another. This has been termed "Heteromorphosis." If the head-end of a living being is substituted by a tail-end, or vice-versa, we speak of "Polar Heteromorphosis"; substitution of a member by one of the kind normally found on another segment of the body is "Homoeosis." We know of three causes producing Heteromorphosis: First, when very plastic forms such as hydroids are acted on by external forces their head- and tail-ends may be transposed. These animals are attached by rootlike stolons to the ground. A point of the body getting into close contact with the substratum may grow such a stolon. On the other hand, when detached the posterior end may produce hydroid heads. The operating factors may be light, oxygen or gravity, the latter when the stem is turned upside down. The sensitiveness towards these factors varies with different species. The second cause of heteromorphic structures is the process of regeneration under the condition that the lost part cannot be restored as such, whereas the faculty to grow its like has not been lost in the torso. The tail of a tadpole will not be able to regenerate the body, but has been known to grow forward into a second tail. If the head of a flatworm is removed it will grow a heteromorphic head from its cut surface. In this case the inability to produce body and tail is only temporary; tail-ends will appear between the heads, each of these moving with all body regions restored. Thirdly, certain cases of heteromorphic appendages may be explained by a portion of cells getting detached in the embryo and again coalescing, but in a wrong place.

BIBLIOGRAPHY.—J. Loeb, "On some Facts and Principles of Physiological Morphology," *Biol. Lectures* (Woods Hole, 1893-94); W. Bateson, *Materials for the Study of Variation* (1894). See also **REGENERATION IN ANIMALS** and **GRAFTING IN ANIMALS**. (H. P.)

HETERONOMY, the state of being under the rule of another person (from Gr. *ἑτερος* and *νόμος*, the rule of another). In ethics the term is specially used as the antithesis of "autonomy," which, especially in Kantian terminology, treats of the true self as will, determining itself by its own law, the moral law. "Heteronomy" is therefore applied by Kant to all other ethical systems, inasmuch as they place the individual in subjection to external laws of conduct.

HETEROSPORY, the name given in botany to the phenomenon of plants producing two kinds of spores. (See **PTERIDOPHYTES**, **PALAEOBOTANY**, **GYMNOSPERMS**.)

HETMAN, a military title formerly in use in Poland; the *hetman wielki*, or great hetman, was the chief of the armed forces of the nation, and commanded in the field, except when the king was present in person. The office was abolished in 1792. From Poland the word was introduced into Russia in the form *ataman*, and was adopted by the Cossacks as a title for their head, who was practically an independent prince, when under the suzerainty of Poland. After the acceptance of Russian rule by the Cossacks in 1654, the post was shorn of its power. "Ataman" or "hetman" was also the name of the elected elder of the *stanitsa*, the unit of Cossack administration. See **COSSACKS**.

HETTSTEDT, a town of Germany, in Prussian Saxony, on the Wipper, and at the junction of the railways Magdeburg-Eisleben and Hettstedt-Halle, 23 m. N.W. of the last town. Pop. (1925) 8,499. Hettstedt is mentioned as early as 1046; in 1220 it possessed a castle; and in 1380 it received civic privileges. When the countship of Mansfeld was sequestered, Hettstedt came into the possession of Saxony, passing to Prussia in 1815.

It has manufactures of pianofortes and cigars. In the neighbourhood are mines of argentiferous copper. Silver, sulphuric acid, nickel and gold are also found in small quantities.

HETZER or **HAETZER**, **LUDWIG** (d. 1529), Swiss *Anabaptist*, was born at Bischofszell, Switzerland, and studied at Freiburg-im-Breisgau. By 1523 we find him in Zürich, where he published *Judicium Dei*, a small tract against the religious use of images. In 1524 he brought out a tract on the conversion of the Jews, and published a German version of Johann Bugenhagen's brief exposition of the epistles of St. Paul (Ephesians to Hebrews). He was expelled from Augsburg, where he had been working as corrector of the press for Silvan Ottmar, in the autumn of 1525, and made his way through Constance to Basel, where Oecolampadius received him kindly, and then to Zürich. He had gone to the length of rejecting all sacraments, and his relations with Zwingli were difficult; he therefore returned to Basel, and then went to Strasbourg, where, in 1526, he fell in with Hans Dengk or Denck, who collaborated with him in the production of his *opus magnum*, the translation of the Hebrew Prophets, *Alle Propheten nach hebraischer Sprach vertuetscht* (Worms, 1527; Augsburg 1527 and 1528). It was the first Protestant version of the prophets in German, preceding Luther's by five years. Denck died at Basel in Nov. 1527, and Hetzer was arrested at Constance in the summer of 1528. After long imprisonment and many examinations he was beheaded on Feb. 4, 1529.

Hetzer's papers included an unpublished treatise against the essential deity of Christ, which was suppressed by Zwingli; the only extant evidence of his anti-trinitarian views being contained in eight quaint lines of German verse preserved in Sebastian Frank's *Chronica*. The discovery of his heterodox Christology (which has led modern Unitarians to regard him as their proto-martyr) was followed by charges of loose living, never heard of in his lifetime, and destitute of evidence or probability.

See Breiting, "Anecdota quaedam de L. H." in *Museum Helveticum* (1746), parts 21 and 23; Wallace, *Antitrinitarian Biography* (1850); *Dutch Martyrology* (Hanserd Knollys Society) (1856); Th. Keim, in Hauck's *Realencyklopädie* (1899).

HEUGLIN, THEODOR VON (1824-1876), German traveller in north-east Africa, was born on March 20, 1824, at Hirschlanden, Württemberg. In 1850 he went to Egypt where he learnt Arabic, afterwards visiting Arabia Petraea. In 1853 he was appointed Austrian consul at Khartum. He travelled in Abyssinia and Kordofan, making a collection of natural history specimens. He died at Stuttgart, on Nov. 5, 1876. It is principally by his ornithological labours that Heuglin has taken rank as an independent authority.

His chief works are *Systematische Übersicht der Vögel Nordost-Afrikas* (1855); *Reisen in Nordost-Afrika, 1852-53* (Gotha, 1857); *Syst. Übersicht der Säugetiere Nordost-Afrikas* (Vienna, 1867); *Reise nach Abessinien, den Gala-Ländern, etc., 1861-62* (Jena, 1868); *Reise in das Gebiet des Weissen Nil, etc. 1862-64* (Leipzig, 1869); *Reisen nach dem Nordpolarmeere, 1870-71* (Brunswick, 1872-74); *Ornithologie von Nordost-Afrika* (Cassel, 1869-75); *Reise in Nordost-Afrika* (Brunswick, 1877, 2 vols.).

HEULANDITE, mineral of the zeolite group, consisting of hydrous calcium and aluminium silicate, $H_4CaAl_2(SiO_3)_6 \cdot 3H_2O$. Small amounts of sodium are commonly present, replacing part of the calcium. Crystals are monoclinic, and have a characteristic coffin-shaped habit. They have a perfect cleavage parallel to the plane of symmetry on which the lustre is markedly pearly; on other faces the lustre is of the vitreous type. The mineral is usually colourless or white, sometimes brick-red. The hardness is $3\frac{1}{2}$ -4, and the specific gravity 2.2. It closely resembles stilbite (*q.v.*) in appearance, and differs from it chemically only in containing rather less water of crystallization.

Heulandite occurs with stilbite and other zeolites in the amygdaloidal cavities of basaltic volcanic rocks, and occasionally in gneiss and metalliferous veins. The best specimens are from the basalts of Beruffjord, in Iceland and the Faroe Islands, and the Deccan traps near Bombay. Crystals of a brick-red colour are from Campsie Fells in Stirlingshire and the Fassathal in the Tirol.

HEVELIUS (HEVEL or HÖWELCKE), **JOHANN** (1611–1687), German astronomer, was born at Danzig, on Jan. 28, 1611. In 1641 he built an observatory in his house, provided with a splendid instrumental outfit; his chief work was the careful charting of the lunar surface, his *Selenographia* (1647) entitling him to be called the founder of lunar topography. He also catalogued 1,564 stars; made observations of sunspots; discovered four comets, and suggested the revolution of such bodies in parabolic paths about the sun. He published two books on comets: *Prodromus cometicus* (1665), and *Cometographia* (1668). He died on Jan. 28, 1687.

Westphal, *Leben, Studien und Schriften des Astronomen Johann Hevelius* (1820); F. Bailey, "The Catalogue of Hevelius," in *Memoirs of the Royal Astronomical Society* (vol. xiii, 1843); R. Wolf, *Geschichte der Astronomie* (1890–93); see also J. C. Puggendorff, *Biographisch-Literarisches Handwörterbuch zur Geschichte der exacten Wissenschaften* (4 vols. Leipzig, 1863–1904); and *Allgemeine Deutsche Biographie* (ed. R. von Lilien-cron and F. X. Wegele, 68 vols., Leipzig, 1875–1912).

HEWART, GORDON HEWART, 1ST BARON (1870–), British lord chief justice, was born on Jan. 7, 1870, at Bury, Lancashire. A scholar of University college, Oxford, he was called to the bar in 1902 and practised on the northern circuit. After an unsuccessful contest in Northwest Manchester in 1912, in which year he took silk, he was elected as a Liberal for Leicester in 1913, and after the rearrangement of constituencies in 1918 represented the eastern division of that city from 1918 till his retirement from parliament. In Dec. 1916 he was appointed solicitor-general in Lloyd George's Coalition Government. He was made attorney-general in Jan. 1919, and was admitted to the cabinet in 1921. He gave material assistance in the conduct of reconstructive legislation, and took an active part in the final phase of the negotiations with the Sinn Feiners, being one of the signatories of the so-called Irish Treaty. He acted as president of the War Compensation Court from 1922. He had been knighted in 1916; on Jan. 16, 1918, he was sworn of the privy council, and on March 24, 1922, was appointed lord chief justice, being at the same time created Baron Hewart of Bury.

HEWER, the name applied in the North of England coal-fields (i.e. Northumberland, Durham and Cumberland) to the miner who hews down or "gets" the coal. Elsewhere this individual is variously named pitman, collier, stallman, holer, getter or buttocker. (See COAL.)

HEWITT, ABRAM STEVENS (1822–1903), American manufacturer and political leader, was born in Haverstraw (N.Y.), July 31, 1822. His father, John, a Staffordshire man, was one of a party of four mechanics who were sent by Boulton and Watt to Philadelphia about 1790 to set up a steam engine for the city water-works and who in 1793–94 built at Belleville (N.J.), the first steam engine constructed wholly in America. He graduated at Columbia college in 1842, and taught mathematics at Columbia. With Edward Cooper, son of Peter Cooper, he went into the manufacture of iron girders and beams under the firm name of Cooper, Hewitt and Co. His study of the making of gun-barrel iron in England enabled him to be of great assistance to the U.S. Government during the Civil War, when he refused any profit on such orders. The men in his works never struck—indeed from 1873 to 1878 his plant was run at an annual loss of \$100,000. In 1871 he was prominent in the reorganization of Tammany after the fall of the "Tweed Ring"; from 1875 until the end of 1886 (except in 1879–81) he was a Representative in Congress; he was one of the House members of the joint committee which drew up the famous Electoral Count act providing for the electoral commission. In 1886 he was elected mayor of New York city over Henry George and Theodore Roosevelt. He broke with Tammany, was not renominated, ran independently for re-election, and was defeated. He died in New York city, on Jan. 18, 1903. He gave liberally to Cooper Union, of which he was trustee and secretary.

HEWLETT, MAURICE HENRY (1861–1923), English novelist, was born on Jan. 22, 1861, the eldest son of Henry Gay Hewlett, of Shaw Hall, Addington, Kent. He was educated at the London International College, Spring Grove, Isleworth, and was

called to the bar in the year 1891. He published in 1895 two books on Italy, *Earthwork out of Tuscany*, and (in verse) *The Masque of Dead Florentines*. *Songs and Meditations* followed in 1897, and in 1898 he won an immediate reputation by his *Forest Lovers*, a romance of mediaeval England. In the same year he printed the pastoral and pagan drama of *Pan and the Young Shepherd*, produced at the Court theatre in March 1905, when it was followed by the *Youngest of the Angels*, dramatized from a chapter in his *Fool Errant*. In *Little Novels of Italy* (1899), a collection of brilliant short stories, he showed a close knowledge of mediaeval Italy. The new and vivid portraits of Richard Coeur de Lion in his *Richard Yea-and-Nay* (1900), and of Mary, queen of Scots, in *The Queen's Quair* (1904) showed real historical sense. *The New Canterbury Tales* (1901) was another volume of stories of English life, but he returned to Italian subjects with *The Road in Tuscany* (1904); in *Fond Adventures, Tales of the Youth of the World* (1905), two are Italian tales, and *The Fool Errant* (1905) purports to be the memoirs of Francis Antony Stretley, citizen of Lucca.

Other novels followed, but his main interest was directed to verse. *The Song of the Plow* (1916) is one of the most considerable English narrative poems of the new century; it describes the fortunes of the English farm labourers from the earliest times down to the present, and contains many fine passages. Other poems were *The Village Wife's Lament* (1918) and *The Lore of Proserpine* (1913). The popularity of his earlier fiction perhaps accounts for the limited appreciation of the real strength and originality of his later work. He died on June 15, 1923, at Broad-Chalke, near Salisbury.

HEXACHORD, in music, the scale of six degrees attributed to Guido d'Arezzo (11th century) and introduced as an improvement on the Greek scale system based on tetrachords or groups of four notes. The six notes making up each hexachord received the names *ut, re, mi, fa, sol, la* from the initial syllables of the lines of a certain hymn to St. John, the melody of which happened to be such that each line began on successive degrees of the hexachordal scale. As, however, the hexachords could begin on either C, F or G the syllabic names of the notes associated with the alphabetical names were not always the same. Thus in the scale of C the note G was *sol*, or *G sol*, whereas in the scale of F it was *re* and was therefore called *G re*, while in the scale of G itself it became naturally *G ut*. Hence in the complete gamut (a word derived from the note just named, *gamma-ut*) each alphabetical note was given a compound name according to the different syllabic names which coincided with it, e.g., *G sol re ut*, *A la mi re*, and so on. These names remained in use for centuries until the whole system was superseded with the adoption of the octave as the standard group unit and recognition of the modern principles of key-relationship. But the same syllables—*ut, re, mi*, etc.—are still retained, with the addition of *si* for the seventh note, in the musical nomenclature of France and Italy as the names for the notes of the existing diatonic scale of C major.

See Guido d'Arezzo, *Musical Notation*.

HEXAMETER, the earliest known form of classical verse in dactylic rhythm. The word indicates that each line contains six feet or measures (*μέτρα*), whereof the last is always a spondee (— —) or a trochee (— ^). When the last foot is a trochee, the pause at the end of the line makes up for the short syllable. The fifth foot is usually a dactyl (— ^ ^); the rest indifferently dactyls or spondees.

In Latin and Greek it is the invariable metre of epic and didactic poetry; in Latin it is also the metre of satire from the period of Horace onwards. In modern languages, Longfellow, Kingsley, Clough, and several German poets have written hexameters of a sort, substituting accent for quantity. The English verses are usually unsatisfactory, owing to the lack of any real equivalent for a spondee; and the German are much worse, owing to the scarcity of really short syllables. Accent alone cannot give the true effect of either spondee or dactyl. Even the classic Greek poets made many variations in their treatment of the hexameter.

Examples of hexameters are:

Arma vi|rūmq̄ue cāno Trōjāe quī | primus ab | orīs
these lame | hexamēters the | strong-winged | music of | Homer
weil du | Helena | hast und | Eidam | ihnen des | Zeus bist.

In ancient authors, according to age and subject matter, hexameters differ widely as regards proportion of dactyls to spondees, avoidance of elision, relation of quantity to accent, and other less obvious features.

HEXAPLA, the term for an edition of the Bible in six versions, and especially the edition of the Old Testament compiled by Origen. (See *BIBLE: Old Testament, Texts and Versions.*)

HEXAPODA (hēks-āp'ō-dā), an alternative name for insects (q.v.), having reference to their three pairs of walking legs.

HEXASTYLE, the term given to a temple or portico that has six columns in front.

HEXATEUCH, the name given to the first six books of the Old Testament (the Pentateuch and Joshua) to mark the fact that these form one literary whole, describing the early traditional history of the Israelites from the creation of the world to the conquest of Palestine. See *BIBLE (Old Testament: Canon)*, and *GENESIS, EXODUS, LEVITICUS, NUMBERS, DEUTERONOMY* and *JOSHUA*.

HEXHAM, a town in Northumberland, England, 21 m. west from Newcastle on the L.N.E. railway. Pop. (1921) 8,843. It lies on the Tyne, and its market square and narrow streets bear many marks of antiquity. It is famous for its great abbey church of St. Andrew. In 1536 the last prior was hanged for being concerned in the Pilgrimage of Grace. The church is a fine monument of Early English work, with interesting Transitional details. There are also fragments of the monastic buildings remaining, and west of the churchyard is the monks' park, known as the Seal. In the town are two strong castellated 14th century towers, known as the Moot Hall and the Manor Office. Aydon castle near Corbridge is a fortified house of the late 13th century; and Dilston or Dyvillston, a typical border fortress dating from Norman times. There is an Elizabethan grammar school. Manufactures are leather gloves and other goods. In the neighbourhood are barytes and coal mines and extensive market gardens.

The church and monastery at Hexham (Hextoldesham) were founded about 673 by Wilfrid, archbishop of York. The church in 678 became the head of the new see of Bernicia, united to that of Lindisfarne about 821; after which the bishop of Lindisfarne held the lordship until it was restored to the archbishop of York by Henry II. In 1545 the archbishop exchanged Hexhamshire with the king for other property. Hexham was a borough by prescription, as early as 1276, and the same form of government continued in force until the year 1853. In 1227 a market on Monday and a fair on the vigil and day of St. Luke the Evangelist were granted and in 1320 Archbishop Melton obtained the right of holding two new fairs on the feasts of St. James the Apostle lasting five days and of SS. Simon and Jude lasting six days. The market day was altered to Tuesday in 1662, and there was a grant of a cattle market on the Tuesday after the feast of St. Cuthbert in March and every Tuesday fortnight until the feast of St. Martin. The market rights were purchased by the town in 1886.

HEYDEN, JAN VAN DER (1637-1712), the Dutch painter, was born at Gorcum in 1637, and died at Amsterdam on March 28, 1712. He was an architectural landscape painter. According to Houbraken he was first apprenticed to a glass painter. There is no evidence to show who was his master. What distinguishes his work is the careful and detailed draughtsmanship. It is said of him that he painted every brick in his buildings and the mortar in the joints. The compositions are pleasing—the clear atmosphere, the play of the sunlight, the colour of the various buildings, the green of the foliage, contribute to a fine colour scheme, the scenes enlivened by accessory figures. In 1690 he published his *Brandspiritenboek* (Fire engine book) for which he etched a number of plates. His work may be seen in most European galleries and is also found in numerous private collections. Besides his architectural pieces and landscapes he left a small number of studies of still life and some charming studies in chalk.

See Hofstede de Groot, *Catalogue of Dutch Painters* (1927); C. G. t. Hooft edited a volume of reproductions of Van der Heyden's views of Amsterdam in 1912, on the second centenary of the painter's death.

HEYLYN or HEYLIN, PETER (1600-1662), English historian and controversialist, was born at Burford in Oxfordshire. He entered Hart Hall, Oxford, in 1613, afterwards joining Magdalen college; and in 1618 he began to lecture on cosmography and became fellow of Magdalen. He disputed with John Prideaux, regius professor of divinity at Oxford, replied to the arguments of John Williams in his pamphlets, "A Coal from the Altar" and "Antidotum Lincolnense," assisted William Noy to prepare the case against Prynne for the publication of his *Histriomastix*, and made himself useful to the Royalist party in other ways. He joined the king at Oxford in 1642. At Oxford Heylyn edited *Mercurius Aulicus*, a vivacious but virulent news-sheet; consequently his rectory at Alresford was plundered and his library dispersed. After some years of wandering and poverty he settled in 1653 at Lacy's Court, Abingdon, where he resided undisturbed by the Government of the Commonwealth. His numerous works include *Cyprianus Anglicus, or the history of the Life and Death of William Laud*, a defence of Laud and a valuable authority for his life; *Ecclesia restaurata, or the History of the Reformation of the Church of England* (1661; ed. J. C. Robertson, 1849); and *A Survey of France* (1625), a work frequently reprinted. He died on May 8, 1662.

HEYN, PIETER PIETERZOOM (commonly abbreviated to **PIET**) (1578-1629), Dutch admiral, was born at Delfshaven in 1578. In Sept. 1628 he captured the Spanish fleet carrying bullion from the American mines. The total loss was estimated by the Spaniards at four millions of ducats. Soon thereafter Heyn was given command of the naval force of the Republic, with the rank of lieutenant admiral of Holland, in order to clear the Channel and the North Sea of the Dunkirkers, acting for the king of Spain in his possessions in the Netherlands. In June 1629 he severely defeated the Dunkirkers, but was killed in the fight.

See de Jonge, *Geschiedenis van het Nederlandsche Zeewezen*; I. Duro, *Armada Espanola*, iv.; der Aa, *Biograph. Woordenboek der Nederlanden*.

HEYNE, CHRISTIAN GOTTLÖB (1729-1812), German classical scholar was born on Sept. 25, 1729, at Chemnitz, Saxony. In 1748 he entered the University of Leipzig. In 1752 he went to Dresden on the invitation of Count von Brühl, the prime minister, from whom, however, he got no more than a post as clerk in the count's library with a miserable salary. He published his first edition of *Tibullus* in 1755, and in 1756 his *Epictetus*. In the latter year the Seven Years' War broke out, and Heyne was compelled to support himself by tutoring, being driven from place to place by the war. The bombardment of Dresden on July 18, 1760, destroyed all his possessions, including an almost finished edition of *Lucian*, based on a valuable codex of the Dresden library. In the summer of 1761, although still without any fixed income, he married, and at the end of 1762 he was enabled to return to Dresden, where he was commissioned by P. D. Lippert to prepare the Latin text of the third volume of his *Dactyllothea* (an account of a collection of gems). In 1763 he obtained a professorship at Göttingen, and his growing celebrity brought him offers from other German Governments, which he persistently refused. He died on July 14, 1812. He was the first to attempt a scientific study of Greek mythology.

Of Heyne's numerous writings, the following may be mentioned. Editions, with copious commentaries, of *Tibullus* (ed. E. C. Wunderlich, 1817), *Virgil* (ed. G. P. Wagner, 1830-41), *Pindar* (3rd ed. by G. H. Schäfer, 1817), *Apollodorus, Bibliotheca Graeca* (1803), *Homer, Iliad* (1802); *Opuscula academica* (1785-1812), dissertations of which the most valuable are those relating to the colonies of Greece and the antiquities of Etruscan art and history. His *Antiquarische Aufsätze* (1778-79) is a valuable collection of essays connected with the history of ancient art.

See biography by A. H. Heeren (1813) which forms the basis of the interesting essay by Carlyle (*Misc. Essays*, ii.); H. Sauppe, *Göttinger Professoren* (1872); C. Bursian in *Allgemeine deutsche Biographie*, xii.; J. E. Sandys, *Hist. Class. Schol.* (1908), iii. 36-44.

HEYSE, PAUL JOHANN LUDWIG (1830–1914), German novelist, dramatist and poet, was born at Berlin on March 15, 1830, the son of the philologist K. W. L. Heyse (1797–1855). He studied classics, and then the Romance languages at Bonn, and, before he had completed his course, wrote a tragedy, *Francesca von Rimini*. After a year's stay in Italy, he was summoned, early in 1854, by King Maximilian II. to Munich. Heyse was a master of the short story. He published at Munich in 1855 four in one volume, one of which, *L'Arrabbiata*, showed his genius. Many other volumes of stories appeared in due course, and in these his most characteristic work is to be found. Heyse worked on his stories in the spirit of a sculptor; he seized upon some picturesque incident or situation, and chiselled and polished until all the effect which it was capable of producing had been extracted from it. He wrote also several novels, the more important being *Kinder der Welt* (1873), *Im Paradiese* (1875)—the one dealing with the religious and social problems of its time, the other with artist-life in Munich, *Der Roman der Stiftsdame* (1888), and *Merlin* (1892), a novel directed against the modern realistic movement of which Heyse had been the leading opponent in Germany. He was a prolific dramatist; among the best of his plays are *Die Sabinerinnen* (1859), *Hans Lange* (1866), *Kolberg* (1868), *Die Weisheit Salomos* (1886), and *Maria von Magdala* (1903). His best stage pieces were, however, the one-act plays corresponding in their scope to his short stories. There are masterly translations by him of Leopardi, Giusti and other Italian poets (*Italienische Dichter seit der Mitte des 18ten Jahrhunderts*, 4 vols., 1888–1890). Some of the translations of Shakespeare in the Bodenstein edition are by him. His collected works contain many admirable original lyrics and some admirable verse tales. Heyse received the Nobel prize for literature in 1910. He died at Munich on April 2, 1914.

See his autobiography, *Jugenderinnerungen und Bekenntnisse* (1901). Also O. Kraus, *Paul Heyse's Novellen und Romane* (1888); E. Petzet, *Paul Heyse als Dramatiker* (1904), and the essays by T. Ziegler (in *Studien und Studienköpfe*, 1877), and G. Brandes (in *Moderne Geister*, 1887); Spiero, *Paul Heyse* (1910); H. Raff, *Paul Heyse* (1910). A new edition of Heyse's *Gesammelte Werke* appeared in 1924 (15 vols.). See his *Briefwechsel* with J. Burckhardt (1916), with Th. Storm (ed. G. Plottke 1917–1918), with G. Keller (ed. Kalbeck, 1919), and with E. Geibel (ed. F. E. A. Geibel, 1922).

HEYSHAM, seaport, urban district, Lancaster parliamentary division, Lancashire, England, on the south shore of Morecambe bay, served by the L.M.S. railway. Pop. (1921) 5,027; area 1,974 acres. A harbour was opened in 1904 by the Midland (now L.M.S.) railway. The harbour is enclosed by breakwaters, and has a depth of 17 ft. at low tide. It has extensive accommodation for live stock and merchandise, and has regular services with Belfast and other Irish ports. Heysham is in some favour as a watering-place. The church of St. Peter is mainly Norman, and has fragments of even earlier date. Ruins of a very ancient oratory stand near it. This was dedicated to St. Patrick, and is traditionally said to have been erected as a place of prayer for those at sea.

HEYWOOD, JASPER (1535–1598), son of John Heywood (q.v.), who translated into English three plays of Seneca, the *Troas* (1559), the *Thyestes* (1560) and *Hercules Furens* (1561). He died at Naples on Jan. 9, 1598. His translations of Seneca were supplemented by other plays contributed by Alexander Neville, Thomas Nuce, John Studley and Thomas Newton. Newton collected these translations in one volume, *Seneca, his tenne tragedies translated into Englysh* (1581). The importance of this work in the development of English drama can hardly be overestimated.

See Dr. J. W. Cunliffe, *On the Influence of Seneca upon Elizabethan Tragedy* (1893).

HEYWOOD, JOHN (b. 1497), English dramatist, known to his contemporaries as "merry John Heywood," was probably the son of William Heywood, who was coroner of Coventry in 1505–06. In 1519 John Heywood was in receipt of a quarterly payment in the king's music book as "player of the virginals," and later he appears as a "singer." In 1528 he was granted a pension of £10 a year; from time to time he received emoluments and grants which show that he was in high favour at court under Edward VI. and Mary. As early as 1538 he "played an interlude with his children"

before the princess Mary. He may have owed his introduction to her to Sir Thomas More, for he evidently belonged to the More circle; two at any rate of the pieces commonly attributed to him show strong evidence of More's influence. Moreover, his wife, Joan Rastell, was a daughter of the printer, John Rastell, who was More's brother-in-law. He was attached to the old religion, and in 1564, when a commission was appointed by Elizabeth to enforce the Act of Uniformity, he left England and took refuge in Belgium at Malines. From there he wrote in 1575 to Lord Burleigh, saying that he was an old man of 78, and asking that his daughter might collect his rents. The date of his death is unknown.

Heywood's name was actually attached to four interludes: *The Playe called the foure PP*; a *newe and a very mery interlude of a palmer, a pardoner, a potycary, a pedler* (not dated), is a contest in lying, easily won by the palmer, who said he had never known a woman out of patience. *The Play of the Wether, a new and a very mery interlude of all maner of Wethers* (printed 1533), describes the chaotic results of Jupiter's attempts to suit the weather to the desires of a number of different people. *The Play of Love* (printed 1533) is an extreme instance of the author's love of wire-drawn argument. *The Dialogue of Wit and Folly* is more of an academic dispute than a play. But two pieces usually assigned to Heywood, though printed by Rastell without any author's name, are *The Mery Play between the Pardoner and the Frere, the Curate and Neybour Pratte* (printed 1533, but probably written much earlier), and the *Mery Play betwene Johan Johan the Husbnde, Tyb the Wyfe, and Syr Jhan the Preest* (printed 1533). These two pieces show the strong influence of Sir Thomas More, but there does not seem to be any ground for excluding them from the list of Heywood's plays. Heywood's other works are a collection of proverbs and epigrams, the earliest extant edition of which is dated 1562; some ballads, one of them being the "Willow Garland," known to Desdemona; and a long verse allegory of over 7,000 lines entitled *The Spider and the Flie* (1556), which contains a very energetic statement of the social evils of the time, and especially of the deficiencies of the English law.

The proverbs and epigrams were reprinted by the Spenser Society in 1867; there are modern reprints of *Johan Johan* (1819), *The Foure PP* (Dodsley's *Old Plays*, 1825, 1874), and *The Pardoner and the Frere* (Dodsley's *Old Plays*, 1874). *The Spider and the Flie* was edited by A. W. Ward for the Spenser Society in 1894. For notes and strictures on that edition see J. Haber in *Literärhistorische Forschungen*, vol. xv. (1900). See also A. W. Pollard's introduction to the reprint of the *Play of the Wether and Johan Johan in Representative English Comedies* (1903); *The Dramatic Writings of John Heywood*, edited by John S. Farmer for the Early English Drama Society (1905); and A. W. Reed, *Early Tudor Drama* (1926).

HEYWOOD, THOMAS (d. 1641), English dramatist and miscellaneous author, was a native of Lincolnshire, born about 1570, and said to have been educated at Cambridge. Heywood is mentioned by Philip Henslowe as having written a book or play for the Lord Admiral's company of actors in Oct. 1596; and in 1598 he was regularly engaged as a player in the company in which he presumably had a share, as no wages are mentioned. He was later a member of other companies, of the earl of Derby's and of the earl of Worcester's players, afterwards known as the Queen's Servants. In his preface to the *English Traveller* (1633) he describes himself as having had "an entire hand or at least a main finger in 220 plays." Of this number, probably considerably increased before the close of his dramatic career, only a score survive. He wrote for the stage, not for the press, and protested against the printing of his works, which he said he had no time to revise. He was, said Tieck, the "model of a light and rapid talent," and his plays, as might be expected from his rate of production, bear little trace of artistic elaboration. Charles Lamb called him a "prose Shakespeare." It is true that Heywood had a keen eye for dramatic situations and great constructive skill, but his powers of characterization were not on a par with his stagecraft. He delighted in what he called "merry accidents," that is, in coarse, broad farce; his fancy and invention were inexhaustible. It was in the domestic drama of sentiment that he won his most distinctive success. For this he was especially fitted by

his genuine tenderness and his freedom from affectation, by the sweetness and gentleness for which Lamb praised him. His masterpiece, *A Woman killed with kindness* (acted 1603; printed 1607), is a type of the *comédie larmoyante*, and *The English Traveller* (1633) is a domestic tragedy scarcely inferior to it in pathos and in the elevation of its moral tone. His first play was probably *The Four Prentises of London: With the Conquest of Jerusalem* (printed 1615, possibly acted as early as 1592 under the title *Godfrey of Bulloigne*). The two parts of *King Edward the Fourth* (printed 1600), sometimes attributed to Heywood, and of *If you know not me, you know no bodie; Or, the Troubles of Queene Elizabeth* (1605 and 1606) are chronicle histories. His other comedies include: *The Royall King, and the Loyall subject* (acted perhaps c. 1602; printed 1637); *A Challenge for Beautie* (1636); *The Wise-Woman of Hogsdon* (perhaps acted c. 1604; printed 1638); and *Fortune by Land and Sea* (acted c. 1607; printed 1655), with William Rowley. The five plays called respectively *The Golden, The Silver, The Brazen and The Iron Age* (the last in two parts), dated 1611, 1613, 1613, 1632, are series of classical stories strung together with no particular connection except that "old Homer" introduces the performers of each act in turn. The tragedy of the *Rape of Lucrece* (1608) is varied by a "merry lord," Valerius, who lightens the gloom of the situation by singing comic songs. A series of pageants, most of them devised for the City of London, or its guilds, by Heywood, were printed in 1637. For other plays attributed to Heywood see the authorities mentioned in the bibliography. Thomas Heywood was buried at Clerkenwell on Aug. 16, 1641.

Besides his dramatic works, he was the author of *Troia Britanica, or Great Britain's Troy* (1609), a poem in 17 cantos "intermixed with many pleasant poetical tales" and "concluding with an universal chronicle from the creation until the present time"; *An Apology for Actors, containing three brief treatises* (1612), edited for the Shakespeare Society in 1841; *Ἑννακείον or nine books of various history concerning women* (1624); *England's Elizabeth, her Life and Troubles during her minority from the Cradle to the Crown* (1631); *The Hierarchy of the Blessed Angels* (1635), a didactic poem in nine books; *Pleasant Dialogues, and Dramas selected out of Lucian, etc.* (1637; ed. W. Bang, Louvain, 1903); and *The Life of Merlin surnamed Ambrosius* (1641).

See A. W. Ward, *History of English Dram. Lit.* ii. 550 seq. (1899); the same author's Introduction to *A woman killed with kindness* ("Temple Dramatists," 1897); J. A. Symonds in the Introduction to *Thomas Heywood* in the "Mermaid" series (new issue, 1903); E. K. Chambers, *The Elizabethan Stage* vol. iii. (1923). See also Heywood's *Dramatic Works* (2 vols., Shakespeare Soc., ed. B. Field and J. Collier, 1842-51); *Dramatic Works*, Pearson Reprints (6 vols., 1874); *Best Plays*, "Mermaid" series (ed. A. W. Verity, 1888).

HEYWOOD, municipal borough, Heywood and Radcliffe parliamentary division, Lancashire, England, 9 m. N. of Manchester on the L.M.S. railway. Pop. (1921) 26,693. It is of modern growth. The Queen's park (opened 1879) was laid out at a cost of £11,000 with money which devolved to Queen Victoria from her duchy and county palatine of Lancaster. Heywood owes its rise to the Peels, its first manufactures being introduced by the father of the first Sir Robert Peel. It is an important seat of the cotton manufacture, and there are power-loom factories, iron foundries, chemical works, boiler-works and railway wagon works. Coal is worked extensively in the neighbourhood. Heywood was incorporated in 1881. Area, 3,658 acres.

HEZEKIAH, son and successor of Ahaz, one of the greatest of the kings of Judah. He flourished at the end of the 8th and the beginning of the 7th century B.C. in critical times. There are difficulties about the chronology of his reign, the one fixed point being 701 B.C. when Judah was invaded by Sennacherib. Whether he came to the throne before or after the fall of Samaria (722-721 B.C.) is disputed. Shortly before 701 B.C. the whole of western Asia was in a ferment; Sargon had died and Sennacherib had come to the throne (in 705); vassal kings plotted to recover their independence and Assyrian puppets were removed by their opponents. Judah was in touch with a general rising in S.W. Palestine, in which Ekron, Lachish, Ascalon (Ashkelon) and other towns of the Philistines were supported by the Kings of Muṣri and

Meluḥḥa. Sennacherib completely routed them at Eltekeh (a Danite City), and thence turned against Hezekiah, who had been in league with Ekron. In this invasion Sennacherib claims entire success; 46 towns of Judah were captured, 200,150 men and many herds of cattle were carried off among the spoil, and Jerusalem itself was closely invested. Hezekiah was imprisoned "like a bird in a cage"—to quote Sennacherib.

The brief account in 2 Kings xviii. 14-16, supplements the Assyrian record by the statement that Sennacherib besieged Lachish, a fact which is confirmed by a bas-relief (now in the British Museum) depicting the king in the act of besieging the town. This historical fragment is followed in 2 Kings by two narratives which tell how the king sent an official from Lachish to demand the submission of Hezekiah and conclude with the unexpected deliverance of Jerusalem. Both these stories appear to belong to a biography of Isaiah, and are open to the suspicion that historical facts have been subordinated to idealize the work of the prophet (cf. the similar accounts about Elijah and Elisha). See **KINGS, FIRST AND SECOND BOOKS OF**.

The narratives are (a) 2 Kings xviii. 13, 17-xix. 8; cf. Isa. xxxvi. i.-xxxvii. 8, and (b) xix. 9b-35; cf. Isa. xxxvii. 9-36 (2 Chron. xxxii. 9, sqq. is based on both). Jerusalem's deliverance is attributed to a certain rumour (xix. 7), to the advance of Tirhakah, king of Ethiopia (v. 9), and to a remarkable pestilence (v. 35) which finds an echo in a famous story related, not without some confusion of essential facts, by Herodotus (ii. 141; cf. Josephus *Antiq.* X. i. 5). It has been widely assumed that the two narratives are duplicates. It is, however, much more probable that they refer to different events. Sennacherib really made two expeditions against Judah. In the first of these, 701 B.C., the Assyrian Monarch was bought off by payment of a heavy tribute, cf. 2 Kings xviii. 14-16, and deprived Judah of a good deal of territory. In the second expedition which took place after the accession of Tiharkah, King of Egypt, 691 or 688 B.C. occurred the disaster described in 2 Kings xix. 9-35; cf. Herodotus II. § 141. An attractive solution of the chronological difficulty would be to reckon the 15 years, extension to Hezekiah from 705, in which case his reign would have been prolonged to 690.

The reforms mentioned in 2 Kings xviii. 1-8, cannot have been carried out until after 701 when the prestige of the Prophet and the Temple had been enormously enhanced by the Deliverance of Jerusalem. The most striking of the reforms was the destruction of the brazen serpent, the cult of which was traditionally traced back to the time of Moses (Num. xxi. 9).

According to Prov. xxv. 1, Hezekiah was a patron of literature (see **PROVERBS**). The hymn which is ascribed to the king (Isa. xxxviii. 9-20, wanting in 2 Kings) is of post-exilic origin (see Chayne, *Introd. to Isaiah*, 222 seq.), but is further proof of the manner in which the Judæan king was idealized in subsequent ages, partly, perhaps, in the belief that the deliverance of Jerusalem was the reward for his piety.

For special discussions, see Stade, *Zeits. d. alttest. Wissenschaft*, 1886, pp. 173, sqq.; Winckler, *Alttest. Untersuch.*, 26 sqq.; Driver, *Isaiah, his Life and Times*, pp. 43-83; A. Jeremias, *Alte Test.*, 304-310; K. Fullerton, *Bibliotheca sacra* 1906, pp. 577-634; A. Alt, *Israel u. Agypten* (Leipzig, 1909); Lewy, *Orient. Lit. Zeitung*, 1928, cols. 150-163; also bibliography to **ISAIAH**. (S. A. C.; G. H. B.)

HIATUS, a break in continuity. In anatomy (*q.v.*) an opening or foramen, as the *hiatus Fallopii*, a foramen of the temporal bone. In logic a hiatus occurs when a link in reasoning is wanting; and in grammar it is the pause made for the sake of euphony in pronouncing two successive vowels which are not separated by a consonant.

HIAWATHA ("he makes rivers"), a legendary chief (c. 1450) of the Onondaga tribe of North American Indians. The formation of the League of Six Nations, known as the Iroquois, is attributed to him by Indian tradition. In his miraculous character, Hiawatha is the incarnation of human progress and civilization. He teaches agriculture, navigation, medicine and the arts, conquering by his magic all the powers of nature which war against man. He was adopted as the hero of the well-known poem by Longfellow.

See J. N. B. Hewitt, in *Amer. Anthropol.* for April 1892.

HIBBEN, JOHN GRIER (1861–), American educator, was born at Peoria (Ill.), on April 19, 1861. He graduated at Princeton university in 1882; was a student at Princeton Theological seminary from 1883 to 1886; and later studied at Berlin. In 1887 he was ordained a minister in the Presbyterian Church and was a pastor for four years at Chambersburg, Pennsylvania. In 1891 he returned to Princeton, where he taught logic as an instructor, assistant professor, and from 1907 professor. In 1912 he succeeded Woodrow Wilson as president of the university.

His works include *Inductive Logic* (1896); *The Problems of Philosophy* (1898); *Hegel's Logic* (1902); *Logic Deductive and Inductive* (1905); *The Philosophy of the Enlightenment* (1910); *A Defence of Prejudice and Other Essays* (1911), and *The Higher Patriotism* (1915). He also edited the *Epochs of Philosophy* series.

HIBBING, a village of Saint Louis county, Minn., U.S.A., 75m. N.W. of Duluth. It is served by the Duluth, Missabe and Northern and the Great Northern railways. The population was 15,089 in 1920 (37% foreign-born white) and was estimated locally at over 19,000 in 1928. It lies in the midst of the great iron deposits of the Mesabi range and the beauties of the great "North woods." Shipments from mines in the Hibbing district totalled about 16,000,000 tons in 1923. Underground mining, which prevailed earlier, has been largely superseded by the open-pit method, in which the surface is stripped down to the ore-beds, and the ore is then dipped out with steam shovels. In North Hibbing is the largest open-pit mine in the world: 1¼m. long by ½ to 1m. wide, with a stripped area of 600ac., and an output in 1926 of 4,537,605 gross tons. Hibbing has a fine high school and junior college (built 1920–24), with provision for 3,000 students. The village was settled in 1892, when mining developments began, and was incorporated in 1893.

HIBERNACULUM, in botany a term for a winter bud; in botanical gardens, the winter quarters for plants; in zoology, the winter bud of a polyzoan.

HIBERNATION, the more or less comatose condition in which certain animals pass the winter in cold latitudes. It is commonly referred to as the "Winter-sleep." A similar state of suspended animation, known as aestivation, overtakes some animals which have to contend with prolonged periods of heat or drought. These two kindred states have apparently been evolved as a means of escape from the recurrent shortage of the food-supply, brought about by seasonal change, accompanied by cold in the one case, and by heat and drought in the other.

The persistent association of hibernation with cold weather has had the effect of distracting attention from other important factors. Many cases, indeed, can be cited in support of this belief in the influence of a low temperature; but these must be studied side by side with others which cannot thus be explained. When a survey of all the facts is taken, the importance of cold is seen to have been over-estimated. Hibernation and aestivation occur in every group of vertebrates save birds, and its pre-disposing causes, immediate and remote, are by no means uniform.

Mammals.—Among mammals hibernation occurs in insect-eating bats, hedgehogs and many rodents; among carnivores only in the Arctoidea,—the bears and allied types,—which are partly vegetarian. But we have a very wide divergence in the intensity of the phenomena: "coma" is in some profound, in others intermittent, or feebly developed. Some striking and significant differences are seen among bats. Thus Leisler's bat displays a normally continuous torpidity; while in the pipistrelle, hibernation is intermittent. The reason for this is unknown.

The common hedgehog (*Erinaceus*) displays a puzzling eccentricity in the periods of its torpidity. Careful observations on this animal made by Moffat in Ireland showed that it was only on cold nights that it was roused from its sleep. It showed, however, a progressive decrease in appearances from October to February, when it ceased to emerge altogether. Trustworthy data will only be available after a careful survey of observations taken over several degrees of latitude.

Available evidence seems to show that the state of torpidity in the dormouse is profound. By late September it has become exceedingly fat. In October or November, having finished building its winter-nest, and laid up a store of food, it retires to sleep,

curling itself up into a ball with its fore-paws against its cheeks, and its tail wrapped around its head and back. And this sleep may endure for six months. The animal's breathing slows down so as to become almost imperceptible; and it becomes so cold and rigid that it can be rolled like a ball across a table. A mild day may arouse it for an hour or two, when it will feed before again relapsing into slumber. By the time of its final emergence, April, most of its fat has disappeared. During the few days just before and after hibernation it is extremely erratic in its behaviour, passing at frequent intervals first into a state of torpidity, then into the most lively activity. A hibernating dormouse can always be aroused, but the process takes about 20 minutes: if left, however, to itself it soon relapses. If the awakening be too rapid, as when warmth is too suddenly applied, death speedily follows. Young dormice born just before the season of retirement generally die forthwith, owing to their inability to accumulate sufficient fat to induce torpor. Certain African dormice (*Graphiurus*) hibernate when brought to Europe.

That food-supply is a more important factor than temperature seems to be shown by the fact that the Marmots of the Yakh-su-Valley, Bokhara, at 6,000 ft. go into their winter sleep soon after the middle of August. Two thousand feet higher, where green food is to be had longer, they do not retire till mid-September. The Marmots (*Aretomys*) both of the Old World, and the North American species, like that of woodchucks, retire to their hibernaculum at the time of the autumnal equinox, while the weather is yet warm, and emerge at the vernal equinox before the snows of winter have vanished. Before retiring they have become loaded with fat, and this forms their only reserve for the support of life till their spring awakening. Their near relatives, however, the ground-squirrels or chipmunks, and the gophers of northern Europe and America, before hibernation lay up large stores of roots, seeds and berries for occasional feasts. But none of the true squirrels hibernate. Such as live in northern latitudes, however, it is significant to notice, hide away during the autumn stores of food for future use.

Among the carnivores, the brown bear of north-temperate Europe and Asia, as well as the American grizzly and black bears, hibernate; but there seems reason to question whether they pass into absolute coma. This because, they, like the female polar bear (in which species the adult males, and the immature of both sexes, seem to remain at large throughout the winter, migrating to open water) retire to winter quarters early in the season, being then pregnant. The young are born soon after the turn of the year. This being so, the mother must perforce remain, if not exactly "active," at any rate awake: partly because the temperature of her body and the flow of milk must be maintained. Her only source of nutriment, save accumulated fat, is the faeces expelled by the cub. It is said that defaecation on the part of the mother, at any rate in the case of the brown and black bears, is rendered impossible because the rectum is blocked by a plug known as "tappen," composed of pine-needles, which is not evacuated till the spring.

The racoon-dog (*Nyctereutes procyonides*) of north-east Asia is the only hibernating carnivore outside the Arctoidea though individuals which have failed to accumulate sufficient fat remain at large throughout the winter. The racoon, skunk and badger also pass the severest part of the winter in hibernation.

It has been suggested that hibernating mammals are imperfectly warm-blooded and during hibernation relapse into a "cold-blooded" condition. Hormones have also been shown to have marked effect on hibernation.

Other Vertebrates.—Among reptiles a "winter sleep" in temperate latitudes is the rule. The bodily temperature at no time rising but little above that of the surrounding air, this state of coma in mid-winter would seem inevitable; moreover their food-supply is practically completely cut off. Land tortoises bury themselves in the soil, water-tortoises in the mud on the banks of the stream, or on the bottom. Snakes and lizards retire to crevices in rocks, and, considerable numbers often harbour together possibly for warmth.

Frogs, toads, newts and salamanders, hibernate in dry

holes or clefts, though some frogs, (e.g., *Rana temporaria*) retreat to the mud at the bottom of ponds. But H. Gadow remarks that though common toads (*Bufo vulgaris*), which he kept in a greenhouse, remained lively throughout the winter, they would withdraw for an occasional sleep of a few weeks at any time of the year. This suggests that a resting period is necessary.

Fishes do not normally hibernate, but some, like carp, during prolonged frost, will descend into the mud until the thaw sets in. And it seems certain that immature plaice, which haunt shallow water, burrow in the sand during the winter.

Invertebrates.—It has already been hinted that hibernation is biologically not so much a reaction to cold as to lack of food. This is shown in the case of many Lepidoptera, as for example the winter moth, December moth and mottled umber, which appear in their adult stage *only* during winter. The cold does not inhibit their vitality, and they have no need for food, since their mouth-parts are vestigial.

Many caterpillars hibernate. Late in July, the female silver-washed fritillary (*Argynnis paphia*) deposits her eggs sometimes 50 ft. above the ground, in the crevices of the bark of trees growing among or near the food plants, the dog-violet. The eggs hatch early in August. Immediately after emergence the tiny larva settles down close to the empty shell, in a crevice of the bark, and sleeps for about eight months. In spring it descends to search for its food-plant.

In the pearl-bordered fritillary (*Argynnis euphrysone*), the eggs are laid on the dog-violet during May and June, and hatch in about 15 days. The larva continues feeding till the end of July, when it hibernates, "selecting for the hibernaculum the under-side of dead crumpled-up leaves, generally two or more close together" (Frohawk). During hibernation it diminishes greatly in size. It is remarkable that "those plants which *were most subjected to cold and wet* appeared most suitable for the health of the larvae." During hibernation the caterpillars shrink to about half their previous size.

Some caterpillars, on the other hand, hibernate at the *end* of larval life, like the sand-dot (*Agrotis ripae*), which in late autumn burrows down into the sand and does not pupate till spring.

Many butterflies hibernate in the imago state; and again, long before the approach of winter. The large tortoise-shell (*Vanessa polychloris*) emerges from the chrysalis in July or August, but almost immediately hibernates. The usual time for its reappearance is April. In the brimstone butterfly (*Gonopteryx rhamni*), some imagos hibernate soon after emergence, while others remain active for some considerable time, but all hibernate before winter. Where butterflies or moths hibernate soon after emergence, pairing does not take place till the spring.

There appears to be no evidence of hibernation among spiders. Where the winter is long, they disappear, but rather because of the absence of suitable cover. If search be made among ground vegetation, or if fallen leaves are shaken over a newspaper, or search is made under stones and logs, spiders are easily found. In true hibernation, the life of the animal is brought almost to a standstill. There is here no need for this period of suspended animation; for spiders are able to fast at any time for many months without distress.

The hibernation of land-snails presents some interesting features. The common garden snail in late autumn retires into cranies, often large numbers are found attached to one another, not so much for the sake of keeping one another warm as because suitable shelter was not easily to be found. Other species retire beneath stones, under dead leaves, in fissures of rocks or walls, or bury themselves in the earth. But all close the shell by a membranous, and sometimes chalky, disc, closely fitting the shell-mouth. Slugs bury themselves, contract till they are almost spherical and secrete a mantle of slime. Some fresh-water snails retire deep into the mud. *Dreissensia*, or zebra mussel, casts off its byssus and retires to the mud in deeper water.

That the phenomena of the hibernation cannot be interpreted in terms of a single explanation is beyond dispute. The factor of cold is, at most, but a secondary agent. The accumulation of fat, again, is not unusual. There are many, which pass into the coma-

tose condition in mid-August, before even slight night-frosts have begun. But all agree in that their winter-sleep, whether continuous, or intermittent, is their only means of escape from starvation during the winter months. All that can be said, at present, is that this common end is attained by varied means in different groups of animals.

Aestivation.—As with hibernating species, respiration, alimentation and secretion almost cease in aestivating animals. But no records seem to have been made as to the temperature of the blood in the warm-blooded types during the "summer-sleep." With some, both among "winter" and "summer-sleepers," the passage into the dormant stage seems to have become a fixed, automatic habit taking place at the appropriate season even when there can be no external stimulus. Thus the tenrec (*Centetes ecaudatus*), a large insectivore of Madagascar, aestivates during the hottest weeks of the year, when the drought induces a shortage of insect food; and captive specimens in the London zoological gardens behaved in exactly the same way, though there was no excessive heat, and an abundance of food was within reach.

Among aquatic fishes and reptiles, aestivation is enforced not so much by lack of food as by the drying up of the waters in which they live. At such times, crocodiles and alligators, bury themselves in the mud, and there remain till released by the rains. The Iberian water-tortoise (*Clemmys leprosa*), on the drying up of the water-courses, retreats under ledges of rocks, where it remains in a state of torpor for months. Even moisture-loving frogs will survive this ordeal of being enclosed in sun-baked mud, into which a retreat is made on the onset of drought.

Among fishes there are many which have to endure a prolonged period of aestivation. One of the best known of these is the African lung-fish (*Protopterus*). As the swamps in which it lives become dried up during the summer, it aestivates till the next rainy season. It dives down into the mud to a depth of about 18 in., then bends the body round till the tail covers the head. A layer of mucus exuded by the skin forms a lining wall around the flask-shaped bottom of the burrow, and at the same time envelops the body of the fish. Around the lips the mucus turns in to form a tubular funnel leading into the mouth to enable air to pass to the lungs. The animal then passes into a state of torpor. Preparatory to retirement, abundant fat is accumulated round the kidneys and gonads. During the imprisonment this is slowly absorbed, and a further source of nutriment is obtained by a partial breaking up of the muscular tissue of the tail. The South American *Lepidosiren*, a near relation of *Protopterus*, and also a swamp dweller, similarly retires to a burrow at the onset of drought.

In both these fishes the air-bladder acts as a lung. But there are other aestivating fishes wherein air-breathing apparatus is furnished within the gill-chamber, as vascular outgrowths, formed in various ways. This is true of the Indian climbing perch (*Anabas*), the Gouramis (*Osphromenidae*), the Indian "serpent heads" (*Ophiocephalidae*) and some cat-fishes (*Clarias*, *Heterobranchius*). The Senegambian *Clarias lazera* spends several months of the dry season in open burrows from which it emerges at night to crawl about in search of food.

Many frogs aestivate. Baldwin Spencer explored during the dry season a central Australian "clay pan," bordered with shrubs. The ground, hard as a rock, was cut away, and at about a foot below the surface, he came upon a spherical chamber with moist and slimy walls, three inches in diameter, in which lay a dirty-yellow frog (*Cheireroleptes platycephalus*) fast asleep, with the lower eyelids drawn up tightly over the eyes. Its body was puffed out till it was almost spherical, the bladder being enormously distended with water. Later another species of the same genus was found, two others of the genus *Helioporus* and several *Notadon benneti*, all of which had adopted this method of storing moisture. When it is remembered that they must be prepared to spend 12 or 18 months in such a living grave, the need for such provision will be appreciated. Another frog (*Limnodynaster ornatus*) lives in the sand of creek-beds, and emerges at night, when it is comparatively cool, to feed.

Many of the pools contained water-snails, which had developed a remarkable power of tiding over drought. *Bithinia australis*

draws its body far up into the shell, which is closed with a plug formed of earth passed through the intestine. Some specimens were put into a tin, taken to Melbourne, and forgotten for 15 months, when, placed in water, all emerged apparently none the worse. Other animals found included fresh-water mussels, a crab (*Telephusa transversa*), which in other parts of Australia lives where there is no water-failure, and a crayfish (*Engans bicarinatus*).

Some land-snails can withstand very prolonged aestivation. Thus an Egyptian desert snail (*Helix desertorum*), on the assumption that the shell was empty, was fixed to a card in the British museum in March 1846; in March 1850, traces of slime were noted on the tablet, which was immediately immersed in water, when presently the shell became detached from the card and the animal began to crawl about.

In this field, an emphatic emphasis is laid on the relative viability of animals. The plasticity they display in their response to adverse conditions has a surprising range, varying even between related species. It is clear that we can, as yet, but imperfectly interpret these elusive differences and qualities of the living tissues which manifest themselves in the phenomena of hibernation and aestivation.

For physiology of hibernation, see ANIMAL HEAT. (W. P. P.)

HIBERNIA, in ancient geography, one of the names by which Ireland was known to Greek and Roman writers. Other names were Ierne, *Iouepvla*, Iberio. All these are adaptations of a stem from which also Erin is descended. The island was well known to the Romans through the reports of traders, so far at least as its coasts. But it never became part of the Roman empire. Agricola (about A.D. 80) planned its conquest, which he judged an easy task, but the Roman government forbade it. (See ERIN.)

HIBISCUS, in botany, a genus of plants of the mallow family (Malvaceae), many of which are popularly known as rose-mallow. When broadly defined, the genus comprises about 200 species of herbs, shrubs and trees, native to temperate and tropical regions, but most abundant in the latter. They bear palmately veined, lobed or parted leaves and mostly bell-shaped, frequently very large, scarlet, pink, yellow or white flowers, with the parts, except the numerous stamens, usually in fives. A few species yield food and fibre products but in Great Britain and the United States they are grown chiefly for ornament. Representative economic species are *H. esculentus* (okra or gumbo) and *H. tiliaceus*, a tropical plant which yields a fibre. Among the best known ornamental species are *H. syriacus* (rose-of-Sharon or shrubby althea), *H. Rosa-sinensis* (rose-of-China or shoe-flower) and *H. Trionum* (flower-of-an-hour). The North American *H. Moscheutos*, one of the most popular rose-mallows in cultivation, is native to swamps near the coast from Massachusetts to Florida, and sparingly westward to Indiana and Missouri. (See FIBRES; MALVACEAE.)

HICHENS, ROBERT SMYTHE (1864–), English novelist, was born at Speldhurst, Kent, on Nov. 14, 1864. He was educated at Tunbridge Wells and Clifton college, and then became a student at the Royal College of Music, London. He was, however, diverted to journalism and later to fiction. He first attracted serious attention with *The Green Carnation* (1894); but his best known work in fiction was a series of novels with an Eastern setting, beginning with *The Garden of Allah* (1905) and including *The Call of the Blood* (1906) and *Bella Donna* (1909). *The Dweller on the Threshold* (1911) is a good example of his tales of the supernatural. Of his dramatized novels *Bella Donna*, produced at the St. James theatre, London, in 1911–12, and *The Garden of Allah*, produced first in New York and (1920) at Drury Lane, were the most successful.

HICKES, GEORGE (1642–1715), English divine and scholar, was born at Newsham near Thirsk, Yorkshire, on June 20, 1642. In 1659 he entered St. John's college, Oxford, whence after the Restoration he removed to Magdalen college and then to Magdalen hall. In 1664 he was elected fellow of Lincoln college, and in 1675 was appointed rector of St. Ebbe's, Oxford. In 1676, as private chaplain, he accompanied the duke of Lauderdale, the royal commissioner, to Scotland. Hickes was vicar of All

Hallows, Barking, London (1680), chaplain to the king (1681), and dean of Worcester (1683). He opposed both James II.'s declaration of indulgence and Monmouth's rising, and he tried in vain to save from death his nonconformist brother John Hickes, one of the Sedgemoor refugees harboured by Alice Lisle. At the revolution Hickes, as a nonjuror, was first suspended and afterwards deprived of his deanery. When he heard of the appointment of a successor he affixed to the cathedral doors a "protestation and claim of right." After remaining some time in concealment in London, he was sent by Sancroft and the other nonjurors to James II. in France to discuss episcopal succession; upon his return in 1694 he was consecrated suffragan bishop of Thetford. In 1713 he persuaded two Scottish bishops, James Gadderar and Archibald Campbell, to assist him in consecrating Jeremy Collier, Samuel Hawes and Nathaniel Spinckes as bishops among the nonjurors. He died on Dec. 13, 1715. A posthumous publication of his *The Constitution of the Catholic Church and the Nature and Consequences of Schism* (1716) gave rise to the celebrated Bangorian controversy (see HOADLY, BENJAMIN).

His chief writings are the *Institutiones Grammaticae Anglo-Saxonicae et Moeso-Gothicae* (1689), and *Linguarum veterum Septentrionalium Thesaurus grammatico-criticus et archaeologicus* (1703–05), a work of great learning. His two treatises, one *Of the Christian Priesthood* and the other *Of the Dignity of the Episcopal Order* (1707) were reprinted in the *Library of Anglo-Catholic Theology* (1847). There is a ms. in the Bodleian Library which sketches his life to 1689, and many of his letters are extant in various collections.

See also J. H. Overton, *The Nonjurors* (1902).

HICKORY, a city of Catawba county, North Carolina, U.S.A., in the Piedmont region, at an altitude of 1,165 feet. It is on Federal highway 70, and is served by the Carolina and North-western and the Southern railways. The population was 5,076 in 1920 and was estimated locally at 7,100 in 1928 (15% negroes). With the adjoining municipalities of Highland, West Hickory and Longview, the urban unit had a population of 14,000. It is in the Catawba river valley, which produces fine melons and grapes; and commands views of Mount Mitchell, Grandfather and other peaks of the Blue Ridge. Hickory manufactures farm wagons which are widely used throughout the South, and has cotton mills (32,000 spindles in 1928), hosiery mills, furniture factories and other manufacturing industries. It is the seat of Lenoir Rhyne college (opened 1891), a Lutheran institution, named after two benefactors. Hickory was founded about 1874 and chartered in 1884. Since 1913 it has had a council-manager form of government.

HICKORY, a shortened form of the American Indian name *pohickery*. Hickory trees are natives of eastern North America,

and belong to the genus *Carya* (or *Hicoria* of many American botanists) of the family Juglandaceae. They are closely allied to the walnuts (*Juglans*), the chief or at least one very obvious difference being that, whilst in the hickory the husk which covers the shell of the nut separates into four valves, in the walnut it consists of but one piece, which bursts irregularly. The timber is both strong and heavy, and remarkable for its extreme elasticity. It is very extensively employed in manufacturing axle-trees, chair-backs, axe-handles, whip-handles and other articles requiring great strength and elasticity. The species which furnish the best wood are *Carya ovata* (shellbark hickory), *C. alba* (mockernut), *C. Pecan* (pecan or pacane nut), and *C. glabra* (pig-nut), that of the last named, on account of its extreme tenacity, being preferred for axle-trees and axe-handles. The wood of *C. ovata* splits very easily and is very elastic, so that it is much used for making

whip-handles and baskets.

Most of the hickories form fine trees of from 60 to 90 ft. in height, with straight, symmetrical trunks, well-balanced ample heads, and bold, handsome, pinnated foliage. When confined in the forest they shoot up 50 to 60 ft. without branches, but when standing alone they expand into a fine head, and produce a lofty round-headed pyramid of foliage. They have all the qualities necessary to constitute fine graceful park trees. The most ornamental of the species are pecan, the mocker-nut or big-bud hickory, and the pig-nut, all producing delicious nuts.

The husk of the hickory nut, as already stated, breaks up into four equal valves or separates into four equal portions in the upper part, while the nut itself is tolerably even on the surface, but has four or more blunt angles in its transverse outline. The wild hickory nuts of the American markets are chiefly the produce of *C. ovata*, called the shell-bark or shag-bark hickory because of the roughness of its bark, which becomes loosened from the trunk in long scales. The pecan-nuts, which come from the Southern States, are from 1 in. to 1½ in. long, smooth, cylindrical, pointed at the ends and thin-shelled, with the kernels full, not like those of most of the hickories divided by partitions, and of delicate and agreeable flavour. The thick-shelled fruits of the pig-nut (*C. glabra*) are generally left on the ground for swine, squirrels, etc., to devour. In *C. cordiformis*, the bitter-nut hickory, the kernel is so very bitter that even the squirrels refuse to eat it.

Since 1900 pecan culture has become widely established in the Southern States; in 1926 the total commercial crop was estimated by the U.S. Department of Agriculture at 64,046,000 lb., valued at \$9,772,000, of which the states of Oklahoma and Texas produced about one-half. In 1925 the total cut of hickory lumber, principally shag-bark, pig-nut, mocker-nut and bitter-nut, amounted to 79,293,000 bd.ft. Its value per thousand at the mill was exceeded only by that of the black walnut and the white ash.

The hickory genus has an interesting geological history, some 20 or more ancestral fossil species being known, ranging from early Eocene to late Pliocene times. In the Miocene these were widespread across the continents of North America and Europe and in parts of Asia. None, however, survived the Ice Age in Europe, only one (*C. cathayensis*) remains in Asia, and those in North America became restricted chiefly to the eastern half of the United States, none occurring in or west of the Rocky Mountains, and but a single species (*C. mexicana*) in Mexico, where it is not widely distributed.

HICKS, ELIAS (1748-1830), American Quaker, was born in Hempstead, L.I., New York, U.S.A., March 19, 1748. His parents were Friends, but he took little interest in religion until he was about twenty years of age. A carpenter's apprentice and farmer, by 1775 he had "openings leading to the ministry," and in 1779 he first set out on his itinerant preaching tours. He attacked slavery in his sermons, and in *Observations on the Slavery of the Africans and their Descendants* (1811); and was influential in procuring the passage in 1817 of the act declaring free after 1827 all negroes born in New York and not freed by the act of 1799. He died at Jericho, L.I., on Feb. 27, 1830. His preaching was practical and he was heartily opposed to any set creed; hence his successful opposition at the Baltimore yearly meeting of 1817 to the proposed creed which would make the Society in America approach the position of the English Friends by definite doctrinal

statements. His Doctrinal Epistle (1824) stated his position, and a break ensued in 1827-1828, Hick's followers, who called themselves the "Liberal Branch," being called "Hicksites" by the "Orthodox" party, which they for a time outnumbered. The village of Hicksville, in Nassau County, New York, 15 m. E. of Jamaica, lies in the centre of the Quaker district of Long Island and was named in honour of Elias Hicks.

See *A Series of Extemporaneous Discourses . . . by Elias Hicks* (1825); his *Journal* (1832); his *Letters* (1834); and H. W. Wilbur, *Life and Labors of Elias Hicks* (1910), also a monograph by G. W. Burnap (1851).

HICKS, HENRY (1837-99), Welsh physician and geologist, was born on May 26, 1837 at St. David's, in Pembrokeshire, where his father, Thomas Hicks, was a surgeon. He studied medicine at Guy's Hospital, London, and practised in his native place until 1871; when he removed to Hendon, where he died on Nov. 18, 1899. In conjunction with Salter, he established in 1865 the Menevian group (Middle Cambrian) characterized by the trilobite *Paradoxides*. Subsequently Hicks contributed a series of important papers on the Cambrian and Lower Silurian rocks, and figured and described many new species of fossils. Later he worked at the Pre-Cambrian rocks of St. David's, describing the Dime-tian (granitoid rock) and the Pebidian (volcanic series), and his views, though contested, have been generally accepted. At Hendon Dr. Hicks gave much attention to the local geology and also to the Pleistocene deposits of the Denbighshire caves. He detected organic remains in the Morte slates, previously regarded as unfossiliferous, and these he regarded as including representatives of Lower Devonian and Silurian. His papers appeared in the *Geol. Mag.* and *Quart. Journ. Geol. Soc.* He was elected F.R.S. in 1885, and president of the Geological Society of London (1896-98).

HICKS, WILLIAM (1830-1883), British soldier, entered the Bombay army in 1849, and served through the Indian mutiny and the Abyssinian expedition of 1867-68. He retired with the honorary rank of colonel in 1880. After the close of the Egyptian war of 1882, he entered the khedive's service and was made a pasha. Early in 1883 he went to Khartum as chief of the staff of the army there, then commanded by Suliman Niaz Pasha. Camp was formed at Omdurman and a new force of some 8,000 fighting men collected—mostly recruited from the fellahin of Arabi's disbanded troops, sent in chains from Egypt. After a month's vigorous drilling Hicks led 5,000 of his men against an equal force of dervishes in Sennar, whom he defeated, and cleared the country between the towns of Sennar and Khartum of rebels. Relieved of the fear of an immediate attack by the mahdists, the Egyptian officials at Khartum intrigued against Hicks, who in July tendered his resignation. This resulted in the dismissal of Suliman Niaz and the appointment of Hicks as commander-in-chief of an expeditionary force to Kordofan with orders to crush the mahdi, who in January 1883 had captured El Obeid, the capital of that province. Hicks, aware of the worthlessness of his force for the purpose contemplated, stated his opinion that it would be best to "wait for Kordofan to settle itself" (telegram of Aug. 5). The Egyptian ministry, however, did not then believe in the power of the mahdi, and the expedition started from Khartum on Sept. 9. It was made up of 7,000 infantry, 1,000 cavalry and 2,000 camp followers and included 13 Europeans. On the 20th the force left the Nile at Duem and struck inland across the almost waterless wastes of Kordofan for Obeid. On Nov. 5, the army, misled by treacherous guides and thirst-stricken, was ambuscaded in dense forest at Kashgil, 30 m. south of Obeid. With the exception of some 300 men the whole force was killed. According to the story of Hicks's cook, one of the survivors, the general was the last officer to fall, pierced by the spear of the khalifa Mohammed Sherif.

See Sir F. R. Wingate, *Mahdism and the Egyptian Sudan*, book iv. (1891), and J. Colborne, *With Hicks Pasha in the Soudan* (1884). See also EGYPT.

HIDALGO, an inland plateau, State of Mexico. Pop. (1921) 622,241. Area, 8,063 sq. miles. The northern and eastern parts are elevated and mountainous, culminating in the Cerro de Nav-

ajas (10,528ft.). A considerable area of this region on the eastern side of the State is arid and semi-barren, being part of the elevated table-land of Apam where the *magüey* (American aloe) has been grown for centuries. The southern and western parts of the State consist of rolling plains, in the midst of which is the large lake of Metztitlan. Hidalgo produces cereals, magüey, coffee, beans, sugar, cotton and tobacco. Magüey is cultivated for the production of *pulque*, the national drink. The chief industry, however, is mining, the mineral districts of Pachuca, El Chico, Real del Monte, San José del Oro and Zimapán being among the richest in Mexico. The mineral products include silver, gold, mercury, copper, iron, lead, zinc, antimony, manganese and plumbago. Coal, marble and opals are also found. Railway facilities are afforded by a branch of the Veracruz and Mexico line, which runs from Ometusco to Pachuca, the capital of the State, and by the Mexican Central. Among the principal towns are Tulancingo (pop. 10,083 in 1921), a rich mining centre 24m. E. of Pachuca, and Mineral del Monte (pop. 1921, 9,758).

HIDALGO, originally a Spanish title of the lower nobility; the hidalgo being the lowest grade of nobility which was entitled to use the prefix "don." The word is contracted from *hijo d'algo*, son of something, or somewhat. The term is now used generally to denote one of gentle birth. The Portuguese *fidalgo* has a similar history and meaning.

HIDALGO Y COSTILLA, MIGUEL (1753-1811), Mexican patriot, was born on May 8, 1753, on a farm at Corralejos, near Guanajuato. He was educated at Valladolid in Mexico, and was ordained priest in 1779. Until 1809 he was known only as a man of pious life who exerted himself to introduce various forms of industry among his parishioners at Dolores. But Napoleon's invasion of Spain in 1808 caused a widespread commotion. The colonists were indisposed to accept a French ruler and showed great zeal in proclaiming Ferdinand VII. as king. The societies they formed for their professedly loyal purpose were regarded, however, by the Spanish authorities with suspicion as being designed to prepare the independence of Mexico. Hidalgo and several of his friends, among whom was Miguel Dominguez, mayor of Querétaro, engaged in preparations which the authorities considered treasonable. Dominguez was arrested, but Hidalgo was warned in time. He collected some hundred of his parishioners, and on Sept. 16, 1810, they seized the prison at Dolores. This action began what was in fact a revolt against the Spanish and Creole elements of the population. At first he met with some success and moved on the city of Mexico. But here the Spaniards and Creoles were concentrated. Hidalgo lost heart and retreated. Many of his followers deserted, and at Aculco he was attacked on Nov. 7, 1810, and routed. He succeeded in collecting a mob estimated at 100,000 about Guadalajara. With this ill-armed and undisciplined crowd he took up a position on the bridge of Calderon on the river Santiago. On Jan. 17, 1811, he was completely beaten by a small force of Spanish soldiers. Hidalgo and the other leaders were betrayed to the Spaniards. Hidalgo was first degraded from the priesthood and then shot as a rebel on July 31, or Aug. 1, 1811.

See H. H. Bancroft, *The Pacific States*, vol. vii., which contains a copious bibliography.

HIDATSA. A native American people of Siouan family, one of three agricultural "village tribes" on the upper Missouri, the others being the Mandan (*q.v.*) and Arikara (*q.v.*); the surrounding groups were buffalo hunting nomads of the plains. Culturally, the Hidatsa resembled the Mandan; in speech, the Crow (*q.v.*). They are also known as Minitari and Gros Ventre of the River. Five hundred remain of the 2,100 estimated in 1804.

See W. Matthews, *Ethnography and Philology of the Hidatsa* (1877).

HIDDENITE, a green transparent variety of spodumene (*q.v.*), used as a gem-stone. It was discovered by William Earl Hidden (1853-1918) at Stonypoint (now called Hiddenite), Alexander Co., North Carolina.

HIDE. This word can most accurately be rendered by the phrase "family land"; originally it denoted the amount of land necessary for the support of a free peasant family. The actual amount of land covered by this term is still and is long likely to

be a matter under discussion. In the 12th and 13th centuries, when records are first abundant, the hide commonly appears as 120 acres of arable, with the meadow and the pasture-rights locally considered appurtenant to such a tenement. But the scanty evidence which comes from an earlier time suggests that, at least in Wessex, the hide had once been much smaller than this, and there are facts which point to a pre-Conquest southern hide of 48 acres. The large hide of 120 acres is best recorded in the eastern midlands, and its appearance there may in part be due to the influence of the large Scandinavian tenements introduced into the neighbouring country by the Danish settlements of the ninth century. In any case, throughout England, the hide underlay the whole local organization of Early English society. It was the basis of the earliest taxation, the contributions made by different districts to the support of kings and ealdormen, and it seems to have formed also the basis according to which the primitive English militia, the *fyrd*, was raised. By the end of the old English period it had become unusual for a single peasant to hold an entire hide. The quarter hide, or yardland (Lat. *virgata*) had become, and long continued to be, the normal peasant tenement. Long after the Norman Conquest, however, the hide was the unit according to which assessment to national taxation, such as *dane-geld* (*q.v.*), was expressed. The Norman administration maintained the old English system by which most villages in the midlands and the south and west of England were assessed at some round number of hides, such as 5, 10 or 25, an arrangement which undoubtedly descends from the time when the hide was the essential unit of agrarian economy. (F. M. S.)

BIBLIOGRAPHY.—The voluminous literature relating to the hide may conveniently be approached through J. H. Round, *Feudal England* (1895); F. W. Maitland, *Domesday Book and Beyond* (1897); F. Liebermann, "Hufe" in *Die Gesetze der Angelsachsen* (1898-1916); P. Vinogradoff, *English Society in the Eleventh Century* (1908). The system of assessment based on the hide will be found explained in any of the articles on Domesday Survey contributed by Round in the *Victoria History of the Counties of England*, ed. H. A. Doubleday (1900).

HIDES. The importation of hides into the United Kingdom is very large, and there is a considerable re-exportation of imported hides. The Board of Trade returns give the following figures:

United Kingdom: Imports and Re-Exports of Hides and Skins, Undressed: 1927.

Material.	Imports.	Re-exports of imported material.	Net imports.
<i>Wet hides:</i>			
Cwts.	811,000	247,000	564,000
Value £	3,093,000	926,000	2,167,000
<i>Dry and dry salted hides:</i>			
Cwts.	720,000	176,000	544,000
Value £	3,309,000	768,000	2,541,000

In addition, there were imports of £3,862,000 worth of sheep and lamb skins (of which £1,537,000 worth were re-exported), and £1,234,000 worth of goat skins (of which £700,300 worth were re-exported). (See **LEATHER**.)

HIEL, EMMANUEL (1834-1899), Belgian-Dutch poet and prose writer, was born at Dendermonde, Flanders, in May 1834. Hiels was one of the leaders of the Flemish movement in Belgium. For the 50th anniversary of Belgian independence he wrote two cantatas *Belgenland* and *Eer Belgenland*. His efforts to counteract Walloon influence and to revive Flemish as a literature made him famous in Holland, and in 1874 a volume of his poems appeared in a collection of Dutch authors. His collected poetical works were published in three volumes at Rousselaere in 1885.

HIEMPSAL, the name of the two kings of Numidia. For Hiempsal I. see **JUGURTHA**. Hiempsal II. was the son of Gauda, the half-brother of Jugurtha. In 81 he was driven from his throne by the Numidians themselves, or by Hiabaras, ruler of part of the kingdom, supported by Cn. Domitius Ahenobarbus, the leader of the Marian party in Africa. Soon afterwards Pompey was sent to Africa by Sulla to reinstate Hiempsal. From Suetonius

(Caesar, 71) it is evident that Hiempsal was alive in 62.

HIERAPOLIS. 1. (Arabic *Manbij* or *Mumbij*) an ancient Syrian town occupying one of the finest sites in Northern Syria, in a fertile district about 16 m. south-west of the confluence of the Sajur and Euphrates. There is abundant water supply from large springs. The place first appears in Greek as *Bambyce*, but Pliny (v. 23) tells us its Syrian name was *Mabog*. It was doubtless an ancient Commagenian sanctuary. The Seleucids made it the chief station on their main road between Antioch and Seleucia-on-Tigris; and as a centre of the worship of the Syrian Nature Goddess, Atargatis (*q.v.*), it became known to the Greeks as the city of the sanctuary *Ἱερόπολις*, and finally as the Holy City *Ἱεράπολις*. Lucian (or some anonymous writer) has described the orgiastic luxury of the shrine in the tract *De Dea Syria*. According to this the worship was of a phallic character, votaries offering little male figures of wood and bronze. There were also huge *phalli* set up before the temple, which were climbed once a year with certain ceremonies, and decorated. For the rest the temple was of Ionic character. Inside was a holy chamber into which priests only were allowed to enter. Here were statues of a goddess and a god in gold. Between them stood a gilt *xoanon*, which seems to have been carried outside in sacred processions. Other rich furniture is described, and a mode of divination by movements of a *xoanon* of Apollo. A great bronze altar stood in front, and in the forecourt lived numerous sacred animals and birds (but not swine) used for sacrifice. The lake was the centre of sacred festivities and it was customary for votaries to swim out and decorate an altar standing in the middle of the water. Self-mutilation and other orgies went on in the temple precinct, and there was an elaborate ritual on entering the city and first visiting the shrine.

The temple was sacked by Crassus on his way to meet the Parthians (53 B.C.); but in the 3rd century of the empire the city was the capital of the Euphratensian province and one of the great cities of Syria. It was, however, in ruins when Julian collected his troops there, and Chosroes I. held it to ransom after Justinian had failed to put it in a state of defence. Harun restored it at the end of the 8th century and it became a subject of dispute between Byzantines, Arabs, and Turks. The crusaders captured it from the Seljuks in the 12th century, but Saladin retook it (1175) and later it became the headquarters of Hulagu and his Mongols, who completed its ruin. A colony of Circassians was settled here in 1879 after the Russo-Turkish War. The remains are extensive, but almost wholly of late date, as is to be expected in the case of a city which survived into Muslim times. The sacred lake survives. The first modern account of the site is in a short narrative appended by H. Maundrell to his *Journey from Aleppo to Jerusalem*. He was at Mumbij in 1699.

The coinage of the city begins in the 4th century B.C. with an Aramaic series, showing the goddess, either as a bust with mural crown or as riding on a lion. She continues to supply the chief type even during imperial times, being generally shown seated with the *tympanum* in her hand. Other coins substitute the legend *Θεᾶς Συρίας Ἱεροπολιτῶν*, within a wreath. It is interesting to note that from *Bambyce* (near which much silk was produced) were derived the *bombycina vestis* of the Romans and, through the crusaders, the bombazine of commerce.

See F. R. Chesney, *Euphrates Expedition* (1850); W. F. Ainsworth, *Personal Narrative of the Euphrates Expedition* (1888); E. Sachau, *Reise in Syrien*, etc. (1883); D. G. Hogarth in *Journal of Hellenic Studies* (1909).

2. A Phrygian city, altitude 1,200 ft. on the right bank of the Churuk Su (Lycus), about 8 m. above its junction with the Menderes (Maeander), situated on a broad terrace, 200 ft. above the valley and 6 m. N. of Laodicea. On the terrace are springs, that have deposited calcareous material in their neighbourhood. To these and to the "Plutonium"—a probable fissure in the limestone rocks—the place owed its celebrity and sanctity. Here, at an early date, a religious establishment (*hieron*) existed in connection with the old Phrygian Kydrara, a settlement of the tribe Hydrelitae; and the town which grew round it became one of the greatest centres of Phrygian native life but of non-political

importance. The chief religious festival was the Letoia, named after the goddess Leto, a local variety of the Mother Goddess (Cybele), who was honoured with orgiastic rites in which elements of the original Anatolian matriarchate and Nature-cult survived: there was also a worship of Apollo Lairbenos.

Hierapolis was the seat of an early church (Col. iv. 13), with which tradition closely connects the apostle Philip. Epictetus, the philosopher, and Papias, a disciple of John and author of a lost work on the Sayings of Jesus, were born there. The village of Yuruks has gradually grown below the site. The goddesses of the two Hierapoleis were closely akin. The ruins of Hierapolis are remarkable for the long avenue of tombs (mostly inscribed sarcophagi on plinths) in the west of the city, and for a very perfect theatre partly excavated in the hill at the north side of the site. Stage buildings as well as auditorium are well preserved. On the south just above the terraces and largely blocked with petrified deposit, stand large baths, into which the natural warm spring was once conducted. Behind these is a fine triumphal arch, whence runs a colonnade. Ruins of several churches survive, and also of a large basilica. Over 300 inscriptions have been collected, mostly sepulchral, whence have been deduced interesting facts about the very early Christian community which existed here.

See K. Humann, *Altortümer v. Hierapolis* (1888); Sir W. M. Ramsay, *Cities and Bishoprics of Phrygia*, vol. i. (1895).

HIERARCHY, priestly government, a term commonly used in ecclesiastical language to denote the graded organization of angels or of the clergy. The word *ἱεραρχία*, which does not occur in any classical Greek writer, owes its present extensive currency to the celebrated writings of the pseudo-Dionysius Areopagiticus. Of these the most important are the two which treat of the celestial and of the ecclesiastical hierarchy respectively. Defining hierarchy as the "function which comprises all sacred things," or, more fully, as "a sacred order and science and activity, assimilated as far as possible to the godlike, and elevated to the imitation of God proportionately to the Divine illuminations conceded to it," the author proceeds to enumerate the nine orders of the heavenly host, which are subdivided again into hierarchies or triads, in descending order, thus: Seraphim, Cherubim, Thrones; Dominations, Virtues, Powers; Principalities, Archangels, Angels. The ecclesiastical or earthly hierarchy is the counterpart of the other. In it the first or highest triad is formed by baptism, communion and chrism. The second triad consists of the three orders of the ministry, bishop or hierarch, priest and minister or deacon (*ἱεράρχης, ἱερεὺς, λειτουργός*). The third or lowest triad is made up of monks, "initiated" and catechumens. (See ORDER, HOLY, and article "Hierarchy" in the *Catholic Encyclopedia*.)

HIERATIC, priestly or sacred (Gr. *ἱερατικός, ἱερός*, sacred), a term applied to a simplified cursive form of hieroglyphic in ancient Egyptian writing. The name was first given by Champollion (see EGYPTIAN LANGUAGE).

HIERO I., the brother of Gelo, and tyrant of Syracuse from 478 to 467 B.C. During his reign he greatly increased the power of Syracuse. He removed the inhabitants of Naxos and Catana to Leontini, peopled Catana (which he renamed Aetna) with Dorians, concluded an alliance with Agragas (Agrigentum), and espoused the cause of the Locrians against Anaxilaus, tyrant of Rhegium. His most important achievement was the defeat of the Etruscans at Cumae (474), by which he saved the Greeks of Campania. A bronze helmet (now in the British Museum), with an inscription commemorating the event, was dedicated at Olympia. Though despotic in his rule, Hiero was a liberal patron of literature. He died at Catana in 467.

See Diod. Sic. xi. 38-67; Xenophon, *Hiero*, 6. 2; E. Lübbert, *Syrakus zur Zeit des Gelon und Hieron* (1875); for his coins see NUMISMATICS (section Sicily).

HIERO II., tyrant of Syracuse from 270 to 216 B.C., was the illegitimate son of a Syracusan noble, Hierocles, who claimed descent from Gelo. On the departure of Pyrrhus from Sicily (275) the Syracusan army and citizens appointed him commander of the troops. He materially strengthened his position by marrying the daughter of Leptines, the leading citizen. In the meantime, the

Mamertines, a body of Campanian mercenaries who had been employed by Agathocles, had seized the stronghold of Messana, whence they harassed the Syracusans. They were finally defeated in a pitched battle near Mylae by Hiero, who was only prevented from capturing Messana by Carthaginian interference. His grateful countrymen then chose him king (270). In 264 he again returned to the attack, and the Mamertines called in the aid of Rome. Hiero at once joined the Punic leader Hanno, who had recently landed in Sicily; but being defeated by the consul Appius Claudius, he withdrew to Syracuse. Pressed by the Roman forces, in 263 he was compelled to conclude a treaty with Rome, by which he was to rule over the south-east of Sicily and the eastern coast as far as Tauromenium (Polybius i. 8-16; Zonaras viii. 9). From this time till his death in 216 he remained loyal to the Romans, and frequently assisted them with men and provisions during the Punic wars (Livy xxi. 49-51, xxii. 37, xxiii. 21). He kept up a powerful fleet for defensive purposes, and employed his famous kinsman Archimedes in the construction of those engines that, at a later date, played so important a part during the siege of Syracuse by the Romans.

A picture of the prosperity of Syracuse during his rule is given in the 16th idyll of Theocritus, his favourite poet. See Diod. Sic. xxii. 24-xxvi. 24; Polybius i. 8-vii. 7; Justin xxiii. 4.

HIEROCLES OF ALEXANDRIA (fl. c. A.D. 430), a Neoplatonist, was a pupil of Plutarch at Athens, and taught for some years in his native city. Banished from Alexandria, he went to Constantinople, where his religious opinions led to his imprisonment. His commentary on the *Carmina Aurea* of Pythagoras, which enjoyed a great reputation in middle age and Renaissance times, is extant. Several other writings, especially one on providence and fate, are referred to by Photius and Stobaeus. The collection of some 260 witticisms (*ἀστεῖα*) called *Φιλόγελας* (ed. A. Eberhard, Berlin, 1869), attributed to Hierocles and Philagrius, has no connection with Hierocles of Alexandria, but is probably a later compilation. It is now agreed that the fragments of the *Elements of Ethics* (*Ἠθικὴ στοιχειώσις*) preserved in Stobaeus are by a Stoic named Hierocles, contemporary of Epictetus, who has been identified with the "Hierocles Stoicus vir sanctus et gravis" in Aulus Gellius (ix. 5. 8). This theory is confirmed by the discovery of a papyrus (ed. H. von Arnim in *Berliner Klassikertexte*, iv. 1906; see also C. Prächter, *Hierokles der Stoiker*, 1901).

The commentary was edited by F. W. Mullach in *Frag. philos. Graec.* (1860); there is an Eng. trans. by N. Rowe (1906). See W. Christ, *Gesch. der griech. Literatur* (1898); Überweg, *Grund. der gesch. der Phil.*, pt. 1 (1926) and Zeller, *Phil. der Griechen*.

Another Hierocles, who flourished under Justinian, was the author of a list of provinces and towns in the Eastern Empire, called *Συνέκδημος* ("fellow-traveller"; ed. A. Burckhardt, 1893); it was one of the chief authorities used by Constantine Porphyrogenitus in his work on the "themes" of the Roman Empire (see C. Krumbacher, *Gesch. der byzantinischen Literatur*, 1897).

HIEROGLYPHS, sacred carvings, the picture characters of ancient Egyptian writing, and of analogous scripts found in Crete, Asia Minor and Syria (Hittite), the Sinai peninsula, etc. The ancient Egyptian system seems to have originated, developed and finally expired strictly within the limits of the Nile valley, its only ascertained offshoot being the Meroitic (*q.v.*). It is essentially Egyptian and adapted only to the expression of the Egyptian language, for Egyptian monumental use by Egyptians. It was carried by conquest up the Nile into Nubia, and across the Sinai desert and the Levant into Palestine and Syria, and may have contributed to the formation of the Phoenician alphabet and other modes of writing in Asia.

The discovery by Champollion (*q.v.*) of the key to Egyptian writing in 1822 brought about the first effective entry of historical investigation into a vast ancient world of monuments before the age of Greece and Rome, but the century that has passed since then has brought our knowledge and understanding of the language and writing to a wonderful completeness.

From the 4th Dynasty onwards the mode of writing in Egypt was essentially that extinguished by the fall of paganism in the 4th century A.D. Its elements in the hieroglyphic form were pictorial, but each hieroglyph had one or more well-defined functions, fixed by convention in such a manner that the Egyptian

language was expressed word by word in writing never intended to convey merely an idea. How far this holds good for the period before the 4th Dynasty, it is difficult to say. The known inscriptions of the earlier times are so brief and so limited in range that the system on which they were written cannot yet be fully investigated. In the 1st Dynasty, phonograms (*see below*) were in full use. But the spelling then was very concise; it is possible that some of the slighter words, such as prepositions, were omitted in the writing and were supplied from the context. As a whole, we gain the impression that a really distinct and more primitive stage of hieroglyphic writing by a substantially vaguer notation of words lay not far behind the time of the 1st Dynasty.

It must be clearly realised that the Egyptian hieroglyphic system did not provide for the notation of vowels; only consonants were recorded.

The employment of the signs is of three kinds: any given sign represents either (1) a whole word or root; or (2) a sound as part of a word; or (3) pictorially defines the meaning of a word the sound of which has already been given by a sign or group of signs preceding. Thus signs, according to their employment, are said to be (1) "word-signs," (2) "phonograms," or (3) "determinatives." Phonograms may be used also as word-signs and word-signs as determinatives, but phonograms rarely occur as determinatives.

Word-signs.—The word value of a sign is, in the first place, the name of the object it represents, or of some material, or quality, or action, or idea suggested by it. Thus  is *hr*, "face";  a vase of ointment, is *mrh.t* "ointment";  is *wdb*, "turn." No other system of writing bears upon its face so clearly the history of its development, yet much investigation is still required to establish the origins of the values of the signs; in some cases the connection between the pictures and the *primary* values seems to be curiously remote. Probably all the signs in the hieroglyphic signary can be employed in their primary sense. The secondary value expresses the consonantal root of the name or other primary value, and any, or almost any, derivative from that root; as when , a mat with a cake upon it, is not only *htp*, an "offering-mat," but also *htp* in the sense of "conciliation," "peace," "rest," "setting" (of the sun), with many derivatives. In the third place, some signs may be transferred to express another root having the same consonants as the first; thus, from the middle kingdom onwards, , the ear, by a play upon words can express not only *šm*, "hear," at that time changed to *sdm*, but also *sdm*, "paint the eyes."

Phonograms.—The limited number of signs found with this use are of the greatest importance. By searching throughout the whole mass of normal inscriptions, earlier than the periods of Greek and Roman rule when great liberties were taken with the writing, probably no more than one hundred different phonograms can be found. The number of those commonly employed in good writing is between seventy and eighty. The most important phonograms were the *unilateral* or *alphabetic* signs, twenty-four in number in the Old Kingdom and without any homophones; later these were increased by homophones to thirty. Of *bilateral* phonograms—each expressing a combination of two consonants—there were about fifty commonly used: some fifteen or twenty were rarely used. As Egyptian roots seldom exceeded three letters, there was no need for *trilateral* phonograms to spell them. There is, however, one trilateral phonogram, the

eagle  *tyw* or *tiu* (?), used for the plural ending of adjectives in *y* formed from words ending in *t* (whether radical or the feminine ending).

The phonetic values of the signs are derived from their word-sign values, and consist usually of the bare root, though there are rare examples of the retention of a flexional ending; they often ignore also the weaker consonants of the root, and on the same principle reduce a repeated consonant to a single one, as when the hoe  *hnn*, has the phonetic value *hn*. The history of some of the alphabetic signs is still very obscure, but it is nearly certain that the values of all were obtained on the same prin-

THE THREE VARIETIES OF ANCIENT EGYPTIAN WRITING: HIEROGLYPHIC, SACRED TO THE PRIESTS; HIERATIC, A CURSIVE FORM OF THE HIEROGLYPHIC, AND THE DEMOTIC, THE ULTIMATE SIMPLIFIED POPULAR SCRIPT

shaped characters into square groups, and this could be done in great measure by taking advantage of the different ways in which many words could be spelt. Thus *hs* could be written

hsy *hs-f* *hs-n-f* . But some words in the classical writing were intractable from this point of view. The alphabetic signs obviously played a very important part in the formation of the groups, and many words could only be written in alphabetic signs. A great advance was therefore made when several homophones were introduced into the alphabet in the middle and New Kingdoms, partly as the result of the wearing away of old phonetic distinctions, giving the choice between

and for *s*, and for *t*, and for *m*, and for *n*, and and for *w*. In later times the

number of homophones in use increased greatly throughout the different classes, the tendency being helped by the habit of fanciful writing; but few of these homophones found their way into the cursive script. Occasionally a scribe of the old times indulged his fancy in "sportive" or "mysterious" writing, either inventing new signs or employing old ones in unusual meanings. Short sportive inscriptions are found in tombs of the 12th Dynasty; some groups are so written cursively in early medical papyri, and certain religious inscriptions in the royal tombs of the 19th and 20th Dynasties are in secret writing. Fanciful writing abounds on the temples of the Ptolemaic and Roman periods.

Hieroglyphic is normally written from right to left, the signs facing to the commencement of the line; hieratic and demotic follow the same direction. But monumental hieroglyphic may also be written from left to right, and is constantly so arranged for purposes of symmetry, e.g., the inscriptions on the two jambs of a door are frequently turned in opposite directions; the same is frequently done with the short inscriptions scattered over a scene amongst the figures in order to distinguish one label from another.

In modern founts of type, the hieroglyphic signs are made to run from left to right in order to facilitate the setting where European text is mixed with the Egyptian. The table shows them in their more correct position, in order to display more clearly their relation to the hieratic and demotic equivalents.

Clement of Alexandria states that in the Egyptian schools the pupils were first taught the "epistolographic" style of writing

(i.e., demotic), secondly the "hieratic" employed by sacred scribes, and finally the "hieroglyphic" (*Strom.* v. 657). It is doubtful whether they classified the signs of the huge hieroglyphic syllabary with any strictness. The only native work on the writing that has come to light as yet is a fragmentary papyrus of Roman date which has a table in parallel columns of hieroglyphic signs, with their hieratic equivalents and words written in hieratic describing them or giving their values or meanings. The list appears to have comprised about 460 signs, including most of those that occur commonly in hieratic. They are to some extent classified. The bee heads the list as a royal sign, and is followed by figures of nobles and other human figures in various attitudes, more or less grouped among themselves, animals, reptiles and fishes, scorpions, animals again, twenty-four alphabetic characters, parts of the human body carefully arranged from to , 32 in number, parts of animals, celestial signs, terrestrial signs, vases. The arrangement down to this point is far from strict, and beyond it is almost impossible to describe concisely, though there is still a rough grouping of characters according to resemblance of form, nature or meaning. (In modern lists the signs are classified according to the nature of the objects they depict, as human figures, plants, vessels, instruments, etc.) Horapollon's *Hieroglyphica* may be cited as a native work, but its author, if really an Egyptian, had no knowledge of good writing. His production consists of two elaborate complementary lists, the one describing sign-pictures and giving their meanings, the other cataloguing ideas in order to show how they could be expressed in hieroglyphic. Each seems to us to be made up of curious but perverted reminiscences eked out by invention, but they might some day prove to represent more truly the usages of mystics and magicians in designing amulets, etc., at a time approaching the middle ages.

The early scribe's outfit, often carried slung over his shoulder, is seen in the hieroglyph . It consisted of reed pens, a small pot of water and a palette with two circular cavities in which black and red ink were placed, made of finely powdered colour solidified with gum. In business and literary documents red ink was used for contrast, especially in headings; in demotic, however, it is very rarely seen. The pen became finer in course of time, enabling the scribe to write very small.

PALAEOGRAPHY

Hieroglyphic.—The main division is into monumental or epigraphic hieroglyphs and written hieroglyphs. The former

may be rendered by the sculptor or the painter in stone, on wood, etc., with great delicacy of detail, or may be simply sunk or painted in outline. When finely rendered they are of great value to the student investigating the origins of their values. Monumental hieroglyphic did not cease till the 3rd century A.D. (Temple of Esna). The written hieroglyphs, formed by the scribe with the reed pen on papyrus, leather, wooden tablets, etc., have their outlines more or less abbreviated, leading to the cursive scripts, hieratic and demotic, (*q.v.*). The written hieroglyphs were employed at all periods, especially for religious texts.

Hieratic.—A kind of cursive hieroglyphic or hieratic writing is traceable even in the 1st Dynasty, and though few examples have survived on papyrus or elsewhere from the old kingdom, it was already well characterised in the 6th Dynasty. When it reappears in the Middle Kingdom it has changed considerably and in its most cursive form seems hardly to retain any definable trace of the original hieroglyphic pictures; there is again a great change of style about the time of Akhenaten. The most cursive forms of hieratic appear in accounts and memoranda, but, however cursive, the hieratic was intended to be a transcript of hieroglyphic rendered sign by sign. With the deterioration of orthography at the end of the new kingdom this principle began to break down, and by the time of the 22nd Dynasty the cursive, at least of the conservative Thebais, had become very obscure. In the course of the reign of Amasis II. a better form from Lower Egypt drove this out completely and is the true demotic (*q.v.*), which, unlike hieratic, is something more than a variety of hieroglyphic. The employment of hieratic was thenceforth almost confined to the literal transcription of religious and traditional hieroglyphic texts in a clear and formal hand. Hieratic was at all times used for graffiti, whether in ink or cut in stone, until demotic appeared, and some formal engraved records, especially of the 22nd Dynasty, are in this script.

It may be observed that demotic continued to be employed after hieroglyphic writing had ceased until the end of paganism in the 5th century, and that a few signs were taken to complete the Greek alphabet in its adaptation to Coptic. These last remnants of the ancient Egyptian hieroglyphic system thus live on in church use to the present day.

See A. H. Gardiner, *Egyptian Grammar*, Oxford, 1927, especially pp. 432-527; G. Möller, *Hieratische Paläographie*, 3 vols. Leipzig, 1909-12. (F. L. G.)

HIERONYMITES, a common name for certain congregations of hermits living according to the rule of St. Augustine with supplementary regulations taken from St. Jerome's writings. The most important of these were the Spanish Hieronymites, established near Toledo in 1374. They possessed some of the most famous monasteries in the Peninsula, including the royal monastery of Belem near Lisbon, and the magnificent monastery built by Philip II. at the Escorial. Though the manner of life was very austere the Hieronymites devoted themselves to studies and to the active work of the ministry, and they possessed great influence both at the Spanish and the Portuguese courts. The order decayed during the 18th century and was suppressed in 1835.

Information on this and the other orders called by the same name will be found in Max Heimbucher, *Orden und Kongregationen*, 1896, i. § 70; article "Hieronymiten" in Herzog-Hauck, *Realencyklopädie*; article "Hieronymites" in the *Catholic Encyclopedia*.

HIERONYMUS OF CARDIA, Greek general and historian, contemporary of Alexander the Great. After the death of the king he joined Eumenes. He was taken prisoner by Antigonus, who pardoned him and appointed him superintendent of the asphalt beds in the Dead Sea. Demetrius Poliorketes made him polemarch of Thespieae, and he died at the court of Antigonus Gonatas at the age of 104. He wrote a history of the Diadochi and their descendants, from the death of Alexander to the war with Pyrrhus (323-272 B.C.), which was used by Diodorus Siculus (xviii. xx.) and by Plutarch in his life of Pyrrhus. He made use of official papers and was careful in his investigation of facts.

See Lucian, *Macrobii*, 22; Plutarch, *Demetrius*, 39; Diod. Sic. xviii. 42, 44, 50, xix. 100; Dion. Halic. *Antiq. Rom.* i. 6; Pausanias

Wachsmuth, *Einleitung in das Studium der alten Geschichte* (1895); fragments in C. W. Müller, *Frag. hist. Graec.*, ii. 450-461. See also Jacoby's article in Pauly-Wissowa viii. 2.

HIERRO or FERRO, an island forming part of the Spanish archipelago of the Canary islands (*q.v.*). Pop. (1920) 8,344; area 107 sq.m. Hierro is the smallest island of the group. Its length is about 18 m., its greatest breadth about 15 m., and its circumference 50 m. It lies 92 m. W.S.W. of Teneriffe. Fresh water is scarce, but there is a sulphurous spring, with a temperature of 102° F. The once celebrated and almost sacred Til tree, which was reputed to be always distilling water in great abundance from its leaves, no longer exists. Valverde (pop. about 5,000) is the principal town. Geographers were formerly in the habit of measuring all longitudes from Ferro, the most westerly land known to them. The longitude assigned at first has, however, turned out to be erroneous; and the so-called "Longitude of Ferro" does not coincide with the actual longitude of the island.

HIGDON or HIGDEN, RANULF (c. 1299-c. 1363), English chronicler, was a Benedictine monk of the monastery of St. Werburg in Chester, in which he lived, it is said, for 64 years, and died "in a good old age," probably in 1363. Higdon was the author of the *Polychronicon*, a summary of general history popular in the 15th century. More than a hundred mss. of it exist. Higdon's part of the work is said to go no farther than 1326 or 1327 at latest, after which time it was carried on by two continuators to the end. Three early translations of the *Polychronicon* exist. The first was made by John of Trevisa, chaplain to Lord Berkeley, in 1387, and was printed by Caxton in 1482; the second by an anonymous writer, was written between 1432 and 1450; the third, based on Trevisa's version, with the addition of an eighth book, was prepared by Caxton.

The *Polychronicon*, with the continuations and the English versions, was edited for the Rolls Series (No. 41) by Churchill Babington (vols. i. and ii.) and Joseph Rawson Lumby (1865-86).

HIGGINSON, HENRY LEE (1834-1919), American banker, was born in New York city on Nov. 18, 1834. He entered the banking house of S. and E. Austin, of Boston, but later went to Vienna for a year, where he studied music. In the Civil War he served as a volunteer officer. In 1863 he was severely wounded and honourably discharged. In 1868 he joined the banking firm of Lee, Higginson and Co., of Boston, with whom he remained until his death.

His interest in music led to his founding the Boston Symphony orchestra in 1881. A long line of distinguished directors placed this organisation in the first rank and won full recognition abroad. In 1891, as a memorial to certain friends who died in the Civil War, he presented Soldiers' Field to Harvard university. In 1899 he erected the Harvard union as a general meeting-place for all undergraduates. For many years a fellow of Harvard university, he died in Boston (Mass.), on Nov. 14, 1919.

See Bliss Perry, *The Life and Letters of Henry Lee Higginson* (1921).

HIGGINSON, THOMAS WENTWORTH (1823-1911), American author and soldier, was born of Puritan stock in Cambridge (Mass.), Dec. 22, 1823, and died there on May 9, 1911. Graduating from Harvard in 1841, he was a schoolmaster for two years, a student of theology at the Harvard divinity school, and pastor of the First Religious Society (Unitarian) of Newburyport (Mass.), and of the Free Church at Worcester. He was such an ardent abolitionist that he felt moved to resign his first pulpit. In the Civil War he was captain in the 51st Massachusetts volunteers, and from Nov. 1862 to Oct. 1864, when he was retired because of a wound received earlier, he was colonel of the 1st South Carolina Volunteers, the first regiment recruited from former slaves for the Federal service.

In *Army Life in a Black Regiment* (1870) he described his experiences. The rest of his life was spent chiefly in literary work at Newport (R. I.), and at Cambridge. His writings show a deep love of nature, art and humanity; they are marked by vigour of thought, sincerity of feeling, grace and finish of style. In his *Common Sense about Women* (1881), and his *Women and Men*

(1887), he advocated equality of opportunity and equality of rights for the two sexes.

Among his numerous books are *Outdoor Papers* (1863); *Malbone: an Oldport Romance* (1869); *Young Folks' History of the United States* (1875); *Life of Margaret Fuller Ossoli* (1884); *Travellers and Outlaws* (1889); *The Afternoon Landscape* (1889), poems and translations; *Life of Francis Higginson* (1891); *Procession of the Flowers and Kindred Papers* (1897); *Henry Wadsworth Longfellow* (1902); *John Greenleaf Whittier* (1902); *Reader's History of American Literature* (1903); "Lowell Institute lectures" edited by H. W. Boynton; and *Life and Times of Stephen Higginson* (1907). His volumes of reminiscence, *Cheerful Yesterdays* (1898), *Old Cambridge* (1899), *Contemporaries* (1899), and *Part of a Man's Life* (1905) are characteristic and charming works.

A definitive edition of his writings was published in seven volumes (1900). A biography by his second wife, Mary T. Higginson, *Thomas Wentworth Higginson: The Story of His Life*, was issued in 1914.

HIGHAM FERRERS, a market town and municipal borough of Northamptonshire, England, on the Nene, 63 m. N.N.W. from London, on branches of the L.M.S. railway. Pop. (1921) 2,850. Higham (Hecham, Heccam, Hegham Ferers) was a large village before the Domesday survey. It was then held by William Peverel of the king, but passed to the families of Ferrers and later to de Valence and then to the crown. The castle, which may have been built before Henry III. visited Higham in 1229, is mentioned in 1322, but had been destroyed by 1540. To the Early English chancel of the church of St. Mary a very wide north aisle, resembling a second nave, was added in the Decorated period, and the general appearance of the chancel, with its north aisle and Lady-chapel, is Decorated. The west front was partially rebuilt in the 17th century. Close to the church stands a beautiful Perpendicular building, the school-house founded in 1422. The Bede House is a somewhat similar structure. In the town are remains of Chichele's college. Higham Ferrers, now almost continuous with Rushden (*q.v.*), makes boots and shoes.

HIGH-BUSH CRANBERRY: see GUELDER ROSE.

HIGH COMMISSION, COURT OF. The Act of Supremacy (1534) recognized Henry VIII. as "Supreme Head in earth of the Church of England" and assigned to the Crown the power of ecclesiastical visitation. The Act of Supremacy (1559) recognized Elizabeth as "Supreme Governor of this realm . . . as well in all spiritual or ecclesiastical things or causes as temporal" and empowered the Crown to nominate persons by letters patent to exercise "all manner of jurisdictions . . . touching . . . any spiritual or ecclesiastical jurisdiction . . . and to . . . amend all such errors, heresies, schisms, abuses, offences, contempts and enormities whatsoever," which by any manner of spiritual authority ought to be reformed. But the act of 1559 purported explicitly (as did the act of 1534 implicitly) merely to "restore" to the Crown "the ancient jurisdictions" "usurped" by the bishop of Rome. It was, therefore, "not a statute introductory of a new law, but declaratory of the old." The Crown, then, could without statutory authority delegate to commissioners the fullest ecclesiastical jurisdiction; and thus, in *Caudrey's Case* (1591), "it was resolved by all the judges that the king or queen of England for the time being may make such an ecclesiastical commission as is before mentioned by the ancient prerogative and law of England."

Heresy and Visitation.—The Reformation settlement called for a greater measure of supervision and discipline than the rather meagre authority of the bishops was able to provide; moreover, the consequent deprivations and the like led to a mass of litigation with which the ordinary ecclesiastical courts were too ineffectual to cope adequately. What was the use of such penalties as excommunication when "laymen cheerfully remained excommunicated for years"? Hence, the origin of the later court of high commission is to be found "in the systematic attempt to suppress a peculiar type of heresy by the machinery of a commission in which ecclesiastics, ministers of state and lawyers sat side by side, and whose procedure was a compound of the old heresy trial, the ordinary ecclesiastical procedure, and the judicial traditions of the privy council." This device of an ecclesiastical privy council "dealing with heresy and the visitation of the church" was first employed about 1535, when Thomas Cromwell was appointed vicegerent, invested with the plenitude of royal

authority in ecclesiastical affairs, and directed to delegate part of it from time to time to such persons as he thought fit.

But "the first general commission of this nature directed to a number of men" was issued by Edward VI. in 1549, and the substance and form of the letters patent assumed final shape in the general commission issued by Mary in 1557, and were not essentially altered until Stuart times. Then, to meet the criticism of opponents, considerable modifications took place. But, though framed more explicitly and at greater length, the later letters patent may be said to have confined the powers of the commissioners within narrower limits than the more vaguely drawn commissions of earlier days.

Evolution of the Court.—Until 1565 the work performed by these commissioners was mainly visitatorial. Granted for a specific purpose, their authority was regarded as temporary and was supposed to lapse as soon as the work was done; and their activities were strictly controlled by the council. But the permanence of the Elizabethan settlement; the development of additional administrative functions by the commission itself, the gradual delegation to it by the overworked privy council of the routine ecclesiastical business hitherto transacted by the council itself, and finally the growing habit of referring petitions of an ecclesiastical nature to the commissioners, gave the latter "a sufficiently permanent tenure to enable them to establish those traditions and judicial forms which, in time, caused contemporaries to call the sessions of her majesty's commissioners in causes ecclesiastical 'The court of high commission'." The term "high commission" begins to appear by 1570, the title "court" about ten years later. By then the organization, procedure and jurisdiction had been defined and delimited. This involved a relaxation of the privy council's control and "a lighter emphasis on the visitatorial functions which had been the original business of the commission."

The total membership varied between 24 in 1549 and 108 in 1633, but of these any three were usually empowered to act, provided one of them was "of the quorum" (the quorum numbered 11 in 1549, 68 in 1633). The lord chief justice, a colleague and the attorney general sat on the earlier commissions, but, as the latter developed into an ecclesiastical court, the common law judges, though more of them were appointed, ceased to attend. The commission originally sat anywhere in the province of Canterbury, but came later to sit only in London on certain fixed days and to keep the law terms. Its jurisdiction, best summarized in connection with the other ecclesiastical courts as concurrent, appellate and equitable, though vague, was by no means unlimited. The court could assume jurisdiction only *in personam*, in criminal matters (though here the interpretation was rather free and loose), and could not initiate cases of party and party. The chief point about its procedure, which statute and letters patent had left to its discretion, was the use of the oath *ex officio*, *i.e.*, imposed by the judge himself by virtue of his office, and the penalties it inflicted were almost exclusively fine and imprisonment. There appears to be no authority whatsoever for the allegations that the court resorted to torture, mutilation or the penalty of death.

Opposition.—Its functioning was sometimes beneficent, sometimes tyrannical, but always efficient. That it was widely popular is proved by the enormous number of suitors who flocked to it voluntarily even to the last. But with two sections of the community it could not fail to be unpopular. The Puritans resented its enforcement of vestments, ritual and ceremonies, and when in 1584 Whitgift's Twenty-four Articles, upon which the commissioners proposed to examine them after they had taken the oath *ex officio*, turned a visitatorial investigation into a judicial hearing they not unnaturally complained that a man was thereby compelled to convict himself. And they were encouraged in their opposition by the common lawyers and, more especially, by the common law judges. No doubt the latter were actuated to some extent by jealousy and self-interest, by the desire to extend their own jurisdiction in order to increase their fees, but they had nobler motives as well. The duality of judicial authority in England, of a law temporal and of a law ecclesiastical, was in itself

offensive to men who dreamt of a time when the common law should embrace all jurisdiction whatsoever.

Moreover, the two jurisdictions overlapped; the boundaries between them were vague; each was inclined to trespass on the other. And, lastly, but not least to a judicial mind, "the commission was a hybrid, half ecclesiastical, half temporal in membership; using ecclesiastical procedure, but inflicting temporal penalties; a law court and a visitatorial commission at the same time." Led by the disgruntled Coke, who had himself in earlier days played a large part in building up the authority of the court, the common law judges by prohibitions and pronouncements first of all attempted to confine the commission within what they considered to be its proper limits, and then, encouraged by the popularity of their proceedings and the example of recalcitrant Puritans, embarked on a vigorous attack on its jurisdiction and procedure. They wrongly and contradictorily (since in 1591 in Caudrey's case the judges themselves had unanimously adopted another view) dated the "origin" of the commission from the act of 1559, allowed it no other authority for its existence, and interpreted the words of that statute in a ludicrously and indefensibly narrow fashion. They took exception to the penalties of fine and imprisonment, because these were not, strictly speaking, ecclesiastical penalties, and they challenged the legality of the *ex officio* oath, mainly because that procedure was so different from that of the common law as to appear necessarily illegal to common lawyers.

Suppression.—Opposition on legal and judicial grounds, however, collapsed after 1611. The letter of the law was against the Puritans, the judges could not hope to enforce their views so long as the State supported the commission, and in 1616 Coke was dismissed from the bench. The struggle was henceforth not legal, but political. It was fought, not in the law courts, but in parliament. Already in 1607 and in 1609–10 bills on the subject had been brought in, read twice and dropped; and on July 7, 1610, a petition of grievances had declared the act of 1559 "inconvenient and of dangerous extent."

In 1641, when the parliamentary cause at last triumphed, "the clause of the Act of Supremacy which gave the Crown power to exercise its supremacy through commissioners was repealed; the court was abolished, and it was provided that no similar court should be again set up. . . . At the Restoration the criminal and corrective jurisdiction of the other ecclesiastical courts was revived; but the court of high commission was explicitly exempted from the act." Nevertheless, it was re-established by James II. in 1686 by virtue of the powers belonging to the king as supreme governor of the Church, to be finally condemned after the revolution in the Bill of Rights (1689) as "illegal and pernicious."

HIGHER EDUCATION: see WOMEN, EDUCATION OF.

HIGHGATE, a northern district of London, England, partly in the borough of St. Pancras, but extending into Middlesex. It lies high (max. 426 ft.). The Great North Road passes through Highgate, which is supposed to have received its name from the toll-gate erected by the bishop of London when the road was formed through his demesne in the 14th century. Bacon died here in 1626; Coleridge and Andrew Marvell, the poets, were residents. Cromwell House, now a convalescent home, was presented by Oliver Cromwell to his eldest daughter Bridget on her marriage with Henry Ireton. Lauderdale House, now attached to the public grounds of Waterlow Park, belonged to the duke of Lauderdale, one of the "Cabals" of Charles II. Among various institutions may be mentioned Whittington's almshouses, near Whittington Stone, at the foot of Highgate Hill, on which the future mayor of London is reputed to have been resting when he heard the peal of Bow bells and "turned again." Highgate grammar school was founded (1562–65) by Sir Roger Cholmley, chief-justice.

HIGHLAND PARK, a residential city of Lake county, Ill., U.S.A., 23m. N. of Chicago, on Lake Michigan. It is served by the Chicago and North Western and the Chicago, North Shore and

Milwaukee railways. The population was 6,167 in 1920, and was estimated locally at 14,000 in 1928.

HIGHLAND PARK, a city of Wayne county, Michigan, adjoining Detroit. The population was 46,499 in 1920 (27% foreign-born white) and was estimated locally at 65,000 in 1928. It is a residential and industrial suburb, with automobile factories employing 43,000 men. Its total factory output in 1925 was valued at \$390,249,842; and the assessed valuation of property in 1927 was \$207,882,500. In 1900 Highland Park was a village of 427 inhabitants. Between 1900 and 1910 the population was multiplied by nearly 10; and between 1910 and 1920 by more than 10. The city was incorporated in 1918.

HIGHLANDS, THE, that part of Scotland north-west of a line drawn from Dumbarton to Stonehaven, sometimes including the Inner and Outer Hebrides and the county of Bute, but excluding the Orkneys and Shetlands, Caithness, the flat coastal land of the shires of Nairn, Elgin and Banff, and all East Aberdeenshire (see SCOTLAND). This area is to be distinguished from the Lowlands by language and race, the long persistence of the Gaelic speech being characteristic. Even in a historical sense the Highlanders were separate from the Lowlanders, with whom, during many centuries, they shared nothing in common. The town of Inverness is usually regarded as the capital of the Highlands.

HIGHNESS, literally the quality of being lofty or high, a term used, as are so many abstractions, as a title of dignity and honour, to signify exalted rank or station. These abstractions arose in great profusion in the Roman empire, both of the East and West, and "highness" is to be directly traced to the *altitudo* and *celstitudo* of the Latin and the *ὕψιλον* of the Greek emperors. See FORMS OF ADDRESS.

HIGH PLACE, is the literal translation of the Heb. *bāmāh*. This rendering is etymologically correct, as appears from the poetical use of the plural but in prose *bāmāh* is always a place of worship. It has been surmised that it was so called because the places of worship were originally upon hill-tops, or that the *bāmāh* was an artificial platform or mound, but neither view is historically demonstrable. The word was probably adopted from the Canaanites together with the holy places themselves.

In old Israel every town and village had its own place of sacrifice which was often on the hill above the town, as at Ramah (1 Sam. ix. 12–14); there was a *stelē* (*maṣṣēbāh*), the seat of the deity, and a wooden post or pole (*ashērāh*), which marked the place as sacred and was itself an object of worship; there was a stone altar, on which offerings were burnt; a cistern for water, and perhaps low stone tables for dressing the victims; sometimes also a hall (*lishkāh*) for the sacrificial feasts.

Around these places the religion of the ancient Israelite centred; at festival seasons, or to make or fulfil a vow, he might journey to more famous sanctuaries, but ordinarily the offerings were paid at the *bāmāh* of his own town. The building of royal temples in Jerusalem or in Samaria made no change in this respect; they simply took their place beside the older sanctuaries to which they were, indeed, inferior in repute.

The religious reformers of the 8th century assail the popular religion as corrupt and as fostering the monstrous delusion that immoral men can buy the favour of God by worship; but they make no difference in this respect between the high places of Israel and the temple in Jerusalem; Hosea stigmatizes the whole cultus as pure heathenism—Canaanite baal-worship.

HIGH POINT, a city of Guilford county, North Carolina, U.S.A., in the Piedmont region, at an altitude of 940ft., 99m. W. by N. of Raleigh. It is on Federal highways 70 and 311, and is served by the Southern Railway system, and High Point, Randleman, Asheboro and Southern, the High Point, Thomasville and Denton railways. The population was 14,302 in 1920 (20% negroes); 22,279 in 1922, after annexations of territory, and was estimated locally at 32,000 in 1928. It is an important manufacturing centre, with 73 furniture and wood-working factories and 29 textile mills in 1928. The factory output in 1925 was valued at \$32,132,296. The Southern Furniture exposition is held here twice a year, and two journals devoted to the interests of the trade are published here. High Point was settled about 1855 and incorpo-

rated in 1899. Since 1916 it has had a commission-manager form of government. The population increased considerably more than threefold between 1900 and 1920.

HIGH RELIEF: *see* ALTO-RELIEVO.

HIGH SEAS, the open seas or those parts of the sea not under the dominion of any State. Claims have at times been made to exclusive dominion over large areas of the sea as well as over wide margins, such as room., 6om., range of vision, etc., from land. The general interests of navigation, however, have brought States to adopt a limitation first enunciated by Bynkershoek in the formula "terrae dominium finitur ubi finitur armorum vis." Thenceforward cannon-shot range or three marine miles determined the limits of marginal waters known as "territorial waters." With the exception of these marginal waters, inland waters, gulfs, arms of the sea of certain dimensions or waters allowed by immemorial usage to rank as territorial, all waters form part of the high sea. The use of the high sea is free to all the nations of the world, subject only to such restrictions as result from respect for the equal rights of others, and to those which nations may agree *inter se* to observe.

HIGH SPEED STEEL, a tungsten-chromium tool steel of great importance in machining various grades of iron and steel, was developed almost simultaneously by American and European metallurgists. It is the outcome of significant research by F. W. Taylor and Maunsel White. By the Taylor-White method a heat treatment was developed which applies substantially to all the "high speed" steels. It consists of two essential parts: (a) heating the forged tool unusually hot (in fact, until the sharp edges start melting and appear to sweat) and then cooling in oil or an air blast, (b) reheating in a lead bath at 625° C and cooling in air. Such combination of high-quench and high-draw induces the quality of "red-hardness," whereby the tool retains its useful hardness even when working so fast that the tip is heated red-hot by friction of the chip.

When given the Taylor-White heat treatment such improved steels cut at about 100 ft. per minute, whereas steels formerly used did not exceed 60 ft. per minute. The addition of a fractional per cent of vanadium, due to the work of John A. Mathews, marks a further step. High speed steel with properly adjusted chemical analysis, made with utmost care in the steel mill, properly shaped and hardened, produces tools capable of cutting at a speed greater than 150 ft. per minute. A ten-fold increase in machinery speed has thus been accomplished between 1875 and 1915. Whether 4% of cobalt is a worthwhile addition is debatable; in 1927 it was definitely shown that 10 to 15% increases the red-hardness sufficiently so that Hadfield's manganese steel, hitherto non-machineable, can be cut.

About 13,500 tons of high speed steel were made in the United States in 1926, of which four-fifths were high tungsten alloys, whose chemical analysis is shown in the first column of the accompanying table. The slightly cheaper low-tungsten tools, shown in the second column, are preferred in America for deep cuts on rough forgings; this is probably more popular in Great Britain for general purposes than the high tungsten variety. A theoretical study of the Taylor-White method of heat treatment is difficult and cannot be given in this article.

Approximate Analysis of High Speed Steel

	High tungsten	Low tungsten
Carbon, per cent	0.65 to 0.70	0.60 to 0.75
Silicon	0.25 to 0.30	0.25
Manganese	0.25 to 0.30	0.25
Sulphur	0.025 max.	0.025 max.
Phosphorus	0.025 max.	0.025 max.
Tungsten	18.0	14.0
Chromium	4.0	4.0 to 4.5
Vanadium	0.8 to 1.0	1.6 to 2.0

HIGHWAY. This word, which in England is used to indicate any road of size and importance, has been specifically applied to a network of national roads in the United States with which this article is concerned. For the law of Highways *see* LAW OF HIGHWAY, THE.

As European peoples went to America they first settled along the seaboard. They therefore first used the sea and adjacent waterways for intercommunication. The few intercommunity roads then built, closely followed coast lines. Even as the desire to move inland developed, the vast waterways were used for transportation and roads were not required. The founders of the Republic, however, had the vision to see the future need of roads. In 1780 George Washington conceived the building of a national road to the West and in 1802 Congress passed a financing act for that purpose on admitting Ohio into the Union. This was the beginning of the later building by the Federal Government of a road leading from Washington, D.C., to Santa Fe. This road, known variously as the "Cumberland road," the "National pike," "the Santa Fe trail," and now the "National Old Trails road" (q.v.), is the only national road built by the U.S. Government.

As the country grew, needed transportation facilities were supplied by the rapid extension of railroad mileage. Most road building was confined to centres of population and these early roads were mostly of soft dirt. Such intercommunity roads as were built were often financed by private capital through charters allowing the collection of tolls. These toll roads, beginning in 1795 were called "turnpikes" and were later built of broken stone crushed into place by passing horse-drawn vehicles. Some of these turnpikes like the Old York road from Philadelphia towards New York, the Baltimore and Lancaster pikes, also out of Philadelphia, remained until well after the close of the last century; but many of them were abandoned by 1850. Their financial failure was due to the development of steam railroads taking away their business.

With the advent of the bicycle came the organization in 1880 of the League of American Wheelmen, the first national organization to arouse general public interest to the need of improved roads. It gave an impetus to road building then done entirely by towns or townships and counties. New Jersey in 1891 first passed a law giving "State aid" to her counties to help them financially in carrying forward the building of good roads. By 1903, 11 States were giving aid and ten years later in 1913, 42 States were giving aid. But even in 1913 most roads were being built around centres of population and not so much to connect those at any considerable distance from each other. The need for interstate roads was just beginning to be felt. Because of this need there arose a strong public demand that the U.S. Government should again contribute financially towards road building. This demand took definite form in 1916 in the passage by Congress of the first Federal aid bill providing for financial aid to the States to build roads, to be administered by the Department of Agriculture through the Bureau of Public Roads. When this bill was passed all but three States were giving aid and these did so the following year.

Until 1890 broken stone, gravel, shell and slag were about the only materials used for road surfacing. By 1904 there were about 150,000 m. of surfaced highways. Only 141 m. of these were of the higher type of bituminous, tar, asphalt or brick. But the motor vehicle was then beginning to indicate the need of hard and paved roadways. In 1928 there were about 600,000 m. of surfaced highways with 2,400,000 more miles of roads still of native soil to be improved. These surfaced roads had about 90,000 m. paved, 40,000 m. hard surfaced and 470,000 m. surfaced with material such as gravel, sand clay, sand oil and other types not paved or hard.

The Federal Aid Act was amended and extended in 1919, resulting later in the Federal Highway Act of 1921. The entrance of the Federal Government into road building resulted in the creation in all the States of State highway commissions to lay out and build a system of State highways with Federal aid. highways in 1928 aggregated about 300,000 m. to about 200,000 m. to which Federal aid contributed. Of this Federal aid mileage approximately 100,000 m. have been designated as "United States Highways" and are so marked and numbered with the shield of the United States. They are the primary trunk interstate highways of the Nation.

Thousands of organizations were formed to advocate not only good roads in general but a specific good road in particular. By 1913 there were over 50 major good roads organizations and over 500 minor ones, while so-called trail associations, advocating the improvement of a particular through road, were being formed with surprising rapidity. In 1911 the National Highways Association was organized, and over 10,000 organizations have since become members of or affiliated with this association.

The principal national highways (for fuller description see under separate headings) in the United States are the ocean to ocean highways: the National Old Trails road extending from Washington, D.C., to Los Angeles; the Lincoln highway extending across the north central United States; the Pikes Peak Ocean to Ocean highway from New York city to San Francisco; the Yellowstone trail from Plymouth rock on the Atlantic to Seattle on Puget sound; the Lee highway from Washington, D.C., to San Diego, Calif.; the Old Spanish trail from St. Augustine, Fla., to San Diego; and the better known north and south alignments: the Atlantic highway from Maine to Florida; the Dixie highway from Lake Michigan to Florida; the Meridian road from Canada to Mexico; and the Pacific highway from Vancouver, Canada, to the Mexican boundary line south of San Diego, Calif. (C. DAV.)

HILARION, ST. (c. 290–371), abbot, the first to introduce monasticism into Palestine, was born of heathen parents at Tabatha near Gaza, and was educated at Alexandria where he became a Christian. About 306 he visited St. Anthony and, embracing the eremitical life, lived for many years as a hermit in the desert by the marshes on the Egyptian border. Many disciples put themselves under his guidance in south Palestine. In 356 he returned to Egypt; but the accounts given in St. Jerome's *Vita* of his later travels must be taken with caution. It is there said that he went from Egypt to Sicily, and thence to Epidauros, and finally to Cyprus where he met Epiphanius and died in 371.

See O. Zöcker, "Hilarion von Gaza," *Neue Jahrb. f. deutsche Theol.* (1894); A. Butler, *Lives of the Saints* for Oct. 21, and Herzog-Hauck, *Realencyklopädie*.

HILARIUS, ST. (c. 300–367), bishop of Poitiers, was born of pagan parents at Poitiers, but later became a Christian, and about 353 was unanimously elected bishop of his native town. Almost at once, he secured the excommunication of Saturninus, the Arian bishop of Arles and of Ursacius and Valens, two of his prominent supporters, and wrote to the emperor Constantius a remonstrance against the persecutions by the Arians. But at the synod of Biterrae (Beziers), summoned in 356 by Constantius, Hilary was banished to Phrygia, continuing, however, to govern his diocese.

He wrote there the important *De synodis* or *De fide Orientalium*, an epistle addressed in 358 to the Semi-Arian bishops in Gaul, Germany and Britain, expounding the views of the Oriental bishops on the Nicene controversy, and the *De trinitate*. In 359 Hilary attended the convocation of bishops at Seleucia in Isauria, where, with the Egyptian Athanasians, he joined the Homoiousian majority against the Arianizing party headed by Acacius of Caesarea; thence he went to Constantinople, and through a petition (*Ad Constantium Augustum liber secundus*) personally presented to the emperor, was sent back to his diocese. In 364 he impeached Auxentius, bishop of Milan, and a man high in the imperial favour, as heterodox; he was summoned to appear before the emperor Valentinian at Milan, but being unable to maintain his charges, was expelled from the city. In connection with the controversy, he published the *Contra Arianos vel Auxentium Mediolanensem liber*, and the *Contra Constantium Augustum liber*.

Hilary is sometimes regarded as the first Latin Christian hymn-writer, but none of the compositions assigned to him is indis-

putable. Augustine termed him "the illustrious doctor of the churches." His feast is celebrated in the West on Jan. 13.

Hilary's works were edited by Erasmus (Basel, 1523, 1526, 1528); P. Coustant (Paris, 1693); Migne (*Patrol. Lat.* ix., x., 1844–45). The *Tractatus de mysteriis*, ed. J. F. Gamurrini (Rome, 1887), and the *Tractatus super Psalmos*, ed. A. Zingerle in the Vienna *Corpus script. eccl. Lat.* xxii. Translation by E. W. Watson in *Nicene and Post-Nicene Fathers*, ix.

BIBLIOGRAPHY.—The life by (Venantius) Fortunatus c. 550 is almost worthless. More trustworthy are the notices in Jerome (*De vir. illus.* 100), Sulpicius Severus (*Chron.* ii. 39–45) and in Hilary's own writings. H. Reinkens, *Hilarius von Poitiers* (1864); Barbier, *Vie de S. Hilaire* (1882); L. Dubois, *Saint Hilaire* (1902); A. Beck, *Die Trinitätslehre des St. Hilarius* (1903); A. F. Feder, *Studien zu Hilarius von Poitiers* (1910). See also O. Bardenhewer, *Patrologie*; A. Harnack, *Hist. of Dogma*, in Herzog-Hauck's *Realencyk.*

HILARIUS (HILARY), ST. (c. 403–449), bishop of Arles, was born probably in northern Gaul. In early youth he entered the abbey of Lérins, then presided over by his kinsman Honoratus (St. Honoré), and succeeded Honoratus in the bishopric of Arles in 429. He held the rank of metropolitan of Vienne and Narbonne, and attempted to realize the sort of primacy over the church of south Gaul which seemed implied in the vicariate granted to his predecessor Patroclus (417). Hilarius deposed the bishop of Besançon (Chelidonius), for ignoring this primacy, and for claiming a metropolitan dignity for Besançon. An appeal was made to Rome, and Leo I. used it to extinguish the Gallican vicariate (A.D. 444). Hilarius was deprived of his rights as metropolitan to consecrate bishops, call synods or exercise ecclesiastical oversight in the province, and the pope secured the edict of Valentinian III., so important in the history of the Gallican church, "ut episcopis Gallicanis omnibusque pro lege esset quidquid apostolicae sedis auctoritas sanxisset." The papal claims were made imperial law, and violation of them subject to legal penalties (*Novellae Valent.* iii. tit. 16). Hilarius died in 449, and is commemorated on May 5.

His writings are printed in Migne's *Patrol. Lat.* vol. i. See O. Bardenhewer, *Patrologie* (1894); and Herzog's *Realencyklopädie*.

HILARIUS or HILARUS (d. 468), bishop of Rome from 461 to 468, is known to have acted as legate of Leo the Great at the "robber" synod of Ephesus in 449. There he so vigorously opposed the condemnation of Flavian of Constantinople that he was thrown into prison, whence he escaped to Rome. He was chosen to succeed Leo on Nov. 19, 461. In 465 he held at Rome a council which put a stop to some abuses, particularly to that of bishops appointing their own successors. His pontificate was also marked by the extension of papal authority in France and Spain. Hilarius died on Nov. 17, 467.

His briefs and decrees are published in A. Thiel's *Epistolae pontificum Romanorum* (Braunsberg, 1868). See *Liber Pontificalis* (ed. Duchesne), and Jaffé, *Regesta Pont. Rom.*

HILARIUS (fl. 1125), a Latin poet who is supposed to have been English. He was a pupil of Abélard to whom he addressed a copy of verses with its refrain in the vulgar tongue, "*Tort avers vos li mestre*." Later Hilarius made his way to Angers. His works consist chiefly of light verses of the goliardic type. Of his three miracle plays in rhymed Latin with an admixture of French, two, *Suscitatio Lazari* and *Historia de Daniel repraesentanda*, are of purely liturgical type. The third, *Ludus super iconia Sancti Nicholai*, is founded on a foolish legend and Petit de Julleville sees in it a satiric intention.

A rhymed Latin account of a dispute in which the nuns of Ronceray at Angers were concerned, contained in a cartulary of Ronceray, is also ascribed to the poet, who there calls himself Hilarius Canonicus. The poem is printed in the *Bibliothèque de l'Ecole des Chartes* (vol. xxxvii. 1876), and is dated by P. Marchegay from 1121. The Paris ms. containing the genuine poems of Hilarius was edited in 1838 by Champollion Figeac. See notice in *Hist. lit. de la France* (xii. 251–254), supplemented (in xx. 627–630), s.v. Jean Bodel, by Paulin Paris; also Wright, *Biographia Britannica literaria, Anglo-Norman Period* (1846); and Petit de Julleville, *Les Mystères* (vol. i. 1880).

HILARY TERM, in England, the first term of legal administration held by the High Courts of Justice. It begins on Jan. 11, and follows the custom of being named according to the festival of the saint nearest the date of the commencement of the term. It is also one of the dining terms of the Inns of Court. See **INNS OF COURT**.

HILBERSEIMER, LUDWIG (1885–), German architect, was born at Karlsruhe. Like Le Corbusier in France, he has latterly devoted perhaps as much time to town-planning as to the erection of individual buildings. An original and logical thinker, he sees the solution of town-planning problems in a vertical building system, i.e., to some extent, two cities one on top of the other, the dwelling-house of each worker being as far as possible above his place of business. Vehicular traffic would be on the ground level, with streets and cross-streets for pedestrians above. Hilberseimer shares with Le Corbusier the aim of industrializing building, advocating ferro-concrete construction and simple interiors with as much built-in furniture as possible, and disclaims the aesthetic element as an end in itself; "like all other elements it is co-ordinated in the whole." Among the larger buildings erected to his designs the Rheinlandhaus, Berlin, a well-articulated unity, pleasantly airy in effect, illustrates his conception of modern non-domestic building.

HILDA, ST., strictly **HILD** (614–680), was the daughter of Hereric, a nephew of Edwin, king of Northumbria. She was converted to Christianity before 633 by Paulinus. About 650 she became abbess of Hartlepool, where she remained several years. From Hartlepool Hilda moved to Whitby, and in 657 founded the famous double monastery which in her time included among its members five future bishops, Bosa, Aetta, Offfor, John and Wilfrid II. as well as the poet Caedmon. Hilda exercised great influence in Northumbria, and ecclesiastics from all over England and from Strathclyde and Dalriada visited her monastery. In 655 after the battle of Winwaed Oswio, King of Northumbria, entrusted his daughter Aelfled to Hilda, with whom she went to Whitby. At the synod of Whitby in 664 Hilda sided with Colman and Cedd against Wilfrid, and in spite of the defeat of the Celtic party, remained hostile to Wilfrid until about 679. Hilda died in 680.

See Bede, *Hist. eccl.* (ed. C. Plummer, Oxford, 1869); Eddius, *Vita Wilfridi* (Raine, *Historians of Church of York*, Rolls Series, vol. i., 1879), c. liv.

HILDBURGHAUSEN, a town of Germany, in the republic of Thuringia, situated on the river Werra, 19 m. S.E. of Meiningen, on the railway Eisenach-Coburg. Pop. (1925) 6,515. Hildburghausen (in records *Hilpershusia* and *Villa Hilperti*) belonged in the 13th century to the counts of Henneberg, from whom it passed to the landgraves of Thuringia and then to the dukes of Saxony. In 1683 it became the capital of a principality which in 1826 was united to Saxe Meiningen.

It has a former ducal palace erected 1685–95, and an old town hall. The manufactures include toys, baskets, turnery, agricultural machines, knives, mineral waters and condensed soups.

HILDEBERT OF LAVARDIN (c. 1055–1133), archbishop of Tours, was born at Lavardin, near Vendôme. He was probably a pupil of Berengarius of Tours, and became master of the school at Le Mans; in 1091 he was made archdeacon and in 1096 bishop of Le Mans. While he was absent in Rome in 1111, Henry of Lausanne spread heretical doctrines and denounced the bishop. In 1125 he was translated unwillingly to the archbishopric of Tours, and there he came into conflict with the French king Louis VI. over ecclesiastical patronage and with the bishop of Dol about the authority of his see in Brittany. He presided over the synod of Nantes in 1127, and died at Tours about Dec. 18, 1133.

The writings of Hildebert which include letters, poems, a few sermons and lives of Hugo, abbot of Cluny and of St. Radegunda, were published in Paris in 1708 and later in Migne's *Patrol. Lat.*

See B. Hauréau, *Les Mélanges poétiques d'Hildebert de Lavardin* (1882); and *Notices et extraits de quelques manuscrits latins de la Bibliothèque nationale* (1890–93); P. de Déservillers, *Un Evêque au XII^e siècle, Hildebert et son temps* (1876); E. A. Freeman, *The Reign of Rufus*, vol. ii. (Oxford, 1882); L. Dieudonné, *Hildebert de Lavardin* (1898); F. Barth, *Hildebert von Lavardin* (Stuttgart, 1906). See also Herzog's *Realencyklopädie*.

HILDEBRAND, ADOLF VON (1847–1921), German sculptor, born in Marburg on Oct. 6, 1847. He studied at the art school in Nuremberg, under K. v. Zumbusch in Munich and under Siemering in Berlin. From 1867–68 he was in Rome, where he met his lifelong friends, Hans von Marées, the painter, and

Konrad Fiedler, the writer on art. He returned to Italy in 1874 and settled in the neighbourhood of Florence. In 1897 he built himself a house in Munich. He died there on Jan. 1, 1921. His work combined lifelike realism with classic conception of form. He modelled many portrait busts, among which may be mentioned Clara Schumann, Hermann von Helmholtz, Max von Pettenkofer, Wilhelm von Bode, Henriette Hertz. For the market place in Jena he designed the Bismarck fountain (1894); for Munich the Wittelsbach fountain (1895) and the Hubertus fountain (1907); for Strasbourg a fountain with the bronze figure of Father Rhine (1903), the architectural part of which was destroyed in 1919 and the figure placed in a park; for Meiningen he created a monument of Brahms (1898) and one of the poet Otto Ludvig (1898); for Bremen a monument of Bismarck (1910); for Nürnberg a monument of Schiller (1911).

His small book entitled *Das Problem der Form* (Stuttgart, 1893), in which he analysed the optical laws underlying the artistic representation of form, exercised a revolutionary influence on art criticism. It was widely read and theorists in art such as C. Fiedler, H. Wölfflin and J. Strzygowski have founded their writings on it.

See A. Heilmeyer, *Adolf Hildebrand* (Leipzig, 1902).

HILDEBRAND, LAY OF (*Das Hildebrandslied*), a unique example of Old German alliterative poetry, written about the year 800 on the first and last pages of a theological manuscript by two monks of the monastery of Fulda. The fragments only extend to 68 lines, and are clearly a transcript of an older original, which the copyists imperfectly understood. The language of the poem shows a curious mixture of Low and High German forms; as the High German elements point to the dialect of Fulda, the inference is that the copyists were reproducing an originally Low German lay in the form in which it was sung in Franconia.

The fragment is mainly taken up with a dialogue between Hildebrand and his son Hadubrand. When Hildebrand followed his master, Theodoric the Great, who was fleeing eastwards before Odoacer, he left his young wife and an infant child behind him. At his return to his old home, after 30 years' absence among the Huns, he is met by a young warrior and challenged to single combat. Hildebrand asks for the name of his opponent, and discovering his own son in him, tries to avert the fight, but in vain; Hadubrand only regards the old man's words as the excuse of cowardice. The Old High German *Hildebrandslied* is dramatically conceived and written in a terse, vigorous style; it is the only remnant that has come down from early Germanic times of an undoubtedly extensive ballad literature, dealing with the national sagas.

The ms. of the *Hildebrandslied* is now in the Landesbibliothek at Cassel. The literature on the poem will be found in K. Müllenhoff and W. Scherer, *Denkmäler deutscher Poesie und Prosa aus dem VIII. bis XI. Jahrh.*, 3rd ed. (1892), and in W. Braune, *Althochdeutsches Lesebuch*, 5th ed. (1902). The poem was discovered and first printed (as prose) by J. G. von Eckhart, *Commentarii de rebus Francie orientalis* (1729), i. 864 ff.; the first scholarly edition was that of the brothers Grimm (1812). Facsimile reproductions of the ms. have been published by W. Grimm (1830), E. Sievers (1872), G. Konnecke in his *Bilderatlas* (1887; 2nd ed., 1895) and M. Enneccerus (1897). See also K. Lachmann, *Über das Hildebrandslied* (1833) in *Kleine Schriften*, i. 407 ff.; C. W. M. Grein, *Das Hildebrandslied* (1858, 2nd ed., 1880); O. Schröder, *Bemerkungen zum Hildebrandslied* (1880); H. Möller, *Zur althochdeutschen Alliterationspoesie* (1888); R. Heinzel, *Über die ostgotische Heldensage* (1889); B. Busse, "Sagengeschichtliches zum Hildebrandslied," in Paul and Braune's *Beiträge*, xxvi., pp. 1 ff. (1901); R. Koegel, *Geschichte der deutschen Literatur bis zum Ausgang des Mittelalters*, i., pp. 210 ff. (1894); and R. Koegel and W. Brückner, in Paul's *Grundriss der germanischen Philologie*, 2nd ed., ii. pp. 71 ff. (1901).

HILDEBRANDSSEN, HUGO HILDEBRAND (1838–1925). Swedish meteorologist, was professor of meteorology and director of the Meteorological Institute at Upsala from 1878 to 1906. He was an associate member of the Comité Permanent International Météorologique from 1882 to 1885, ordinary member from 1891 and general secretary from 1900 to 1907. In 1886 he undertook, in conjunction with Ralph Abercromby, the classification of cloud forms, and he published in 1896 his *Atlas international des nuages* (with Riggenbach and L. Teisserenc de Bort), together with *Les bases de la météorologie dynamique* (1898–

1907), in collaboration with Teisserenc de Bort. He died on July 29, 1925.

HILDEBRANDT, EDUARD (1818-1869), German landscape painter, was born at Danzig, on Sept. 9, 1818, the son of a house painter. He studied under Wilh. Krause in Berlin and under E. Isabey in Paris. His most important work was in water-colour and he travelled all over the world in search of subjects. In 1862-64 he travelled round the world by order of Frederick William IV. of Prussia, who was his patron, "to learn from personal view the phenomena that the sea, the air, and the solid earth bring forth beneath the most various skies." He returned with 300 water-colours, a selection of which were published. Among his works are: "Castle Kronborg" (1857), in the National Gallery, Berlin; "Moonrise in Madeira," Corcoran Gallery, Washington; "The Bay of Naples," Metropolitan Museum of Art, New York; "Sunset on Rio de Janeiro" (1851), in the museum at Hamburg. The interest of his work lies in the subject represented. His colour effects are often crude, though his execution is not without technical merit.

See F. Arndt, *Eduard Hildebrandt, der Maler des Kosmos* (1869).

HILDEGARD, ST. (1098-1179), German abbess and mystic, was born of noble parents at Böckelheim, near Sponheim, and from her eighth year she was educated at the Benedictine cloister of Disibodenberg by Jutta, sister of the count of Sponheim, whom she succeeded as abbess in 1136. From childhood she experienced visions, which in her 43rd year she divulged to her friend, the monk Godefridus, who committed them to writing (1141-50), entitling them *Scivias*. She corresponded with Anastasius IV. and Adrian IV. and the emperors Conrad III., and Frederick I., also the theologian Guibert of Gembloux, who submitted numerous questions in dogmatic theology for her determination. After she migrated with 18 of her nuns to a new convent on the Rupertsberg near Bingen, she continued to exercise the gift of prophecy and to record her visions in writing. She died on Sept. 17, 1179; she has never been canonized, but her name is in the Roman martyrology.

Though Hildegard's claims to Divine inspiration prevented her from citing profane authors, she seems to have combined fragments of Aristotle and Galen with elements derived from St. Augustine, Isidore, Bernard of Tours, Hugh of St. Victor and from the Salernitan school. She elaborates the traditional doctrines of the macrocosm and the microcosm, indicates the relation between them, and around these ideas weaves her interesting physiological, psychological and theological opinions.

Her works, which include the above-named *Scivias*, the curious *Liber divinorum operum*, the *Liber vitae meritorum*, medical treatises, homilies, letters, hymns and lives of St. Disibode and of St. Rupert, were published in Migne's *Patrol. Lat.* vol. 197 and in Pitra's *Analecta sacra* (1882) which contain the contemporary biographies by the monks Theodoric, Godefrid and Guibert. See J. P. Schmalzeis, *Das Leben und Wirken der hl. Hildegardis* (Freiburg i/B., 1879); F. W. Roth, *Lieder und unbekannte Sprache der hl. Hildegardis* (Wiesbaden, 1880); P. Franche, *S. Hildegardis* (1903); J. May, *Die hl. Hildegard* (1911); F. M. Steel, *Life and Visions of St. Hildegard* (1914); C. Singer, *Studies in the Hist. of Science* (1917); L. Bronarski, *Die Lieder der hl. Hildegard* (Leipzig, 1922).

HILDEN, a town in the Prussian Rhine province on the Itter, 9 m. S.E. of Düsseldorf by rail. Pop. (1925) 20,014. Its manufactures include silks, calico-printing, tanning, machinery and brick-making.

HILDESHEIM, a town and episcopal see in the Prussian province of Hanover, at the north foot of the Harz mountains, on the right bank of the Innerste, 18 m. S.E. of Hanover by railway, and on the main line from Berlin, via Magdeburg to Cologne. Pop. (1925) 58,181.

Hildesheim owes its rise and prosperity to the fact that in 822 it was made the seat of the bishopric which Charlemagne had founded at Elze a few years before. St. Bernward, bishop from 993 to 1022, walled the town, and stimulated the art of working in metals. In the 13th century Hildesheim became a free city of the empire; in 1249 it received municipal rights and about the same time it joined the Hanseatic league. Its bishops gradually became practically independent, and carried on wars with neighbouring princes, especially with the house of Brunswick-Lüneburg,

under whose protection Hildesheim placed itself several times. The extent of their lands depended on the fortune of war, but at the beginning of the 19th century the extent of the prince bishopric was 682 sq.m. In 1801 the bishopric was secularized and in 1813 it was transferred to Hanover. In 1866, along with Hanover, it was annexed by Prussia. In 1803 a new bishopric of Hildesheim, a spiritual organization only, was established, and this has jurisdiction over all the Roman Catholic churches in the centre of north Germany.

The town consists of an old and a new part, and is surrounded by ramparts. Its streets contain many old houses with overhanging upper storeys and adorned wooden façades. The Roman Catholic cathedral (mid. 11th century) occupies the site of a building of the early 9th century. The Romanesque church of St. Godehard was built in the 12th century and restored in the 19th. The church of St. Michael, founded by Bishop Bernward early in the 11th century and restored after injury by fire in 1186, contains a unique painted ceiling of the 12th century, the sarcophagus and monument of Bishop Bernward, and a bronze font; it is now a Protestant parish church, but the crypt is used by the Roman Catholics. The church of the Magdalene possesses two candelabra, a gold cross, and various other works in metal by Bishop Bernward; and the Lutheran church of St. Andrew has a choir dating from 1389. In the suburb of Moritzberg there is an abbey church founded in 1040, the only pure columnar basilica in north Germany.

The chief secular buildings are the town-hall (Rathaus), which dates from the 15th century and was restored in 1883-92, adorned with frescoes illustrating the history of the city; the Tempelherrenhaus, in Late Gothic, erroneously said to have been built by the Knights Templars; the Knochenhaueramthaus, formerly the guild-house of the butchers, restored after a fire in 1884, and probably the finest specimen of a wooden building in Germany; the Michaelis monastery, used as a lunatic asylum; and the old Carthusian monastery. The buildings of Trinity hospital, partly dating from the 14th century, are now a factory; and the Wedekindhaus (1598) is now a savings-bank. Hildesheim is the seat of considerable industry. Its chief productions are sugar, tobacco and cigars, stoves, machines, vehicles, rubber and gutta percha, paper, oil, agricultural implements and bricks. Other trades are brewing and tanning.

HILFERDING, RUDOLF (1877-), German statesman, was born on Aug. 10, 1877, at Vienna. He took his degree in medicine in Vienna University. In 1907 he joined the staff of *Vorwärts* in Berlin as political director, and became one of the most important publicists of the social-democratic party. He opposed the decision of the party to vote war credits in 1914, and conducted pacifist propaganda. After the war he acquired German citizenship and then conducted the *Freiheit* (1918-22) an organ of the majority socialist party, and was one of the most effective opponents of the communists. When, however, the new communist party broke off from the independent social democratic party, he became the leader of the independent social democrats and worked for their reunion, accomplished in 1922, with the social democratic party. Dr. Hilferding was one of the German experts at the Genoa conference (April-May 1922) and from August to October 1923 finance minister in the Stresemann cabinet. Having failed to stop the devaluation of the mark, he had to retire, but remained the financial expert of the social democratic party, until appointed minister of finance in the Müller cabinet of 1928. Hilferding edited *Marx-studien* (1904-1922, 4 vols.) and *Gesellschaft* (1924 seq.), an international socialist review. His principal single work was *Das Finanz Kapital* (1910, 2nd ed. 1920).

HILL, AARON (1685-1750), English author, was born in London, the son of George Hill, of Malmesbury abbey, Wiltshire. On leaving Westminster school at 14 he was sent to travel in the Near East. After his return in 1709 he engaged in all kinds of commercial enterprises, wrote a play, and was for a brief time a theatrical manager. In 1730 he wrote *The Progress of Wit, being a caveat for the use of an Eminent Writer*. The "eminent writer" was Pope, who had introduced him into *The Dunciad* as one of the competitors for the prize offered by the goddess of Dullness,

though the satire was qualified by an oblique compliment. Hill died on Feb. 8, 1750. The best of his plays were *Zara* (acted 1735) and *Merope* (1749), both adaptations from Voltaire. He also published two series of periodical essays, *The Prompter* (1735) and, with William Bond, *The Plaindealer* (1724).

The Works of the late Aaron Hill, consisting of letters . . . original poems. . . With an essay on the Art of Acting appeared in 1753, and his *Dramatic Works* in 1760. His *Poetical Works* are included in Anderson's and other editions of the British poets. A full account of his life is provided by an anonymous writer in Theophilus Cibber's *Lives of the Poets*, vol. v.

HILL, AMBROSE POWELL (1825-1865). American Confederate soldier, was born in Culpeper county, Va., on Nov. 9, 1825, and graduated at West Point in 1847, being appointed to the 1st U.S. artillery. He served in the Mexican and Seminole Wars, was promoted first lieutenant in Sept. 1851, and in 1855-1860 was employed on the U.S. coast survey. In March 1861, just before the outbreak of the Civil War, he resigned his commission, and when his State seceded he was made colonel of a Virginian infantry regiment, winning promotion to the rank of brigadier-general on the field of Bull Run. In the Peninsular campaign of 1862 he gained further promotion, and as a major-general was one of the most prominent and successful divisional commanders of Lee's army in the Seven Days', Second Bull Run, Antietam and Fredericksburg campaigns. His division formed part of "Stonewall" Jackson's corps, and he was severely wounded in the flank attack of Chancellorsville in May 1863. After Jackson's death Hill was made a lieutenant-general and placed in command of a corps of Lee's army, which he led in the Gettysburg campaign of 1863, the autumn campaign of the same year, and the Wilderness and Petersburg operations of 1864-65. He was killed in front of the Petersburg lines on April 2, 1865. His reputation as a troop leader in battle was one of the highest among the generals of both sides.

See James P. Mathews, "How General A. P. Hill met his Fate," in *Southern Hist. Soc. Papers*, vol. xxvii., p. 26-38 (1899).

HILL, DANIEL HARVEY (1821-1889), American Confederate soldier, was born in York district, South Carolina, July 12 1821. He graduated at the United States military academy in 1842, and became a major in the Mexican War. From 1849 until the outbreak of the Civil War he was professor of mathematics at Washington college (Washington and Lee university), at Davidson college, North Carolina, and superintendent of the North Carolina military institute. As colonel of a Confederate infantry regiment he won the action of Big Bethel, June 10 1861. As major-general he led a division with great distinction in the battle of Fair Oaks and the Seven Days, in the second Bull Run campaign. In the Antietam campaign the resistance of his division enabled Lee to concentrate for battle. It was conspicuous in the battles of the Antietam and Fredericksburg. In 1863 he commanded one of Bragg's corps in the victory of Chickamauga. In 1866-69 he edited *The Land We Love*, at Charlotte (N.C.). He became president of the University of Arkansas in 1877 and in 1885 of the Military and Agricultural College of Georgia. He died at Charlotte on Sept. 24 1889.

HILL, DAVID JAYNE (1850-), American diplomat, was born at Plainfield, N.J., on June 10, 1850. After graduating in 1874 from the University of Lewisburg, Pa.—later known as Bucknell university—he became instructor in Greek and Latin there and from 1877 professor of rhetoric. In 1879 he was elected president of Bucknell, and in 1888 of the University of Rochester. In 1896 he resigned and went abroad to study public law. In 1898 he was appointed assistant secretary of State by President McKinley. While in Washington he was also professor of European diplomacy in the school of comparative jurisprudence and diplomacy. In 1903 he was appointed minister to Switzerland, and in 1905 was transferred to Holland. He was a delegate to the Second Peace Conference at The Hague in 1907. From 1908-11 he was ambassador to Germany.

Hill's best-known work is his *History of Diplomacy in the International Development of Europe*, embracing *The Struggle for Universal Empire* (1905), *The Establishment of Territorial Sovereignty* (1906) and *The Diplomacy of the Age of Absolutism* (1914). His other writings include *World Organization as Affected by the Nature*

of the Modern State (1911, lectures delivered at Columbia university); *Impressions of the Kaiser* (1918); *Present Problems in Foreign Policy* (1919); *American World Policies* (1920); and *The Problem of a World Court* (1927).

HILL, GEORGE BIRKBECK NORMAN (1835-1903), English author, editor of Boswell and commentator on Samuel Johnson, was born at Tottenham, Middlesex, the son of Arthur Hill, head master of Bruce Castle school. He was educated in his father's school and at Pembroke college, Oxford. In 1858 he began to teach at Bruce Castle school, and from 1868 to 1877 was head master. In 1869 he became a regular contributor to the *Saturday Review*. He settled at Oxford in 1887, but from 1891 onwards his winters were usually spent abroad. He died at Hampstead, London, on Feb. 27, 1903. His works include: *Dr. Johnson, his Friends and his Critics* (1878); an edition of Boswell's *Correspondence* (1879); a laborious edition of *Boswell's Life of Johnson, including Boswell's Journal of a Tour to the Hebrides, and Johnson's Diary of a Journey into North Wales* (6 vols., 1887); *Wit and Wisdom of Samuel Johnson* (1888); *Select Essays of Dr. Johnson* (1889); *Footsteps of Dr. Johnson in Scotland* (1890); *Letters of Johnson* (1892); *Johnsonian Miscellanies* (2 vols., 1897); an edition (1900) of Edward Gibbon's *Autobiography*; *Johnson's Lives of the Poets* (3 vols., 1905), and other works on the 18th-century topics. Dr. Birkbeck Hill's elaborate edition of Boswell's *Life* is a monumental work, invaluable to the student.

See a memoir by his nephew, Harold Spencer Scott, in the edition of the *Lives of the English Poets* (1905), and the *Letters* edited by his daughter, Lucy Crump, in 1903.

HILL, JAMES J. (1838-1916), American railway capitalist, was born near Guelph (Ont.), Canada, Sept. 16, 1838, and attended Rockwood (Ont.) academy, a Quaker institution. In 1856 he settled in St. Paul (Minn.). He became a clerk in the office of a firm of river steamboat agents and shippers, and later was agent for a line of river packets; he established (about 1870) transportation lines on the Mississippi and on the Red river (of the North). He effected a traffic arrangement between the St. Paul Pacific railroad and his steamboat lines; and when the railway failed in 1873 for \$27,000,000, Hill interested Sir Donald A. Smith (Lord Strathcona), George Stephen (Lord Mount Stephen), and other Canadian capitalists, in the road and in the wheat country of the Red river valley; he reorganized the road as the St. Paul, Minneapolis and Manitoba, and in 1883 he became its president. He was president of the Great Northern railway from 1893 until April 1907, when he became chairman of its board of directors, serving in that capacity until 1912. The Hill interests obtained control not only of the Great Northern system, but of the Northern Pacific and the Chicago, Burlington and Quincy, and proposed the construction of another northern line to the Pacific coast. Hill was the president of the Northern Securities Co., which in 1904 was declared by the U.S. Supreme Court to be in conflict with the Sherman Anti-Trust law. Feeling that the farmers and millers of the northwest needed a large financial institution near at hand, in 1913 he secured control of the First and Second National banks of St. Paul, and merged them. He wrote *Highways of Progress* (1910).

HILL, JOHN (c. 1716-1775), called from his Swedish honours, "Sir" John Hill, English author, edited the *British Magazine* (1746-50), and for two years (1751-53) wrote a daily letter, "The Inspector," for the *London Advertiser and Literary Gazette*. He also produced novels, plays and scientific works.

He was involved in many literary quarrels. Henry Fielding attacked him in the *Covent Garden Journal*, Christopher Smart wrote a mock-epic, *The Hilliad*, against him, and David Garrick replied to his strictures against him by two epigrams, one of which runs:—

"For physics and farces, his equal there scarce is;
His farces are physis, his physis a farce is."

He had other literary passages-at-arms with John Rich, who accused him of plagiarizing his *Orpheus*, also with Samuel Foote and Henry Woodward. From 1759 to 1775 he was engaged on a huge botanical work—*The Vegetable System* (26 vols.)—adorned

by 1,600 copperplate engravings. Hill's botanical labours were undertaken at the request of his patron, Lord Bute, and he was rewarded by the order of Vasa from the king of Sweden in 1774. He had a medical degree from Edinburgh, and he now practised as a quack doctor, making considerable sums by the preparation of vegetable medicines. He died in London on Nov. 21, 1775. He is said to have been the author of the second part of *The Oeconomy of Human Life* (1751), the first part of which is by Lord Chesterfield, and Hannah Glasse's famous manual of cookery was generally ascribed to him (see Boswell, ed. Hill, iii. 285). Dr. Johnson said of him that he was "an ingenious man, but had no veracity."

See a *Short Account of the Life, Writings and Character of the late Sir John Hill* (1779), which is chiefly occupied with a descriptive catalogue of his works; also *Temple Bar* (1872, xxxv. 261-266).

HILL, MATTHEW DAVENPORT (1792-1872), English lawyer and penologist, was born on Aug. 6, 1792, at Birmingham. He was a brother of Sir Rowland Hill. In 1819 he was called to the bar at Lincoln's Inn. In 1832 he was elected one of the Liberal members for Kingston-upon-Hull, but he lost his seat at the next election in 1834. On the incorporation of Birmingham in 1839 he was chosen recorder; and in 1851 he was appointed commissioner in bankruptcy for the Bristol district. In his charges to the grand juries, as well as in special pamphlets, he advocated many important reforms in the methods of dealing with crime. He was supported by his brother Frederick Hill (1803-96), whose *Amour, Causes and Remedies of Crime*, the result of his experience as inspector of prisons for Scotland, marked an era in the methods of prison discipline. Hill was a promoter of the Society for the Diffusion of Useful Knowledge, and the originator of the *Penny Magazine*. He died at Stapleton, near Bristol, on June 7, 1872.

His principal works are *Practical Suggestions to the Founders of Reformatory Schools* (1855); *Suggestions for the Repression of Crime* (1857), consisting of charges addressed to the grand juries of Birmingham; *Mettray* (1855); *Papers on the Penal Servitude Acts* (1864); *Journal of a Third Visit to the Convict Gaols, Refuges and Reformatories of Dublin* (1865); *Addresses delivered at the Birmingham and Midland Institute* (1867). See *Memoir of Matthew Davenport Hill*, by his daughters Rosamond and Florence Davenport Hill (1878).

HILL, OCTAVIA (1838-1912) and **MIRANDA** (1836-1910), English pioneers in housing reform, were born in London, being daughters of James Hill and granddaughters of Dr. Southwood Smith, the pioneer of sanitary reform. Octavia Hill's attention was early drawn to the bad condition of the housing of the working classes and of the poor in London. With the help of John Ruskin Octavia Hill purchased the 56 years' lease of three houses in one of the poorest courts of Marylebone. The houses were put in repair, and let out in sets of two rooms. The experiment proved to be financially sound. What specially distinguished this scheme was that Miss Hill herself collected the rents, thus coming into contact with the tenants and helping to enforce regular and self-respecting habits. The success of her first attempt encouraged her to continue. Six more houses were bought and treated in a similar manner. A yearly sum was set aside for the repairs of each house, and whatever remained over was spent on such additional appliances as the tenants themselves desired. This encouraged them to keep their tenements in good repair. By the help of friends Octavia Hill was now enabled to enlarge the scope of her work. Several large owners of tenement houses, notably the ecclesiastical commissioners, entrusted to her the management of property, and consulted her about plans of rebuilding.

See Charles E. Maurice, *Life of Octavia Hill as told in her Letters* (1913).

HILL, ROWLAND (1744-1833), English preacher, sixth son of Sir Rowland Hill, Bart. (d. 1783), was born at Hawkstone, Shropshire, on Aug. 23, 1744. He was educated at Shrewsbury, Eton and St. John's college, Cambridge. Having inherited considerable property, he built for his own use Surrey chapel, in the Blackfriars road, London (1783). Hill conducted his services in accordance with the forms of the Church of England, in whose communion he always remained. Both at Surrey chapel and in his provincial "gospel tours" he had great success. His oratory

was specially adapted for rude and uncultivated audiences. He possessed a voice of great power, and according to Southey "his manner" was "that of a performer as great in his own line as Kean or Kemble." He helped to found the Religious Tract society, the British and Foreign Bible society, and the London Missionary society, and was a stout advocate of vaccination. His best-known work is the *Village Dialogues*, which first appeared in 1810, and reached a 34th edition in 1839. He died on April 11, 1833.

See *Life* by E. Sidney (1833); *Memoirs*, by William Jones (1834); and *Memorials*, by Jas. Sherman (1857).

HILL, SIR ROWLAND (1795-1879), English administrator and educationist, author of the penny postal system, a younger brother of Matthew Davenport Hill, and third son of T. W. Hill, who named him after Rowland Hill the preacher, was born on Dec. 3, 1795, at Kidderminster. At the age of 12 he began to teach mathematics at his father's school at Hilltop, Birmingham. At Rowland's suggestion the school was removed in 1819 to larger premises at Hazelwood, of which he was the architect, in order to carry out his improved system of education, expounded by him in *Plans for the Government and Education of Boys in Large Numbers* (1822; 2nd ed., 1827). The system, whose principal feature was "to leave as much as possible all power in the hands of the boys themselves," was so successful that after six years it was announced that "the head master had never once exercised his right to veto on their proceedings." The experiment is described in *Public Education* (1822), by Matthew Davenport Hill. Rowland Hill ranks with Arnold of Rugby, who was probably influenced by him, as an educationist, and was equally successful in making moral influence the predominant power in school discipline. After his marriage in 1827 Hill removed to a new school at Bruce Castle, Tottenham, which he conducted until compelled by failing health to retire in 1833.

Hill then became interested in various inventions, and for the purpose of exploiting them was joined by Sir John Shaw-Lefevre, and Prof. Wheatstone, the inventor of the electric telegraph. Hill invented a successful rotary printing-press but the objections raised by the Treasury delayed the introduction of the method for another 35 years.

About this time (1835) he became secretary of Gibbon Wakefield's scheme for colonizing South Australia, the objects of which he had explained in 1832 in a pamphlet on *Home Colonies*, afterwards partly reprinted during the Irish famine under the title *Home Colonies for Ireland*.

In 1835 the large surplus in the revenue turned his attention to the possibility of using it to improve the existing postal system, which he had seen was a great burden to the poor. He had already in 1826 considered the possibility of a travelling post office, but had never published his scheme. He failed to obtain admission to the Post Office, but with the aid of a great mass of statistical information succeeded in demonstrating that the chief expense of letter carriage was in receiving and distribution, and that the cost varied so little with the distance that a uniform rate of postage was the fairest and most practical course. The principle is now so much a commonplace that it is not easy to realize how startling it was to Hill's contemporaries. He had observed that during the previous 20 years the postal revenue in England had diminished, instead of increasing, whereas in France where lower rates were in operation, it had increased considerably. He prophesied that the decrease in the postal rate would be made good by the increase of correspondence, and by the saving obtained from prepayment (at that time unusual), simplified accountancy, and smaller costs of distribution. He recommended within the United Kingdom a penny rate for letters not exceeding half an ounce in weight. He submitted his proposals privately to Lord Melbourne's government in Jan. 1837, but as no result followed, soon afterwards published them in pamphlet form, under the title *Post Office Reform: Its Importance and Practice*. The employment of postage stamps is suggested in the following words, which have interest as the earliest definition of a postage stamp: "Perhaps the difficulties might be obviated by using a bit of paper just large enough to bear the stamp, and covered at the back with a glutinous wash

which by applying a little moisture might be attached to the back of the letter." On Nov. 23, 1837 the House of Commons appointed a committee to examine the subject, and on July 17, 1838 recommended, by the casting vote of the chairman, a uniform rate of twopence the half ounce. The government was opposed to the measure, but was eventually compelled to yield to public opinion, and penny postage was included in the budget and carried by the House of Commons on July 12, 1839. After an intermediate rate of fourpence had been in operation from Dec. 5 that year, the penny rate commenced on Jan. 10, 1840.

Hill received an appointment in the Treasury to introduce his reforms, but was dismissed (1842) soon after the Liberal government resigned office. By way of compensation for his losses, and in public appreciation of his services, he was in 1846 presented by public subscription, with the sum of £13,360. On the Liberals returning to office in the same year he was appointed secretary to the Postmaster General, and in 1854 he was made chief secretary. His ability as a practical administrator enabled him to improve his original scheme, taking advantage of increasing facilities of communication. During the period 1838-64 the number of chargeable letters rose from seventy-six millions to six hundred and forty-two millions. On his retirement in 1864 he received from parliament a grant of £20,000 and was allowed to retain his salary of £2,000 a year as a retiring pension. He died at Hampstead on Aug. 27, 1879, and was buried in Westminster Abbey.

See G. Birkbeck Hill, *Life of Sir Rowland Hill* (1880).

HILL, ROWLAND HILL, 1ST VISCOUNT (1772-1842), British general, was the second son of (Sir) John Hill, of Hawkstone, Shropshire, and nephew of the Rev. Rowland Hill (1744-1833), was born at Prees Hall near Hawkstone on Aug. 11, 1772. He entered the army in 1790, and had already seen much active service when in 1808 he was appointed to a brigade in the force sent to Portugal. From Vimeira to Vittoria, in advance or retreat, he proved himself Wellington's ablest and most indefatigable coadjutor. He led a brigade at Vimeira, at Corunna and at Oporto, and a division at Talavera (*see* PENINSULAR WAR). His capacity for independent command was fully demonstrated in the campaigns of 1810, 1811 and 1812. In 1811 he annihilated a French detachment under Girard at Arroyo-dos-Molinos, and early in 1812, having now attained a rank of lieutenant-general (Jan. 1812) and become a K.B. (March), he carried by assault the important works of Almaraz on the Tagus. Hill led the right wing of Wellington's army in the Salamanca campaign in 1812 and at the battle of Vittoria in 1813. Later in this year he conducted the investment of Pampeluna and fought with the greatest distinction at the Nivelle and the Nive. In the invasion of France in 1814 his corps was victoriously engaged both at Orthez and at Toulouse. Hill was one of the general officers rewarded for their services by peerages, his title being at first Baron Hill of Almaraz and Hawkstone, and he received a pension, the thanks of parliament and the freedom of the city of London. In 1815 Hill was appointed to one of the two corps commands in Flanders. At Waterloo he led the famous charge of Sir Frederick Adams's brigade against the Imperial Guard, and continued with the army in France until its withdrawal in 1818. When Wellington became premier in 1828, he received the appointment of general commanding-in-chief, and on resigning this office in 1842 he was created a viscount. He died on Dec. 10 of the same year.

See E. Sidney, *Life of Lord Hill, G.C.B.* (1845).

HILL, a natural elevation of the earth's surface. The word was formerly applied to mountains of any height but is now usually confined to fairly low elevations.

HILLAH, a town in Iraq, about 60 m. south of Baghdad, in 32° 28' N. and 44° 48' E. It lies on the Hillah branch of the Euphrates, 11 m. below the fork at Hindieh. The population is estimated at 30,000, mostly Shiah Arabs, but includes a number of Jews. The town lies on the Baghdad-Basra railway line, and on the land routes along the river. There is also a certain amount of river traffic. There is a telegraph and post office and a small garrison. Saddlery and similar industries are carried on in the town, but the principal trade is in grain—wheat, barley and rice—and there are a large number of grain stores. The two halves

of the town are connected by a bridge of boats. Along the river there are flourishing palm groves although these have been threatened by periodic bursting of the Hindieh barrage and the drying up of the channel. The country round Hillah is essentially agricultural and is improving in production owing to renovation of the ancient canals. To the north lie the ruins of Babylon, which have been looted to build the town, while 14 miles east is Tell Oheimer, the ancient Kish. The bazaars of Hillah are large and good and the whole town appears to be very flourishing.

HILLEBRAND, KARL (1829-1884), German author, born at Giessen on Sept. 17, 1829, was a student at Heidelberg when he was caught in the revolutionary movement in Baden and had to leave Germany. He was for some months secretary to Heine in Paris, and finally settled in Florence, where he died on Oct. 19, 1884. He wrote fluently in English and French, as well as German, and was a good cosmopolitan critic of European literature. The best known of his many works is *Zeiten, Völker und Menschen* (Berlin, 7 vols., 1874-85), being collections of essays on different subjects.

See H. Homberger, *Karl Hillebrand* (Berlin, 1884).

HILLEL (c. 70 B.C.-c. A.D. 10), Jewish rabbi, was of Babylonian origin and descended from the family of David. When about 40, he went to study in the schools of Shemaiah and Abtalion at Jerusalem. There he became numbered among the leaders of the Pharisaic scribes, and tradition assigns him the highest dignity of the Sanhedrin, under the title of *nasi* ("prince") about 30 B.C. Hillel is said to have laid down seven rules for the interpretation of the Scriptures, which became the foundation of rabbinical hermeneutics. He founded a more lenient school in opposition to that of his colleague Shammai, and introduced the well known institution of the *Prosbol* (*προσβολή*), which was intended to avert the evil consequences of the scriptural law of release in the seventh year (Deut. xv. 1).

Hillel lived in the memory of posterity as the great teacher who enjoined and practised the virtues of charity, humility, patience and true piety.

Of the sayings ascribed to him, many of which bear a remarkable resemblance to the teaching of Christ, the following are typical—"My abasement is my exaltation"; "What is unpleasant to thyself that do not to thy neighbour; this is the whole Law, all else is but its exposition"; "If I am not for myself, who is for me? And if I am for myself alone, what then am I? And if not now, then when?" "Separate not thyself from the congregation"; "Judge not thy neighbour until thou art in his place"; "He who wishes to make a name for himself loses his name; he who does not increase [his knowledge] decreases it; he who does not learn is worthy of death; he who works for the sake of a crown is lost"; "He who has acquired the words of doctrine has acquired the life of the world to come."

It is noteworthy that no miraculous legends are connected with Hillel's life. A scholastic tradition, however, tells of a voice from heaven which made itself heard when the wise men had assembled in Jericho, saying: "Among those here present is one who would have deserved the Holy Spirit to rest upon him, if his time had been worthy of it." And all eyes turned towards Hillel (*Tos. Sotah*, xiii. 3). He was lamented after his death as "the humble, the pious, the disciple of Ezra."

HILLEL II., one of the patriarchs belonging to the family of Hillel I., lived in Tiberias about the middle of the 4th century, and introduced the arrangement of the calendar through which the Jews of the Diaspora became independent of Palestine in the uniform fixation of the new moons and feasts.

The Rabbi **HILLEL**, who in the 4th century made the remarkable declaration that Israel need not expect a Messiah, because the promise of a Messiah had already been fulfilled in the days of King Hezekiah (Babli, *Sanhedrin*, 99a), is probably Hillel, the son of Samuel ben Nahman, a well-known expounder of the scriptures.

See Taylor, *Sayings of the Jewish Fathers* (1877); F. Delitzsch, *Jesus und Hillel* (3rd ed. 1879); Schürer, *The Jewish People in the Time of Christ* (1891); Grätz, *Hist. of the Jews* (1894); Herzog's *Realencyklopädie und Jewish Encyclopedia*.

HILLER, FERDINAND (1811-1885), German composer, was born at Frankfurt-on-Main, on Oct. 24, 1811, and studied first under Aloys Schmitt and then under Hummel in Weimar. There he devoted himself to composition, among his work being the entr'actes to *Maria Stuart*, through which he made Goethe's acquaintance. With Hummel he went in 1827 to Vienna, where he met Beethoven and produced his pianoforte quartet. Later he went to Paris where he spent seven years and did good work in making the works of Beethoven and Bach known in French musical circles. Subsequently he joined his friend Mendelssohn in Leipzig, where in 1843-1844 he conducted a number of the Gewandhaus concerts and produced his oratorio, *Die Zerstörung Jerusalems*, one of his best works. Later he became a power at Cologne as conductor of the Gürzenich concerts and head of the Conservatorium. He retired in 1884, and died May 12, 1885 in the following year. Hiller frequently visited England. He composed a work for the opening of the Royal Albert Hall, his *Nala and Damayanti* was performed at Birmingham, and he gave a series of pianoforte recitals of his own compositions at the Hanover Square Rooms in 1871. His compositions, numbering about two hundred, include six operas, two oratorios, six or seven cantatas, much chamber music and a once-popular pianaforte concerto.

HILLER, JOHANN ADAM (1728-1804), German musical composer, was born near Görlitz, in Silesia, on Dec. 25, 1728. He studied law at Leipzig, but adopted music as a profession. In 1789 he became cantor of the Thomasschule, and died at Leipzig, where practically the whole of his life was spent, on June 16, 1804. Hiller played an important part in the German musical life of his day. To him was due the foundation of the famous Gewandhaus concerts in Leipzig. He had much to do with the re-establishment in favour of the *Singspiel* and the general popularization and development of light opera, while he helped materially also in the cultivation and development of the German *Lied* as against the Italian operatic aria. He did good propagandist work for Handel also, and the *Messiah* was first given in Berlin (more than 40 years after it was composed) under his bâton. He was a prolific author as well as a copious composer, his literary works including his autobiography to be found in the volume *Lebensbeschreibungen berühmter Musikgelehrten und Tonkünstler* (1784) and also, more accessibly, in Einstein's *Lebenläufe deutscher Musiker von ihnen selbst erzählt* (1915).

HILLIARD, LAWRENCE (d. 1640), English miniature painter, the son of Nicholas Hilliard. The date of his birth is not known, but he died in 1640. He adopted his father's profession and worked out the unexpired time of his licence after Nicholas Hilliard died. It was from Lawrence Hilliard that Charles I. received the portrait of Queen Elizabeth now at Montagu House, since van der Dort's catalogue describes it as "done by old Hilliard, and bought by the king of young Hilliard." In 1624 he was paid £42 from the Treasury for five pictures, but the warrant does not specify whom they represented. His portraits are of great rarity, two of the most beautiful being those in the collections of Earl Beauchamp and J. Pierpont Morgan. They are as a rule signed L.H., but are also to be distinguished by the beauty of the calligraphy in which the inscriptions round the portraits are written. The writing is as a rule very florid, full of exquisite curves and flourishes, and more elaborate than the more formal handwriting of Nicholas Hilliard. The colour scheme adopted by the son is richer and more varied than that used by the father, and Lawrence Hilliard's miniatures are not so hard as are those of Nicholas and are marked by more shade and a greater effect of atmosphere. (G. C. W.)

HILLIARD, NICHOLAS (c. 1537-1619), the first true English miniature painter, is said to have been the son of Richard Hilliard of Exeter. He was appointed goldsmith, carver and portrait painter to Queen Elizabeth, and engraved the Great Seal of England in 1586. He was in high favour with James I. as well as with Elizabeth, and from the king received a patent of appointment (May 5, 1617), which granted him a sole licence for the royal work for twelve years. He is believed to have been the author of an important treatise on miniature painting, now pre-

served in the Bodleian Library, but it seems more probable that the author of that treatise was John de Critz, Serjeant Painter to James I. It is probable, however, that the treatise was taken down from the instructions of Hilliard, for the benefit of one of his pupils, perhaps Isaac Oliver. Donne, in a poem called "The Storm" (1597) praises Hilliard's work. He painted a portrait of himself at the age of thirteen, and is said to have executed one of Mary queen of Scots when he was eighteen years old. He died on Jan. 7, 1619, and was buried in St. Martin's-in-the-Fields, Westminster.

It seems to be pretty certain that he visited France, and that he is the artist alluded to in the papers of the duc d'Alençon under the name of "Nicholas Belliard, peintre anglois" who was painter to this prince in 1577, receiving a stipend of 200 livres.

For further information respecting Hilliard's sojourn in France, see the privately printed catalogue of the collection of miniatures belonging to J. Pierpont Morgan, compiled by Dr. G. C. Williamson.

HILLSBORO, a city of Illinois, U.S.A., 50m. N.E. of Saint Louis; the county seat of Montgomery county. It is served by the Chicago and Eastern Illinois, the Big Four and the Illinois Traction (electric) railways. The population in 1920 was 5,074 (92% native white). Farming, dairying and coal-mining are the principal occupations of this region. There is a large electric-power plant in the city, as well as zinc smelters, a fruit-jar factory, and brick, tile and concrete works. Hillsboro was settled about 1823. It was incorporated as a town in 1855, and as a city in 1882.

HILLSBORO, a village of south-western Ohio, U.S.A., 48m. E. by N. of Cincinnati; the county seat of Highland county. It is on Federal highway 50, and is served by the Baltimore and Ohio and the Norfolk and Western railways. The population in 1920 was 4,356 (13% negroes). It has factories making bells, hardware and furniture, a poultry-packing house and flour-mills.

HILLSBORO, a city of Texas, U.S.A., 55m. S. by E. of Fort Worth; the county seat of Hill county. It is on Federal highway 81, and is served by the Missouri-Kansas-Texas, the St. Louis Southwestern and the Trinity and Brazos Valley railways. The population was 6,952 in 1920 (15% negroes), and was estimated locally at 8,300 in 1928. Grain, cotton and live stock are raised in this region. Hillsboro was settled about 1846 and incorporated in 1853.

HILLSDALE, a city of southern Michigan, U.S.A., 90 m. W.S.W. of Detroit; county seat of Hillsdale county. It is served by the New York Central railway. The population was 5,476 in 1920 (96% native white). It is the trading centre and shipping point for a rich farming region; manufactures screen doors, clothing, metal dies and punches, gas engines and various other commodities; and is the seat of Hillsdale college (Free Baptist, opened at Spring Arbor, Mich., in 1844, and established here in 1853). Hillsdale was settled in 1837, incorporated as a village in 1847, and chartered as a city in 1869.

HILL TIPPERA: see TRIPURA.

HILTON, JOHN (1804-1878), British surgeon, was born at Castle Hedingham, in Essex, in 1804. He entered Guy's hospital in 1824, and was connected with the hospital all his life. In 1867 he was president of the Royal College of Surgeons. As Arris and Gale professor (1850-62) he delivered a course of lectures on "Rest and Pain" (published 1863; 5th ed., edited by W. H. A. Jackson, 1892), which have become classics. He was surgeon-extraordinary to Queen Victoria. Hilton was the greatest anatomist of his time, and was nicknamed "Anatomical John." It was he who, with Joseph Towne, the artist, enriched Guy's hospital with its unique collection of models. In his grasp of the structure and functions of the brain and spinal cord he was far in advance of his contemporaries. His anatomical knowledge is indicated by the method for opening deep abscesses which is known by his name, and he was the first to reduce a case of obturator hernia by abdominal section, and one of the first to practice lumbar colostomy. He died at Clapham on Sept. 14, 1878.

BIBLIOGRAPHY.—See *Transactions of the Royal Medical and Chirurgical Society* (vol. xxx, 1847) and *Notes on some of the Developmental and Functional Relations of the Cranium*, selected by F. W. Pavy from lectures on Anatomy given by John Hilton at Guy's hospital, 1853 (1854). See also a biographical notice in Wilks and Bethany,

Biographical History of Guy's Hospital (1892).

HILTON, WILLIAM (1786–1839), English painter, born at Lincoln on June 3, 1786, son of a portrait-painter, studied at the Royal Academy schools. He became A.R.A. in 1813, and R.A. in 1820, his diploma picture being "Ganymede." Hilton's most famous work is "Christ Crowned with Thorns" (1823) which was purchased later by the Chantrey Bequest. His portrait of John Keats is in the National Portrait Gallery. Hilton died in London on Dec. 30, 1839.

HILVERSUM, a town in the province of North Holland, 18 m. by rail S.E. of Amsterdam. Pop. (1926) 47,510. It is situated in the middle of the Gooi, a stretch of hilly country extending from the Zuider Zee to about 5 m. south of Hilversum, and composed of pine woods and sandy heaths. Hilversum is a summer resort and residential centre and manufactures large quantities of carpets.

HIMALAYA, that portion of the mountain region between India and Tibet enclosed within the arms of the Indus and the Brahmaputra, having, therefore, a length of 1,500 m., and a width from 100 to 150 miles. North-west of the Indus the region of mountain ranges which stretches to a junction with the Hindu Kush, south of the Pamirs, is usually known as Trans-Himalaya. Thus the Himalaya represents the southern face of the great central elevated region—the plateau of Tibet—the northern face of which is buttressed by the Kuen Lun.

Geographical Classification of the Himalaya.—For this purpose the Himalayan mountain system is divided into three parallel longitudinal zones which have marked differences in orographical features.

(1) *The Great Himalayas.*—The main ranges, which lie in the north, rise above the snow line and have an average elevation of 20,000 ft. above the sea. Here occur the highest peaks, e.g., Everest, K₂ (Godwin Austen), Kanchinjang, etc.

(2) *The Lesser Himalayas.*—The middle ranges, which are closely related to and lie south of the Great Himalayas. They form an intricate mountain system, with an average height of 12,000 to 15,000 ft. above the sea.

(3) *The Outer Himalayas.*—These comprise the Siwalik ranges, lie between the Lesser Himalayas and the plains, and have an average height of 3,000 to 4,000 ft. above the sea.

The Great Northern Watershed.—On the north and north-west of Kashmir, the great water-divide which separates the Indus drainage area from that of the Yarkand and other rivers of Chinese Turkestan, is the Mustagh range which, with the Karakoram, trends south-eastwards, forming a continuous mountain barrier and the true water-divide west of the Tibetan plateau. Shutting off the sources of the Indus affluents from those of the Central Asian system of hydrography, this great water-parting is distinguished by a group of peaks of which the altitude is hardly less than that of the Eastern Himalaya. Mount Godwin-Austen (K₂) (28,250 ft. high), only 750 ft. lower than Everest, affords an excellent example of a dominating, peak-crowned water-parting or divide. From Kailas on the far west to the extreme north-eastern sources of the Brahmaputra, little is known of the great northern water-parting of the Indo-Tibetan highlands. For some 500 or 600 m. E. of Kailas it appears to be lost in the mazes of the minor ranges and ridges of the Tibetan plateau. Nor can it be said to be well defined to the east of Lhasa.

Eastern Tibet.—The Tibetan plateau, or Chang, breaks up about the meridian of 92° E., to the east of which the affluents of the Tsanpo (the same river as the Dihang and subsequently as the Brahmaputra) drain no longer from the elevated plateau, but from wild, rugged mountain slopes. In this region are hidden the sources of all the great rivers of Burma and China. Neither immediately beyond the great bend of the Brahmaputra nor in the Himalayan regions lying north of Assam and east of Bhutan, have scientific investigations yet been systematically carried out; but it is known that the largest of the Himalayan affluents of the Brahmaputra west of the bend derive their sources from the Tibetan plateau, and break down through the containing bands of hills, carrying deposits of gold from their sources to the plains, as do all the rivers of Tibet.

Although the northern limits of the Tsanpo basin are not sufficiently well known to locate the Indo-Tibetan watershed even approximately, there exists some evidence of the nature of that strip of Northern Himalaya on the Tibeto-Nepalese border which lies between the line of greatest elevation and the trough of the Tsanpo. Recent investigations show that all the chief rivers of Nepal flowing southwards to the Tarai take their rise north of the line of highest crests, the "Great Himalayas," and that some of them drain long lateral high-level valleys enclosed between minor ridges whose trend is parallel to that of the Himalayas and, occasionally, almost at right angles to the course of the main drainage channels breaking down to the plains. This formation brings the southern edge of the Tsanpo basin to the immediate neighbourhood of the banks of that river, which runs at its foot like a drain flanking a wall. North of Bhutan, between the Himalayan crest and Lhasa, this formation is approximately maintained; farther east, although the same natural forces first resulted in the same effect of extensive curves of ridge and furrow, the abundant rainfall and the totally distinct climatic conditions which govern the processes of denudation subsequently led to the erosion of deeper valleys enclosed between forest-covered ranges which rise steeply from the river banks.

Height of Himalayan Peaks.—It is now proved that Mount Everest, which appears from the Tibetan plateau as a single dominating peak, has no rival amongst Himalayan altitudes. The main features of Nepalese topography are now fairly well defined. So much controversy has been aroused on the subject of Himalayan altitudes that the present position of scientific analysis in relation to them may be shortly stated. The heights of peaks determined by exact processes of trigonometrical observation are bound to be more or less in error for at least three reasons: (1) the extraordinary geoidal deformation of the level surface at the observing stations in submontane regions; (2) ignorance of the laws of refraction when rays traverse rarefied air in snow-covered regions; (3) ignorance of the variations in the actual height of peaks due to the increase, or decrease, of snow.

Geology.—The Himalaya have been formed by violent crumpling of the earth's crust along the southern margin of the great tableland of Central Asia. Outside the arc of the mountain chain no sign of this crumpling is to be detected except in the Salt Range; and the Peninsula of India has been entirely free from folding of any importance since early Palaeozoic times, if not since the Archæan period itself. But the contrast between the Himalaya and the Peninsula is not confined to their structure: the difference in the rocks themselves is equally striking. In the Himalaya the geological sequence (Cambrian to Eocene) is almost entirely marine; there are occasional breaks in the series, but during nearly the whole of this long period the Himalayan region, or at least its northern part, must have been beneath the sea—the Central Mediterranean Sea of Neumayr or Tethys of Suess. In the peninsula, however, no marine fossils have yet been found of earlier date than Jurassic and Cretaceous, and these are confined to the neighbourhood of the coast; there can be no doubt that, at least since the Carboniferous period, nearly the whole of the Peninsula has been land. Between the folded marine beds of the Himalaya and the nearly horizontal strata of the peninsula lies the Indo-Gangetic plain, covered by an enormous thickness of alluvial and wind-blown deposits of recent date. Deep borings here have failed to reach the rocky bottom, or even to indicate the approach of the base of the alluvium. It is clear, then, that in front of the Himalaya there is a great depression, but there is no indication that this depression was ever beneath the sea.

Geologically, the Himalaya may be divided into three zones. The northern (*Tibetan zone*), in which fossiliferous beds of the Palaeozoic and Mesozoic age are largely developed—excepting in the north-west, no such rocks are known on the southern flanks. The second (*Himalayan zone*) comprises most of the Lesser and Great Himalayas, and is composed chiefly of crystalline and metamorphic rocks, together with unfossiliferous sedimentary beds supposed to be of Palaeozoic age. The southern (*sub-Himalayan zone*) consists entirely of Tertiary beds, and especially of the Upper Tertiaries. The oldest beds which have yielded

fossils occur in the Spiti valley and belong to the Cambrian system (the "Haimanta" system). These are underlain by Archaean gneisses. There appears to be no break in the Lower Palaeozoic beds in the Spiti region but in other parts of the Central Himalayas the conglomerate at the base of the Permian rests unconformably upon older formations. This conglomerate forms an important datum line. From the Permian to the Lias the sequence in the central Himalaya shows no sign of a break. The Spiti shales follow, and although they contain Middle and Upper Jurassic fossils no break has yet been proved at their base. The Spiti shales are succeeded conformably by Cretaceous beds (Giumal sandstone below and Chikkim limestone above), and these are followed without a break by Nummulitic beds of Eocene age. The beginning of the Tertiary period was marked by violent igneous activity, in which intrusion and extrusion occurred. The next succeeding deposit is a sandstone, often highly inclined, which rests unconformably upon the Nummulitic beds and resembles the Lower Siwaliks of the sub-Himalaya (Pliocene) but which as yet has yielded no fossils of any kind. The whole is overlaid unconformably by the younger Tertiaries of Hundes, which are perfectly horizontal and have been folded.

It is evident that in the northern part of the Himalayan belt, at least in the Spiti area, there can have been no post-Archaean folding of any magnitude until after the deposition of the Nummulitic beds, and that the folding was completed before the later Tertiaries of Hundes were laid down. It was, therefore, during the Miocene period that the elevation of this part of the chain began, while the disturbance of the Siwalik-like sandstone indicates that the folding continued into the Pliocene period. Along the southern flanks of the Himalaya the history of the chain is still more clearly shown. The sub-Himalaya are formed of Tertiary beds, chiefly Siwalik or Upper Tertiary, while the Lower Himalaya proper consist mainly of pre-Tertiary rocks without fossils. Throughout the whole length of the chain, wherever the junction of the Siwaliks with the pre-Tertiary rocks has been seen, it is a great reversed fault (the "Main Boundary Fault"). The hade of the fault is constantly inwards, towards the centre of the chain, and the older rocks, which form the Himalaya proper, have been pushed forward over the younger beds of the sub-Himalaya. Moreover, nearly everywhere the fault formed the northern boundary of deposition of the Siwalik beds, and only in a few instances do any of these deposits extend even to a short distance beyond it. The fault, in fact, was being formed by the deposition of the Siwalik beds, and as they were laid down, the Himalaya were pushed forward over them, so that they were folded and upturned during the process. The Siwaliks are fluvial and torrential deposits similar to those which are now being formed at the foot of the mountains in the Indo-Gangetic plain. The "Main Boundary Fault" is really one of a series of approximately parallel faults, all of which formed the northern boundary of deposition of the deposits immediately south of them. The Himalaya grew southwards in a series of stages. A reversed fault was formed at the foot of the chain, and upon this fault the mountains were pushed forward over the beds deposited at their base, crumpling and folding them in the process, and forming a sub-Himalayan ridge in front of the main chain. This process was repeated several times and the earthquakes of to-day in this region can be traced to the fault lines and show that crustal equilibrium has not yet been reached.

Topographical Results of Evolution.—The uplift of the Himalayas was a gradual process protracted over a very long period and the process had a very marked effect upon the scenery, the topography and the river system. The latter is not consequent upon the structure, but the principal rivers were of an age anterior to the Tertiary earth-movements and the drainage is spoken of as "antecedent." During the slow process of uplift, folding and faulting the rivers were able to keep, for the most part, to their original courses, although their erosive power was increased owing to increased gradients. Thus we find the rivers cutting through the main chains in deep transverse gorges after flowing for long distances parallel to the trend of the chain. Examples of this are the Indus and the Brahmaputra.

In the outer valleys of the Himalaya the sides are generally steep, so steep that landslides frequently occur, whilst the streams are still cutting down the river beds and have not yet reached their base level. Here and there a valley has become filled with alluvium, owing to some local obstruction, and when this occurs there is usually to be found a fertile and productive field for agriculture. The straits of the Jhelum, below Baramula, probably account for the lovely vale of Kashmir, which is in form (if not in principles of construction) a repetition on a grand scale of the Maidan of the Afridi Tirah, where the drainage from the slopes of a great amphitheatre of hills is collected and then arrested by the gorge which marks the outlet to the Bara.

Other rivers besides the Indus and the Brahmaputra begin by draining a considerable area north of the snowy range—the Sutlej, the Kosi, the Gandak and the Subansiri, for example. All these rivers break through the main snowy range ere they twist their way through the southern hills to the plains of India. Here the "antecedent" theory will not suffice, for there is no sufficient catchment area north of the snows to support it. Their formation is explained by a process of "cutting back," by which the heads of these streams are gradually eating their way northwards owing to the greater rainfall on the southern than on the northern slopes. The result of this process is well exhibited in the relative steepness of slope on the Indian and Tibetan sides of the passes to the Indus plateau. On the southern or Indian side the routes to Tibet and Ladakh follow the levels of Himalayan valleys with no remarkably steep gradients till they near the approach to the water-divide. The slope then steepens with the ascending curve to the summit of the pass, from which point it falls with a comparatively gentle gradient to the general level of the plateau. The Zoji La, the Kashmir water-divide between the Jhelum and the Indus, is a prominent case in point, and all the passes from the Kumaon and Garhwal hills into Tibet exhibit this formation. Taking the average elevation of the central axial line of snowy peaks as 19,000 ft., the average height of the passes is not more than 10,000 owing to this process of cutting down by erosion and gradual encroachment into the northern basin. (See also TIBET; LEH.)

Climate.—Independently of the enormous variety of topography the vast altitude of the mountains alone is sufficient to cause very great modifications of climate. One-half of the total mass of the atmosphere and three-fourths of the water suspended in it in the form of vapour lie below the average altitude of the Himalaya; and of the residue, one-half of the air and virtually almost all the vapour come within the influence of the highest peaks. The mean winter temperature at 7,000 ft. (which is about the average height of Himalayan "hill stations") is 44° F and the summer mean about 65° F, but in the valleys a temperature of 90 to 100° F may be felt during the day in May and June. At 9,000 ft. the mean temperature of the coldest month is 32° F. At 12,000 ft. the thermometer remains above freezing-point from the end of May to the middle of October, but at 15,000 ft. is seldom above that point even in the height of summer. It should be noted that the thermometrical conditions of Tibet vary considerably from those of the Himalaya. At 12,000 ft. in Tibet the mean of the hottest month is about 60° F and of the coldest about 10° F, while at 15,000 ft. the frost is only permanent from Nov. 1 to May 1. In Tibet the daily range may be 60° and often reaches 50°. The temperature of the sandy surface varies even more and records of 2° and 96° have been taken within 24 hours by the Everest expedition. The soil beneath the surface is far more constant in temperature. The difference of temperature between forest-clad ranges and the Indian plains is twice as much in April and May as in December or January; and the difference between the temperature of a well-wooded hill top and the open valley below may vary from 9° to 24° within twenty-four hours. The general relations of temperature to altitude as determined by Himalayan observations are as follows: (1) The decrease of temperature with altitude is most rapid in summer. (2) The annual range diminishes with the elevation. (3) The diurnal range diminishes with the elevation.

Rainfall is chiefly related to the monsoonal rainfall of India of which the Himalayas catch a large portion. There is more

rain, and rain for a longer season, in the east than in the west. The east may have 50 to 80 in. of rain against southward hill slopes and in certain spots even higher totals are reached, for example Darjeeling gets 120 inches. The rainfall diminishes westward to 40 inches near the place where the Ganges leaves the mountains and falls to 30 towards the emergence of the Indus from the mountains, while in places in a rain-shadow the fall may be only 15 in. though they are in a zone that on the whole averages 30 or more. In the arid zone protected from the rainy winds the rainfall goes below 15 in. and in Tibet for the most part well below 10 inches.

In Tibet the rapid heating of the plains by the morning sun brings a fierce wind down daily from the eternal snows and some air may thus drift through such partial gaps as there are in the great range from India to the Tibetan table-land.

In the eastern Himalaya the ordinary winter limit of snow is 6,000 ft. and it never lies for many days even at 7,000 ft. In Kumaon, on the west, it usually reaches down to the 5,000 ft. level and occasionally to 2,500 feet. Snow has been known to fall at Peshawar. At Leh, in western Tibet, hardly 2 ft. of snow are usually registered and the fall on the passes between 17,000 and 19,000 ft. is not generally more than 3 ft., but on the Himalayan passes farther east the falls are much heavier. Even in September these passes may be quite blocked and they are not usually open till the middle of June. The snow-line, or the level to which snow recedes in the course of the year, ranges from 15,000 to 16,000 ft. on the southern exposures of the Himalaya that carry perpetual snow, along all that part of the system that lies between Sikkim and the Indus. It is not till December that the snow begins to descend for the winter, although after September light falls occur which cover the mountain sides down to 12,000 ft., but these soon disappear. On the snowy range the snow-line is not lower than 18,500 ft. and on the summit of the table-land it reaches to 20,000 ft. On all the passes into Tibet vegetation reaches to about 17,500 ft., and in August they may be crossed in ordinary years up to 18,400 ft. without finding any snow upon them; and it is as impossible to find snow in the summer in Tibet at 15,500 ft. above the sea as on the plains of India.

The glaciers of the Himalayas seem to be in retreat. On the north side of Everest the Rongbuk glacier ends at about 16,500 ft. and the Kyetrak glacier at 15,400 feet. In the Kinchinjunga group the glaciers may come down to 13,000 ft. while in Kumaon they reach 12,000 ft. and in Kashmir, in special situations, they may come as low as 8,000 feet. The level reached is, as in Europe, 3,000–5,000 ft. below the limit of perpetual snow. The air temperatures at the ends of the glaciers are about as in Europe, namely, nearly 60° in July and diminishing slowly until the end of September. Several glaciers are 11–16 m. long, the higher figure being attained in the Kinchinjunga series. Italian geologists have investigated the moraines of the Karakoram Mts. and have given evidence of the great ice sheets of the Pleistocene glaciation, ice sheets which may have been one continuous mass over the whole of central Asia. They have further shown that there is evidence of phases of variation during the Pleistocene Ice Age which seem to correspond with those observed in Europe.

Plants.—A valuable study of the ecology of the Himalayan forests of Osmaston (*Journ. Ecology*, Cambridge, England, 1922, vol. x., p. 129), and the observations taken by the Everest expeditions have added considerably to knowledge of the plants of this region.

The European flora of the Mediterranean reaches the Himalaya, but very few of its members attain the eastern end of the chain. Some Japano-Chinese forms such as *Aucuba*, *Helwingia*, *Skimmia*, *Adamia*, *Goughia* reach the east of the chain, but do not spread far to the west. It is naturally at fairly high levels that the European forms are found, but *Tilia*, *Fagus*, *Arbutus*, *Erica*, *Azalea* and the *Cistaceae* are absent. An African element is claimed to reach the western Himalayas.

The eastern section is very warm and damp and intertropical plants live even at 7,000 ft. above sea, while the forest reaches up to nearly 13,000 ft. in places. In the west the corresponding levels are 5,000 and under 12,000 ft., the dry season being more

marked and the variation of temperature greater.

Using Osmaston's general classification of the forests we have:

(1) The *Shorea* (-Sal) *Anogeissus-Pinus* formation in the warm moist valleys, and up to about 6,500 ft. in places. The warm temperature implies heavy evaporation and rapid decomposition of humus. This forest may be called warm subtropical, the trees form an open canopy and belong to species that either shed their leaves in the warm weather before the rains, or are needle-leaved conifers. *Pinus longifolia* is specially able to survive fires and *Anogeissus* has special powers of coppicing so that it survives grazing and lopping. *Anogeissus* lives up to a 4,000-ft. level in large groups and reaches west as far as the neighbourhood of Srinagar (Kashmir). (2) The *Quercus-Abies* formation on the moist hill sides from 5,000 ft. to 11,500 ft., where the rainfall is typically 50–80 in. per annum, and some of it is snow. The parts which face south are apt to get dry in November and December and from April to June and in the latter season there are often forest fires. The heat and rainfall prevent accumulation of much humus on the south side except under special circumstances, but the north side has humus, and there forest fires are rare. The general covering is dense on the north, but less so on the south; evergreen oaks are the commonest trees, epiphytic ferns abundant and on higher levels mosses and lichens encrust the tree-trunks. (3) The *Pinus-Cedrus* formation on the drier mountain flanks from 9,000 ft. to 12,000 ft. with a rainfall of 10 to 40 in., but in winter the precipitation is mainly snowfall and the temperature is low. Slopes facing the sun are apt to be very dry and suffer from fires. Trees and grass often occur together, both giving place to shrubs in some areas with long dry periods. *Cedrus* itself reaches the 8,000-ft. level in the moist zone, but the 10,000-ft. level in the dry one, it grades into cypress below and blue-pine above. The cypress suffers specially from fires and perhaps for this reason is rarely found near grassland in the Himalayas; it favours rather the steep rocky hill sides. (4) The *Betula-Rhododendron* formation has a general distribution between the 9,000- and the 13,500-ft. contours with vegetative activity chiefly during the monsoon rains. The cold soil makes absorption by the roots slow even if there be abundant moisture, as there is in some parts. The rainfall varies very much and a large proportion is really snowfall, and the formation generally occurs where insolation is low because of a north aspect, or cloudiness. The formation makes a dense covering, but there are no large trees and the branches often bend down and are flexible. It is sometimes quite absent in the moist zone in which oak forest may be succeeded above by grass; much has to be allowed in this matter for the depredations of grazing animals. Sometimes one finds a *Rhododendron-Lonicera* shrubby group, sometimes a *Betula-Abies* tree-group, but it is difficult to distinguish different conditions for them. *Lonicera obovata* is restricted to the higher part of the zone. (5) The *Caragana-Lonicera-Artemisia* formation in the arid Tibetan zone 9,000 ft. to 15,000 ft. above sea with extremely dry conditions during the short period in which vegetative activity is possible. The sun is strong and the dry atmosphere gives it unusual power. The strong daily wind down from the peaks transports sand and dust. Trees and shallow rooted grasses are almost absent, shrubs have branches bent down and very flexible and the leaves are deciduous. *Salix* and *Myricaria* form associations related to No. 5, but choosing moister spots near streams. Only a few plants, save willows and junipers, grow taller than 2 ft. or so. The small amount of grass, and shoots of shrubs are a precious resource to yaks and other animals of the heights and water weeds of the cold lakes are also useful to them. The mouse-hares lay up stores of seeds in their burrows for the winter and perhaps on the whole help in this way to maintain some species of plants.

Animals.—On the outer fringes the Himalayan fauna grades into that of the surrounding regions. Towards India, for example, the langur (*Semnopithecus* sp., a monkey) elephant, rhinoceros, tiger, leopard, civet, mongoose (*Herpestes*), toddy cat (*Paradoxurus*), cat-bear (*Aelurus*), *Helictis* (an aberrant badger), linsang (an aberrant civet), the last two of Malayan affinities, and the bamboo-rat (*Rhizomys*) of the base of eastern Himalayas. The Himalayan fauna in the stricter sense, especially on the Tibetan

side, is, however, mainly northern in its affinities. The fossils of the Siwalik beds include remains of 84 species of mammals akin to those of Miocene and Pliocene Europe. The langur reaches as high as the 12,000-ft. level and bears, martens and related forms and several cats are features of the forests, while moles abound, though they are unknown in India; foxes and wolves are unknown in the forest area, but both, and also the lynx, ounce, marten, ermine and wild ass occur on the Tibetan side, also musk-deer, antelope (2 species) and sheep. The wild dog (*Cyon*) is found in the forest area, so is the wild pig, a form of which reaches very high levels, but the gaur or wild ox is confined to the lower lands; two species of the scaly anteater (*Manis*) reach the eastern Himalayas, but the chevrotain, another southeast Asiatic form, is absent. Goat-like animals called the serow (*Nemorhaedus*), goral (*Cemas*), and tahr (*Hemitragus*) are found, and the tahr ranges up to great heights. The yak and other animals of the great altitudes will be discussed below.

The bird life of the Himalayas is wonderfully rich. Eagles, vultures and many birds of prey soar to great heights. Gorgeous colouring occurs among sun-birds, trogons, kingfishers, etc., but of the parrot family only parrakeets and a small lory are known. The peacock occurs in the forests bordering the plains on the Indian side, and pheasants and partridges include varieties adapted to life on the snow at great altitudes. Waders and waterfowl are not very important features.

Among the snakes the python is found on the Indian side and the cobra penetrates as high as some 8,000 ft. above sea. Lizards and frogs abound and reach remarkable elevations, the lizard, *Phrynocephalus*, and a frog being found even in Tibet. Of the fishes only two Acanthopterygii enter the mountains, most of the fish of the region belonging either to the catfish family (*Siluridae*) or the carp family (*Cyprinidae*), a few of the former and a number of the latter live in Tibetan waters. Most of the fishes of high mountain-torrents have suckers with which to hold on to rocks. The salmon family is absent from the region.

The butterflies are renowned for their magnificence and include among others *Papilionidae*, *Nymphalidae*, *Morphidae*, and *Danaidae*. Insect life of all kinds is very rich and locust-swarms are carried up by the winds even to the perpetual snow.

Major Hingston of the Indian Medical Service has given valuable accounts of the natural history of animals at great altitudes in the Himalayas. Protective colouring, usually in browns and greys akin to those of the desert-like surface of Tibet, is almost universal. The mouse-hare (*Ochotona*) is common and even the sheep and gazelles are coloured like the soil. Most of the birds are protectively coloured, though some show bright colours when on the wing. Unlike the large mammals, the large birds are not protected in colour, and the eagles, kites, ravens and choughs abound. It is said that the birds living among the villages are not protectively coloured. That type of coloration is common among insects, spiders, etc.

The intense cold of the great heights is made still more trying by the fierce winds that rush down from the snows to the plateau as the latter warms up in the morning sun. As a protection most mammals have thick hair and the dogs have wool as well; even the pig is thickly covered with hair. The yak has a coat of wool over which is the long hair that forms a protective skirt under the belly, while the tail may be described as a unique windscreen. The hair under the belly is thought by Major Hingston to keep the animal's legs warm when it is resting. The yak stands with its hindquarters to the wind. The smaller animals and the birds mostly shelter among the rocks and stones when the wind becomes strong, but many of them illustrate its power of damaging fur and feathers. The birds generally face the wind and the great vultures are able to some extent to make use of it. The butterflies may protect themselves by pressing their wings against a stone in as sheltered a nook as can be found. Major Hingston found *Parnassius* sp. as high as 17,000 ft. above sea-level.

The sharp changes of temperature within a few hours, known in all mountain regions, are accentuated here and may be very trying in winter. Many animals of the high mountains are protected from this by the habit of hibernation in burrows where, a

little beneath the snow and the surface soil, the temperature is much more uniform. The mouse-hare was seen by Major Hingston as high as 17,000 ft. above sea and he thinks it may reach 20,000 ft. as a stray. Several birds go up to 20,000 ft. and more on the mountain side, and choughs followed the Everest climbers as high as 27,000 ft.; they seem least incommoded by the great heights. The habits of mammals and birds have been noticed to change on the great heights; thus birds which elsewhere are of the wild, live there on and around the villagers' houses, while communities (even some of birds and mammals) are a characteristic development with mutual aid in view.

HIMERA, an ancient city on the north coast of Sicily, on a hill above the west bank of the Himera Septentrionalis, south of the present railway station of Buonfiorello 6 m. east of Termini Imerese. It was founded in 648 B.C. by Chalcidian inhabitants of Zancle and Syracusan exiles. Early in the 5th century the tyrant Terillus, son-in-law of Anaxilas of Rhegium and Zancle, appealed to the Carthaginians, who came to his assistance, but were utterly defeated by Gelon of Syracuse in 480 B.C., on the same day, it is said, as the battle of Salamis. Thrasydaeus, son of Theron of Agrigentum, seems to have ruled the city oppressively, but an appeal made to Hieron of Syracuse, Gelon's brother, was betrayed by him to Theron; the latter massacred all his enemies and in the following year resettled the town. In 408 Hannibal, after capturing Selinus, destroyed Himera, founding a new town close to the hot springs (Thermae Himeraeae), 8 m. to the west, which, however, soon became a Greek city. The only relic of the ancient town now visible above ground is a small portion (four columns, lower diameter 7 ft.) of a Doric temple, the date of which (whether before or after 480 B.C.) is uncertain.

HIMERIUS (c. A.D. 315-386), Greek sophist and rhetorician, was born at Prusa in Bithynia. He completed his education at Athens, whence he was summoned to Antioch in 362 by the emperor Julian to act as his private secretary. After the death of Julian in the following year Himerius returned to Athens, where he established a school of rhetoric, to which pupils came from all over the world; among them were Gregory of Nazianzus and Basil the Great, bishop of Caesarea; in his later years he became blind and he died of epilepsy. Although a heathen, who had been initiated into the mysteries of Mithra by Julian, he shows no prejudice against the Christians. Himerius is a typical representative of the later rhetorical schools. Photius (cod. 165, 243 Bekker) had read 71 speeches by him, of 36 of which he has given an epitome; 24 have come down to us complete and fragments of 10 or 12 others. They consist of epideictic or "display" speeches after the style of Aristides, the majority of them having been delivered on special occasions, such as the arrival of a new governor, visits to different cities (Thessalonica, Constantinople), or the death of friends or well-known personages.

The *Polemarchicus* is a panegyric of those who had given their lives for their country. Other declamations, only known from the excerpts in Photius, were imaginary orations put into the mouth of famous persons—Demosthenes advocating the recall of Aeschines from banishment, or Themistocles inveighing against the king of Persia. Himerius is more of a poet than a rhetorician, and his declamations are valuable as giving prose versions or even the actual words of lost poems by Greek lyric writers. The prose poem on the marriage of Severus and his greeting to Basil at the beginning of spring are quite in the spirit of the old lyric. Himerius possesses vigour of language and descriptive powers, though his productions are spoilt by too frequent use of imagery, allegorical and metaphorical obscurities, mannerism and ostentatious learning. But they are valuable for the history and social conditions of the time, although lacking the sincerity characteristic of Libanius.

See Eunapius, *Vitae sophistarum*; Suidas, s.v.; editions by G. Wernsdorf (1790), with valuable introduction and commentaries, and by F. Dübner (1849) in the Didot series; C. Teuber, *Quaestiones Himerianae* (Breslau, 1882); on the style, E. Norden, *Die antike Kunstprosa* (1898).

HIMMEL, FREDERICK HENRY (1765–1814), German composer, was born on Nov. 20, 1765 at Treuenbrietzen, Brandenburg. The production of his oratorio *Isaaco* (1792) procured his appointment as court Kapellmeister to the king of Prussia. His Italian operas, successively composed for Stockholm, St. Petersburg and Berlin, were all received with great favour in their day. Of greater importance than these, however, is an operetta to German words by Kotzebue, called *Fanchon*, a good specimen of the German *Singspiel*. Himmel's gift of melody is shown in the still popular anthem "Incline thine ear." He died in Berlin on June 8, 1814.

HIMYARITES: see ARABIA: History.

HINCKLEY, a market town of Leicestershire, England, 14½ m. S.W. from Leicester by rail, and near the Ashby-de-la-Zouch canal. Pop. of urban district (1921) 13,652. The church of St. Mary is a Decorated and Perpendicular structure. The ditch of a castle erected by Hugh de Grentismenil in the time of William Rufus is still to be traced. Hinckley is the centre of a stocking-weaving district, and its speciality is circular hose. It also possesses a boot-making industry. There are mineral springs in the neighbourhood.

HINCKS, SIR FRANCIS (1807–1885), Canadian statesman, was born at Cork, Ireland, and migrated to Canada, where he settled in business at Toronto. After ten years of political life he became premier of Canada (1851–54), and co-operated with Lord Elgin in negotiating the reciprocity treaty of 1854 with the United States. In 1855 he was chosen governor of Barbados and the Windward Islands, and subsequently governor of British Guiana. He was finance minister (1869–73) in the cabinet of Sir John Macdonald. In 1879 the failure of the Consolidated Bank of Canada, of which he was president, led to his being tried for issuing false statements. Though found guilty on a technicality (see *Journal of the Canadian Bankers' Association*, April 1906), judgment was suspended and his personal credit remained unimpaired. He died on Aug. 18, 1885.

His writings include: *The Political History of Canada between 1840 and 1855* (1877); *The Political Destiny of Canada* (1878), and his *Reminiscences* (1884).

HINCMAR (c. 805–882), archbishop of Reims, was born of noble parents and received his education at St. Denis under the direction of abbot Hilduin who brought him in 822 to the court of the emperor Louis the Pious. When Hilduin was disgraced in 830 for supporting Lothair, Hincmar accompanied him into exile at Corvey, but returned with him when the abbot was reconciled with the emperor. Through the influence of Charles the Bald, he received the abbacies of Notre-Dame at Compiègne and St. Germer de Fly, and in 845, the archbishopric of Reims. Archbishop Ebbo had been deposed in 835 at the synod of Thionville (Diedenhofen) for having broken his oath of fidelity to the emperor Louis, but on the death of Louis, he regained possession of his see for some years (840–844), until in 844 Pope Sergius II. confirmed his deposition.

From the beginning of his episcopate Hincmar was in conflict with the clerks who had been ordained by Ebbo during his re-appearance. His view that their ordination was invalid was confirmed in 853 at the council of Soissons, and in 855 by Pope Benedict III. This conflict, however, bred an antagonism of which Hincmar was later to feel the effects. During the next 30 years the archbishop of Reims played a very prominent part in political and religious affairs. In the latter sphere, his first encounter was with Gottschalk (q.v.), whose predestinarian doctrines were claimed to be drawn from St. Augustine. Hincmar secured the condemnation of these doctrines at Quierzy (853) and Valence (855), and the decisions of these two synods were confirmed at the synods of Langres and Savonnières, near Toul (859). To refute the predestinarian heresy he composed his *De praedestinatione Dei et libero arbitrio*, and against certain propositions advanced by Gottschalk on the Trinity he wrote his *De una et non*

trina deitate. The question of the divorce of Lothair II., king of Lorraine, who had repudiated his wife Theutberga to marry his concubine Waldrada, engaged Hincmar's literary activities in another direction.

In the middle of the 9th century there appeared in Gaul the collection of false decretals known as the Pseudo-Isidorian Decretals. Rothad, bishop of Soissons, one of those who favoured the pseudo-Isidorian theories, came into collision with his archbishop. Deposed in 863 at the council of Soissons, presided over by Hincmar, Rothad appealed to Rome. Pope Nicholas I. supported him, and in 865, in spite of the protests of the archbishop of Reims, Arsenius, bishop of Orta and legate of the Holy See, was instructed to restore Rothad to his episcopal see. Hincmar experienced another check when he endeavoured to prevent Wulfad, one of the clerks deposed with Ebbo, from obtaining the archbishopric of Bourges. Nicholas I. pronounced in favour of the deposed clerks, and Hincmar had to submit. He was more successful in his contest with his nephew Hincmar, bishop of Laon, who refused to recognize the authority of his metropolitan. Hincmar exposed his errors in a treatise *Opusculum LV. capitulorum*, and procured his deposition at the synod of Douzy (871). A more serious conflict arose between Hincmar on the one side and Charles and the pope on the other in 876, when Pope John VIII., at the king's request, entrusted Ansegisus, archbishop of Sens, with the primacy of the Gauls and of Germany, and created him vicar apostolic. Hincmar regarded this as an encroachment on the jurisdiction of the archbishops, and published his *De jure metropolitanorum*. At the same time he wrote a life of St. Remigius to prove the supremacy of the church of Reims over the other churches. Charles the Bald, however, upheld the rights of Ansegisus at the synod of Ponthion. On Charles's death, he helped to secure the submission of the nobles to Louis the Stammerer, whom he crowned at Compiègne (Dec. 8, 877).

To Carloman, on his accession in 882, Hincmar addressed his *De ordine palatii*, partly based on a treatise (now lost) by Adalard, abbot of Corbie (c. 814), in which he set forth his system of government and his opinion of the duties of a sovereign, a subject he had already touched in his *De regis persona et regio ministerio*, and in his *Instructio ad Ludovicum regem*. In 882 an irruption of the Normans forced him to take refuge at Epernay, where he died on Dec. 21, 882.

Hincmar's works, which besides the above include many theological tracts and a continuation from 861 of the *Annales Bertiniani*, written by Prudentius, bishop of Troyes, were printed in Paris (1645) and in Migne, *Patrol. Latina*, vol. cxxv. and cxxvi. See J. C. Prichard, *Life of Hincmar* (1849); C. von Noorden, *Hinkmar, Erzbischof von Reims* (Bonn, 1863); H. Schrörs, *Hinkmar, Erzbischof von Reims* (Freiburg-i-B., 1884); Abbé Lesne, *La Hiérarchie épiscopale en Gaule et en Germanie* (1905); Hefele, *Konziliengeschichte IV.* (Freiburg-i-B., 1879).

HIND, the female of the red-deer, usually taken as being three years old and over, the male being known as a "hart." It is sometimes applied to the female of other deer.

In Scotland the "hind" is a farm servant, with a cottage on the farm, and duties and responsibilities that make him superior to the rest of the labourers. Similarly "hind" is used in certain parts of northern England as equivalent to "bailiff."

HINDEMITH, PAUL (1895–), German composer, was born at Hanau on Nov. 16, 1895, and studied at the Hoch conservatorium in Frankfurt. For eight years (1915–23) he was first leader and then conductor of the opera there. In 1923 he joined the Amar quartet as viola-player. Hindemith is one of the most important of the younger school of German composers and among much which is frankly experimental and subversive he has produced a good deal also which has secured the genuine approbation of even conservatively-inclined musicians. His works include three one-act operas, *Mörder, Hoffnung der Frauen* (1921), *Das Nusch-Nuschi* (1921), *Sancta Susanna* (1922); *Cardillac* (1927) and much chamber music, amongst which are four string quartets, a string trio, a wind quintet, and six works for chamber orchestra with one solo instrument (*Kammermusik* Nos. I.–VI.).

See F. Wilms, "Paul Hindemith," in *Von neuer Musik* (1925); Heinrich Strobel, *Paul Hindemith* (1928).

HINDENBURG, PAUL VON (1847–), German soldier and president of the German Reich. Paul Ludwig Hans von Beneckendorff und von Hindenburg was born in Posen Oct. 2, 1847, the son of a Prussian officer. His childhood was spent in his parents' house, and later in Pinne and Glogau. In 1858 he entered the cadet school at Wahlstatt in Silesia, afterwards joining the chief cadet academy in Berlin. At an early age the severity of the training in the Prussian cadet corps lent a note of inflexibility to his character, and developed in him strength of will, resolution and cool-headedness. Intellectually, he developed relatively late, owing to early illnesses and to his too rapid physical growth. Ambition awoke in him slowly; but as success crowned his efforts it grew unceasingly, and won him the reputation of a particularly gifted pupil. At the age of 18 he entered the 3rd Foot Guards at Danzig as a second-lieutenant in 1866, and soon after made his first appearance on the battlefield. At the battle of Königgrätz he stormed with his squadron an Austrian battery under fire. He took part in the war of 1870–71 as adjutant to a battalion, and after gaining distinction at St. Privat, became adjutant to the regiment.

After three years at the staff college in Berlin, he served with the general staff in 1877, and was soon promoted to the rank of captain. The next years were spent as company commander and chief of battalion and in various posts on the general staff. In 1883 he became an instructor at the Staff College in Berlin; and later, on the general staff under Count Schlieffen, he was the spiritual pupil and assistant of that strategist of genius. Several years' labour in the Prussian War Office developed his talent for organisation. After serving from 1893 to 1896 as commander of the 91st infantry regiment (Oldenburg), he was promoted major-general, and for four years served as chief of the general staff of the VIII. Army Corps at Coblenz, subsequently commanding the 28th Div. at Karlsruhe for three years. In 1903 he became general in command of the IV. Army Corps at Magdeburg. In 1911, being 65 years old, he was placed on the retired list.

The Outbreak of War.—The outbreak of the World War found him leading a life of seclusion in Hanover. It was in response to the threatening development of the opening campaign in the East against the Russians that on Aug. 22, 1914, he was appointed commander-in-chief of the VIII. German Army, and had assigned to him Maj.-Gen. Ludendorff as chief of staff. Though hardly acquainted with one another previously, a reciprocal confidence soon resulted, which, despite divergence of character, led to a unity of thought and deed without analogy in history. Hindenburg has given a detailed account of his relations with Ludendorff in his memoirs. When, in Germany, after the War, from personal and political motives, attempts were made to make a scapegoat of Ludendorff, the marshal denied these accusations, saying: "We belong to one another till death. Gen. Ludendorff acted in constant accord with me. He who strikes at him strikes at me." General Ludendorff, too, in his war memoirs, fully reciprocates this attitude of complete trust and confidence.

It must be recognised that the disposition of Ludendorff was the more active, that a daemonic spirit resided in him which was responsible for those decisive acts which changed the course of the world's history. His memoirs of the War and his demeanour in German politics after the War are instinct with the vehement passions of one who has been subjected to many attacks, just or unjust. During the War it was only the presence of the marshal's authority that prevented the vivid, sensitive and at times well-nigh fanatical temperament of his colleague from losing self-control. The character of Ludendorff was the harder, that of Hindenburg the greater. Their processes of thought ran upon separate lines, but each tested his own conclusions and completed them by reference to the other. Ludendorff bore the whole burden of the technical execution of the decisions, a task which he carried through with titanic strength. Hindenburg remained predominantly in the sphere of pure thought, supplying rather the static element in leadership, and leaving the dynamic side in the other's hands.

Hindenburg possessed a gift of inestimable value, and Luden-

dorff enabled him to develop it—that of economising his own mental energy and guarding it against strain and premature exhaustion. He was thus enabled to retain his nerve force until the end of the War, when he was then able to assume a heavier and more thankless task, that of saving his fellow-countrymen from the whirlpool of the revolution. In the political sphere, Gen. Ludendorff's vigorous intervention frequently involved the marshal in spite of all his distaste for political activities, in questions which he would probably have otherwise avoided. Hindenburg as a soldier was hampered by mistrust of his own political ability. Ludendorff frequently had to convince the chief of the general staff of the necessity for taking political decisions. Only the constraint of conscience and the sense of moral responsibility caused Hindenburg and Ludendorff to intervene at all in political questions.

Tannenberg.—The battle of Tannenberg, which lasted from Aug. 26 to 31, 1914, found its origin in the dispositions, involving the assembly of strong forces on the south-west flank, adopted by the superseded Gen. von Prittwitz after breaking off the engagement at Stallupönen (Gumbinnen). Hindenburg's merit lay in converting the possibility thus acquired of a successful defence against Samsonov's Russian Army of the Narew into a victory, whereby despite the numerical inferiority of the Germans the enemy were twice encircled and practically annihilated. The most brilliant feature of the operations was the concentration of all available forces in order to overwhelm this enemy, despite the threats to Hindenburg's rear, first by Rennenkampf in the north and later by new Russian forces which were approaching from the south. In the subsequent battle of the Masurian Lakes, Sept. 7–12, the Niemen army under Rennenkampf was so thoroughly dispersed in the wood and marsh lands as to be unfit for further operations for weeks. In the opening of his campaign in East Prussia Hindenburg showed consummate mastery in the employment of interior lines and in using a central position to prevent hostile forces which were advancing from different directions from uniting on the battlefield. His plan was to overwhelm the first of these with lightning swiftness, and then to turn with all his strength upon the others.

Hindenburg was unable to follow up his victories in East Prussia by advancing across the Lower Narew; the Austro-Hungarian allies had suffered a heavy defeat in Galicia, and the German commander was compelled to hasten to their immediate aid with the bulk of the German forces available in the East. This led to the combined offensive of the German IX. Army through Southern Poland towards the Vistula and of the Austrians in Galicia across the San. The German advance met with little resistance, but the roads were mere morasses. On Oct. 8 the Vistula was reached between Jozefoff and Deblin (Iwangorod) after an advance along the Opatow-Radom line. The attempt to cross the river failed, and the Austrian allies, too, came to a standstill. Finally, the German offensive drew upon itself greatly superior Russian forces which, advancing past Warsaw, assailed its left flank. In this way the ally was relieved. Hindenburg himself succeeded in escaping the threatened envelopment from the north by a timely withdrawal upon Upper Silesia. With the vision of genius he grouped the great bulk of his forces about the railway line running to West Prussia, and at the beginning of Nov. advanced in a surprise attack from the Wrzesnia-Thorn line upon the right flank of the main Russian forces lying in southern Poland. He succeeded at the battle of Łódź in bringing the "Russian steamroller" to a standstill, and eventually compelled the enemy to withdraw behind the Bzura and Rawka.

Further Operations in the East.—Hindenburg in the meantime had been appointed marshal and commander-in-chief of all the German forces in the East. His next blow was in Masuria in Feb. 1915 against the northern wing of the Russian Army on the Upper Bobr, and led to the annihilation of the X. Russian Army. But the attempt to advance across the Narew to Bialystok failed, owing to a powerful Russian counter-offensive at Prazasnysz. The general eastern campaign, directed by Gen. von Falkenhayn, was now concentrated upon Galicia, where on May 8 the break-through at Gorlice-Tarnow initiated a promis-

ing offensive. The front line of the army group of Hindenburg, stretching from the upper Vistula as far as Courland, remained stationary throughout this period, except for local offensives and a large scale cavalry raid. Not until the middle of July was Hindenburg's front-line set in motion, in co-operation with the victorious progress of the offensive in Galicia and southern Poland. But Gen. von Falkenhayn and the Marshal differed fundamentally in their attitude towards the cardinal problem of the War. Hindenburg's conviction, founded on the teaching of Clausewitz, was that the salvation of the Central Powers depended on the destruction of the Russian colossus. He believed that a great "Cannae" was attainable in the East, and that with such a victory all political and military considerations which fettered the commander in his power of decision would vanish.

Falkenhayn, on the other hand, held that it was sufficient by means of a "campaign with limited objectives" to keep the Russian Army at bay and to cripple its offensive power. Hindenburg's proposal was to take the offensive on his extreme left flank on the Niemen northwards past Kovno in the direction of Wilna and beyond, and thus to sever the northern arteries of the Russian Army—namely, the railways. This plan was rejected by Falkenhayn in favour of the advance across the lower Narew, which proved successful, for in conjunction with the successes of Mackensen and of the Austrians in southern Poland it caused the whole Russian front line to waver. Yet it was only gradually and in consequence of continual front-line engagements that the enemy allowed themselves to be driven back upon their rear-guard communications towards the East. Several times during the operations Hindenburg brought up the question of his original project; he also carried out unaided the attack upon the fortress of Kovno, which fell on Aug. 18. Eventually, early in Sept., Falkenhayn gave way ostensibly, without, however, placing at Hindenburg's disposal the strength requisite for carrying out his plans. The offensive upon Wilna, begun too late, encountered powerful Russian forces, and it was only possible to press back the Russian front line, no decisive encounter having taken place.

From the autumn of 1915 onwards Gen. von Falkenhayn treated the East as a merely subsidiary seat of war; for while he was striving to wear down the French forces at Verdun the German eastern front was condemned to inactivity. This facilitated the great Russian successes in June and July against the Austro-Hungarian front, which was broken through and almost shattered at Luck. In Aug. when the danger was at its greatest, the whole of the eastern front from the Gulf of Riga to Galicia was united under Hindenburg. He brought order where chaos had reigned. On the upper Sereth, at Brody and on the Styr a new rampart arose, which, however, proved tenable only where German troops stiffened their allies' resistance. Meanwhile the struggle for Verdun continued to rage, and the battle on the Somme reached its culminating point.

At Headquarters.—When in Aug. Rumania joined the Entente, the Marshal, who was now the national hero, was appointed chief of the general staff in place of Falkenhayn, while Gen. Ludendorff remained with him as quartermaster-general. The new German High Command found itself confronted with innumerable heavy tasks. While the campaign against Rumania had to be improvised, it was necessary to stand on the defensive in the West. The offensive against Verdun was abandoned, not without the French having gained numerous local successes towards the end of the year. Hindenburg expressed his final aim in the words: "We intend, not to hold out to the end, but to conquer." An intensive submarine campaign was carried out as a reply to England's hunger blockade.

In the East every nerve had to be strained to force Russia to make a separate peace, while in the West the defensive campaign continued. The end of 1917 found the Quadruple Alliance, despite the tremendous demands made upon their strength—nay, despite the fact that they were almost exhausted—considerably nearer to their objective. The U-boat warfare was slowly but surely producing its effect. The Italians had in a brief but powerful offensive been, not indeed annihilated, but decisively defeated. In the East the German hammerblows at Tarnopol,

Riga and Osell (Saaremaa) had broken the fighting spirit of the new Russian ruler Kerensky, and carried the Bolsheviks into power. Peace was negotiated with them and with Rumania at Brest-Litovsk and Bucharest and, under military pressure, was finally attained in the winter of 1918. There remained the last and hardest task, the reckoning with France and England in the West, before America should be in a position to intervene as a military factor in the War on land.

In the spring of 1918 Hindenburg set himself to place the cornerstone upon the structure of his military achievements. All available effectives were utilised for this decisive conflict. The great offensive on both sides of St. Quentin was to break through the front line of the French and British on the southern flank of the latter, to roll them up towards the north and drive them towards the coast. From the tactical point of view the first blow in the direction of Amiens was a brilliant success. But it led to no practical advantage, and was supplemented by the attack upon the Lys front. But, here, too, the operations for a break-through miscarried, resulting only in a second massive concentration on the enemy front. Hindenburg, notwithstanding, clung to his resolve to deal the British a decisive blow in Flanders.

It was necessary, however, to effect a diversion in order to draw off the French reserves and to occupy them elsewhere. This led to loss of time, from which the enemy derived advantage. For the intervention of America loomed threateningly near. The first diversion at the Chemin des Dames gained considerable ground and drew in a large number of the French reserves, but not enough to pave the way for the decisive blow in Flanders. A new diverting attack on both sides of Rheims failed, whereupon Marshal Foch seized the initiative and from Villers Cotterêts attacked the German Marne position on the flank with strong forces. The Americans now appeared in the capacity of attacking troops. Hindenburg abandoned the Marne salient and held up the break-through on the Vesle. But from henceforth the initiative remained steadily in the hands of the French generalissimo, while the German reserves melted steadily away.

From a military standpoint the War was lost with the reverse of Aug. 8. Yet Hindenburg still hoped to cripple the fighting spirit of the enemy by a strategic defensive and to secure a peace compatible with the dignity of the German people. But Bulgaria's defection caused the complete collapse of the Macedonian front, and Hindenburg realised that an immediate armistice was necessary to give the army breathing space. With a just appreciation of their prospects of victory, the enemy took their time over granting an armistice, and summoning the full strength of their tremendous material superiority proceeded to force the German Army to throw in its last reserves. Meanwhile Turkey and Austria abandoned their rôles as allies of Germany, who found herself flung entirely upon her own resources in the final struggle. Hindenburg and Ludendorff wished to rouse the people to a final heroic effort of exertion; but the Cabinet of Prince Max of Baden lacked the capacity to check the revolution, and Germany was handed over unconditionally to the dictates of the enemy.

The marshal, victor in countless battles, had to return home, therefore, not as supreme war-lord but as a beaten general. Yet even in misfortune and profound humiliation his spirit remained unbroken, and he succeeded in extricating his country from the disorder of the revolution.

After the war Hindenburg lived in retirement, taking no active part in political life, until the presidential elections following the death of President Ebert. The anti-socialist parties in Germany then combined, and induced him to stand for the presidency as a national figure, representing, indeed, conservative views, but standing to some extent above party. He was elected president on April 26, 1925.

Neither the fears of France, who saw in Hindenburg's election the first step towards a war of revenge, nor the hopes of the German monarchists, were realised. Although openly acknowledging his own monarchist sympathies, Hindenburg remained absolutely loyal to the Republic of which he was president, nor did

he in any sense encourage a provocative foreign policy. He involved himself personally in few disputes, but on May 5, 1926, he issued, without consulting the Reichstag, a decree authorising diplomatic missions and consulates abroad to fly the German commercial flag beside the Republican flag—a move which brought the hostility between monarchists and republicans to a head and led to the fall of the chancellor; and a few days later (May 19) expressed himself strongly in a private letter, which was published in the press, against the justice of the referendum for expropriating the former reigning houses. His few subsequent excursions into politics aroused far less controversy. His emphatic repudiation of Germany's war-guilt at a speech made at Tannenberg (Sept. 18, 1927), was echoed through nearly all Germany, and his appointment of General Groener as minister of defence (Jan. 19, 1928) was welcomed by the republicans. The simplicity, dignity and fidelity with which he has borne himself as president have earned him the name of a great gentleman as well as a great patriot.

HINDENBURG (ZABRZE), a town of Germany, in the extreme south-east of Prussian Silesia, on the railway between Gleiwitz and Königshütte. Pop. (1925) 72,856. Like other towns in this region, it is an important manufacturing centre, having coal-mines, iron, wire, glass, chemical works, breweries, etc.

HINDENBURG LINE, BATTLES OF 1918. On Aug. 26, 1918, began the third stage of the series of offensive operations which formed the British share of the Allied advance to victory. This stage culminated on Oct. 5 in the capture of the last and strongest system of German defence, known as the Hindenburg Line. The first stage had been the attack by Rawlinson's IV. Army, assisted by the French I. Army under Debeney, eastwards and southeastwards from Amiens with the object of freeing the Paris-Amiens railway. In the second phase the British III. Army under Byng had extended the front of the attack northwards by a successful thrust towards Bapaume. The British I. Army under Horne was now to broaden the front of attack by driving eastwards from Arras with the object of turning the German positions on the Somme battlefields.

Hindenburg Line Described.—The Hindenburg Line consisted of a heavily wired system of trenches which ran northwards from St. Quentin to the village of Bantouzelle approximately parallel to the Schelde Canal. This portion was known to the Germans as the Siegfried Line. From Bantouzelle the main line of trenches ran northwest to Havrincourt, whence it turned north and followed the line of the Canal du Nord to Moeuvres. From Moeuvres it ran northwest past Quéant and Bullecourt to the original German front line east of Arras. Within this northern bend in the system, and covering the approaches to Cambrai, lay several switch lines and defensive positions, the most formidable of which were the Drocourt-Quéant Line, which ran in a northerly direction from the Hindenburg Line at Quéant, and the Canal du Nord, which passed by Moeuvres to the Sensée.

On the night of Aug. 25-6 the British line extended from a point northwest of Chaulnes, where the right of the British IV. Army joined the left of the French I. Army, east of Bray, west of Bapaume to Croisilles, and thence northwest to the old British line, southeast of Arras. The IV. Army had the Australian and III. Corps in line; the III. Army, which extended northwards from a point east of Albert, had the V., IV., VI. and XVII. Corps. The I. Army front was held by the Canadian Corps and the VIII. and I. Corps, of which only the Canadian Corps, astride the Scarpe, was involved in the operations to be described. The German troops who were to bear the brunt of the impending blow were the left wing of Bülow's XVII. Army, the II. Army under Marwitz and the right wing of Hutier's XVIII. Army.

The Offensive Launched.—At 3:00 A.M. on Aug. 26 the Canadian Corps under Sir A. Currie attacked the German positions astride the Scarpe on a front of 5½ miles. The attack was carried out by the 2nd and 3rd Canadian Divs. and the 51st High-

land Div. supported by 45 tanks and some 600 guns. The XVII. Corps of the III. Army co-operated on the right. The attack was a complete success. The Bavarian II. Corps and Bavarian I. Res. Corps were driven back through Wancourt, Guémappe, Monchy and Roeux, and by evening, in spite of strong counter-attacks, the Canadian Corps had established itself well to the east of those villages. On Aug. 27 the attack was continued by the same divisions, and Chérisy, Vis-en-Artois and Gavrelle fell into their hands. On the following day the Canadian 3rd Div. made further progress, and that night both divisions were relieved, the Canadian 2nd Div. by the Canadian 1st, while the British 4th Div. relieved the Canadian 3rd. During the next few days considerable progress was made. This advance brought the British to within assaulting distance of the formidable trench system known to the Allies as the Drocourt-Quéant Line, and to the Germans as the Wotan Line. The capture of this system, would, it was anticipated, turn the whole of the German organized positions for some distance southwards. Preparations were put in hand to launch the attack on Sept. 2. The XXII. Corps took over the front north of the Scarpe held by the 51st Div. and relieved that division by the 11th.

The Drocourt-Quéant Line Attacked.—By the evening of Sept. 1 all preparations for the attack of the Drocourt-Quéant Line were complete. The main attack was to be carried out by the Canadian Corps, whose principal task was to break through the defences between Hendecourt and Sailly. The XXII. Corps, also of the I. Army astride the Scarpe, was to secure the Canadian left, while the XVII. Corps of the III. Army, advancing on the right of the Canadians, was to capture the maze of trenches at the junction of the Drocourt-Quéant and Hindenburg lines, and turn the last named defensive position from the north. The XVII. and Canadian Corps were then to push on up to and if possible beyond the Canal du Nord.

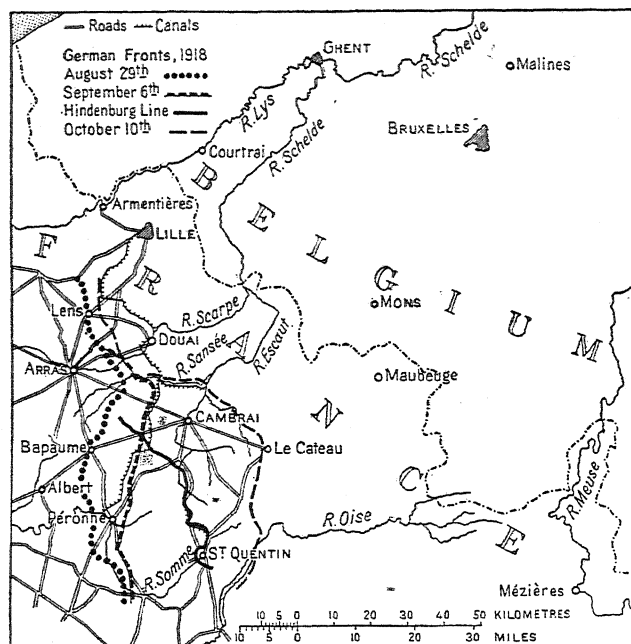

The attack of the Canadian Corps was launched at 5:00 A.M. by the Canadian 1st and 4th and the British 4th Divs., supported by some 500 guns and 40 tanks, on a front of 4½ miles. All resistance on the first objective was speedily overcome, and by 9:15 A.M. the whole system of trenches on the front of the Canadian Corps was in the hands of the assaulting troops. On the XVII. Corps front, the attack was launched at the same hour and met with equal success. The 52nd Div. stormed the network of trenches at the junction of the two systems, and after heavy fighting succeeded in overcoming all resistance. The 57th Div., attacking north of the 52nd, pressed forward south of the Canadians, and by nightfall had swung round to the right and were threatening the villages of Quéant and Pronville from the north. The 63rd Div., which passed through to exploit the success, had heavy fighting during the afternoon, but by dark had reached the railway east of Quéant.

During the afternoon the Canadian Corps met with increased opposition, particularly from machine-guns on the British 4th Div. front, but by the evening an advance of some 3m. had been made and British troops had captured Cagnicourt, Villers and Dury, and were approaching the outskirts of Buissey. Eight thousand prisoners and many guns were captured, bringing the total captures on the I. Army front alone since Aug. 26 to 16,000 prisoners and 200 guns. In eight days the 10 British and Canadian divisions employed by the I. Army had defeated 13 German divisions and driven them back 10m., out of all their organized positions in front of Cambrai. Troops of the III. and IV. Armies prolonged the attack southward on Sept. 2, and substantial progress was made, though the fighting was severe.

The results of this most successful operation became obvious at once, as on the night of Sept. 2-3 the Germans fell back to the line of the Canal du Nord from Péronne to Hermies. The following day they commenced to withdraw from the Somme, south of Péronne, and by the night of Sept. 8 they were back on a line Vermand (6m. west of St. Quentin)-Epehy-Havrincourt and thence along the east bank of the Canal du Nord to the Sensée.

Preparatory Operations Continued.—The Canal du Nord, behind which the German forces facing the I. Army and left of the III. Army had now established themselves, was far too

strong a natural position to warrant attack without very careful preparation. The next three weeks were therefore devoted by the British forces on this front to the organization of an operation which eventually took place on Sept. 27. South of Havrincourt the German main line of resistance was the Hindenburg Line, but strong forces were still occupying advanced positions in the trenches which formed the old British and German lines

MAP SHOWING SUCCESSIVE GERMAN FRONTS BETWEEN AUG. 29 TO OCT. 10, 1918 AND THE GENERAL TREND OF THE HINDENBURG LINE

prior to the German offensive in March 1918. These had to be captured before the Hindenburg Line itself could be assaulted, and to this end operations were undertaken by the British III. and IV. Armies.

On Sept. 12 the III. Army attacked with the IV. Corps and the VI. Corps on a 5m. front in the neighbourhood of Havrincourt Wood. A considerable advance was made and the villages of Trescault and Havrincourt were captured. Meantime the IV. Army had continued to press the German withdrawal, and between Sept. 11 and 17 the line had been pushed forward at several points. On Sept. 18 a much more extensive operation was undertaken, in which the IV. Army in conjunction with the III. Army attacked the German forces on a 17m. front from Holnon to Gouzeaucourt. The French I. Army co-operated on the right. The final objective of the main attack was the old British outpost line running past Pont Ruet, west of Bellicourt, Bony and Vendhuile. It was not intended that this final objective must necessarily be reached on the first day—and in fact it was not reached until after several days of very severe fighting.

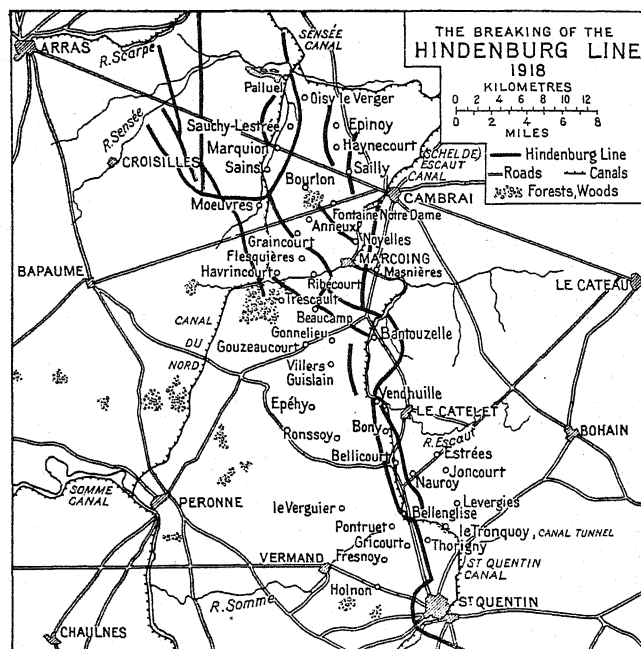

At 7:00 A.M. on Sept. 18 the IV. and III. Armies attacked in heavy rain. The attack was supported by 23 tanks and 978 guns, and in some sectors dummy tanks were used with considerable success. The IX. Corps advanced on the right with the 6th and 1st Divisions. The first objectives were taken at 9:00 A.M., but the 6th Div. was checked at Holnon and west of Fresnoy. The 1st Div. was more successful, but was unable to reach Pont Ruet, and both divisions suffered severe casualties. The Australian Corps had very heavy fighting, particularly in and about Le Verguier, and was held up in front of its final objective till dusk. During the night a successful attack was made which completed the operation on the Australian front.

North of the Australians the III. Corps attacked with the 74th, 18th, 12th and 58th Divs., and met with very stubborn resistance. Ronssoy was captured by the 18th Div. and Epéhy by the 12th and 58th Divs., but little progress was made beyond these places. The V. Corps of the III. Army continued the front of attack to the north and all divisions made considerable prog-

ress, though it was not found possible to take Gouzeaucourt on this day. Minor operations were undertaken during the succeeding week, which resulted in the capture of Gricourt and Pont-ruet by the IX. Corps, and by Sept. 26 the British line had been advanced to a position from which the attack on the main Hindenburg system could be launched. In this last series of operations 15 divisions of the British III. and IV. Armies had driven back 29 divisions of the German II. and XVII. Armies into the Hindenburg defences, and inflicted on them a loss of 12,000 prisoners and 100 guns.

The Storming of the Hindenburg Line.—All was now ready for the great effort to break through the Hindenburg Line. The strategic plan decided on by Marshal Foch and the Allied Commanders-in-Chief involved the launching of four convergent and practically simultaneous offensive operations. The Americans were to attack west of the Meuse in the direction of Mézières. The French offensive, also against Mézières, was to be launched west of the Argonne. The British were to break through the Hindenburg Line between St. Quentin and the river Sensée and advance on Maubeuge, while an Allied force (British, French and Belgian) under the King of the Belgians, was to attack in Flanders in the direction of Ghent. The results to be obtained from these offensive operations depended in no small degree on the success of the British attack in the centre, where a threat to the German vital systems of lateral communication would re-act on their defences elsewhere. It was here, too, that the German system of defence was most highly organized.

In accordance with the above general strategic plan the French and Americans attacked on Sept. 26; the British offensive commenced on the 27th, and the Allied attack in Flanders was launched on the 28th. Haig's plan was to strike first with his left wing in the direction of Cambrai, while the right wing, which was faced by the more formidable defences, was to attack later after a very heavy preliminary bombardment. It was hoped

DETAIL MAP SHOWING THE HINDENBURG LINE, WHICH WAS A SERIES OF STRONGLY FORTIFIED WORKS—NOT A SINGLE OR CONTINUOUS LINE

that any success obtained by the left wing would draw off the German reserves, and deceive their higher command as to the point where the main blow was to fall.

A very heavy bombardment was opened on the night of Sept. 26-27 on the front of the British I., III. and IV. Armies, and at 5:20 A.M. on the 27th four corps attacked on a front of 13m. from Gouzeaucourt to the neighbourhood of Sauchy Lestrée. On the northern flank the Canal du Nord was too formidable an obstacle to be carried in face of opposition, and consequently the plan was conceived of crossing on a comparatively narrow front,

and then of turning the line of the canal farther north by a divergent attack from the point of crossing. This difficult manoeuvre was most successfully carried out. On the right the 5th and 42nd Divs. of the IV. Corps established and held a strong flank between Beaucamp and Ribecourt. On their left the VI. Corps advanced with the 3rd and Guards Divs., and captured Ribecourt and Flesquières, while the 62nd and 2nd Divs., passing through, continued the advance in the direction of Marcoing. Farther north the 52nd and 63rd Divs. of the XVII. Corps forced the passage of the canal and, after heavy fighting, established themselves in Graincourt, and the 57th Div., in close co-operation with the Canadians, reached Anneux.

On the I. Army front the Canadian Corps attacked with the Canadian 4th and 1st Divs., and in the half light of dawn stormed the canal on the line Moeuvres-Sains-Marquion. With irresistible impetus the Canadian 4th Div. pushed on to Bourlon village and wood where the Canadian 3rd Div., taking up the attack, advanced towards Fontaine Notre Dame and Saily. On the left the Canadian 1st Div. was equally successful, and, having captured Sains and Marquion, advanced rapidly towards Haynecourt and Sauchy Lestrée, while the British 11th Div. passed through and captured Epinoy and Oisy-le-Verger. Meanwhile the 56th Div. of the XXII. Corps crossed the canal, west of Sauchy Lestrée, cleared that village and advanced on Palleul. By the evening of Sept. 27 over 10,000 prisoners and 200 guns had been taken. As soon as the crossings of the canal were secured the British and Canadian engineers began to construct the necessary bridges, and in spite of heavy artillery fire completed their task with remarkable speed, and contributed in no small degree to the success of the operation.

On Sept. 28 the advance was continued and Gouzeaucourt, Marcoing, Noyelles, Fontaine Notre Dame, Saily and Palleul were taken, and a footing was obtained on the east bank of the Schelde Canal at Marcoing. At 5:50 A.M. on the morning of Sept. 29, after a preliminary bombardment lasting over two days, in which some 1,600 guns were employed, the British IV. Army advanced to the attack, covered by an intense artillery barrage. The front of attack extended from Holnon to Vendhuile, a distance of about 12 miles. On the right the IX. Corps met with complete success. The 1st Div., advancing south of the bend in the canal at Bellenglise, established a flank facing south-east from Gricourt to the Le Tronquoy tunnel. The 46th Div., which was faced by a most formidable task, advanced with the greatest gallantry, and with the assistance of rafts, mats and even life-belts, stormed the canal at and north of Bellenglise and rushed the German trench system west of the canal. The German defences here faced south, and the British troops swung to the right and took them in flank and rear, capturing many prisoners and guns. By 3:00 P.M. the 46th Div. had broken through the Hindenburg Line to a depth of 3 miles, routed four German divisions, and taken over 4,000 prisoners and 70 guns at the small cost of 800 casualties. The 32nd Div., passing through, completed the capture of the Hindenburg Reserve Line, and by nightfall had taken 800 more prisoners and 20 guns.

Work of the American Corps.—On the left of the IX. Corps the American II. Corps had been superimposed on the Australian Corps. The task of the American troops was to break through the Hindenburg Line at and north of Bellicourt, where the St. Quentin Canal passes through a tunnel. The Australian 5th and 3rd Divs. were then to take up the attack and advance on more distant objectives. The Americans advanced with the greatest gallantry, but owing to the uncertain issue of a preliminary attack that had been made to secure a good starting line, their left division (the 27th) started half a mile behind the barrage—which the Army Command were reluctant to bring back. Without this protection its attack was quickly shattered with great loss. The Australian 3rd Div., following it up, could make but little headway and was finally checked in front of Bony. The American 30th Div. on the right was more successful, but also suffered heavily from German reserves who came up from their shelter in the tunnel, and it was only after very heavy fighting that the Australian 5th Div., passing through, finally succeeded in reaching the

Hindenburg Reserve Line about Nauroy.

On the left the III. Corps carried out their task of securing the left flank of the IV. Army. On the same day the III. Army achieved an important success by securing the canal crossings at Masnières and northward as far as Cambrai, while the I. Army front was advanced northwest of that town. On Sept. 30 the break in the Hindenburg system was widened by the capture by the IX. Corps of Thoiry and Le Tronquoy, and on the same day the Germans abandoned Villers Guislain and Gonnelleu. On Oct. 1, in co-operation with the French I. Army who occupied St. Quentin, the IX. Corps took Levergies and the Australians captured Joncourt, Estrées and Bony. The III. and I. Armies also achieved important successes. During the first week in Oct. the XIII. Corps relieved the III. Corps north of the Australians and a series of successful minor operations were carried out on the fronts of all three armies, and by Oct. 5 the whole of the rearward lines of the Hindenburg system were in British hands.

Results of the Offensive.—During this nine days' battle 30 British and two American divisions had broken through the last and most powerfully organized system of German defences, had overwhelmed 39 German divisions and captured 36,000 prisoners and 380 guns. The effect of the British victory was decisive on the subsequent course of the campaign, and though there was still to be hard and bitter fighting before the termination of hostilities on Nov. 11, only natural obstacles such as woods, rivers and villages now lay between the British Armies and their objective at Maubeuge.

HINDERSIN, GUSTAV EDUARD VON (1804-1872), Prussian general, was born at Wernigerode near Halberstadt on July 18, 1804. He entered the Prussian artillery in 1820, and in 1841, while still a subaltern, he was posted to the great general staff, in which he afterwards directed the topographical section. He served in the suppression of the Baden insurrection (1849), and was ennobled for his services in the Danish war of 1864, where he directed the artillery operations against the lines of Düppel. Soon afterwards he became inspector-general of artillery. His experience at Düppel had convinced him that the days of the smooth-bore gun were past, and he now rearmed and reorganized the Prussian artillery. The available funds were small, and grudgingly voted by the parliament. There was a strong feeling moreover that the smooth-bore was still tactically superior to its rival. Under Hindersin manoeuvres were instituted, and the smooth-bores were, except for ditch defence, eliminated from the armament of the Prussian fortresses. But far more important was his work in connection with the field and horse batteries. In 1864 only one battery in four had rifled guns, but the outbreak of war with Austria one and a half years later found the Prussians with ten in every sixteen batteries armed with the new weapon. But the battles of 1866 revealed a lack of tactical efficiency in the Prussian artillery, and Hindersin was now able to secure the establishment of a school of gunnery. The consequent improvement in the Prussian field artillery between 1866 and 1870 was extraordinary; indeed, the German artillery played the most important part in the victories of the Franco-German war. Hindersin accompanied the king's headquarters as chief of artillery, as he had done in 1866, and was present at Gravelotte, Sedan and the siege of Paris. He died on Jan. 23, 1872, at Berlin.

See Bartholomäus, *Der General der Infanterie, von Hindersin* (1895), and Prince Kraft zu Hohenlohe-Ingelfingen, *Letters on Artillery* (translated by Major Walford, R.A.), No. xi.

HINDĪ, EASTERN, one of the "intermediate" Indo-Aryan languages. It is spoken in Oudh, Baghelkhand and Chhattisgarh. It is derived from the Apabhraṃśa form of Ardhamāgadhi Prakrit (see PRAKRIT), and possesses a large and important literature. Its most famous writer was Tulsī Dās, the poet and reformer, who died early in the 17th century, and since his time it has been

the North-Indian language employed for epic poetry. Eastern Hindī has been an Intermediate language since, at least, the institution of Jainism (say, 500 B.C.), and is much less subject to the influence of the Midland than is Punjabi. To its east it has Bihari, and, to the south Marathi as its neighbour, both Outer languages.

Tulsī Dās was one of the greatest writers that India has produced, and his influence on the language has been as great as that of Shakespeare on English. The peasantry are continually quoting him without knowing it, and his style, simple and yet vigorous, thoroughly Indian and yet free from purism, has set a model which is everywhere followed except in the large towns where Urdu or Sanskritized Hindī prevails. Eastern Hindī is written in the Nāgarī alphabet, or in the current character related to it called "Kaithī" (see BIHARĪ).

Dialects.—The only important dialect of Eastern Hindī is Awadhī, spoken in Oudh, and possessing a large literature of great excellence. Chhattīsgarhī and Baghēlī, the other dialects, have scanty literatures of small value. A detailed sketch of the grammar of Eastern Hindī is given in vol. vi. of the *Linguistic Survey of India* (1904).

HINDĪ, WESTERN, the Indo-Aryan language of the middle and upper Gangetic Doab, and of the country to the north and south. Its standard dialect is Braj Bhāshā, spoken near Muttra, which has a considerable literature mainly devoted to the religion founded on devotion to Krishna. Another dialect spoken near Delhi and in the upper Gangetic Doab is the original from which Hindostani, the great *lingua franca* of India, has developed (see HINDOSTANĪ). Western Hindī is descended from the Apabhraṃśa form of Saurasēnī Prakrit (see PRAKRIT) and represents the language of the Madhyadēśa or Midland, as distinct from the Intermediate and Outer Indo-Aryan languages. Western Hindī has four main dialects, Bundēlī of Bundelkhand, Braj Bhasha (properly "Braj Bhāṣā") of the country round Mathurā (Muttra), Kanaujī of the central Doab and the country to its north, and vernacular Hindostani of Delhi and the Upper Doab. West of the Upper Doab, across the Jumna, another dialect, Bāngarū, is also found. It possesses no literature. Kanaujī is very closely allied to Braj Bhasha, and these two share with Awadhī the honour of being the great literary speeches of northern India. Nearly all the classical literature of India is religious in character, and, as a broad rule, Awadhī literature is devoted to the Ramaite religion and the epic poetry connected with it, while that of Braj Bhasha is concerned with the religion of Krishna.

BIBLIOGRAPHY.—See vol. ix. of the *Linguistic Survey of India* for extensive lists of grammars, dictionaries and specimens. The sketch of Western Hindī grammar and phonology is clear and of great practical value.

HINDKĪ, the name given to the Hindus of the Khatri class who inhabit Afghanistan. It is also loosely used on the upper Indus, in Dir, Bajour, etc., to denote the speakers of Punjabi or any of its dialects.

HINDLEY, an urban district, Westhoughton parliamentary division, Lancashire, England, 2 m. south-east of Wigan, on L.M.S. and L.N.E. railways. Pop. (1921) 23,563. Cotton-spinning and weaving are the principal industries and there are extensive coal mines in the neighbourhood.

HINDOSTAN is a Persian word, and in modern Persian is pronounced "Hindūstān." It means the country of the Hindus. In mediaeval Persian the word was "Hindōstān," with an *ō*, but in the modern language the distinctions between *ē* and *ī* and between *ō* and *ū* have been lost. Indian languages borrowed Persian words in their mediaeval form. The word "Hindu" is in mediaeval Persian "Hindō," representing the ancient Avesta *hendava* (Sanskrit, *saindhava*), a dweller on the *Sindhu* or Indus. Owing to the influence of scholars in modern Persian the word "Hindū" is now established in English and, through English, in the Indian literary languages; but "Hindō" is also often heard in India. "Hindostan" with *o* is much more common both in English and in Indian languages, although "Hindustan" is also employed. Up to the days of Persian supremacy inaugurated in Calcutta by Gilchrist and his friends, every traveller in India spoke of "Indostan" or some such word, thus bearing testimony to the current

pronunciation. Gilchrist introduced "Hindoostan," which became "Hindustan" in modern spelling. The word is not an Indian one, and both pronunciations, with *ō* and with *ū*, are current in India at the present day, but that with *ō* is unquestionably the one demanded by the history of the word and of the form which other Persian words take on Indian soil. On the other hand, "Hindu" is firmly established in English. The word "Hindī" has another derivation, being formed from the Persian *Hind*, India (Avesta *hindu*, Sanskrit *sindhu*, the Indus). "Hindī" means "of or belonging to India," while "Hindu" now means "a person of the Hindu religion." (Cf. Sir C. J. Lyall, *A Sketch of the Hindu-stani Language*, p. 1.)

HINDOSTANI LANGUAGE (properly Hindōstānī, of or belonging to Hindostan), the name given by Europeans to an Indo-Aryan dialect (whose home is in the upper Gangetic Doab and near the city of Delhi), which, owing to political causes, has become the great *lingua franca* of modern India. The name is not employed by Indians, except as an imitation of the English nomenclature. Hindostani is not a mongrel "pidgin" form of speech made up of contributions from the various languages which met in the Delhi bazaars, but an actual living dialect of Western Hindī, and the direct descendant of Saurasēnī Prakrit. It represents Western Hindī merging into Punjabi (Braj Bhasha being admittedly the standard of the language). It was the natural language of the people in the neighbourhood of Delhi, who formed the bulk of those who resorted to the bazaar, and hence it became the bazaar language. From here it became the *lingua franca* of the Mogul camp and was carried everywhere in India by the lieutenants of the empire. It has several recognized varieties, Dakhini, Urdu, Rēkhṭa and Hindī. Dakhini or "southern," is the form current in the south of India, and was the first to be employed for literature. It contains many archaic expressions now extinct in the standard dialect. Urdu, or *Urdū zabān* "the language of the camp," is the name usually employed for Hindostani by natives, and is now the standard form of speech used by Muslims. All the early Hindostani literature was in poetry, and this literary form of speech was named "Rēkhṭa" or "scattered," from the way in which the words borrowed from Persian were "scattered" through it. The name is now reserved for the dialect used in poetry, Urdu being the dialect of prose and of conversation. The introduction of these borrowed words, which has been carried to even a greater extent in Urdu, was facilitated by the fact that Persian was the official language of the Mogul court. In this way Persian (and, with Persian, Arabic) words came into current use, and, though the language remained Indo-Aryan in its grammar and essential characteristics, it soon became unintelligible to anyone who had not at least a moderate acquaintance with the vocabulary of Iran. This extreme Persianization of Urdu was due rather to Hindu than to Persian influence. Although Urdu literature was Muslim in its origin, the Persian element was first introduced in excess by the pliant Hindu officials employed in the Mogul administration, and acquainted with Persian, rather than by Persians and Persianized Moguls, who for many centuries used only their own languages for literary purposes. Prose Urdu literature took its origin in the English occupation of India and the need for textbooks for the college of Fort William. It has had a prosperous career since the commencement of the 19th century, but some writers, especially those of Lucknow, have so overloaded it with Persian and Arabic that little of the original Indo-Aryan character remains, except, perhaps, an occasional pronoun or auxiliary verb. The Hindī form of Hindostani was invented simultaneously with Urdu prose by the teachers at Fort William. It was intended to be a Hindostani for the use of Hindus, and was derived from Urdu by ejecting all words of Persian or Arabic birth, and substituting for them words either borrowed from Sanskrit (*tat-samas*) or derived from the old primary Prakrit (*tadbhavas*) (see INDO-ARYAN LANGUAGES). Owing to the popularity of the first book written in it, and to its supplying the need for a *lingua franca* which could be used by the most patriotic Hindus without offending their religious prejudices, it became widely adopted, and is now the recognized vehicle for writing prose by those inhabitants of northern India who do not employ Urdu. At the present day,

Hindī is beginning to be used for poetry but for this the indigenous dialects (usually Awadhī or Braj Bhasha) are still preferred by Hindus. Urdu, on the other hand, having had a natural growth has a vigorous poetical literature. Modern Hindī prose is often disfigured by the free borrowing of Sanskrit words and is rapidly becoming a Hindu counterpart of the Persianized Urdu, neither of which is intelligible except to persons of high education.

Urdu has adopted a Persian vocabulary and a few peculiarities of Persian construction, and these, perhaps, combined with the use of high-flown and pedantic Persian and Arabic words in place of common and yet chaste Indian words, and the general use of the Persian instead of the Nāgarī character, have induced some to regard Hindostani or Urdu as a language distinct from Hindī. We must define Urdu as the Persianized Hindostani of educated Muslims, while Hindī is the Sanskritized Hindostani of educated Hindus. Urdu, from the number of Persian words which it contains, can only be written conveniently in the Persian character, while Hindī, for a parallel reason, can only be written in the Nāgarī or one of its related alphabets (*see* SANSKRIT). On the other hand, "Hindustani" implies the great *lingua franca* of India, capable of being written in either character, and, without purism, avoiding the excessive use of either Persian or Sanskrit words when employed for literature. It is easy to write this Hindostani, for it has an opulent vocabulary of *tadbhava* words understood everywhere by both Muslims and Hindus. While "Hindustani," "Urdu," and "Hindī" are thus names of dialects, the terms "Western Hindī" and "Eastern Hindī" connote, not dialects, but languages.

The epoch of Akbar was the period of the formation of the language. But its final consolidation did not take place till the reign of Shah Jahān. Changes are comparatively immaterial until we come to the time when European sources began to mingle with those of the East. Like the greater part of those from Arabic and Persian, the contributions from these sources are chiefly nouns, and are casual excrescences rather than ingredients duly incorporated in the speech. In the case of the Persian and Arabic element, indeed, we find instances in which nouns have been furnished with a Hindī termination; but the European element cannot be said to have at all woven itself into the grammar of the language. It consists solely of nouns, principally substantive nouns, which on their admission into the language are spelt phonetically, or according to the corrupt pronunciation they receive in the mouths of the natives, and are declined like the indigenous nouns by means of the usual postpositions or case-affixes. Portuguese, the first in order of seniority, contributes a few words. Of French and Dutch influence scarcely a trace exists. English has contributed a number of words, some of which have even found a place in the literature of the language. Some borrowed words are distorted into the shape of genuine Hindustani words familiar to the speakers; e.g., the English railway term "signal" has become *sikandar*, the Indian name for Alexander the Great, and "signal man" is *sikandar-mān*, or "the pride of Alexander." The free use of Anglicisms of late years has greatly increased in the language of the educated, especially in the case of technical terms.

BIBLIOGRAPHY.—See C. J. Lyall, *A Sketch of the Hindostani Language* (1880); J. T. Platts, *A Grammar of the Hindustani or Urdu Language* (1874); *Linguistic Survey of India*, vol. ix. (1914), where an extensive bibliography will be found and a detailed sketch of the grammar.

HINDŌSTĀNĪ LITERATURE. Hindōstānī is the vernacular of the part of India called Hindōstān,—that is, the Jumna and Ganges valleys as far east as the river Kōsi, Rajpūtānā, Central India (Bundēlkhand and Baghelkhand), the Narmadā valley as far west as Khandwā, and the N. half of the Central Provinces. It does not include the Punjab (though the town population there speak Hindōstānī) or Lower Bengal.

In this region various dialects prevail. The people of the towns use chiefly the form of the language called *Urdū* or *Rēkhṭa*, stocked with Persian words and phrases, and ordinarily written in the Persian character. *Urdū* is a Turkish word meaning a camp or army and is the origin of *horde*. *Rēkhṭa* means "scattered," referring to the way in which Persian words are intermixed with those of Indian origin; it is used chiefly for literary Urdū. The far more

numerous country folk speak different forms of *Hindī*, derived from the Prākritis and literary Sanskrit, written in the Dēvanāgarī or Kaithī character. Of these the most important from a literary point of view are *Mārwārī* and *Jaipurī* (spoken in Rajpūtānā), *Brajbhāshā* (about Mathurā and Agra), *Kanauji* (the lower Ganges-Jumna Doāb and W. Rohilkhand), *Eastern Hindī*, also called *Awadhī* and *Baiswārī* (Eastern Rohilkhand, Oudh and the Benares division of the United Provinces) and *Bihārī* (Bihār or Mithilā, comprising several dialects). *High Hindī* is a modern literary development of the dialect of Western Hindī spoken about Delhi and northwards to the Himālaya, which has formed the vernacular basis of Urdū; the Persian words in Urdū have been replaced by words of Sanskrit origin, and the indigenous order of words in the sentence is more strictly adhered to than in Urdū, which under the influence of Persian has admitted many inversions.

Nearly all the early vernacular literature of Hindōstān is in verse. The only known exceptions are a work in Hindī called the *Chaurāsī Vārtā* and a few commentaries on poems. Both Hindī and Urdū are, as literary languages, at first intruders upon ground occupied by Sanskrit and Persian, representing respectively Hindū and Muslim culture. They differ in that the elevation of Hindī to a literary speech represents, mainly, a revolt against Brahman monopoly while Urdū has been cultivated by authors who have themselves appreciated and used the polished Persian. Both Sanskrit and Persian continue to be employed by Indian writers, but for popular purposes the vernaculars are now used almost exclusively.

The subject may be conveniently divided as follows:—

1. Early Hindī, of the period during which the language was being fashioned as a literary medium out of the ancient Prākritis, represented by the old heroic poems of Rajpūtānā and the literature of the early *Bhagats* or Vaishnava reformers, i.e., from about A.D. 1100 to 1550;
2. Middle Hindī, representing the best age of Hindī poetry, from about 1550 to the end of the 18th century;
3. The rise of literary Urdū, from about the end of the 16th century, reaching its height during the 18th;
4. The modern period, marked by the growth of a prose literature in both dialects, and dating from the beginning of the 19th century.

1. **Early Hindī.**—Our knowledge of the ancient metrical chronicles of Rajpūtānā is still imperfect, and is chiefly derived from Tod's *Annals and Antiquities of Rājāsthān* (published in 1829–1832), which is founded on them. It is in the nature of compositions of this character to be perpetually revised; they are the production of the family bards of the dynasties whose fortunes they record, and they are constantly added to, and their language modified. Round an historical nucleus legends accumulate; later redactors endeavour to systematize and to assign dates, but the mass has the character of ballad literature. The materials used by Tod are nearly all still unprinted, and his important manuscripts are now deposited in the library of the Royal Asiatic Society in London.

Omitting a few fragments, the earliest author of whom any portion has as yet been published in the original text is Chand Bardāi, court bard of Prithwī-Rāj, the last Hindū sovereign of Delhi. His poem, entitled *Prithī-Rāj Rāsan* (or *Rāysā*) is a vast chronicle in 69 cantos, comprising a general history of his period. Of this a small portion has been printed, under the editorship of Mr. John Beames and Dr. Rudolf Hoernle, by the Asiatic Society of Bengal; but the difficult nature of the task prevented both scholars from making much progress. A fresh critical edition of the text by Pandit Mohan Lāl Vishnu Lāl Pandia at Benares, under the auspices of the *Nāgarī Prachārīnī Sabhā*, was completed in 1913. Chand was a native of Lahore, which had for nearly 170 years (since 1023) been under Muslim rule when he flourished, and the poem contains many Persian words. In its present form the work is a redaction made by Amar Singh of Mēwār (early 17th century), more than 400 years after Chand's death. There is, therefore, considerable doubt whether we have in it much of Chand's original composition. The detailed dates contained in the Chronicle have been shown by Kabirāj Syāmal Dās to be in every case

about ninety years astray. The Mongols (Book XV.) are brought on the stage more than 30 years before they actually set foot in India, and are related to have been vanquished by the redoubtable Prithwī-Rāj. The Chronicle, nevertheless, appears to contain a considerable element which, from its language, may belong to Chand's age, and represents the earliest surviving document in Hindi. "We have certainly in his writings some of the oldest known specimens of Gaudīan literature, abounding in pure Apabhramśa Saurasēnī Prākṛit forms" (Grierson).

It is difficult to form a just estimate of the poem as literature. The language, essentially transitional in character, consists largely of obsolete and obscure words. Chand appears to exhibit the merits and defects of ballad chroniclers. There is much that is spirited in his descriptions; and the characters of the Rājput warriors are often sketched with skill and animation. Sound, however, frequently predominates over sense, and the narrative is carried on with wearisome iteration.

Chand may be taken as the representative of a long line of successors, still continued in Rājput states. Many of their compositions are still popular as ballad literature, but are known only in the oral versions of professional singers. One of the most famous is the *Ālhā-khaṇḍ*, reputed to be the work of a contemporary of Chand called Jagnīk or Jagnāyak, of Mahōbā in Bundēlkhaṇḍ, who sang the praises of Rājā-Parmāl, a ruler whose wars with Prithwī-Rāj are recorded in the Mahōbā-Khaṇḍ of Chand's work. Ālhā and Ūdal, the heroes of the poem, are famous warriors in popular legend, and the stories connected with them exist in an eastern recension, current in Bihār, as well as in the Bundēlkhaṇḍī or western form which is best known. Another celebrated bard was Sārangdhar of Rantambhōr, who flourished in 1363, and sang the praises of Hammīr Dēo (Hamir Deo), the Chauhān chief of Rantambhōr who fell in a heroic struggle against Sultān 'Alā'uddīn Khiljī in 1300. He wrote the *Hammīr Kāvya* and *Hammīr Rāsu*, of which an account is given by Tod. Another, but much later, work is the long chronicle, *Chhattra-Prakās*, or the history of Rājā Chhatarsāl, the Bundēlā rājā of Pannā, who was killed, fighting for Prince Dārā-Shukōh, in the battle of Dhōlpur won by Aurangzēb in 1658. The author, Lāl Kabī, has given in this work a history of the valiant Bundēlā nation (translated by Captain W. R. Pogson in 1828, and printed at Calcutta).

Mention may be made here of a remarkable composition, a poem entitled the *Padmāwat*, the materials of which are likewise derived from the heroic legends of Rājputānā. The author, Malik Mohammed of Jā'is, in Oudh, was a Muslin devotee, to whom the Hindu rājā of Amēthi was greatly attached. Malik Mohammed wrote the *Padmāwat* in 1540, the year in which Shēr Shāh Sūr ousted Humāyūn from the throne of Delhi. The poem is composed in pure vernacular Awadhī, with no admixture of traditional Hindu learning, and is generally found written in the Persian character, though the metres and language are thoroughly Indian. It professes to tell the tale of Padmāwatī or Padminī, a princess celebrated for her beauty who was the wife of the Chauhān rājā of Chītōr in Mēwār. The story turns upon the attempts of 'Alā'uddīn Khiljī, the sovereign of Delhi, to gain possession of her person. The heroic and tragic tale of the siege of Chītōr in 1303 by 'Alā'uddīn will be found related in Tod's *Rājāsthān*, i. 262 sqq. Malik Mohammed takes great liberties with the history, and explains at the end of the poem that all is an allegory. A critical edition of this notable and popular poem has been prepared by Sir G. A. Grierson and Paṇḍit Sudhākār Dwivēdi and a later edition (1924) has been published by the Nāgarī-prachārīnī Sabhā, Benares.

The literature of the *Bhagats*, or Vaishnava saints, who propagated the doctrine of *bhakti*, or faith in Vishnu, as the popular religion of Hindōstān, has exercised a powerful influence upon the national speech and poetic literature. It is also of high intrinsic interest. Nearly the whole of subsequent Hindī poetry is impressed with Vaishnava doctrine, which, like Buddhism many centuries before, was essentially a reaction against caste and Brahmanical influence. Many of the writers were non-Brahmans, often of the lowest castes. As Śiva was the popular deity of the Brahmins, so was Vishnu of the people; and while the literature of the Śaivas and Śāktas is almost entirely in Sanskrit, and exercised little influ-

ence on the popular mind in N. India, that of the Vaishnavas is largely in Hindī, and constitutes the great bulk of what has been written in that language.

The Vaishnava doctrine is commonly carried back to Rāmānuja, a Brahman who was born about the end of the 11th century, at Perambur near the modern Madras. His works, which are in Sanskrit and consist of commentaries on the Vēdānta Sūtras, are devoted to establishing "the personal existence of a Supreme Deity, possessing every gracious attribute, full of love and pity for the sinful beings who adore him, and granting the released soul a home of eternal bliss near him." The Deity has on several occasions become incarnate for the salvation of mankind, and of these incarnations two, Rāmachandra, the prince of Ayōdhya, and Kṛishṇa, the chief of the Yādava clan and son of Vasudēva, are pre-eminently those in which it is most fitting that he should be worshipped. Both incarnations had for many centuries attracted popular veneration, and their histories had been celebrated in epics and in *Purānas* or "old stories"; but it was apparently Rāmānuja's teaching which secured for them their exclusive place as the objects of *bhakti*—ardent faith and personal devotion. The adherents of Rāmānuja were, however, all strict Brahmins; the new doctrine had not yet penetrated to the people.

Rāmānuja himself dealt mainly with philosophic conceptions of the Divine Nature. His *mantra*, or formula of initiation, if Wilson was correctly informed, implies devotion to Rāma; but Vāsudēva (Krishna) is also mentioned as a principal object of adoration. It is stated that in his worship of Krishna he joined with that god as his *Śakti*, or Energy, his wife Rukmini; while the later varieties of Krishna-worship prefer to honour his mistress Rādhā. The great difference between these two forms of Vaishnava faith appears to be a later development; but by the time of Jaidēo (about 1250) the theme of Krishna and Rādhā, and the use of passionate language drawn from the relations of the sexes to express the longings of the soul for God had become fully established; thenceforward the two types of Vaishnavism diverged more and more.

The cult of Rāma is founded on family life. Its morality springs from the sources of human piety which in all religions have wrought most in favour of pureness of life, of fraternal helpfulness and of humble devotion to a loving Parent, who desires the good of mankind. That of Krishna, on the other hand, had for its basis the legendary career of a hero, whose exploits are marked by a kind of elvish wantonness; it has more and more developed that side of devotion which is perilously near to sensual thought. It is claimed for its first leaders that their hearts were pure, and that the language of erotic passion which they use is mystical and allegorical. This is probable; but the fervent impulses of adoration undoubtedly made way in later times for those of lust and lasciviousness.

The worship of Krishna, especially in his infant and youthful form (which appeals chiefly to women), is widely popular in the neighbourhood of Mathurā, the capital of that land of Braj where he lived as a boy. Its literature is mainly composed in the local dialect called Brajbhāshā. That of Rāma, though general throughout Hindōstān, has since the time of Tulsi Dās adopted for poetic use the language of Oudh, called Awadhī or Baiswārī, a form of Eastern Hindī. These two dialects are to this day the standard vehicles of poetic expression.

Subsequently to Rāmānuja his doctrine appears to have been set forth, about 1250, in the vernacular of the people by Jaidēo, a Brahman of Bengal, author of the Sanskrit *Gitā Gōvinda*, and by Nāmdēo or Nāmā, a tailor of Mahārāshtra, of both of whom verses are preserved in the *Ādi Granth* of the Sikhs. But it was not until the beginning of the 15th century that the Brahman Rāmānand, a prominent *Gōsāin* of the sect of Rāmānuja, having had a dispute with the members of his order, left the community, migrated to N. India and addressed himself to those outside the Brahman caste, thus initiating the teaching of Vaishnavism as the popular faith of Hindōstān. Among his twelve disciples was a Muslim weaver, the celebrated KABĪR (see separate article). One short Hindī poem by Rāmānand is contained in the *Ādi Granth*, and Sir G. A. Grierson has collected hymns (*bhajans*)

attributed to him and still current in Mithilā or Tirhūt. Both Rāmānand and Kabīr were adherents of the cult of Rāma, who is regarded as identical with the Deity. A contemporary of Rāmānand, Bidyāpati Thākur, is celebrated as the author of numerous lyrics in the Maithilī dialect of Bihār, expressive of the other side of Vaishnavism, Krishna-worship, the aspirations of the worshipper being mystically conveyed in the character of Rādhā, the cowherdess beloved of Krishna. These stanzas of Bidyāpati afterwards inspired the Vaishnava literature of Bengal, whose most celebrated exponent was Chaitanya (b. 1484). Mirā Bāi, "the one great poetess of northern India" (Grierson), was daughter of Rājā Ratiyā Rānā, Rāthōr, of Mērtā in Rajpūtānā, and was married in 1413 to Rājā Kumbhakaran of Mēwār. She was devoted to Krishna in the form of Raṇchhōr, and her songs have a wide currency in northern India.

An important compilation of the utterances of the early Vaishnava saints or *Bhagats* is contained in the sacred book, or *Ādi Granth*, of the Sikh *Gurus*. Nānak, the founder of this sect (1469–1538), took his doctrine from the *Bhagats* (see KABĪR); and each of the 31 *rāgs*, forming the body of the *Granth*, is followed by texts from the utterances of Vaishnava saints, chiefly of Kabīr, while the book's *bhōg* or conclusion contains more verses by the same authors, as well as by a celebrated Sūfī, Shēkh Farid of Pākpaṭṭan. The body of the *Granth* (*q.v.*), being in old Panjābī, falls outside the scope of this article; but the old Hindī extracts included in it are a precious store of specimens of authors some of whom have left no other record. The *Ādi Granth*, which was put together about 1600 by Arjun, fifth *Guru*, sets forth the Sikh creed in its original pietistic form, before it assumed its militant character.

THE GOLDEN AGE

2. **Middle Hindī.**—The second period, that of middle Hindī, begins with the reign of the emperor Akbar (1556–1605); and it is not improbable that his sympathy with his Hindū subjects, and the peace which his organization of the empire secured had an important effect on the great development of Hindī poetry which now set in. Akbar's court was itself a centre of poetical composition, and Sanskrit works were translated into Persian. The court musician Tān Sēn is still renowned, and many verses composed by him in the emperor's name survive to this day. Akbar's favourite minister and companion, Rājā Birbal, was a musician and a poet, and held the title of *Kabī-Rāy*, or poet laureate; his verses and witty sayings are still popular in northern India. Other nobles of the court were also poets, among them the *Khān-khānān*, 'Abdur-Rahīm, whose *dōhās* and *kabittas* are still esteemed, and Faizī, brother of the annalist Abul-Fazl.

By this time the worship of Krishna as the lover of Rādhā (*Rādhā-ballabh*) had been systematized, with its chief habitation at Gokul, near Mathurā, by Vallabhāchārya, a Brāhman from Madras. Born in 1478, in 1497 he chose Braj as his headquarters, thence making missionary tours throughout India. He wrote chiefly in Sanskrit; but among his immediate followers, and those of his son Bīṭṭhalnāth (who succeeded him in 1530), were some of the most eminent poets in Hindī. Four disciples of Vallabhāchārya and four of Bīṭṭhalnāth, who flourished between 1550 and 1570, are known as the *Ashṭ Chhāp*, or "Eight Seals," and are the acknowledged masters of the literature of Braj-bhāshā. Their names are Krishna-Dās Pay-ahārī, Sūr Dās (the Bhāt), Parmānand Dās, Kumbhan Dās, Chaturbhuj Dās, Chhīt Swāmī, Nand Dās and Gōbind Dās. Of these the most celebrated is Sūr Dās, who was descended, as he claims, from the bard Chand Bardāi. The traditional dates of his birth (1483) and death (1573) seem to be placed too early. His many hymns (*bhajans*) to Krishna have been collected in the *Sūr Sāgar*, said to contain 60,000 verses. This work is considered the high-water mark of Braj devotional poetry.

The great glory of this age (coinciding with the Elizabethan age of English literature) is Tulsī Dās (*q.v.*). He and Sūr Dās between them are held to have exhausted the possibilities of the poetic art.

A period of artifice and reflection followed, when many works were composed dealing with the rules of poetry and the analysis

and the appropriate language of sentiment. Especially famous is Kēsab Dās, a Brahman of Bundēlkhand, who flourished in the reigns of Akbar and Jahāngir. His works are the *Rasik-priyā*, on composition (1591), the *Kavi-priyā*, on the laws of poetry (1601), the *Rāmachandrikā*, dealing with the history of Rāma (1610), and the *Vigyān-gītā* (1610). This elaboration of the poetic art reached its highest point in Bihārī Lāl, whose *Sat-sai*, or "seven centuries" (1662), is the most remarkable example in Hindī of the rhetorical style in poetry.

Side by side with this literary cultivation of the themes of Rāma and Krishna, there grew up a class of compositions dealing with the lives of the holy men who guided the development of the popular religion. The most famous is the *Bhakta-mālā*, or "Roll of the *Bhagats*," by Nārāyan Dās, Nābhā Dās, or Nābhājī, a Dom of the Deccan, who had in his youth seen Tulsī Dās, and flourished in the early 17th century. His work consists of 108 stanzas in *chhappāi* metre, each setting forth the characteristics of some holy personage, and expressed in a brief and obscure style. Its date falls between 1585 and 1623. The book was furnished with an *ikā* (supplement or gloss) in the *kabitta* metre, by Priyā Dās in 1713, gathering up, in an allusive and disjointed fashion, the stories related of each saint. This again was expanded about a century later by Lachhman into a work called the *Bhakta-sindhu*. From these nearly all our knowledge of the lives of the Vaishnava authors is derived, and much of it is of a dubious character. Another work, dated 1551, named the *Chaurāsī Vārta*, is devoted to stories of the followers of Vallabhāchārya. It is attributed to Gōkūlnāth, son of Bīṭṭhalnāth, son of Vallabhāchārya.

The themes of the many authors who succeeded the great period of Hindī poetical composition which extended through the reigns of Akbar, Jahāngir and Shāh Jehān exhibit no novelty. (See the list of Hindī authors drawn up by Sir G. A. Grierson, and printed in the *Journal of the Asiatic Society of Bengal* in 1889.) The courts of Chhatarsāl, rājā of Pannā, who died in 1658, and of several rājās of Bāndhō (now Rewah) were famous for their patronage of poets; and the Mogul court itself kept up the office of poet laureate even during the fanatical reign of Aurangzēb.

Such, in brief outline, is the character of Hindī literature during the period when it grew and flourished through its own original forces. Founded by a popular and religious impulse comparable to that which, nearly 1,600 years before, had produced the doctrine and vernacular literature of Jainism and Buddhism, and cultivated largely by non-Brahman authors, it was the legitimate descendant in spirit, as Hindī is in speech, of Prākrit literature. Entirely in verse, it adopted and elaborated Prākrit metrical forms, and carried them to a high pitch of perfection. It covers a wide range of style, and, at its best, expresses a rich variety of human feeling. It deserves much more attention in Europe than it has received. The few who have explored it speak of it as an "enchanted garden" (Grierson), abounding in beauties. Above all it is genuinely popular. The ballads of Rajput prowess, the aphorisms of Kabīr, Tulsī Dās's *Rāmāyan*, and the *bhajans* of Sūr Dās are to this day carried about everywhere by wandering minstrels, and have found their way to the hearts of the people.

3. **Literary Urdū.**—The *origines* of Urdū as a literary language are somewhat obscure. The popular account refers its rise to the time of Timūr's invasion (1398). It is even claimed that a *diwān*, or collection of poems, was composed in *Rēkhta* by Mas'ūd, son of Sa'd, in the late 11th or early 12th century, and that Sa'di of Shirāz and his friend Amīr Khusrāu of Delhi made verses in that dialect before the end of the 13th century. This, however, is improbable. During the early centuries of Muslim rule in India Muslim writers used the language and metrical forms of the country. Persian words early made their way into the popular speech; they are common in Chand, and in Kabīr's Hindī verses. Much confusion is due to the want of a clear understanding of what Urdū really is.

Literary Urdū differs from Hindī rather in its form than in its substance. The grammar, and, mainly, the vocabulary, of both are the same. The really vital point of difference is the *prosody*. Hardly one of the metres taken over by Urdū poets from Persian agrees with those used in Hindī. In the latter language it is the

rule to give the short *a* inherent in every consonant or *nexus* of consonants its full value in scansion (though in prose it is no longer heard), except occasionally at the metrical pause; in Urdū this is never done, the words being scanned generally as pronounced in prose. Most Hindī metres are scanned by the number of *mātrās* or syllabic instants—the value in time of a short syllable—of which the lines consist; in Urdū, as in Persian, the metre follows a special order of long and short syllables.

The question, then, is not: When did Persian first become intermixed with Hindī in the literary speech?—for this process began with the first entry of Muslim conquerors and continued for centuries before a line of Urdū verse was composed—nor: When was the Persian character first employed to write Hindī?—for the written form is but a subordinate matter. We must ask: When was the first verse composed in Hindī according to the forms of Persian prosody? Then, and not till then, did Urdū poetry come into being. This appears to have happened, as already mentioned, about the end of the 16th century. Meantime the vernacular vocabulary had been gradually influenced by Persian. The translation, under Akbar, of Sanskrit works into Persian had brought the indigenous and the foreign literatures into contact. The Hindī spoken about Delhi and northwards was naturally the form of the vernacular most subject to foreign influences; and with the extension of Mogul territory, this idiom was carried abroad by the Imperial armies, and was adopted by the Muslim kingdoms of the Deccan as their court language some time before their overthrow by Aurangzēb.

The first impulse to literary composition in Urdū was given, not in the north, but at the Mohammedan courts of Gōlkondā and Bijāpur in the south, both situated amid an indigenous population speaking Dravidian languages. The literature thus inaugurated had nothing to do with the idiom or ideas of the local people, but was from the beginning an imitation of Persian models. The *qaṣīda* or laudatory ode, the *ghazal* or love-sonnet, usually of mystical import, the *marṣiya* or dirge, the *maṣnavī* or narrative poem with coupled rhymes, the *hiṣṣa* or satire, the *rubāʿī* or epigram—these were the types which Urdū took over ready-made. And with the forms were appropriated also all the conventions of poetic diction. The Persians had elaborated a system of rhetoric and a stock of poetic images which, in the exhaustion of original matter, made the success of the poet depend chiefly upon artifice and conceit. Few of the most eloquent passages of later Persian verse admit of satisfactory translation into any other language. The same is true of Urdū poetry. Until quite modern times, there is scarcely anything in it which can be called original. Differences of school, which are made much of by native critics, are to us hardly perceptible.

Shujāʿuddīn Nūrī, a native of Gujarāt, a contemporary of Akbar, is mentioned as the most ancient Urdū poet after Amīr Khusrau. Several *ghazals* by him are said to survive. Kulī Kuṭb Shāh of Gōlkondā, who reigned from 1581, and his successor ʿAbdullāh Kuṭb Shāh, have both left collections of verse. During the reign of the latter Ibn Nishāṭī wrote two works which are still famous as models of composition in Dakḥnī; they are *maṣnavīs* entitled the *Tūṭī-nāma*, or “Tales of a Parrot,” and the *Phūl-ban*. The first is an adaptation of a Persian work by Nakḥshabī, but derives ultimately from a Sanskrit original; this collection has been frequently rehandled in Urdū, and is the original of the *Tōṭā-Kahānī*, one of the first works in Urdū prose, composed in 1801 by Muḥammad Ḥaidar-bakhsh Ḥaidarī of the Fort William College. The *Phūl-ban* is a love tale, likewise translated from a Persian work. Another famous work which probably belongs to the same place and time is the *Story of Kāmruṭ and Kalā* by Taḥsīnuddīn. It was published (1836) by M. Garcin de Tassy. Though the work of a Muslim, its personages are Hindu. The incidents somewhat resemble those of the tale of as-Sindibād in the *Thousand and One Nights*.

The court of Bijāpur was equally distinguished. Ibrāhīm ʿAdīl Shāh (1579–1626) was the author of a work in verse on music entitled the *Nau-ras* or “Nine Savours,” which, however, appears to have been in Hindī rather than Urdū. A successor of this prince, ʿAlī ʿAdīl Shāh, had as his court poet a Brahman known

poetically as Nuṣratī, who in 1657 composed a *maṣnavī* entitled the *Gulshan-i ʿIshq*, or “Rose-garden of Love,” a romance on an Indian theme. The same poet is author of a long *maṣnavī* entitled the *ʿAlī-nāma*, celebrating the Shāh.

The first generally accepted standard of form, however, a standard which suffered little change in two centuries, was established by Walī of Aurangābād (about 1680–1720) and his contemporary and fellow-townsmen Sirāj. The former of these is commonly called “the Father of Rēkhtah”—*Bābā-e Rēkhta*; and the immense development attained by Urdū poetry in northern India during the 18th century was due to his initiative. Little is known of Walī's life. His *Kullīyāt* or complete works have been published by M. Garcin de Tassy, with notes and a translation of selected passages (Paris, 1834–1836).

The first of the Delhi school of poets was Zuhūruddīn Ḥātim, who was born in 1699 and died in 1792. In 1719 the *diwān* of Walī reached Delhi. Ḥātim was the first to imitate it in the Urdū of the north, and was followed by his friends Nāḥī, Mazmūn and ʿAbrū. Two *diwāns* by him survive. One of his pupils was Rafī us-Saudā, the most distinguished poet of northern India. Khān ʿArzū (1689–1756) was another of the fathers of Urdū poetry in the north. He is chiefly renowned as a Persian scholar, but his Urdū works are also highly esteemed. He was the master of Mīr Taqī, who ranks next to Saudā as the most eminent Urdū poet. ʿArzū died at Lucknow, whither he betook himself after the devastation of Delhi by Nādir Shāh (1739). Another eminent Delhi poet was Inʿāmullāh Khān Yaḥqīn, who died during the reign of Ahmad Shāh (1748–54), aged twenty-five. Another was Mīr Dard, pupil of Shāh Gulshan (who is said to have instructed Walī); his *diwān* is extremely popular. He died in 1793.

Saudā and Mīr Taqī are the most distinguished Urdū poets. The former was born at Delhi about the beginning of the 18th century. He left Delhi after its devastation, and settled at Lucknow, where the Nawāb ʿĀṣafuddaulah gave him a *jāgīr*, and where he died in 1780. His poems are numerous, and cover all styles of Urdū poetry; but it is to his satires that his fame is chiefly due, and in these he surpassed all other Indian poets. Mīr Taqī was born at Agra, but early removed to Delhi, and in 1782 repaired to Lucknow, where he likewise received a pension; he died at an advanced age in 1810. His works are voluminous, including six *diwāns*. Mīr is counted the superior of Saudā in the *ghazal* and *maṣnavī*, while the latter excelled him in the satire and *qaṣīda*.

The rapid decay of the Mogul empire in the 18th century transferred the literary centre from Delhi to Lucknow, the capital of the flourishing state of Oudh. ʿArzū, Saudā and Mīr all ended their days there; they were followed by a school of Lucknow poets hardly inferior to those who had made Delhi illustrious. Here they were joined by Mīr Hasan (d. 1786), Mīr Sōz (d. 1800) and Qalandar-bakhsh Jurʿat (d. 1810), also refugees from Delhi, and illustrious poets. Mīr Hasan was a collaborator of Mīr Dard, and first settled at Faizābād and subsequently at Lucknow; he excelled in the *ghazal*, *rubāʿī*, *maṣnavī* and *marṣiya*, and is counted the third, with Saudā and Mīr Taqī, among Urdū poets. His fame chiefly rests upon a much admired *maṣnavī* entitled the *Sihru-l-bayān*, a romance relating the loves of Prince Bē-nazīr and the Princess Badr-i Munīr; his *maṣnavī* called the *Gulzār-i Iram*, in praise of Faizābād, is likewise highly esteemed. Mīr Muḥammadi Sōz was an elegant poet, remarkable for his compositions in the dialect of the harem called *Rēkhtī*, but somewhat licentious in his verse. Jurʿat was also a prolific poet, but his poems are licentious and full of double meanings. He imitated Saudā in satire with much success; he also cultivated Hindī poetry. Miskīn was another Lucknow poet of the same period, whose *marṣiyas* are especially admired. The school of Lucknow continued to flourish till the dethronement of the last king, Wājīd ʿAlī, in 1856. Atash and Nāsikh (who died respectively in 1847 and 1841) excelled in the *ghazal*; Mīr Anīs and his contemporary Dabīr, the former of whom died in December 1875 and the latter a few months later, in the *marṣiyah*. Rajab Alī Beg Surūr, who died in 1869, was the author of a much-admired romance in rhyming prose entitled the *Fisānah-e ʿTjāib* or “Tale of Marvels,” besides a *diwān*. The dethroned prince Wājīd ʿAlī himself, poetically styled Akhtar, was

also a poet; he published three *diwāns*, among them a quantity of poetry in the rustic dialect of Oudh which is philologically of much interest.

Delhi, meanwhile, was not altogether eclipsed. Among the last Moguls several princes were themselves creditable poets. Shāh Ālam II. (1761–1806), who wrote under the name of Āftāb, his son Sulaimān-shukoh, and his nephew Bahādur Shāh II., the last titular emperor of Delhi (d. 1862), who wrote under the name of Zafar, and was a pupil of Shaikh Ibrāhīm Zauq, a distinguished writer, were all poets. Maṣḥafī (Ghulām-i Ḥamdānī), who died about 1814, was one of the leaders of the revived poetic school of Delhi. Leaving Lucknow for Delhi in 1777, he held conferences of poets, at which several notable authors formed their style. Qāim (Qiyāmuddin 'Alī) was one of his society, and died in 1792; he has left several works of merit. Ghālib, otherwise Mirzā Asadullāh Khān, laureate of the last Mogul, who died in 1869, was the most eminent of the modern Delhi poets. He wrote chiefly in Persian, of which language he was a master; but his Urdū *diwān*, though short, is excellent in its way. To this school, though he lived and died at Agra, may be attached Mir Walī Moḥammed Naẓir (who died in 1832); his *maṣnavīs* as well as his *diwān* are extremely popular. His language is often obscene, but less artificial than that of most Urdū poets, and some of his poems are as much esteemed by Hindus as by Muslims.

4. **Modern Period.**—Such, in outline, is the history of the literary schools of the Deccan, Delhi and Lucknow. Meanwhile a fourth, at Calcutta, was to give no less an impulse to the cultivation of Urdū prose than had a hundred years before been given to that of poetry by Walī. At the commencement of the 19th century Dr. John Gilchrist was the head of the Fort William college, and he set to work to collect a body of literature suitable as textbooks for the study of Urdū by European officers. To this we owe the elaboration of the vernacular as an official speech. He gathered together the leading vernacular scholars, and their works, due to his initiative, are still notable as specimens of admirable prose composition, not only in Urdū, but also in Hindī. The chief authors of this school are Ḥaidarī (Sayyid Moḥammed Ḥaidar-bakhsh), Ḥusainī (Mir Bahādur 'Alī), Mir Amman Luṭfī, Ḥafizuddin Aḥmad, Shēr 'Alī Afsōs, Nihāl Chand of Lahore, Kāzīm 'Alī Jawān, Lallū Lāl Kavi, Mazhar 'Alī Wilā and Ikrām 'Alī.

Ḥaidarī composed the *Toṭā-Kahānī* (1801), a prose redaction of the *Tuṭī-nāmah* mentioned above; a romance *Ārāish-i Mahṣūl*; the *Gul-i Maḡhīrat* or *Dah Maḡlis*, an account of the holy persons of Islam; the *Gulzar-i Dānish*, a translation of a Persian work containing stories descriptive of the failings of women; and the *Tārīkh-i Nādirī*, a translation of a Persian history of Nādir Shāh. Ḥusainī is the author of an imitation in prose of Mir Ḥasan's *Sihru-l-boyān*, under the name of *Nasr-i-Bēnazir*, and of a work adapted from a Persian version of the *Hitopadeśa*, named *Akhḷāq-i Hindī*, or "Indian Morals," both composed in 1802. Mir Amman wrote the *Bāgh o Bahār* (1801–02), an adaptation of Amīr Khusrau's Persian romance, the *Chahār Darwēsh*. Amman's much admired work is not itself directly modelled on the Persian, but is a rehandling of an almost contemporary rendering by Tahsīn of Etāwā. Amman also composed an imitation of Husain Wā'iz Kāshifī's *Akhḷāq-i Muḥsinī* under the name of the *Ganj-i Khūbī*. Ḥafizuddin Aḥmad was a professor at the College; in 1803 he completed a translation of Abu-l-Faḡl's *'Iyār-i Dānish*, under the name of the *Khīrad-afroz*. The *'Iyār-i Dānish* is an imitation of the originally Sanskrit collection of apoloques known in Persian as the *Fables of Bidpāi*, or *Kalīlah and Dimna*. Afsōs was one of the most illustrious of the Fort William school; originally of Delhi, he left that city as a boy, finally joined the college in 1800, and died in 1809. He is the author of a much esteemed *diwān*; but his two chief works are in prose and of great excellence, the *Ārāish-i Mahṣūl* (1805), an account of India adapted from the introduction of the Persian *Khulāṣatu-t-tawārīkh* of Sujān Rāe, and the *Bāgh-i Urdū* (1808), a translation of Sa'dī's *Gulistan*. Nihāl Chand translated into Urdū a *maṣnavī*, the *Gul-i Bakāwālī*, under the name of *Mazhab-i 'Ishq*; this is in prose intermingled with verse, and was composed in 1804. Jawān was originally of Delhi and afterwards of Lucknow; he joined the College in 1800. He is the author

of a version in Urdū, called *Sakuntalā Nāṭak*, of the well-known story of Sakuntalā. He also composed a *Bārāh-māsā*, or poetical description of the twelve months, with accounts of Hindu and Mohammedan festivals, entitled the *Dastūr-i Hind*. Ikrām 'Alī translated, under the name of the *Ikhwānu-s-safā* (1810), a chapter of a famous 10th century Arabian collection of treatises on science and philosophy entitled *Rasā'ilu Ikhwāni-s-safā*. The complete collection, due to different writers who dwelt at Baṣra, has been made known to European readers by the translation of Dr. F. Dieterici (1858–79). Kram 'Alī's translation is one of the best of the Fort William productions.

Srī Lallū Lāl was a Brahman of Gujerati extraction. What was done by the other Fort William authors for Urdū prose was done by Lallū Lāl almost alone for Hindī. He in fact created "High Hindī" as a literary language. His *Prem Sāgar* and *Rājñīti*, the former a version in pure Hindī of the 10th chapter of the *Bhāgavata Purāṇa*, detailing the history of Kṛishṇa, and founded on a previous Braj-bhāshā version by Chaturbhuj Mīsr, and the latter an adaptation in Braj-bhāshā prose of the *Hitopadeśa* and part of the *Pancha-tantra*, are unquestionably the most important works in Hindī prose. The *Prem Sāgar* was begun in 1804 and ended in 1810; it enjoys immense popularity in northern India. The *Rājñīti*, composed in 1809, is much admired for its sententious brevity and the purity of its language. Lallū Lāl was also the author of a collection of a hundred anecdotes in Hindī and Urdū entitled *Latā'if-i Hindī*, an anthology of Hindī verse called the *Sabhā-bīlās*, a *Sat-saī* in the style of Bihārī-Lāl called *Sapta-satika* and several other works. He and Jawān worked together at the *Singhāsān Battīsī* (1801), a redaction in mixed Urdū and Hindī of a famous collection of legends of King Vikramāditya; and he also aided Jawān in writing the *Sakuntalā Nāṭak*. Mazhar 'Alī Wilā was his collaborator in the *Baitāl Pachīsī*, a collection of stories similar to the *Singhāsān Battīsī*; and he aided Wilā in the Urdū *Story of Mādhōnāl*, a romance originally composed in Braj-bhāshā by Mōti Rām.

The works of these authors, though compiled and published under European superintendence and intended for the instruction of the Company's officers, are essentially Indian in taste and style, enjoyed a very wide reputation, and set the standard of prose composition in Urdū and Hindī for fifty years. Meanwhile, among the Muslims of northern India, another almost contemporaneous impulse did much for the expansion of Urdū, and, like the work of the Vaishnava reformers in moulding literary Hindī, gave an invaluable impetus to composition. This was the reform in Islam led by Sayyid Aḥmad and his followers.

Sayyid Aḥmad was born in 1782, and received his early education at Delhi; his instructors were two learned Muslims, Shāh 'Abdul-l-'Aziz, author of a celebrated commentary on the Qur'ān, and his brother 'Abdu-l-Qādir, the first translator of the Qur'ān into Urdū. Under their guidance Sayyid Aḥmad embraced the doctrines of the Wahhābīs. He gathered round him a large number of disciples, among others Ismā'il Ḥājī, nephew of 'Abdu-l-'Aziz and 'Abdu-l-Qādir, the chief author of the sect. After a course of preaching and apostleship at Delhi, Sayyid Aḥmad set out in 1820 for Calcutta, attended by numerous adherents. Thence in 1822 he started on a pilgrimage to Mecca, whence he went to Constantinople, and there gained many disciples. He travelled for nearly six years in Turkey and Arabia, and then returned to Delhi. The religious degradation and coldness which he found in his native country strongly impressed him, and he and his disciples established a propaganda throughout northern India, reprobating the superstitions which had crept into the faith and preaching holy war against the Sikhs. In 1828 he started for Peshāwar, attended by, it is said, upwards of 100,000 Indians, and accompanied by his chief followers, Ḥājī Ismā'il and 'Abdu-l-Ḥayy. He was furnished with means by a general subscription. At the beginning of 1829 he declared war against the Sikhs, and in time made himself master of Peshāwar. His Afghan allies, however, deserted him. He fled across the Indus and, with Ḥājī Ismā'il, was slain in 1831 in combat with the Sikhs. Wahhābī doctrines have spread in India, and still occasion much controversial writing.

The translation of the Qur'ān by 'Abdu-l-Qādir was finished in

1803, and first published by Sayyid 'Abdullāh, disciple of Sayyid Ahmad, in 1829. The *Tambikū-l-ghāfilin*, or "Awakener of the Heedless," a work in Persian by Sayyid Ahmad, was rendered into Urdū by 'Abdullāh, and published at the same press in 1830. Hājī Ismā'il was the author of a treatise in Urdū entitled *Taqwiyat-ul-Imān* ("Confirmation of the Faith"), which had great vogue among the following of the Sayyid. Other works were also composed by the disciples of the *Tariqah-e Muḥammadiyyah*, as the new preaching was called.

Printing was first used for vernacular works by the College Press at Fort William, at the end of the 18th and the beginning of the 19th century, and all the compositions prepared for Dr. Gilchrist and his successors mentioned above were printed. But the expense of this method precluded its extensive use and movable types were not well suited to the Persian characters. Lithography was introduced about 1837, when the first press was set up at Delhi, and immediately gave a powerful stimulus to the multiplication of literature. In 1832 the vernaculars were substituted for Persian as the official language of the courts and the acts of the legislature, and this at once led to a great increase in vernacular technical terms. Thirdly, the spread of education in subjects of Western learning not only greatly enlarged the popular vocabulary, but led to the use of a simpler style, and the abandonment wholesale of florid ornament. Lastly, the establishment of a vernacular newspaper press had far-reaching cultural and literary consequences.

All these revolutionary agencies were already at work when, following on the Mutiny of 1857, the transfer of the government of India from the Company to the Crown inaugurated a new era. Since 1860 their operation has become extremely rapid and far-reaching. The use of lithography annually gives birth to hundreds of works. The extension of education has created a mass of schoolbooks, and the spread of instruction in English and the activity of translators have filled the vernaculars with new words drawn from that language. The newspaper press, in Urdū and Hindī, now counts hundreds of journals. Of this great body of literary production it is possible to speak only in general terms. Style and vocabulary are still in a somewhat fluid condition, and the subjects treated are almost as various as they are in European literatures. Much of the work produced has little claim to literary excellence, and we may content ourselves with mentioning a few writers whose influence and authority make it probable that they will hereafter be known as leaders in the new culture.

One of the first effects of the new literary inspiration seemed to be the extinction of poetical composition as previously practised. With the deaths of Zauq (1854) and Ghālīb (1869) of the Delhi school, and those of Anīs (1875) and Dabīr (1876) of Lucknow, the end of Urdū poetry appeared to have come. The new age was intensely practical and had no time for sentiment, or taste for mystical conceits. Moreover, poetical composition in India has always owed much to court patronage. The thrones of Delhi and Lucknow had passed away, and only at Hyderabad in the Deccan, under the patronage of the Nizam, were laureates still honoured; the last of these, Mirzā Khān Dāgh (1831-1905), enjoyed a wide reputation as a graceful and eloquent poet.

But prose and material prosperity did not succeed in monopolizing the genius of the people. The great movement of reform and liberalism in Islām led by Sir Sayyid Ahmad Khān (1817-1898) found its bard in Sayyid Altāf Ḥusain of Pānīpāt, poetically styled Hālī. Hālī was a pupil of the famous Ghālīb, whose life he wrote and of whose writings he published an able criticism. At the age of forty he came under the influence of Sir Sayyid Ahmad Khān, and devoted his great poetic gifts to the service of his co-religionists. He published much verse, of which an interesting specimen will be found in the edition of his *Rubā'īs* or quatrains (101 in number), with an English translation, by Mr. G. E. Ward (Oxford, 1904); in this is included a famous poem setting forth his ideals in poetry—simplicity, avoidance of exaggeration and unreality, direct appeal to the heart, and above all sincerity. He inaugurated a new and vigorous poetic school. He died in 1915.

Perhaps the most memorable of all Hālī's compositions is his long poem in six-line stanzas (called *musaddas*) on "the flow and

ebb of Islam" (1879), which had an extraordinary influence in stimulating enthusiasm in the cause of Muhammadan progress. In it he draws, in simple but eloquent language, a sketch of the past glories of Islam, and contrasts with this its subsequent degradation in Hindōstān. The poem is still recited and imitated in the Punjab and United Provinces. Hālī also wrote an admirable life of Sir Sayyid Ahmad Khān, entitled *Ḥayāt-i Jāvid*.

Another writer whose work, though chiefly in prose, deals with poetry and poetic style, is Maulavī Moḥammad Ḥusain Azād, professor of Arabic at the Government college, Lahore. His biographies of Urdū poets, with criticisms of their works, entitled *Āb-i Ḥayāt*, is a standard work. His style is much admired. Azād was the pupil of Zauq, of whose poems he has published an annotated edition. Among his other works in prose are *Nairang-i Khayāl*, an allegory dealing with human life; and *Darbār-i Akbari*, an account of the reign of Akbar. He died in 1910.

Sir Sayyid Ahmad Khān's life and work are dealt with elsewhere. Among his literary achievements may be mentioned the *Āsārū-Ṣanādīd* ("Vestiges of Princes"), an excellent account of Delhi and its monuments, first lithographed in 1847. His essays and occasional papers, published in the *Aligarh Institute Gazette* (started in 1864), and afterwards (from 1870 onwards) in a periodical entitled *Tahzīb-ul-Akhḫlāq* (or "Mohammedan Social Reformer"), handle all the problems of religious, social and educational advancement among Indian Muslims—the cause to which his life was devoted. His great *Commentary on the Qur'ān*, in seven volumes, the last finished only a few days before his death in 1898, is carried to the end of *Sūrah* xx., a little more than half the book. In him Urdū prose found its most powerful wielder for the diffusion of modern ideas, and the movement which he set on foot has been the spring of the best literature in the language during recent years.

Another excellent writer of Urdū is Shamsul-'Ulamā Maulavī Nazīr Ahmad of Delhi, who is the author of a series of novels of domestic life, which have had a wide popularity, and have been specially serviceable in the education of Indian women. These are entitled the *Mir'ātul-'Arūs*, *Taubatun-Naṣūh*, *Banātun-Na'sh*, *Ibnul-Waqt* and *Ayāmā*. Nazīr Ahmad was the principal translator into Urdū of the *Indian Penal Code* (1861), which is reckoned a masterpiece in the exact rendering of European legal ideas; and he is the author of the best Urdū version of the Quran. He was closely associated with Sir Sayyid Ahmad Khān.

The novel is one of the most noteworthy features of recent literary composition in Urdū. India has always been rich in stories and romances; but the modern novel, as understood in Europe, is a new development. The most admired Urdū novel is a work entitled *Fisāna-e Azād*, by Paṇḍit Ratan-nāth Sarshār of Lucknow. The story is remarkable for its vivid pictures of Lucknow society, and its faithful delineation of character. Another good writer is Maulavī 'Abdul-Ḥalīm Sharar. He was editor of a monthly Lucknow periodical called the *Dil-gudāz*, composed in European style, and in it his novels, which are all of an historical character, in the style of Sir Walter Scott, originally appeared. The best are *Azīz and Virginā*, a tale of the Crusades, and *Man-ṣūr and Mōhinā*, a story of India at the time of the invasions of Maḥmūd of Ghaznī.

Although Urdū chiefly represents Muslim culture, its use is by no means confined to Muslims. Not only is the most popular Urdū novelist a Hindū, but the statistics of the vernacular press show that this form of the language is widely used by Hindūs.

"High Hindī" has scarcely adapted itself to modern requirements with the thoroughness displayed by Urdū. It is taught in the schools where the population is mainly Hindū, and books of science have been written in it with a terminology borrowed from Sanskrit. But Sanskrit is far removed from the daily life of the people, and most works in this style are read only by Paṇḍits, the great bulk of them dealing with religion, philosophy and the ancient literature. There are a fair number of Hindī and Hindī-Urdū journals; but many of them are exclusively religious in character, and several, though written in Dēvanāgarī, employ a language akin to Urdū. The old dialects of literature, Awadhī and Braj-bhāshā, are now only used for poetry.

The most noticeable authors in Hindi since the middle of the 19th century have been Bābū Harishchandra and Rājā Siva Prasād, both of Benares. The former (1850-1885) was an enthusiastic cultivator of the old (dialect) poetic art. He published, in the *Sundarī Tilak*, an anthology of Hindi poetry, and, as well, a quantity of old texts, with much added matter. He also wrote biographies and critical studies. In history especially he cleared up many problems. In his *Kashmīr Kusum*, or history of Kashmīr, a list is given of about a hundred works by him. He was also the real founder of the modern Hindi drama. Rājā Siva Prasād (1823-1895) published many educational works which have greatly contributed to the formation of a form of Hindi not excessively Sanskritized, and not rejecting current Persian forms. The society at Benares called the *Nāgarī Prachārīṇī Sabhā* ("Society for promoting the use of the Nāgarī character") has, since the death of Harishchandra, been active in the publication of useful works in Hindi, besides conducting a systematic search for old mss.

BIBLIOGRAPHY.—The best account in English of Hindi literature is Dr. G. A. Grierson's *Modern Vernacular Literature of Hindōstān*, issued by the Asiatic Society of Bengal in 1889; the dates in this work, which is founded on indigenous compilations, have, however, in many cases to be received with caution. Before it appeared, Garcin de Tassy's admirable *Histoire de la littérature Hindoue et Hindoustanie*, and his annual summaries of the progress made from 1850 to 1877, were our chief authority. For the religious literature of the Vaishnava sects, Professor H. H. Wilson's *Essay on the Religious Sects of the Hindus* (vol. i. of his collected works) has not yet been superseded.

For Urdū poets, Professor Āzād's *Āb-i Hayāt* (in Urdū) is the most trustworthy record. The catalogues by Professor Blumhardt of Hindōstānī and Hindi books in the libraries of the British Museum and the India Office will give some idea of the scope of recent productions. (C. J. L.)

HINDUISM, a term generally employed to comprehend the social institutions, past and present, of the great majority of the people of India as well as their religious beliefs. Hinduism is also used in a narrower sense, as denoting more especially the modern phase of Indian social and religious institutions from the earlier centuries of the Christian era down to our own days.

Therefore, here are four main elements: religion, race, country, and social organization. They may not be separated. Each is bound up and is an integral factor in the life of the others. It is a living whole forged by the organic stresses of history and a long past, from diverse sources, from various materials, and it is still a living, vigorous whole.

Uniformity could not be expected as a feature of the religious experience of 232,000,000 people of different racial origins, of different history, of different environment, tradition, language, and social structure. Yet there is a true Hindu polity; there are features common to North and South, to East and West. Much of it belongs obviously to the universal pattern for the age-long problems, whose presentations, at various times, in differing modes, constitute the stimulus to religious activity and are based ultimately on certain definite universal experiences and facts. Man is born of woman, grows and withers like the grass. Whence and whither and why? The debate of fate, foreknowledge, freewill, follows inevitably certain lines, and the solutions to these problems conform to type because they are universal problems, wherever, as is markedly the case in India, thought has turned to the scrutiny and analysis of experience.

Main Doctrines.—The characteristic tenets of orthodox Brahmanism (*q.v.*) consist in the conception of an absolute, all-embracing spirit, the Brahma (neutr.), being the one and only reality, itself unconditional, and the original cause and ultimate goal of all individual souls (*jīva*, *i.e.*, living things). As Sir Charles Eliot shows, there are at least two doctrines held by nearly all who call themselves Hindus. "One may be described as polytheistic pantheism . . . the second doctrine is commonly known as metempsychosis, the transmigration of souls or re-incarnation, the last-named being the most correct." Here most certainly are elements which Hinduism shares with and derives from lowlier cults. From these very elements and beliefs the social fabric draws its strength. They make for the stability of social structure. They validate morality. They have a survival value.

The ceaseless working of the Absolute Spirit as a creative, conservative, and destructive principle is represented by the divine personalities of Brahma (masc.), Vishnu, and Siva, forming the Trimūrti or Triad. These latter two gods were in early days favourite objects of popular adoration. Sectarianism goes back beyond the formulation of the Brahmanical creed, right up to the Vedic age. Siva, so far from being merely the destroyer, is the

THE THREE GRAND ATTRIBUTES OF THE DEITY—CREATION, PRESERVATION AND DESTRUCTION, PERSONIFIED IN BRAHMA, VISHNU AND SIVA

representative of generative and reproductive power in nature. Brahma, having performed his legitimate part in the mundane evolution by his original creation of the universe, has retired into the background. The Trimūrti has retained to this day at least its theoretical validity in orthodox Hinduism and has exercised influence in promoting feelings of toleration towards the claims of rival deities and a tendency towards identifying divine figures newly sprung into popular favour with one or other of the principal deities, and thus helping to bring into vogue that notion of avatars, or periodical descents or incarnations of the deity, so prominent in later sectarian belief.

At all times orthodox Brahmanism has had to wink at, or ignore, all manner of gross superstitions and repulsive practices, along with the popular worship of countless hosts of godlings, demons, spirits, and ghosts, and mystic objects and symbols of every description. Fully four-fifths of the people of the Southern area, whilst nominally acknowledging the spiritual guidance of the Brahmans, worship nondescript local village deities (*grāma-devatā*), with animal sacrifices, frequently involving the slaughter, under revolting circumstances, of thousands of victims. These local deities are nearly all of the female, not the male, sex. In the estimation of these people Siva and Vishnu may be more dignified beings, but the village deity is regarded as a more present help in trouble, and more intimately concerned with the happiness and prosperity of the villagers. This represents a religion, more or less modified in various parts of South India by Brahmanical influence. Many of the deities themselves are of quite recent origin, and it is easy to observe a deity in making even at the present day.

From the point of view of social organization (*see* CASTE) the cardinal principle which underlies the system of caste is the preservation of purity of descent, and purity of religious belief and ceremonial usage. Hindu polity is aristocratic, not egalitarian. It recognizes, utilizes, and explains the inequalities of individuals and of groups of individuals. It is based on a sense of duty and of reciprocal obligation permeating the whole society from the king to the peasant. *Dharma* is duty. In the caste system, with its hierarchical gradations, its complex relations, its jealous endogamy, its fissiparous nature, it expresses an exclusiveness which at first sight seems to create a rigid barrier, but its process of proselytization is by the absorption of whole communities, and that process is still active.

In the sphere of religious belief we find the whole scale of types represented from the lowest to the highest. In their theory of a triple manifestation of an impersonal deity, the Brahmanical theologians elaborated a doctrine which could only appeal to the sympathies of a comparatively limited portion of the people. The

religious belief of the Aryan classes underwent changes in post-Vedic times, due to aboriginal influences, and the later creeds offer many features in which one might suspect influences of that kind. The two epic poems, the *Mahabharata* and *Ramayana*, still show us in the main the *personnel* of the old pantheon; but the gods have become anthropomorphized and almost purely mythological figures. A number of the chief gods, sometimes four, but generally eight, now appear as *lokapalas* or world-guardians, having definite quarters or intermediate quarters of the compass assigned to them as their special domains. One of them, Kubera, the god of wealth, is a new figure; whilst another, Varuna, the most spiritual and ethical of Vedic deities—the king of the gods and the universe; the nightly star-spangled firmament—has become the Indian Neptune, the god of waters. Indra, their chief, is virtually a kind of superior rajah, residing in *svarga*, and as such is on visiting terms with earthly kings, driving about in the air with his charioteer Matali, and is actually defeated in battle by the son of the demon-king of Lanka (Ceylon), and kept there a prisoner till ransomed by Brahma and the gods conferring immortality on his conqueror. Hanuman, the deified chief of monkeys, probably represents the aboriginal tribes of Southern India, whose wonderful exploits as Rama's ally on the expedition to Lanka Indian audiences will never weary of hearing recounted. The Gandharvas figure already in the Veda, either as a single divinity, or as a class of genii, conceived of as the body-guard of Soma and as connected with the moon. In the later Vedic times they are represented as being fond of and dangerous to women; the Apsaras, apparently originally water-nymphs, were closely associated with them. In the heroic age the Gandharvas have become the heavenly minstrels plying their art at Indra's court, with the Apsaras as their wives or mistresses. Hence also the universal reverence paid to serpents (*naga*) since those early days. (See SERPENT CULTS.) In addition to such essentially mythological conceptions, we meet in the religious life of this period with an element of more serious aspect in the two gods, on one or other of whom the religious fervour of the large majority of Hindus has ever since concentrated itself, viz., Vishnu and Siva. Both these divine figures have grown out of Vedic conceptions, the genial Vishnu mainly out of a not very prominent solar deity of the same name; whilst the stern Siva, i.e., the kind or gracious one—doubtless a euphemistic name—has his prototype in the old fierce storm-god Rudra, the "Roarer," with certain additional features derived from other deities, especially Pushan, the guardian of flocks and bestower of prosperity, worked up therewith. In the epic poems which took final shape in the early centuries before and after the Christian era, their popular character appears in full force; whilst their cult is likewise attested by the coins and inscriptions of the early centuries of our era. The co-ordination of the two gods in the Trimūrti does not exclude a certain rivalry between them; but, on the contrary, a supreme position as the true embodiment of the Divine Spirit is claimed for each of them by their respective votaries, without, however, an honourable place being refused to the rival deity, who is often represented as another form of the favoured god. The people's polytheistic instincts extended the pantheon by groups of new deities in connection with them. Two such new gods actually pass as the sons of Siva and his consort Parvati, viz., Skanda—also called Kumara (the youth), Karttikeya, or Subrahmanya (in the south)—the six-headed war-lord of the gods, and Ganesa, lord (or leader) of Siva's troupes of attendants, who is at the same time the elephant-headed, paunch-bellied god of wisdom. A third, Kama (Kamadeva) or Kandarpa, the god of love, gets his popular epithet of Ananga, "the bodiless," from his having once, in frolicsome play, tried the power of his arrows upon Siva, whilst engaged in austere practices, when a

single glance from the third (forehead) eye of the angry god reduced the mischievous urchin to ashes. For his chief attendant, the great god (Mahadeva, Mahésvara) has already with him the "holy" Nandi—identical in form as in name with Siva's sacred bull of later times, the symbol of the god's reproductive power. Thus we meet in the epics with the prominent feature of the worship of Siva and his consort all over India, viz., the feature represented by the *linga*, or phallic symbol. (See PHALLICISM.)

As regards Vishnu, the epic poems, including the supplement to the *Mahabharata*, the *Harivamsa*, supply the framework of legendary matter on which the later Vaishnava creeds are based. The theory of Avatars makes the deity—also variously called Narayana, Purushottama, or Vasudeva—periodically assume some material form in order to rescue the world from some great calamity, the ten universally recognized "descents" being enumerated in the larger poem. The incarnation theory is peculiarly characteristic of Vaishnavism; and the fact that the principal hero of the *Ramayana* (Rama), and one of the prominent warriors of the *Mahabharata* (Krishna) become in this way identified with the supreme god, and remain to this day the chief objects of the adoration of Vaishnava sectaries, naturally imparts to these creeds a human interest and sympathetic aspect which is wholly wanting in the worship of Siva.

Sectarianism.—During the early centuries of our era, whilst Buddhism, where countenanced by the political rulers, was still holding its own by the side of Brahmanism, sectarian belief in the Hindu gods made steady progress. The caste-system, by favouring unity of religious practice within its social groups, must naturally have contributed to the advance of sectarianism. Even greater was the support it received later on from the Puranas, a class of poetical works of a partly legendary, partly discursive, and controversial character, mainly composed in the interest of special deities, of which 18 principal (*maha-purana*) and as many secondary ones (*upa-purana*) are recognized, the oldest of which may go back to about the 4th century of our era. During this period, probably, the female element was first definitely admitted to a prominent place amongst the divine objects of sectarian worship, in the shape of the wives of the principal gods viewed as their *sakti*, or female energy, theoretically identified with the *Maya*, or cosmic illusion, of the idealistic Vedanta, and the *Prakriti*, or plastic matter, of the materialistic Sankhya philosophy, as the primary source of mundane things. The connubial relations of the deities may thus be considered "to typify the mystical union of the two eternal principles, spirit and matter, for the production and reproduction of the universe." But whilst this privilege of divine worship was claimed for the consorts of all the gods, it is principally to Siva's consort, in one or other of her numerous forms, that adoration on an extensive scale came to be offered by a special sect of votaries who therefore are known as the *Saktas*.

Sankara.—An attempt was made, about the latter part of the 8th century, by the distinguished Malabar theologian and philosopher, Sankara Acharya, to bring about a uniform system of orthodox Hindu belief. The practical result of his labours was the foundation of a new sect, the *Smartas*, i.e., adherents of the *smriti* or tradition, which has a numerous following amongst southern Brahmans, and is usually classed as one of the Saiva sects, its members adopting the horizontal sectarian mark, peculiar to Saivas, of a triple line, the *tripundra*, prepared from the ashes of burnt cow-dung and painted on the forehead.

Worship.—Since the time of Sankara, the gods Vishnu and Siva, or *Hari* and *Hara* as they are also commonly called—with their wives, especially that of the latter god—have shared between them the practical worship of the vast majority of Hindus. But, though the people have thus been divided between two different religious camps, sectarian animosity has upon the whole kept within reasonable limits. In fact, the respectable Hindu, whilst owning special allegiance to one of the two gods as his *ishtā devatā* (favourite deity), will not withhold his tribute of adoration from the other gods of the pantheon. The high-caste Brahman will probably keep at his home a *śālagrām* stone, the favourite symbol of Vishnu, as well as the characteristic emblems

of Siva and his consort, to both of which he will do reverence in the morning; and when he visits some holy place of pilgrimage he will not fail to pay his homage at both the Saiva and the Vaishnava shrines there. The same spirit of toleration shows itself in the celebration of the numerous religious festivals. Widely different, however, as is the character of the two leading gods are also the modes of worship practised by their votaries.

Siva.—The favourite god of the Brahmans has always been Siva. He is said to have first appeared in the beginning of the present age as *Sveta*, the White, for the purpose of benefiting the Brahmans, and he is invariably painted white. His worship is widely extended, especially in Southern India. Indeed, there is hardly a village in India which cannot boast of a shrine dedicated to Siva, and containing the emblem of his reproductive power; for almost the only form in which the "great god" is adored is the *linga*, consisting usually of an upright cylindrical block of marble or other stone, mostly resting on a circular perforated slab. The mystic nature of these emblems seems, however, to be but little understood by the common people; and it requires a rather lively imagination to trace any resemblance in them to the objects they are supposed to represent. The worship of Siva has never assumed a really popular character, especially in Northern India. The temple, which usually stands in the middle of a court, is as a rule a building of very moderate dimensions, consisting either of a single square chamber, with a pyramidal structure, or of a chamber for the *linga* and a small vestibule.

A MENDICANT, ONE OF THE MANY HINDUS THROUGHOUT INDIA WHO SEEK DETACHMENT FROM THE WORLD AS A MEANS OF SPIRITUAL WELFARE

Avatars.—From early times Vishnu proved to the lay mind a more attractive object of adoration on account of his genial character and the additional elements he has received through the theory of periodical "descents" (*avatāra*) or incarnations applied to him. At least one of his avatars is clearly based on the Vedic conception of the sun-god, viz., that of the dwarf who claims as much ground as he can cover by three steps, and then gains the whole universe by his three mighty strides. Of the ten or more avatars, only two have entered to any considerable extent into the religious worship of the people, viz., those of *Rama* (or *Ramachandra*) and *Krishna*, the favourite heroes of epic romance.

It may not be without significance, from a racial point of view, that Vishnu, Rama, and Krishna have various darker shades of colour attributed to them, viz., blue, hyacinthine, and dark azure or dark brown respectively. The names of the two heroes meaning simply "black" or "dark," the blue tint may originally have belonged to Vishnu, who is also called *pītavāsas*, dressed in yellow garment, i.e., the colours of sky and sun combined.

By these two incarnations, especially that of Krishna, a new spirit was infused into the religious life of the people by the sentiment of fervent devotion to the deity, as expressed in certain portions of the epic poems, especially the *Bhagavadgita*, and in the *Bhagavata-purana* (as against the more orthodox Vaishnava works of this class such as the *Vishnu-purana*), and formulated into a regular doctrine of faith in the *Sandilya-sutra*, and ultimately translated into practice by the Vaishnava reformers.

Eroticism and Krishna Worship.—The Vaishnava sects, in their adoration of Vishnu and his incarnations, Krishna and Ramachandra, usually associate with these gods their wives, as their *saktis*, or female energies, to enhance the emotional character of the rites of worship. In some of the later Vaishnava creeds, the favourite object of adoration is the juvenile Krishna, Govinda or Bala Gopala, "the cowherd lad," the foster son of the cowherd, Nanda of Gokula, taken up with his amorous sports with the *Gopis* or wives of the cowherds of Vrindavana (Brindaban, near Mathura on the Yamuna), especially his favourite mistress Radha or Radhika. This episode in the legendary life of Krishna

bursts forth full-blown in the *Harivansa*, the *Vishnu-purana*, the *Narada-Pancharatra*, and the *Bhagavata-purana*, the tenth canto of which, dealing with the life of Krishna, has become, through vernacular versions, especially the Hindi *Prem-sagar*, or "ocean of love," a favourite romance all over India. Krishna's favourite Radha makes her appearance in the *Brahma-vaivarta*, in which Krishna's amours in Nanda's cow-station are dwelt upon in detail; whilst the poet Jayadeva, in the 12th century, made her love for the gay and inconstant boy the theme of his beautiful, if highly voluptuous, lyrical drama, *Gita-govinda*.

Saktipuja.—The Saktas are worshippers of the *sakti*, or the female principle as a primary factor in the creation and reproduction of the universe. And as each of the principal gods is supposed to have associated with him his own particular *sakti*, as an indispensable complement enabling him to perform properly his cosmic functions, adherents of this persuasion might be expected to be recruited from all sects. In connection with the Saiva system an independent cult of the female principle has been developed; whilst in other sects, and in the ordinary Saiva cult, such worship is combined with, and subordinated to, that of the male principle. The theory of the god and his *Sakti* as cosmic principles is perhaps foreshadowed in the Vedic couple of Heaven and Earth, an entirely primitive concept. In the speculative treatises of the later Vedic period, and in the post-Vedic Brahmanical writings, the assumption of the self-existent being dividing himself into a male and a female half usually forms the starting-point of cosmic evolution. In the later Saiva mythology this theory finds its artistic representation in Siva's androgynous form of *Ardha-narisa*, or "half-woman-lord," typifying the union of the male and female energies; the male half in this form of the deity occupying the right-hand, and the female the left-hand side. In accordance with this type of productive energy, the Saktas divide themselves into two distinct groups, according to whether they attach the greater importance to the male or to the female principle, viz., the *Dakshinacharis*, or "right-hand-observers" (also called *Dakshina-margis*, or followers "of the right-hand path"), and the *Vamacharis*, or "left-hand-observers" (or *Vama-margis*, followers "of the left path"). Only in the numerous Tantras are Sakta topics fully and systematically developed.

The principal seat of Sakta worship is the north-eastern part of India—Bengal, Assam, and Behar. The great majority of its adherents profess to follow the right-hand practice; and apart from the implied purport and the emblems of the cult, their mode of adoration does not seem to offer any very objectionable features. And even amongst the adherents of the left-hand mode of worship, many of these are said to follow it, as a matter of family tradition, in a sober and temperate manner; whilst only an extreme section carry on the mystic and licentious rites taught in many of the Tantras.

The divine object of the adoration of the Saktas is Siva's wife—the *Devi* (goddess), *Mahadevi* (great goddess), or *Jagan-mata* (mother of the world)—in one or other of her numerous forms, benign or terrible. The forms in which she is worshipped in Bengal are of the latter category, viz., *Durga*, "the unapproachable," and *Kali*, "the black one," or, as some take it, the wife of *Kala*, "time," or death the great dissolver, viz., Siva. In honour of the former, the *Durga-puja* is celebrated during ten days at the time of the autumnal equinox, in commemoration of her victory over the buffalo-headed demon, *Mahishasura*; when the image of the ten-armed goddess, holding a weapon in each hand, is worshipped for nine days, and cast into the water on the tenth day, called the *Dasahara*, whence the festival itself is commonly called *Dasara* in Western India. *Kali*, on the other hand, the most terrible of the goddess's forms, has a special service performed to her, at the *Kali-puja*, during the darkest night of the succeeding month; when she is represented as a naked black woman, four-armed, wearing a garland of heads of giants slain by her, and a string of skulls round her neck, dancing on the breast of her husband (*Mahakala*), with gaping mouth and protruding tongue, and when she has to be propitiated by the slaughter of goats, sheep, and buffaloes. On other occasions also *Vamacharis* commonly offer animal sacrifices, usually one or

more kids; the head of the victim, which has to be severed by a single stroke, being always placed in front of the image of the goddess as a blood-offering (*bali*), with an earthen lamp fed with ghee burning above it, whilst the flesh is cooked and served to the guests attending the ceremony, except that of buffaloes, which is given to the low-caste musicians who perform during the service. Even some adherents of this class have, however, discontinued animal sacrifices, and use certain kinds of fruit, such as coco-nuts or pumpkins, instead. The use of wine, at one time very common on these occasions, is now restricted; and only members of the extreme section adhere to the practice of the so-called five *m's* prescribed by some of the Tantras, viz., *mamsa* (flesh), *matsya* (fish), *madya* (wine), *maithuna* (sexual union), and *mudra* (mystical finger signs).

Tantric theory has devised an elaborate system of female figures representing either special forms and personifications or attendants of the "great goddess." They are generally arranged in groups, the most important of which are the *mahavidyas* (great sciences), the eight (or nine) *mataras* (mothers) or *mahamataras* (great mothers), consisting of the wives of the principal gods; the eight *nayikas* or mistresses; and different classes of sorceresses and ogresses, called *yoginis*, *dakinis*, and *sakinis*. A special feature of the Sakti cult is the use of obscure Vedic *mantras*, often changed so as to be quite meaningless and on that very account deemed the more efficacious for the acquisition of superhuman powers; as well as of mystic letters and syllables called *bija* (germ), of magic circles (*chakra*) and diagrams (*yantra*), and of amulets of various materials inscribed with formulae of fancied mysterious import.

Since by the universally accepted doctrine of *karma* (deed) or *karmavipaka* ("the maturing of deeds") man himself—either in his present, or some future, existence—enjoys the fruit of, or has to atone for, his former good and bad actions, Hindu thought has no precise belief in the remission of sin by divine grace or vicarious substitution. The "descents" or incarnations of the deity have for their object the deliverance of the world from some material calamity threatening to overwhelm it. Indeed, any man credited with exceptional merit or achievement, or even remarkable for some strange incident connected with his life or death, might ultimately be looked upon as a veritable incarnation of the deity, capable of influencing the destinies of man, and become an object of local adoration. The transmigration theory, which makes the spirit of the departed hover about for a time in quest of a new corporeal abode, lent itself to superstitious notions of this kind.

The worship of the *Pitris* ("fathers") or deceased ancestors, enters largely into the everyday life and family relations of the Hindus. (See ANCESTOR WORSHIP.) At stated intervals, to offer reverential homage and oblations of food to the forefathers up to the third degree is one of the most sacred duties the devout Hindu has to discharge. The periodical performance of the commemorative rite of obsequies called *Sraddha*—i.e., an oblation "made in faith" (*sraddha*, Lat. *credo*)—is the duty and privilege of the eldest son of the deceased, or, failing him, of the nearest relative who thereby established his right as next-of-kin in respect of inheritance; and those other relatives who have the right to take part in the ceremony are called *sapinda*, i.e., sharing in the *pindas* (or balls of cooked rice, constituting along with libations of water the usual offering to the Manes). The first *Sraddha* takes place as soon as possible after the *antyeshti* ("final offering") or funeral ceremony proper, usually spread over ten days; being afterwards repeated once a month for a year, and subsequently at every anniversary and otherwise voluntarily on special

FROM RUSSELL, "TRIBES AND CASTES OF CENTRAL INDIA"

A JOGI MENDICANT

Jogis are famous for sooth-saying and feats of jugglery, which the public regards as evidence of superhuman powers attained by the performer's ascetic life

occasions. Moreover, a simple libation of water should be offered to the fathers twice daily at the morning and evening devotion called *sandhya* ("twilight"). Anxious care was caused to the "fathers" by the possibility of the living head of the family being afflicted with failure of offspring, this dire prospect compelling them to use but sparingly their little store of provisions, in case the supply should shortly cease altogether. At the same time any irregularity in the performance of the obsequial rites might cause the fathers to haunt their old home and trouble the peace of their undutiful descendant, or even prematurely draw him after them to the *Pitri-loka* or world of the fathers. Terminating as it usually does with the feeding and feeing of a greater or less number of Brahmans and the feasting of members of the performers' own caste, the *Sraddha*, especially its first performance, is often a matter of very considerable expense; and more than ordinary benefit to the deceased is supposed to accrue from it when it takes place at a spot of recognized sanctity, such as one of the great places of pilgrimage like Prayaga (Allahabad, where the three sacred rivers, Ganga, Yamuna, and Sarasvati, meet), Mathura, and especially Gaya and Kasi (Benares). The pilgrimage to holy bathing-places is in itself an act of piety conferring religious merit. The number of such places is legion, and is constantly increasing. The water of the Ganges, the Jumna, the Narbada, and the Kistna rivers, is supposed to be imbued with the essence of sanctity capable of cleansing the pious bather of all sin and moral taint. To follow the entire course of one of the sacred rivers from the mouth to the source on one side and back again on the other in the sun-wise (pradakshina) direction—that is, always keeping the stream on one's right-hand side—is held to be a highly meritorious undertaking which requires years to carry through. Water from these rivers, especially the Ganges, is sent and taken in bottles to all parts of India to be used on occasion as healing medicine or for sacramental purposes. Sick persons are frequently conveyed long distances to a sacred river to heal them of their maladies; and for a dying man to breathe his last at the side of the Ganges is devoutly believed to be the surest way of securing for him salvation and eternal bliss.

Conclusion.—Who can venture to say what the future of Hinduism is likely to be? Is the regeneration of India to be brought about by the modern theistic movements, such as the Brahma-samaj (*q.v.*) and Arya-samaj (*q.v.*) as so close and sympathetic an observer of Hindu life and thought as Sir A. Lyall held? "The Hindu mind," he remarked, "is essentially speculative and transcendental; it will never consent to be shut up in the prison of sensual experience, for it has grasped and holds firmly the central idea that all things are manifestations of some power outside phenomena. And the tendency of contemporary religious discussion in India, so far as it can be followed from a distance, is towards an ethical reform on the old foundations, towards searching for some method of reconciling their Vedic theology with the practices of religion taken as a rule of conduct and a system of moral government. One can already discern a movement in various quarters towards a recognition of impersonal theism, and towards fixing the teaching of the philosophical schools upon some definitely authorized system of faith and morals, which may satisfy a rising ethical standard, and may thus permanently embody that tendency to substitute spiritual devotion for external forms and caste rules which is the characteristic of the sects that have from time to time dissented from orthodox Brahmanism." Purified from within, Hinduism, in its highest expression, by which it, as any other religion, has a right to be judged, with its great vitality, its power of adaptation, its philosophic tradition, its insistence on the development of the powers that are latent in man and are in jeopardy of being atrophied by modern dependence on machinery, may yet serve humanity by correcting the stress laid by other schools of thought upon the material to the neglect of the spiritual.

HINDU KUSH, a range of mountains in Central Asia. Throughout 500 m. of its length, from the Pamir region to the Koh-i-Baba, west of Kabul, it forms the water-divide between the Kabul and the Oxus basins, and, for the first 200 m. is the southern boundary of Afghanistan. Probably it branches from the head of the Taghdumbash Pamir, where it unites with the Sarikol stretching northwards, and the impressive mountain barrier of Muztagh, the northern base of which separates China from Kanjut. The Wakhjir pass, crossing the head of the Taghdumbash Pamir into the river Hunza, almost marks the trijunction of the three great chains. As the Hindu Kush strikes westwards, after first rounding the head of an Oxus tributary (the Ab-i-Panja), it closely overlooks the trough of that glacier-fed stream under its northern spurs, its crest at the nearest point being separated from the river by a distance of about 10 m. As the river is here the northern boundary of Afghanistan, and the crest of the Hindu Kush the southern boundary, this distance represents the width of the Afghan kingdom at that point.

Physiography.—For the first 100 m. the Hindu Kush is a comparatively wide flat-backed range with small lakes on the crest, and possessing no considerable peaks. It is crossed by many passes, varying in height from 12,500 ft. to 17,500 ft., the lowest and the easiest being the group about Baroghil. As the Hindu Kush gradually recedes from the Ab-i-Panja and turns south-westwards it gains in altitude, and prominent peaks rise to more than 24,000 ft. above sea-level. The main central water-divide is not the line of highest peaks, which line is farther south, where Tirach Mir dominates Chitral from a southern spur. For some 40 or 50 m. of this south-westerly bend, the crest is intersected by many passes, of which the most important is the Durah group (including the Minjan and the Mandal), which rise to about 15,000 ft., and which are practicable links between the Oxus and Chitral basins.

From the Durah to the Khawak group of passes (11,000 and 12,000 ft. in altitude), the water-divide overlooks Kafiristan and Badakshan. Here, its exact position uncertain, it lies amidst a wild, inaccessible region of snow-bound crests, and is nowhere less than 15,000 ft. above sea-level. The Khawak, at the head of the Panjshir river, leading straight from Badakshan to Charikar and the city of Kabul, is now an excellent kafila route, and is available for traffic throughout the year. From the Khawak to the head of the Ghorband (a river which meets the Panjshir near Charikar), the Hindu Kush is intersected by passes at intervals, e.g., the Kaoshan (the "Hindu Kush" pass *par excellence*), 14,340 ft.; the Chahardar (13,900 ft.), on the Afghanistan high road to Turkistan; and the Shibar (9,800 ft.). Here is the southern extremity of the Hindu Kush, for here commences the Koh-i-Baba system into which the Hindu Kush is merged.

The general structure of the Hindu Kush south of the Khawak, no less than such evidence as at present exists to the north, points to similar conditions of uplift and subsequent denudation as in

the western Himalaya and the whole of the trans-Indus borderland. The uplift was later than the Himalayas and was marked by the overthrusting of Cretaceous limestones upon Recent shales and clays as on the Baluch frontier. The Hindu Kush is, in fact, but the face of a great plateau-land lying north of it, just as the Himalaya forms the southern face of the table-land of Tibet, and its general physiography, exhibiting long, narrow, lateral valleys and transverse lines of "antecedent" drainage, is similar. There are few passes across the southern section of the Hindu Kush which have not to surmount a succession of crests or ridges as they cross from Afghan Turkistan to Afghanistan. The exceptions are notable, and have played an important part in the military history of Asia. From a little ice-bound lake called Gaz Kul, which lies on the crest of the Hindu Kush near the Taghdumbash Pamir, two very important river systems (those of Chitral and Hunza) are believed to originate. The lake really lies on the watershed and is probably a glacial relic. Its contribution to either stream appears to depend on the blocking of ice masses towards one or other end. It marks the commencement of the water-divide which separates the Gilgit basin from that of the Yashkun, and subsequently divides the drainage of Swat, and Bajour from that of the Chitral (or Kunar). The Yashkun-Chitral-Kunar river is the longest affluent of the Kabul, and it is in many respects a more important river than the Kabul. It is closely flanked on its left bank by this main water-divide. It is this range, crowned by peaks of 22,000 ft. and of an average height of 10,000 ft. throughout its length of 250 m., that is the real barrier of the north—not the Hindu Kush itself. Across it are glacial passes (Darkot) which lead to the foot of the Baroghil. Those passes (the Kilik and Mintaka, both above 15,000 ft.) from the Pamir, which lead into the gorges of the upper affluents of the Hunza, east of Darkot, belong rather to the Muztagh system. Other passes are the Shandur (12,250 ft.), between Gilgit and Mastuj; the Lowarai (10,450 ft.), between the Panjkora and Chitral valleys; and farther south certain lower crossings which formed part of the great highway between Kabul and India.

Facing Chitral, on the right bank of the river, and extending for 70 m., is the lofty snow-clad spur of the Hindu Kush known as Shawal, across which one or two difficult passes lead into the Bashgol valley of Kafiristan. This spur carries the boundary of Afghanistan. South of Arnawai the Kunar valley becomes a part of Afghanistan (see KUNAR). The value of Chitral as an outpost of British India may be best gauged by its geographical position. The Durah pass leads into the Chitral valley from the Oxus, as also the Mandal pass, a few miles south, is the connecting link between the Oxus and the Bashgol valley of Kafiristan; and the Bashgol valley leads directly to the Chitral valley at Arnawai, about 50 m. below Chitral. Nor must we overlook the connection between north and south afforded by the long narrow valley of the Chitral (or Yashkun) itself, leading up to the Baroghil pass. This route was once made use of by the Chinese for purposes of pilgrimage, if not for invasion. Access to Chitral from the north is therefore but a matter of practicable tracks, or passes, in two or three directions, and the measure of practicability under any given conditions can best be reckoned from Chitral itself.

Historical.—Hindu Kush is the Caucasus of Alexander's historians. It is also included in the Paropamisus, though the latter term embraces more, Caucasus being apparently used only when the alpine barrier is in question. It was no doubt regarded (and perhaps not altogether untruly) as a part of a great alpine zone believed to traverse Asia from west to east, whether called Taurus, Caucasus or Imaus. Arrian himself applies Caucasus distinctly to the Himalaya also. The application of the name Tanais to the Syr seems to indicate a real confusion with Colchian Caucasus. Alexander, after building an Alexandria at its foot (probably at Hupian near Charikar), crossed into Bactria, first reaching Drapsaca, or Adrapsa. This has been interpreted as Anderab, in which case he probably crossed the Khawak pass, but the identity is uncertain. The ancient Zend name is, according to Rawlinson, Paresina, the essential part of Paropamisus; this accounts for the great Asiatic *Parnassus* of Aristotle, and the *Pho-lo-sin-a* of Hsüan Tsang.

The Hindu Kush, formidable as it seems, and often as it has been the limit between petty states, has hardly ever been the boundary of a considerable power. Greeks, White Huns, Samanidae of Bukhara, Ghaznevides, Mongols, Timur and Timuridae, down to Saddozais and Barakzais, have ruled both sides of this great alpine chain. (See also AFGHANISTAN; INDIA.)

BIBLIOGRAPHY.—Of publications before 1900 the following are very useful:—Report of the Russo-Afghan Boundary Commission (1886); Report of Lockhart's Mission (1886); Report of Asmar Boundary Commission (1895); Report of Pamir Boundary Commission (1896); J. Biddulph, *Tribes of the Hindu Kush* (Calcutta, 1880); W. M'Nair, "Visit to Kafiristan," vol. vi. *R.G.S. Proc.*, 1884; F. Younghusband, "Journeys on the Pamirs, etc.," vol. xiv. *R.G.S. Proc.*, 1892; Colonel Durand, *Making a Frontier* (London, 1899); Sir G. Robertson, *Chitral* (London, 1899); L. M. P. d'Orleans, *à travers l'Hindo-Kush* (1906); L. J. Thomas, *Beyond the Khyber Pass* (1925); E. Suess, *The Face of the Earth* (Eng. trans., 5 vols., 1904-1924).

HINDUR or **NALAGARH**, hill state, Punjab, India. Pop. (1921) 46,868; area, 256 sq.m.; estimated revenue, £20,000. The country was overrun by the Gurkhas for some years before 1815, when they were driven out by the British, and the raja was confirmed in possession of the territory.

HINDUS: see CASTE; INDIA: *Ethnology*; HINDUISM.

HINES, JOHN LEONARD (1868-), American soldier, was born at White Sulphur Springs, W.Va., on May 21, 1868. After graduating from the U.S. Military academy in 1891 he was stationed for five years at Fort Omaha, Neb. He served as acting quartermaster in Cuba during the Spanish-American War, and afterwards in the Philippines, 1900-01, 1903-05, 1911-12. He was assistant chief quartermaster 1908-09 in the department of Missouri and 1910-11 in Japan. In 1916-17 he served as adjutant of the punitive expedition into Mexico, and in June 1917 was sent to France as assistant adjutant-general of the American Expeditionary Forces. In May 1918, he was appointed to the command of the 1st Brigade of Infantry, 1st Division, A.E.F. which he commanded during the Cantigny operations and in the Montdidier and Aisne-Marne defenses. In August he was transferred to the 4th Division, which he commanded at the Battle of St. Mihiel and in the earlier stages of the Meuse-Argonne offensive. He was appointed commander of the III. Army Corps Oct. 11, 1918 with a temporary commission as major-general. He was made a major-general of the Regular Army on March 5, 1921, and in Dec. 1922, became deputy chief of staff. Upon the retirement of Gen. John J. Pershing on Sept. 18, 1924, Maj.-gen. Hines succeeded as chief of staff.

HINES, WALKER DOWNER (1870-), American lawyer, was born at Russellville, Ky., Feb. 2, 1870. He was educated at Oden college and the University of Virginia. From 1893 to 1904 he was with the Louisville and Nashville railroad in the legal department and, after 1901, as first vice-president. He practised law in Louisville, Ky., 1904-06 and in New York city 1906-16. In 1906 he became general counsel for the Atchison, Topeka and Santa Fe Railroad, later becoming chairman of the board of directors. In Feb. 1918, after the U.S. Government had assumed control of the railways as a war measure, he was appointed assistant director-general, and in January of the following year director-general. In May 1920 he was designated by President Wilson as arbitrator in the distribution of German, Austrian and Hungarian inland shipping under the peace treaties. In 1925 he made an investigation and report of navigation on the Rhine and Danube for the League of Nations. He wrote *The War History of the American Railroads* (1928).

HINGANGHAT, a town of British India in the Wardha district of the Central Provinces, 21 miles S.W. of Wardha, on the railway to Chanda. Pop. (1921) 17,200. It has given its name to one of the best known indigenous cotton staples in India. It is a flourishing place with two cotton mills and several presses and ginning factories. The new town is well laid out with broad streets and there are many prosperous Marwari traders.

HINGE, a movable joint, e.g., of a door or window (M.E. *hengen*, to hang); any device joining two parts together, but allowing them to move upon each other (see JOINERY). Figuratively, the word is used of a turning point or crisis on which something depends.

In modern industrial nations the manufacture of hinges of steel or brass has become a trade of large dimensions. The better sort of brass hinges are cast, but there is a big production of machine-made cheap articles.

HINGHAM, a town of Plymouth county, Mass., U.S.A., on Massachusetts bay, 12m. S.E. of Boston; served by the New York, New Haven and Hartford railroad. The area is 30 sq.m., and the population in 1925 was 6,158. It is primarily a residential town and a summer resort. It has some manufactures and is the seat of a United States arsenal and of Derby academy, founded in 1784 by Sarah Derby. The Old Meeting house was built in 1681. There were settlers here as early as 1633, some of whom were natives of Hingham in England; and in 1635 the common land called Barecove became the town of Hingham.

HINNY, a hybrid between a horse and an ass in which the latter is the female parent. (See MULE.)

HINRICHS, HERMANN FRIEDRICH WILHELM (1794-1861), German Hegelian philosopher, studied theology at Strassburg, and philosophy at Heidelberg under Hegel (q.v.), who wrote a preface to his *Religion im innern Verhältniss zur Wissenschaft* (Heidelberg, 1822) directed against Schleiermacher. He became a *Privatdozent* in 1819, and held professorships at Breslau (1822) and Halle (1824).

BIBLIOGRAPHY.—Philosophical works, *Grundlinien der Philosophie der Logik* (Halle, 1826); *Genesis des Wissens* (Heidelberg, 1835). On aesthetics: *Vorlesungen über Goethes Faust* (Halle, 1825); *Das Wesen der antiken Tragödie* (Halle, 1827); *Schillers Dichtungen* (Leipzig, 1837). Historical: *Geschichte der Rechts- und Staatsprinzipien seit der Reformation* (Leipzig, 1848-52); *Die Könige* (Leipzig, 1852).

HINSCHIUS, PAUL (1835-1898), German jurist, was the son of Franz Sales August Hinschius (1807-77), and was born in Berlin on Dec. 25, 1835. His father was not only a scientific jurist, but also a lawyer in large practice in Berlin. After working under his father, Hinschius in 1852 began to study jurisprudence at Heidelberg and Berlin, the teacher who had most influence upon him being Aemilius Ludwig Richter (1808-64), to whom he afterwards ascribed the great revival of the study of ecclesiastical law in Germany. In 1855 Hinschius took the degree of *doctor utriusque iuris*, and in 1859 was admitted to the juridical faculty of Berlin. He lectured at Halle, Berlin and Kiel universities, and in 1870-71 represented Kiel in the Prussian Upper House (1870-71). In 1872 he was appointed professor ordinarius of ecclesiastical law at Berlin. He took part in the conferences of the ministry of ecclesiastical affairs, which issued in the famous "Falk laws." In connection with the developments of the *Kulturkampf* which resulted from the "Falk laws," he wrote several important treatises. He sat in the Reichstag as a National Liberal from 1872 to 1878, and again in 1881 and 1882, and from 1889 onwards he represented the University of Berlin in the Prussian Upper House. He died on Dec. 13, 1898.

The two great works by which Hinschius established his fame are the *Decretales Pseudo-Isidorianae et capitula Angilramni* (2 parts, Leipzig, 1863) and *Das Kirchenrecht der Katholiken und Protestanten in Deutschland*, vols. i.-vi. (1869-77). The first of these, for which during 1860 and 1861 he had gathered materials in Italy, Spain, France, England, Scotland, Ireland, Holland and Belgium, was the first critical edition of the False Decretals. The *Kirchenrecht* is an exhaustive historical and analytical study of the Roman Catholic hierarchy and its government of the church.

See the articles s.v. by E. Seckel in Herzog-Hauck, *Realencyklopädie* (3rd ed., 1900), and by Ulrich Steitz in the *Allgemeine deutsche Biographie*, vol. 50 (Leipzig, 1905).

HINSDALE, a residential village of Du Page county, Ill., U.S.A., on the Burlington (railway) Route, 17m. W.S.W. of Chicago. The population in 1920 was 4,042, and was estimated locally at 7,500 in 1928. Since 1908 it has had a commission-manager form of government.

HINTERLAND, the region lying behind a littoral country dependent for trade or commerce upon it. As a political term the word first came into prominence during 1883-85, when Germany insisted on her right to exercise jurisdiction in the territory behind those parts of the African coast that she had occupied. The "doc-

trine of the hinterland" was that the possessor of the littoral was entitled to as much of the back country as geographically, economically or politically was dependent upon the coast lands, a doctrine which, in the space of ten years, led to the partition of Africa between various European Powers.

HINTZE, PAUL VON (1864–), German admiral and diplomatist, was born at Schwedt-on-the-Oder on Feb. 13, 1864. He entered the navy, and became (1908) military plenipotentiary at the Russian court, where he was said to enjoy the Tsar's confidence. From 1911–14 he was ambassador in Mexico, but was recalled at the end of 1914, was sent to Peking, and accomplished the journey in spite of the vigilance of the Allies. Transferred to Christiania (Oslo) in 1915 he again succeeded in eluding the blockade. From July 9 to Oct. 3, 1918 he was State secretary at the foreign office in succession to Kühlmann, representing it at German headquarters in the months preceding the armistice in 1918. Tirpitz expressed the opinion in his *Erinnerungen* (1919) that war with Russia might have been averted in 1914 if the emperor had sent Hintze on a special mission to the Tsar.

HIP. (1) (From O.E. *hype*, a word common in various forms to many Teutonic languages; cf. Dutch, *heup*, and Ger., *Hüfte*), the projecting part of the body formed by the top of the thigh-bone and the side of the pelvis, in quadrupeds generally known as the haunch (see JOINTS AND LIGAMENTS). (2) (O.E. *héope*, from same root as M.H. Ger. *hiefe*, a thorn-bush), the fruit of the dog-rose (*Rosa canina*); "hips" are usually spoken of with "haws," the fruit of the hawthorn.

HIPPARCHUS (fl. 146–126 B.C.), Greek astronomer, was born at Nicaea in Bithynia early in the 2nd century B.C. He observed in the island of Rhodes probably from 161, and made the capital discovery of the precession of the equinoxes in 130. (See ASTRONOMY: History.) Hipparchus founded trigonometry, invented the method of fixing terrestrial positions by circles of latitude and longitude, and catalogued more than 1,000 stars. None of his many works has survived except a Commentary on the *Phaenomena* of Aratus and Eudoxus, published by P. Victorius at Florence in 1567, and included by D. Petavius in his *Urano-logium* (Paris, 1630). A new edition was published by Carolus Manitius (Leipzig, 1894).

See J. A. Schmidt, *Variorum philosophicorum decas* (Jena, 1691); J. F. Montulca, *Histoire des mathématiques* (1758); J. B. J. Delambre, *Histoire de l'astronomie ancienne* (1817); R. Grant, *History of Physical Astronomy* (1852); G. Cornwell Lewis, *Astronomy of the Ancients* (1862); M. Marie, *Histoire des sciences* (12 vols., 1883–88); R. Wolf, *Geschichte der Astronomie* (1890–93); A. Berry, *History of Astronomy* (1891); P. Tannery, *Recherches sur l'histoire de l'astronomie ancienne* (1893); F. Boll, *Sphaera* (Leipzig, 1903).

HIPPARION, one of the extinct horses which spread from North America over Europe and Asia during the lower Pliocene. *Hipparion* (or *Hippotherium*) was not directly ancestral to the modern horse (*Equus*), but probably represents a lateral offshoot derived from *Merychippus*. It is the most abundant fossil in the so-called Hipparion fauna. (See EQUIDAE.)

HIPPASOS OF METAPONTUM, Pythagorean philosopher, was one of the earliest disciples of Pythagoras. Nothing is known of his life. Diogenes Laërtius says that he left no writings, but other authorities ascribe to him a *μυστικός λόγος* directed against the Pythagoreans. According to Aristotle (*Met.*, i. 3), he held the Heraclitean fire-doctrine, whereas the Pythagoreans maintained that number is the first principle. He seems to have regarded the soul as composed of igneous matter, and so approximates the Pythagorean doctrine of the central fire to the theories of Heraclitus. In spite of this divergence, Hippasos is always regarded as a Pythagorean.

See Diogenes, viii. 84; Diels, *Fragmente der Vorsokratiker*, vol. i (4th ed., 1922); also PYTHAGORAS.

HIPPEASTRUM, in botany, a genus of the family Amaryllidaceae, containing about 75 species of bulbous plants, natives of tropical and sub-tropical South America. The various forms in cultivation are generally known as Amaryllis. The handsome funnel-shaped flowers are borne in a cluster of two to many, at the end of a short hollow scape. The species and the numerous hybrids which have been obtained artificially show a great variety in size

and colour of the flower, including the richest deep crimson and blood-red, white, and striped, mottled or blended colours. They are of easy culture, and free-blooming habit. Like other bulbs they are increased by offsets, which should be carefully removed when the plants are at rest, and should be allowed to attain a fair size before removal.

HIPPED ROOF, in architecture, a roof which starts on all sides on the same level at the eaves and slopes up towards a ridge or point in the centre. Hipped roofs were apparently common in the domestic work of the Mediterranean countries from the time of Greece, and are still the most common form for informal buildings throughout the near east and in Italy, southern France and Spain. With the coming of the Renaissance into northern Europe the hipped roof tended to supersede the gable, owing to the emphasis on the horizontal line of the cornice. Thus most of the Renaissance *châteaux* of France and many of the earlier Georgian manors of England have hipped roofs. A remarkable development of hipped roof design was made by the Chinese, particularly in the north, where many of the great temple and palace halls have widely projecting and gently curved hipped roofs in which the hips (the intersections of the slopes) and the ridges are richly decorated with moulded tiles and terminated by fantastic dragons or grotesque gottles.

HIPPEL, THEODOR GOTTLIEB VON (1741–1796), German satirical and humorous writer, was born on Jan. 31, 1741, at Gerdauen, East Prussia, the son of a schoolmaster. In 1770 he was appointed chief burgomaster in Königsberg, and in 1786 president of the town. He died at Königsberg on April 23, 1796. *Lebensläufe nach aufsteigender Linie* (1778–81) is an autobiography, in which persons well known to him are introduced, together with a mass of heterogeneous reflections on life and philosophy. *Kreuz- und Querzüge des Ritters A bis Z* (1793–94) is a satire levelled against the follies of the age—ancestral pride and the thirst for orders, decoration and the like. Hippel has some resemblance to Jean Paul Richter in his constant digressions and in the interweaving of scientific matter in his narrative. Like Richter he was strongly influenced by Laurence Sterne.

In 1827–38 a collected edition of Hippel's works in 14 vols., was issued at Berlin. *Über die Eke* has been edited by E. Brenning (Leipzig, 1872), and the *Lebensläufe nach aufsteigender Linie* has in a modernized edition by A. von Ottingen (1878), gone through several editions. See J. Czerny, *Sterne, Hippel und Jean Paul* (Berlin, 1904).

HIPPIAS OF ELIS, Greek sophist, was born about the middle of the 5th century B.C. At Athens he made the acquaintance of Socrates, and seems to have lectured on politics, mathematics, music and astronomy. He boasted that he was more popular than Protagoras, and could deliver an extempore address on any subject to the assembly at Olympia. Plato's dialogues, the *Hippias major* and *minor*, contain an exposé of his methods, exaggerated no doubt, but written with full knowledge of the man. His aim was not to give knowledge, but to provide his pupils with the weapons of argument, to make them fertile in discussion on all subjects alike. Hippias did a real service to Greek literature by insisting on the meaning of words, the value of rhythm and literary style. He is credited with an excellent work on Homer, collections of Greek and foreign literature, and archaeological treatises, but only the barest notes remain.

See Diels, *Fragmente der Vorsokratiker*, vol. 2 (4th ed., 1922); and Überweg, *Grund. der Gesch. der Phil.*, pt. 1 (1926).

HIPPIUS, ZINAIDA (1869–), Russian poet and prose writer, was born on Nov. 8, 1869 at Belev, in the Tula province. She married Dmitry Mereshkovsky (q.v.) in 1889 and went to live in St. Petersburg (Leningrad). Later she settled in Paris. Hippus was one of the leading poets of the Russian symbolist movement of the 'nineties and her poetry bears the usual character of the movement: the cult of beauty, mysticism and individualism. The influence of Nietzsche's philosophy is also apparent as in the famous line "I love myself as I love God," which became the slogan of the Russian "decadents." Her later poetry shows the influence of the neo-Christian theories of Mereshkovsky but at the same time reveals deep individual and emotional power. Her prose works were much inferior to her poetry, but under the pseudonym of "Anton Krainy" she was known as a trenchant

literary critic. Among her works are *Revolution and Violence* (French trans., 1907); *The Green Ring* (Eng. trans. by S. S. Koteliensky, 1920); *My Journal under the Terror* (French trans., 1921).

HIPPO, Greek philosopher and natural scientist of the Ionian or physical school, was probably a contemporary of Archelaus and lived chiefly in Athens. Aristotle thought him unworthy of the name of philosopher. Hippo held that the principle of all things is moisture (*τὸ ὑγρόν*); that fire develops from water, and from fire the material universe. His denial of all existence save that of things known through the senses led to his being classed among the "Atheists." The gods are merely men canonized by popular tradition. It is said that he composed his own epitaph, wherein he claims for himself a place in this company.

See Diels, *Fragmente der Vorsokratiker*, vol. i. (4th ed., 1922).

HIPPOCRAS. An old medicinal drink or cordial, made of wine mixed with spices—such as cinnamon, ginger, and sugar—and strained through woollen cloths. The early spelling usual in English was *ipocras* or *ypocras*. The word is an adaptation of the M.Lat. *Vinum Hippocraticum*, or wine of Hippocrates, so called, not because it was supposed to be a receipt of the physician, but from an apothecary's name for a strainer or sieve. "Hippocrates' sleeve" (see W. W. Skeat, *Chaucer*, note to the *Merchant's Tale*).

HIPPOCRATES AND THE HIPPOCRATIC COLLECTION. The attitude of scholars towards Hippocrates and the Hippocratic problem has altered greatly during the last quarter of a century. Serious investigators now agree that we know next to nothing of the man and that few, if any, of the works to which his name is attached can be by him.

According to Soranus (*g.v.*) Hippocrates, the "Father of Medicine" was born on the island of Cos off the coast of Asia Minor at a date corresponding to 460 B.C. He is spoken of, both by Soranus and by Plato as a member of the sect, family, guild or society known as the Asclepiadae (*i.e.* sons of Asclepius). Unfortunately we know nothing of the rights, duties or functions of these Asclepiadae, though highly conjectural statements about them have become current. It is said that Hippocrates was descended from Asclepius on his father's side and from Heracles on his mother's. Since Asclepius is an historical figure—being mentioned as a physician in the *Iliad*—the former is at least possible. It is said that Hippocrates prosecuted his early medical studies in the famous temple of Asclepius at Cos, but neither the results of the excavations on that island nor the description by Herondas (born c. 300 B.C.) of the conduct of the place suggest any affinity with the spirit of the *Hippocratic* collection. We shall, therefore, not occupy space with the mass of Hippocratic legend, centring round Cos and spreading also to other sites. It is said, and it is likely, that Hippocrates travelled widely. He is stated to have taught and practised in Thrace, Thessaly, Delos, Athens and elsewhere. He is said to have died at Larissa, at an age given variously, the extremes being 85 and 110. His "floruit" may be safely placed about 400 B.C. Biographies of him were written by Soranus of Ephesus in the second century A.D., by Suidas the lexicographer in the eleventh, and by Tzetzes the historian in the twelfth centuries. None of them contain much concerning him.

The character and abilities of Hippocrates as a physician have been held in almost universal veneration by medical men in the ages which have followed. Nevertheless, early references to him are very scanty. He is mentioned twice by Plato with respect (in the dialogues *Protagoras* and *Phaedrus*). When we reflect that Plato was his younger contemporary, it is surprising that he does not mention Hippocrates more often, especially in the *Timaeus* which deals with physiological subjects. There are some passages in the Platonic dialogues which have been influenced by works now included in the *Hippocratic Collection*. Aristotle mentions the name of Hippocrates once only (in his *Politics*) but a number of parallels can be discovered between works of the Hippocratic collection and those of Aristotle. These are most frequent in Aristotle's *Historia Animalium*. On the other hand, Hippocrates has had very few detractors. Among them were Andreas of Carystus, who practised in Egypt at the end of the third century B.C., and Asclepiades of Bithynia, who practised in Rome in the first

century B.C. The works of neither Andreas nor of Asclepiades have survived. We shall make no attempt to entertain the reader by inventing a life of Hippocrates, but pass straight to the so called *Hippocratic Collection*.

THE HIPPOCRATIC COLLECTION

Early in the history of the Alexandrian medical school—probably not long after 300 B.C.—there began to circulate a group of medical works that has since become known as the *Hippocratic Collection*. The name of Hippocrates was already at that date held in high veneration, and into this collection was thrown everything that could, by any device, be passed off as of Hippocratic origin. The genuineness of some of these works was suspected from a very early date. Ancient scholars applied themselves to their critical study. Notable among these students was Galen (*g.v.*) who lived six hundred years after Hippocrates and wrote commentaries on a number of works of the *Collection*. But dubious in its origin as was the *Collection*, it had not remained intact even between the time when first put together and the time of Galen. On the contrary, during that interval it had suffered considerable alteration—both by accretion and loss—to say nothing of confusion and error due to the mistakes, dishonesty, haste and ignorance of booksellers, scribes and editors. Further, the deterioration continued after Galen. Our earliest manuscript of the *Collection* is of the ninth century A.D.; our earliest manuscript of a translation is of the seventh century, and is a Latin version of the obviously spurious *Dynamidia*; while the earliest documents of any part of the *Collection* are papyrus fragments, of the third or fourth century, of the no less spurious *Epistolae*. Thus the *Hippocratic Collection* provides an ideal battle ground for textual criticism and for the discussion of genuineness. The literature on it is vast. Here, we shall give only conclusions.

The works which make up the *Hippocratic Collection* are variously numbered and divided, and can be regarded, according to taste, as between about 70 and about 100. Where and when were they written? Of later works, some of the more recent, dating from the time of the Empire, were probably mostly written in Rome and may be as late as the third century A.D. The main interest of the *Collection* is, however, concentrated on the earlier works. Of these the very earliest were composed in the 5th century B.C. and came from the shores of Asia Minor, one or two possibly from Sicily. In Asia Minor two schools of Medicine were early organized. The older was associated with the peninsula of Cnidus. The younger has always been associated with the opposite island of Cos, though it would be safer to link it with Coan physicians rather than with Coan soil, for reasons which we have given above. It is with the Coan school that the name of Hippocrates will be for ever linked. The Coan and the Cnidian schools represent divergent views and their differences cleft the medical world of the fifth and fourth centuries B.C. There is indeed evidence of further sub-division of medical opinion even at this early period. Later medical writers, in the sect-ridden days of the Empire, looked back to the Hippocratic time as to a golden age which basked in the uninterrupted sunshine of a pure and undisputed doctrine. Modern historians have not been slow to follow and to see in the Hippocratic writers clear-eyed observers, unmoved in their pursuit of truth by any preconceived view of its nature, uncorrupted by the jargon of the schools, naked heroes of science facing the world as it is and not as it may be thought to be. A very small body of works there is to which such a conception is particularly applicable—and perhaps these only because we do not possess them in the complete form. For most of them the cold and piteous light of investigation dispels the radiant vision. The men of that time were well-nigh as riven into sects and driven by doctrines as those of a later age.

But Hippocrates was, by all tradition, above and beyond the noisy warfare of the Schools. He it was, as Celsus (1st century A.D.) tells us, "who first separated medicine from philosophy." That is, in the language of the present day, he observed and inferred without allowing his judgment to be biased by preconceived ideas. Now there is a small group of treatises in the *Collection* of which this can fairly be said. Is this the residuum of works of

which perhaps the famous tracts known as the first and third books of the *Epidemics* are the foremost examples by the "father of medicine" himself? We may say so, if we will, but in doing so we have no test of authenticity save excellence. If we examine even these "authentic" works closely we shall find them by no means as free from preconceived ideas as many have considered. Scientific thinkers of the fifth century B.C. were indeed much like those of the twentieth century A.D., for all their work was conditioned and controlled by their past.

Among the more striking literary characteristics of the *Hippocratic Collection* is the so-called "aphoristic style," in which conclusions of wide general import are compressed into very short and easily remembered sentences. Several of the works of the Collection adopt this method, the best known being the admirable treatise which bears the title *Aphorisms* and opens with the most famous sentence of the whole Collection, "Art is long and Life is short." As a rule common style is an argument for common authorship, but in the case of aphorisms imitation is so easy that confidence as to authorship is almost impossible. (See MEDICINE, HISTORY OF.) Nearly every treatise in the Collection requires separate and individual discussion from the point of view of style, authorship, philosophical associations, language, sources, doctrines and interpretation. The works of the Collection can no more be treated in common than can the books of the Old Testament, which cover a comparable area of time. We may, however, make one general negative statement. The works of the Collection contain nothing of superstition. They are sometimes wearisomely sophistic; they are frequently ludicrously wrong; they often advance absurd hypotheses; they are not seldom obscure. But the attitude of their authors to the supernatural is the same throughout and none swerves in his loyalty to the idea of natural law. There is a work on *The Sacred Disease* (i.e. Epilepsy) which puts the point for us:

"As for this disease called divine, surely it too has its nature and causes whence it originates, just like other diseases, and is curable by means comparable to their cure. It arises—like other diseases—from things which enter and quit the body, such as cold, the sun, and the winds, things which are ever changing and never at rest. Such things are divine or not—as you will, for the distinction matters not—and there is no need to make such division anywhere in nature, for all are alike divine or all are alike human. All have their antecedent causes which can be found by those who seek them." (Slightly paraphrased.)

The Sacred Disease was written about 400 B.C. and another work in the Collection, the *Airs, Waters and Places* is perhaps by the same author, but there are not many instances in the collection in which several works can be safely ascribed to one hand.

A famous section of the Collection is the so-called *Hippocratic Oath*, which sets the tone of that ethical character which characterises nearly all—though not quite all—of the writings which bear the name of Hippocrates. We regard the *Oath* in its present form as of the third century A.D. It is perhaps the latest work in the Collection. By its very lateness, however, it illustrates the width and depth of the ethical influences exerted by this great Collection. (For the *Hippocratic Oath* see MEDICINE, HISTORY OF.)

There are several surgical treatises in the Collection, of which the earliest, *On Wounds of the Head*, dates from the early part of the fourth century B.C. It has affinities with certain Egyptian papyri and part of it may be of Egyptian origin. It awakens in us a peculiarly vivid interest when we find it describing the operation of trephining almost as practised to-day. Nor can our attention fail to be arrested by the startling modernness of the little lecture notebook *Concerning Things in the Surgery*, when we read such a category as this:—

"Operative requisites in the surgery; the patient, the operator, assistants, instruments, the light, where and how placed; the patient's person and apparatus. The operator, whether seated or standing, should be placed conveniently to the part being operated upon, and to the light. Each of the two kinds of light, ordinary and artificial, may be used in two ways, direct or oblique."

Or again, such details as:—

"The nails (of the operator) neither to exceed nor come short of the finger tips. Practice using the finger ends. Practice all the operations with each hand and with both together, your object being to attain

ability, grace, speed, painlessness, elegance, and readiness."

"Let those who look after the patient present the part for operation as you want it, and hold fast the rest of the body so as to be all steady, keeping silence and obeying their superior."

Surely we are here in an up-to-date operating theatre, and the Greeks are the most modern of peoples.

BIBLIOGRAPHY.—The only complete translation of the Hippocratic Collection is Emile Littré, *Oeuvres complètes d'H.*, 10 vols., Paris (1839-1869). A critical text is appearing in the *Corpus Medicorum Graecorum* (Teubner, Leipzig). The most important works are treated by W. H. S. Jones and E. T. Withington in the *Loeb Classical Library*. Francis Adams, *The Genuine Works of Hippocrates*, London (1849) is still valuable. For references to H. in classical writings see H. Poschenrieder, *Die platonischen Dialoge in ihrem Verhältnisse zu den hippokratischen Schriften*, Landshut (1882) and *Die naturwissenschaftlichen Schriften des Aristoteles in ihrem Verhältnis zu den hippokratischen Sammlung*, Bamberg (1887). For mss. see H. Diels, *Die Handschriften der antike Aerzte*, Teil I, Berlin (1905). From the vast recent literature on the Hippocratic problem we select: F. Spaet, *Geschichtliche Entwicklung der Hippokratischen Medizin*, Berlin (1897); C. Friedrich, *Hippokratische Untersuchungen*, Berlin (1899); M. Wellmann, *Die Fragmente der Sikelischen Aerzte Akron Philistion und Diokles*, Berlin, 1901 (radical); W. H. Roscher, *Die Hebdomadenlehren der Griechischen Philosophen und Aerzte*, Leipzig, 1906 (fanciful at times); A. Nelson, *Die Hippokratische Schrift ΗΕΡΗ ΦΥΣΙΣ* Upsala, (1909); W. A. Heidel, "Hippocratea" in *Harvard Studies in Classical Philology*, Camb. Mass. (1914); "Conception of Nature among Pre-Socratics" *American Academy of Arts and Sciences* (1910); T. Gomperz, "Die hippokratische Frage" (radical) in *Philologus*, Leipzig (1911); E. Nachmanson, *Erotianstudien*, Upsala (1917); C. Singer, *Greek Biology and Greek Medicine*, Oxford (1922); R. O. Moon, *Hippocrates and his Successors*, London, 1923 (conservative); E. Wenkebach, *Untersuchungen über Galens Kommentare zu den Epidemien des H.*, Berlin (1925); W. H. S. Jones, *The Doctor's Oath*, Cambridge (1926) (differs from views expressed above); A Bibliography of the excavations at Cos is in K. Sudhoff, *Kos und Knidos* (Munich, 1927). For Hippocratic Bibliography, E. Kind in *Bursians Jahresbericht über die Fortschritte der klassischen Altertums wissenschaft*, Leipzig (1919). (C. St.)

HIPPOCRATIC OATH, still taken at some universities by graduates in medicine, whereby they undertake not to divulge confidential information. (See PRIVILEGE.) See MEDICINE, HISTORY OF: *The Hippocratic Oath*.

HIPPOCRENE (Gr. ἡ Ἰπποκρήνη), "the fountain of the horse," the spring on Mt. Helicon, in Boeotia, which like the other spring there, Aganippe, was sacred to the Muses and Apollo, and hence taken as the source of poetic inspiration. The spring, surrounded by an ancient wall, is now known as *Kryopegadi* or the cold spring. According to the legend, it was produced by the stamping of the hoof of Bellerophon's horse Pegasus. The same story accounts for the Hippocrene in Troezen and the spring Peirene at Corinth.

HIPPODAMUS, of Miletus, a Greek architect of the 5th century B.C. who introduced a system of town planning, in series of broad straight streets, cutting each other at right angles. He planned the harbour-town Peiraeus at Athens for Pericles about 446 B.C. and was architect to the Athenian colony which founded Thurii in Italy about 445 B.C. He superintended the building of the new city of Rhodes in 408 B.C. His plan consisted of series of broad, straight streets, cutting one another at right angles. See C. F. Hermann, *De Hippodamo Milesio* (Marburg, 1841).

HIPPODROME, a Greek building for horse and chariot races, corresponding to the Roman *circus*. It was usually placed on a hill slope, so that the excavated material from one side could serve for an embankment for the other. One end was semi-circular and the other square. The seats ran continuously around the semi-circle and the two long sides, in rising tiers, and down the centre was a division. Owing to the fact that as many as ten chariots raced at a time, a width of about 400 ft. was necessary. The usual length varied from 600 to 700 feet. Many remains of the hippodrome at Constantinople exist, and are now (1928) being carefully investigated. In this case much of the area was supported on tiers of great vaults instead of the more usual embankment. On the centre division, between an Egyptian obelisk and a memorial column, was placed the famous bronze serpent tripod from the oracle at Delphi. These three monuments still exist in place. Begun by Severus in 203, and completed by Con-

stantine in 330, it was both the largest and the most splendid hippodrome of the ancient world. Among its decorations were the four Greek bronze horses that now stand on the façade of St. Mark's at Venice.

HIPPOLYTUS (d. c. 230), a writer of the early Church, whose personality was enveloped in mystery before the discovery in 1851 of the *Philosophumena* (see below). Assuming the authenticity of this work, and correlating it with tradition, we get a tolerably clear picture. Hippolytus was born in the second half of the 2nd century, probably in Rome. He was learned and eloquent and under Bishop Zephyrinus (199-217) was presbyter of the church at Rome. He accused Zephyrinus's successor, Calixtus I. (q.v.), of favouring the Christological heresies of the Monarchians, and of subverting discipline by receiving back into the Church those guilty of gross offences. The result was a schism, and for some ten years Hippolytus stood as bishop at the head of a separate church. During the persecution under Maximinus the Thracian, Hippolytus and Pontius, who was then bishop, were transported in 235 to Sardinia, where it would seem that both of them died, the former having been reconciled with the Church.

Hippolytus's voluminous writings, some of which are listed in Eusebius, *Hist. Eccl.* vi. and in Jerome, *De Viris Ill.* lxi., exist chiefly in fragments. They embrace the spheres of exegesis, apologetics and polemic, chronography and ecclesiastical law. Of his exegetical works the best preserved are the *Commentary on the Prophet Daniel* and the *Commentary on the Song of Songs*, both distinguished by sobriety and sense of proportion. Of his polemical treatises the chief is the *Refutation of all Heresies*, or *Philosophumena*. Bk. i. was for a long time printed among the works of Origen; bks. iv.-x. were found in 1842 by the Greek Minoides Mynas, without the name of the author, in a ms. at Mount Athos, but it is now accepted as a work of Hippolytus; books ii. and iii. are lost. The work has been much overrated, the exposition of the Gnostic system in particular being untrustworthy. Of the dogmatic works, that on *Christ and Antichrist* which survives in a complete state, gives a vivid account of the events of the beginning of the 3rd century. The chronicle of the world, from the creation to 234, formed a basis for many chronological works both in the East and West. In the great compilations of ecclesiastical law which arose in the East since the 4th century (see APOSTOLIC CONSTITUTIONS) much material was taken from Hippolytus.

BIBLIOGRAPHY.—The edition by J. A. Fabricius (2 vols., Hamburg, 1716-18, reprinted in Gallandi, *Bibliotheca veterum patrum* (vol. ii., 1766), and Migne, *patrol. graeca*, x.) is out of date. The *Commentaries on Daniel* and on the *Song of Songs*, the treatise on *Antichrist*, and the *Lesser Exegetical and Homiletic Works* were edited by N. Bonwetsch and H. Achelis in 1897. The *Chronicle* has been published by A. Bauer (Leipzig, 1905) and the *Refutation* by Miller (Oxford, 1851), Duncker and Schneidewin (Göttingen, 1859) and Cruice (Paris, 1860). The *Philosophumena* has been translated by F. Legge (1921).

See Bunsen, *Hippolytus and his Age* (1852, 2nd ed., 1854); Döllinger, *Hippolytus und Kallistus* (Regensb. 1853; Eng. transl., 1876); G. Ficker, *Studien zur Hippolytfrage* (Leipzig, 1893); H. Achelis, *Hippolytstudien* (Leipzig, 1897); K. J. Neumann, *Hippolytus von Rom in seiner Stellung zu Staat und Welt*, part i. (Leipzig, 1902); Adhémar d'Alès, *La Théologie de Saint Hippolyte* (1906).

HIPPOLYTUS, in Greek legend, son of Theseus and Hippolyte, queen of the Amazons (or of her sister Antiope), a famous hunter and charioteer and favourite of Artemis. His stepmother Phaedra became enamoured of him, but, finding her advances rejected, she hanged herself, leaving a letter in which she accused Hippolytus of an attempt upon her virtue. Theseus, to whom his father Poseidon had given three wishes, then prayed for the destruction of Hippolytus and banished him. While Hippolytus was driving along the shore at Troezen (the scene of the *Hippolytus* of Euripides), a sea-monster sent by Poseidon frightened his horses; Hippolytus was thrown out of the chariot, and was dragged along, entangled in the reins, until he died. According to a tradition of Epidaurus, Asclepius restored him to life at the request of Artemis; later, he was represented as having been removed to Aricia (see VIRBIUS). At Troezen he had a cult, and girls used to dedicate a lock of hair to him before marriage (Eurip. Hipp. 1423; Paus. ii., 32, 1); a local cult-legend said he was not dead, but turned into the constellation Auriga (Paus.

ibid.). Well-known classical parallels to the main theme are Bellerophon and Antea (or Stheneboea) and Peleus and Astydania. The story was the subject of two plays by Euripides (the later of which is extant), and a tragedy by Seneca. Trace of it has survived in the legendary death of the apocryphal martyr Hippolytus, a Roman officer who was torn to pieces by wild horses as a convert to Christianity.

See Roscher's *Lexikon*, art. HIPPOLYTUS; L. R. Farnell, *Greek Hero-Cults* (1921).

HIPPOLYTUS, THE CANONS OF. This book stands at the head of a series of Church Orders, which contain instructions in regard to the choice and ordination of Christian ministers, and regulations for baptism, the Eucharist, fasts and other observances. We possess the *Canons of Hippolytus* only in an Arabic version, itself made from a Coptic version of the original Greek. It was only in 1870 that it was edited by Haneberg, who added a Latin translation, and so made it generally accessible. In 1900 a German translation was made by H. Riedel, based on fresh mss. These showed that the book, as hitherto edited, had been thrown into disorder by the displacement of two pages near the end; they also removed other difficulties upon which the theory of interpolation had been based.

Contents of the Canons.—The book is attributed to "Hippolytus, the chief of the bishops of Rome," and is divided into thirty-eight canons, to which short headings are prefixed. This division is certainly not original, but it is convenient for purposes of reference. Canon 1 is prefatory; it contains a brief confession of faith in the Trinity, and especially in the Word, the Son of God; and it speaks of the expulsion of heretics from the Church. Canons 2-5 give regulations for the selection and ordination of bishops, presbyters and deacons. The bishop is chosen by the whole congregation: "one of the bishops and presbyters" is to lay hands upon him and say a prayer which follows (3): he is at once to proceed with "the offering," taking up the eucharistic service at the point where the *sursum corda* comes in. A presbyter (4) is to be ordained with the same prayer as a bishop, "with the exception of the word bishop"; but he is given no power of ordination (this appears to be inconsistent with c. 2). The duties of a deacon are described, and the prayer of his ordination follows (5). Canons 6-9 deal with various classes in the Church. One who has suffered punishment for the faith (6) is to be counted a presbyter without ordination: "his confession is his ordination." Readers and sub-deacons (7) are given the Gospel, but are not ordained by laying-on of hands. A claim to ordination on the ground of gifts of healing (8) is to be admitted, if the facts are clear and the healing is from God. Widows are not ordained (9): "ordination is for men only." Canons 10-15 describe conditions for the admission of converts. Certain occupations are incompatible with Christian life: only under compulsion may a Christian be a soldier. Canons 16-18 deal chiefly with regulations concerning women.

Canon 19 is a long one dealing with catechumens, preparation for baptism, administration of that sacrament, and of the eucharist for the newly baptized. The candidate is twice anointed: first, with the oil of exorcism, after he has said, with his face westward, "I renounce thee, O devil, and all thy following"; and, again, immediately after the baptism. As he stands in the water, he declares his faith in response to an interrogatory creed; and after each of the three clauses he is immersed. After the second anointing the bishop gives thanks "for that Thou hast made them worthy that they should be born again, and hast poured out Thy Holy Ghost upon them, so that they may belong, each one of them, to the body of the Church": he signs them with the cross on their foreheads, and kisses them. The eucharist then proceeds: "the bishop gives them of the body of Christ and says, This is the body of Christ, and they answer Amen": and similarly for the cup. Milk and honey are then given to them as being "born a second time as little children." A warning is added against eating anything before communicating. Canons 20-22 deal with fast-days, daily services in church, and the fast of the passover-week. Canon 23 seems as if it closed the series, speaking, as it does, of "our brethren the bishops" who in their cities have made

regulations "according to the commands of our fathers the apostles": "let none of our successors alter them; because it saith that the teaching is greater than the sea, and hath no end." We pass on, however, to regulations about the sick (24) who are to be visited by the bishop, "because it is a great thing for the sick that the high-priest should visit them (for the shadow of Peter healed the sick)."

Canons 25-27 deal again with prayers and church-services. The "seven hours" are specified, with reasons for their observance (25): attendance at sermons is urged (26), "for the Lord is in the place where his lordship is proclaimed" (comp. *Didachè* 4, part of the *Two Ways*). When there are no prayers in church, reading at home is enjoined (27): "let the sun each morning see the book upon thy knees" (comp. Ath. *Ad virg.*, § 12, "Let the sun when he ariseth see the book in thy hands"). Prayer must be preceded by the washing of the hands. "No believer must take food before communicating, especially on fast-days": only believers may communicate (28). The sacred elements must be guarded, "lest anything fall into the cup, and it be a sin unto death for the presbyters." No crumb must be dropped, "lest an evil spirit get possession of it." Canons 30-35 contain various rules, and specially deal with suppers for the poor (i.e., *agapae*) and memorial feasts. Then we have a prayer for the offering of first-fruits (36); a direction that ministers shall wear fair garments at "the mysteries" (37); and a command to watch during the night of the resurrection (38). The last canon hereupon passes into a general exhortation to right living, which forms a sixth part of the whole book. In Riedel's translation we read this for the first time as a connected whole. It falls into two parts, and describes, first, the true life of ordinary Christians, warning them against an empty profession, and laying down many precepts of morality; and then it addresses itself to the "ascete" who "wishes to belong to the rank of the angels," and who lives a life of solitude and poverty. He is encouraged by an exposition, on somewhat strange lines, of the temptations of our Lord, and is specially warned against spiritual pride and contempt of other men. The book closes with an appeal for love and mutual service, based on the parables in St. Matthew xxv.

Authenticity of Authorship.—The Puritan severity of the canons well accords with the temper of the writer to whom the Arabic title attributes them; and it is to be noted that the exhortation at the close contains a quotation from 2 Peter actually attributed to the apostle, and Hippolytus is perhaps the earliest author who can with certainty be said to have used this epistle. But the general style of Hippolytus, which is simple, straightforward and strong, is in marked contrast with that of the closing passage of the canons; moreover, his mind, as presented to us in his extant writings, appears to be a much larger one than that of the writer of these canons; it is as difficult to think of Hippolytus as it would be to think of Origen in such a connection. How, then, are we to account for the attribution? There is evidence to show that Hippolytus was highly revered throughout the East: his writings, which were in Greek, were known, but his history was entirely unknown. He was supposed to be "a pupil (γρόριμος) of apostles" (Palladius, 4th century), and the Arabic title calls him "chief of the bishops of Rome," i.e., archbishop of Rome. A whole group of books on Church Orders bears the name of Clement of Rome; and the attribution of our canons to Hippolytus may be only an example of the same tendency.

BIBLIOGRAPHY.—See H. Achelis, *Texte u. Unters.* vi. 4 (1891); Rahmani, *Testamentum Domini* (1899); Hauler, *Didascalie Apostolorum* (1900); Riedel, *Kirchenrechtsquellen des Patriarchats Alexandrien* (1900).

HIPPONAX, of Ephesus, Greek iambic poet. Expelled from Ephesus in 540 B.C. by the tyrant Athenagoras, he took refuge in Clazomenae, where he spent the rest of his life in poverty. He was caricatured by the Chian sculptors Bupalus and Athenis, upon whom he revenged himself by a series of satires. His coarseness, his rude vocabulary, and his numerous allusions to local matters prevented his becoming a favourite in Attica. He was considered the inventor of parody and of a peculiar metre, the *scazon* or

choliambus, which substitutes a spondee for the final iambus of an iambic senarius.

Fragments in Bergk. *Poëtae Lyrici Graeci*; see also B. J. Peltzer, *De parodica Graecorum poësi* (1855), containing an account of Hipponax and the fragments.

HIPPOTAMUS, the largest living non-ruminating even-toed mammal (see ARTIODACTYLA). The common hippopotamus (*H. amphibius*) inhabits the large rivers of Africa, though its range has now become much restricted. It is the type of the

HIPPOTAMUS OR RIVER-HORSE (*HIPPOTAMUS AMPHIBIUS*)
An inhabitant of Africa and one of the largest living mammals, it usually reaches a length of 14 ft., and weighs between 3 and 4 tons

family *Hippopotomidae*, whose nearest relatives are the pigs.

In form the hippopotamus is huge and unwieldy, reaching a length of 14 ft., a height of 3 ft. 10 in. at the shoulder, and a weight of at least 3 tons. The ears are small but flexible, the body thick, the legs short. The eyes and nostrils protrude so as to be out of water when the animal is floating; the gape is enormous and the upper lip thick and bulging. Both canines and incisors are of continuous growth and very large. The skin, which is 2 in. thick in places, is almost destitute of hair. Hippopotami live in herds of 20 to 40 on the banks and in the beds of rivers, feeding mainly at night and on aquatic plants growing in the water, but they also come on shore to feed, frequently doing immense damage to crops. Of a mild and inoffensive disposition, the hippopotamus can exhibit great ferocity when wounded or defending its young; its immense strength and agility, despite its unwieldy bulk, render it a formidable antagonist. As among elephants, old bulls may become "rogues" and will attack all and sundry without provocation.

The only other living species is the pygmy hippopotamus (*H. liberiensis*) inhabiting the rivers of West Africa. In the Pleistocene epoch, a hippopotamus inseparable from *H. amphibius*, inhabited the greater part of Europe, while dwarf species were natives of Crete, Malta, and Sicily, India, Burma, and northern Africa. More recently, one species, *H. lemerlei*, lived in Madagascar.

HIPPURIC ACID, found in the urine of horses (whence the Gr. derivation) and other herbivora. It is excreted when certain aromatic compounds, such as benzoic acid and toluene, are taken internally. It is one of the amino-acids, being benzoylaminoacetic acid, $C_6H_5CO \cdot NH \cdot CH_2 \cdot CO_2H$, or benzoyl glycine. It crystallizes in rhombic prisms which are readily soluble in hot water, melt at 187° C and decompose at about 240° C. It is formed by heating benzoic anhydride with glycine, and by heating benzamide with monochloroacetic acid. It is readily hydrolysed by hot caustic alkalis to benzoic acid and glycine.

HIRA, capital of old Arabian kingdom of Lakhmid dynasty, 4 m. S.E. of modern Najaf in 'Iraq, founded 2nd century B.C. Practically subordinate to the Sasanian empire, this kingdom, comprising the Euphrates valley and upper part of the Persian gulf, constituted a buffer State towards Arabia. After the battle

of Qadisiya (637) and, the founding of Kufa by the conquering Arabs, Hira rapidly fell into decay, and its ruins do not suggest that it was ever of any architectural merit.

HIRADO, an island belonging to Japan, 19½ m. long and 6 m. wide, lying off the west coast of the province of Hizen, Kyushu, in 33° 15' N. and 129° 25' E. It is celebrated as the site of the original Dutch factory—often erroneously written Firando—and as the place where one of the finest blue-and-white porcelains of Japan (*Hiradoyaki*) was produced in the 17th and 18th centuries. The kilns are still active.

HIRE PURCHASE: see *INSTALMENT SELLING*.

HIRE-PURCHASE-AGREEMENT: see *INSTALMENT PURCHASE; INSTALMENT SELLING*.

HIRING, in law, a contract by which one man grants the use of a thing to another in return for a certain price. It corresponds to the *locatio-conductio* of Roman law. That contract was either a letting of a thing (*locatio-conductio rei*) or of labour (*locatio operarum*). The distinguishing feature of the contract was the price. In modern English law the term can scarcely be said to be used in a strictly technical sense. The contracts which the Roman law grouped together under the head of *locatio-conductio*—such as those of landlord and tenant, master and servant, etc.—are not in English law treated as cases of hiring but as independent varieties of contract, but hiring is generally applied to contracts in which the services of a man or the use of a thing are engaged for a short time.

Hiring Fairs or *Statute Fairs*, still held in Wales, and some parts of England, were formerly an annual fixture in every important country town. The men and maids seeking work stood in rows, the males together and the females together, while masters and mistresses walked down the lines and selected those who suited them. Originally these hiring-fairs were always held on Martinmas day (Nov. 11). Now they are held on different dates in different towns, usually in October or November. In Cumberland the men seeking work stood with straws in their mouths. In Lincolnshire the bargain between employer and employed was closed by the giving of the "fasten-penny," the earnest money, usually a shilling, which "fastened" the contract for a twelvemonth. Some few days after the statute fair it was customary to hold a second called a mop fair or runaway mop. "Mop" meant in Old English a tuft or tassel, and the fair was so called, it is suggested, in allusion to tufts or badges worn by those seeking employment. Thus the carter wore whipcord on his hat, the cowherd, a tuft of cow's hair, and so on.

See *FAIRS; LABOUR LEGISLATION; MASTER AND SERVANT; WAKE*.

HIROHITO (1901–), Emperor of Japan, was born on April 29, 1901, son of Emperor Taisho. While Crown Prince Hirohito visited Europe in 1921, and in that year the Emperor Taisho retired from the direction of public affairs on the ground of ill-health, leaving the government to Hirohito as prince regent. He married Princess Nogako on Jan. 26, 1924, and has one daughter (b. 1925). For the events of his regency, see *JAPAN: History*. He had thus been effectively the ruler of Japan for five years when he succeeded to the throne on Dec. 25, 1926. The new reign was officially designated the period of Showa (Light and Peace), and in the rescript issued by the new emperor on ascending the throne stress was laid on harmony at home and peace abroad.

HIROSAKI, a town of North Japan, 22 m. S.W. of Aomori by rail. Pop. c. 40,000. The fine isolated cone of Iwakisan, a mountain of pilgrimage, rises to the west. Hirosaki is noted for its distinctive green lacquer-ware.

HIROSHIGE (1797–1858), Japanese artist, was one of the principal members of that branch of the *Ukiyo-ye* or Popular School of Painting in Japan, a school which chiefly made colour-prints. His family name was Andō Tokitarō; that under which he is known having been, in accordance with Japanese practice, adopted by him in recognition of the fact that he was a pupil of Toyohiro. The earliest reference to him is in the account given by an inhabitant of the Lu-chu islands of a visit to Japan; where a sketch of a procession drawn with great skill by Hiroshige at the age of ten years only is mentioned as one of the remarkable sights

seen. At the age of fifteen he applied unsuccessfully to be admitted to the studio of the elder Toyokuni, but was eventually received by Toyohiro. On the death of the latter in 1828, he began to practise on his own account, but finding small encouragement at Yedo (Tōkyō) he removed to Kiōto, where he published a set of landscapes. He soon returned to Yedo, where his work soon became popular, and was imitated by other artists. He died in that city on the 6th day of the 9th month of the year, Ansei 5th, at the age of sixty-two, and was buried at Asakusa. One of his pupils, Hironobu, received from him the name of Hiroshige II. and another, Ando Tokubei, that of Hiroshige III. All three were closely associated with the work signed with the name of the master. Hiroshige II. some time after the year 1863 fell into disgrace and was compelled to leave Yedo for Nagasaki, where he died; Hiroshige III. then called himself Hiroshige II. He died in 1896. The earlier prints by these artists, whose work can hardly be separated, are of extraordinary merit. They applied the process of colour block printing to the purposes of depicting landscape, with a breadth, skill and suitability of convention that has been equalled only by Hokusai in Japan, and by no European. Most of their subjects were derived from the neighbourhood of Yedo, or were scenes on the old high road—the Tokaidō—that ran from that city to Kiōto. The two elder of the name were competent painters, and pictures and drawings by them are occasionally to be met with.

See E. F. Strange, "Japanese Colour-prints" (*Victoria and Albert Museum Handbook*, 1904), and *Hiroshige* (1925). (E. F. S.)

HIROSHIMA, a city seaport and district of central Japan. Pop. (1925), 195,731. It is very beautifully situated on a small plain surrounded by hills, the bay being studded with islands. It is one of the most important commercial centres on the inland sea. The government has an area of about 3,000 sq.m., with a population of about 1,500,000. Hiroshima is famous all over Japan owing to its association with the neighbouring islet of Itaku-Shima, "Island of Light," which is dedicated to the goddess Bentin and regarded as one of the three wonders of Japan. The chief temple dates from the year 587.

HIRPINI, from an Oscan or Sabine stem *hirpo-*, "wolf." An inland Samnite tribe in the south of Italy, whose territory was bounded by that of the Lucani on the south, the Campani on the south-west, the Appuli (Apuli) and Frentani on the east and north-east. On the north we find them, politically speaking, identified with the Pentri and Caracēni, and with them constituting the Samnite alliance in the wars of the 4th century B.C. (See *SAMNITES*.) On the final defeat of the Samnites by Sulla in 83 B.C., they received the Roman franchise. Of their Oscan speech, besides the evidence of their place-names, only a few fragments survive.

See R. S. Conway, *The Italic Dialects* (1897), pp. 170 ff.; and for *hirpo-*, *ib.* p. 200.

HIRSAU (formerly *Hirschau*), a village of Germany, in Württemberg, on the Nagold-Pforzheim railway, 2 m. N. of Calw. Pop. 1,219. Hirsau has some small manufactures, but it owes its origin and historical interest to its former Benedictine monastery, *Monasterium Hirsaugiense*, at one period one of the most famous in Europe. Of its ruins only the chapel with the library hall are still in good preservation. It was founded about 830 by the Count of Calw, and its first occupants (838) were a colony of 15 monks from Fulda. Under the counts of Calw, it became an important seat of learning, but towards the end of the 10th century the pestilence, the rapacity of its patrons and the immorality of its inmates caused it to decay. After it had been in ruins for 60 years it was rebuilt in 1059, and under Abbot Wilhelm von Hirsau (1069–91), it more than regained its former splendour. By his *Constitutiones Hirsaugienses*, a new religious order, the *Ordo Hirsaugiensis*, was formed, the rule of which was afterwards adopted at Blaubeuren, Erfurt, Schaffhausen and many other abbeys. The friend and correspondent of Pope Gregory VII., and of Anselm of Canterbury, Abbot Wilhelm took active part in controversies, and also wrote *De musica et tonis*, as well as the *Philosophicarum et astronomicarum institutionum libri iii*. Hirsau declined about the end of the 12th century and, after

the Reformation it was secularized in 1558; in 1692 it was laid in ruins by the French. The *Chronicon Hirsauense*, or, as in the later edition it is called, *Annales Hirsauenses* of Abbot Tritheim (Basel, 1559; St. Gall, 1690), though largely legendary, is an important source of information on the early history of Germany. The *Codex Hirsauensis* was edited by A. F. Gfrörer and printed at Stuttgart in 1843.

HIRSCH, MAURICE DE, Baron Hirsch auf Gereuth, in the baronage of Bavaria (1831–1896), German capitalist and philanthropist, was born at Munich on Dec. 9, 1831, the grandson of Baron Jakob von Hirsch, who founded the family fortune. He attended school at Brussels, but when 17 went into business. In 1855 he became associated with the banking house of Bischoffsheim & Goldschmidt, of Brussels, London and Paris. He amassed a fortune, which he increased by purchasing and working railway concessions in Austria, Turkey and the Balkans, and by speculations in sugar and copper. While living in splendour, he devoted much time to schemes for the relief of his persecuted Hebrew co-religionists, and took a deep interest in the educational work of the Alliance Israélite Universelle, on two occasions presenting the society with a million francs. For some years he regularly paid the deficits of the Alliance, amounting to several thousand pounds a year. In 1889 he capitalized his donations and presented the society with securities producing an annual income of £16,000.

On the 40th anniversary of Emperor Francis Joseph's accession to the Austrian throne Hirsch gave £500,000 for the establishment of schools in Galicia and the Bukowina. His greatest charitable enterprise was in connection with the persecution of the Jews in Russia (see **ANTI-SEMITISM**). He gave £10,000 for the repatriation of the refugees in 1882 and offered the Russian Government £2,000,000 for the endowment of a system of secular education in the Jewish pale of settlement. The Russian Government, while willing to accept, declined to allow any foreigner to be concerned in its administration. Thereupon Baron de Hirsch devoted the money to a colonization scheme which should enable persecuted Jews to establish themselves in agricultural colonies outside Russia. He founded the Jewish Colonization Association as an English society, with a capital of £2,000,000, and in 1892 presented to it a further £7,000,000. On the death of his wife in 1899 the capital was increased to £11,000,000, of which £1,250,000 went to the Treasury in death duties. This fund, which is probably the greatest charitable trust in the world, is now managed by delegates of Jewish societies, chiefly the Anglo-Jewish Association of London and the Alliance Israélite Universelle of Paris, among whom the shares in the association have been divided. The association, which is prohibited from working for profit, possesses large colonies in South America, Canada and Asia Minor, and deals with the whole problem of Jewish persecution, including emigration and distributing agencies, technical schools, co-operative factories, savings and loan banks and model dwellings in the congested Russian jewries.

Baron de Hirsch also founded in 1891 a trust in the United States for the benefit of Jewish immigrants, which he endowed with £493,000. His minor charities were on a princely scale. While in London he distributed over £100,000 among the local hospitals. In this manner he disposed of the whole gross proceeds derived from his successes on the English turf. He raced, as he said himself, "for the London hospitals," and in 1892, when his filly, La Flèche, won the Oaks, St. Leger and One Thousand Guineas, his donations from this source amounted to £40,000. Baron de Hirsch married Clara, daughter of Senator Bischoffsheim of Brussels (b. 1833), by whom he had a son and daughter, both of whom predeceased him. He died at Ogyalla, near Komorn, in Hungary, April 21, 1896.

For details of Baron de Hirsch's chief charities see the annual reports of the Alliance Israélite Universelle and of the "Administration Centrale" of the Jewish Colonization Association.

HIRSCH, SAMSON RAPHAEL (1808–1888), Jewish theologian, was born in Hamburg on June 20, 1808, and died at Frankfurt-on-the-Main on Dec. 31, 1888. He studied at Mannheim and at Bonn university, and was chief rabbi of Oldenburg from 1830–41, when he was transferred to Aurich and Osnabrück. In 1846 he was called to Moravia, but five years later, became

rabbi of a reformed section of Jews at Frankfurt-on-the-Main. Hirsch opposed the reform tendency of Geiger (*q.v.*), and presented Jewish orthodoxy in a new light. His philosophical conception of tradition, associated as it was with conservatism in ritual practice, created what is often known as the Frankfurt "Neo-Orthodoxy." His famous *Nineteen Letters* (1836, Eng. trs. 1899) was followed by *Horeb*, and commentaries on the Pentateuch and Psalms. Three volumes of his essays were published (1902–8).

For his philosophy see S. A. Hirsch, *A Book of Essays* (1905).

HIRSCHBERG, town in the Prussian province of Silesia, at the confluence of the Bober and Zacken, 1,120 ft. above the sea-level, 48 m. S.E. of Görlitz. Pop. (1925) 28,619. Hirschberg existed in the 11th century, and obtained town rights in 1108 from Duke Boleslaus of Poland. It withstood a siege by the Hussites in 1427, and an attack of the imperial troops in 1640. The foundation of its prosperity was laid in the 16th century by the introduction of the manufacture of linen and veils. It possesses an Evangelical church, the church of the Holy Cross, one of the six *Gnaden Kirchen* for the Silesian Protestants stipulated for in the agreement at Altranstädt between Charles XII. of Sweden and the emperor Joseph I. in 1707, and a Roman Catholic church, of the 14th century. It cards and spins wool, and makes linen and cotton fabrics, yarn, artificial flowers, paper, cement, porcelain, machinery, gloves, cellulose and cider. There is also a trade in wine and leather.

Hirschberg is also the name of a town of Thuringia on the Saale with manufactures of leather and knives. Pop. 2,800.

HIRSON, a town of northern France in the department of Aisne, 35 m. by rail N.E. of Laon, on the Oise. Pop. (1926) 10,858. It occupies an important strategic position near the intersection of several railway lines, and near the Belgian frontier. For its defence there are a permanent fort and two batteries, near the railway junction. The town carries on the manufacture of glass bottles, tiles, iron and tin goods.

HIRTIVS, AULUS (c. 90–43 B.C.), Roman historian and statesman. He was with Julius Caesar as legate in Gaul, but after the civil war broke out in 49 he seems to have remained in Rome to protect Caesar's interests. He was also a personal friend of Cicero. He was nominated with C. Vibius Pansa by Caesar for the consulship of 43; and after the dictator's assassination in March 44, he and his colleague supported the senatorial party against M. Antonius, with whom Hirtius had at first sided. The consuls set out for Mutina, where Antonius was besieging Decimus Brutus. On April 15 Pansa was attacked by Antonius at Forum Gallorum, about 8 m. from Mutina, and killed. Hirtius, however, compelled Antonius to retire on Mutina, where another battle took place on April 25 (or 27) in which Hirtius was slain. Of the continuations of Caesar's *Commentaries*—the eighth book of the Gallic war, the history of the Alexandrian, African and Spanish wars—the first is generally allowed to be by Hirtius; the Alexandrian war is perhaps by him (or Oppius); the last two are supposed to have been written at his request, by persons who had taken part in the events described, with a view to subsequent revision and incorporation in his proposed work on military commanders. The language of Hirtius is good, but his style is monotonous and lacks vigour.

Hirtius and the other continuators of Caesar are discussed in M. Schanz, *Geschichte der römischen Literatur*, i.; also R. Schneider, *Bellum Africanum* (1905). For the history of the period see ANTONIUS; Cicero's *Letters* (ed. Tyrrell and Purser); G. Boissier, *Cicero and his Friends* (Eng. trans., 1897).

HIRUDINEA, a class of the Annelida (*q.v.*), comprising the leeches (*q.v.*).

HIRUNDINIDAE: see SWALLOW, MARTIN.

HISHĀM IBN AL-KALBĪ (Abū-l Mundhir Hishām ibn Maḥammed ibn us-Sā'ib ul-Kalb) (d. c. 819), Arabic historian, was born in Kufa but spent much of his life in Baghdad. Like his father, he collected information about the genealogies and history of the ancient Arabs. According to the *Fihrist* (see NADĪM) he wrote 140 works, most of which are lost. His account of the genealogies of the Arabs is continually quoted in the *Kitāb ul-Aghāni*.

Large extracts from another of his works, the *Kitāb ul-Asnām*, are contained in the *Khizānat ul-Adab* (iii. 242-246) and in the geography of Yāqūt (q.v.). These latter have been translated by J. Wellhausen in *Reste des arabischen Heidentums* (2nd ed., 1897). (G. W. T.; X.)

HISPELLUM (mod. Spello, q.v.), an ancient town of Umbria, Italy, 3 m. N. of Fulginiae, on the road between it and Perugia, 1,030 ft. above sea-level. Augustus founded a colony there (*Colonia Iulia Hispellum*) and extended its territory to the springs of the Clitumnus. It received the name of Flavia Constans by a rescript of the emperor Constantine, a copy of which on a marble tablet is still preserved at Spello. The gate by which the town is entered is ancient and has three portrait statues above it; a ruined amphitheatre and two other gates and a part of the city wall, built of rectangular blocks of local limestone, may still be seen; one of these gates, the Porta Venere, has two dodecagonal towers resembling those of the ancient Augusta Taurinorum (Turin) and is probably, like them, of the Augustan period.

(T. A.)

HISSAR. (1) A town in the Tajik A.S.S.R. of Asiatic Russia in lat. 38° 30' N., long. 68° 39' E., at a strategic point at the head of the defile carved out by the Kafirnigan river, a tributary of the Amu-Darya. It is the ancient capital of a once independent region where principalities rose and fell, finally incorporated with the former emirate of Bukhara. The town was at one time famous for its damascene swords and silk goods. Before the revolution it was the winter residence of the Beg of Hissar; in summer fever, malaria and mosquitoes drive the inhabitants to the hills. The moist and oppressive heat leads to an abundance of reeds, and Hissar at present is little more than a collection of reed thatched huts. (2) The Hissar Mountains 6,500 to 9,800 ft. also in the Tajik A.S.S.R. form the snow-capped southern arm of the bifurcation in long. 67° 45' E. of the Alai Range, a western extension of the Tian-Shan. The Turkistan Range forms its northern arm, and a long spur, the Zarafshan Range branches off west of the Pakshif Pass, from which point the Hissar Range turns off in a slightly south-west direction, with two deep curves on its northern slopes, and numerous spurs thrusting into the plain on the south. The valleys here are well wooded on their lower slopes, with clumps of poplar, ash, birch, willow, maple, juniper, pear, hawthorn and walnut interspersed with currant bushes and shrubs. From these southern slopes the Surkhan and Kafirnigan flow into the Amu-Darya. In the narrow parallel valley between the Turkistan Range and the Zarafshan Range the glacier-fed Zarafshan river flows westward, while between the Zarafshan Range and the Hissar Range, its tributary, the Yag-nob, flows parallel to it.

See W. R. Rickmers, *The Duab of Turkestan*, with bibliography (1913).

HISSAR, a town and district of British India, in the Umballa division of the Punjab. The town is situated on the Western Jumna canal, 102 m. W.N.W. of Delhi. Pop. (1921) 21,415. It was founded in 1356 by the emperor Feroz Shah, who constructed a canal to supply it with water; but this fell into decay during the 18th century, owing to the constant inroads of marauders. Hissar was almost completely depopulated during the famine of 1783, but was afterwards occupied by the famous Irish adventurer George Thomas, who built a fort and collected inhabitants. It is now chiefly known for its cattle-farm supported by the Government.

The DISTRICT comprises an area of 5,213 sq.m. It forms the western border district of the great Bikanir desert, and consists for the most part of sandy plains dotted with shrub and brushwood, and broken by undulations towards the south, which rise into hills of rock like islands out of a sea of sand. The Ghaggar is its only river, and its supply is uncertain. The Western Jumna canal crosses the district from east to west, irrigating many villages. Hissar produces a breed of large milk-white oxen, which are in great request. Before recent extensions of irrigation the district was often subject to famine. Its population in 1921 was 816,810. The climate is very dry, hot westerly winds blowing from the middle of March till July. Cotton weaving, ginning and pressing are carried on. The chief trading centres are Bhi-

wani, Hansi, Hissar and Sirsa.

Early in the mutiny of 1857 Hissar was wholly lost for a time to British rule, and all Europeans were either murdered or compelled to fly. The Bhattis rose under their hereditary chiefs, and the majority of the Mahommedan population followed their example. Before Delhi had been recovered, however, the rebels were utterly routed.

HISTAMINE: see ANAPHYLAXIS.

HISTIAEUS (d. 494 B.C.), tyrant of Miletus under the Persian king Darius, son of Hystaspes. According to Herodotus he rendered service to Darius while he was in Scythia by persuading his fellow-despots not to destroy the bridge over the Danube by which the Persians must return. In reward for this he was given some rich territory near Amphipolis. Darius became alarmed at his influence in Ionia and invited him to Susa, whence he would not let him return. Aristagoras, his son-in-law, meanwhile ruled Miletus in his place. Finding his position in danger, Aristagoras meditated revolt and was finally induced to attempt to raise Ionia against Persia, according to Herodotus, by a message tattooed on the head of a slave. The revolt assumed a formidable character and Histiaeus persuaded Darius that he alone could quell it. He was allowed to leave Susa, but on his arrival at the coast found himself suspected by the satrap, and was driven to establish himself (Herodotus says as a pirate) at Byzantium. Eventually he was captured by the Persian Harpagus and crucified by Artaphernes at Sardis in 494 B.C. His head was embalmed and sent to Darius, who gave it honourable burial.

HISTOLOGY, the science or study of the tissues, is that branch of biology which deals with the appearance and nature of the structural elements of living organisms, whether animal or vegetable. The term was introduced by A. F. J. K. Mayer in 1819; when used alone, it is understood to refer to animal tissues, otherwise the term "vegetable histology" is usually employed. As such study is largely with the microscope, histology has come in the English-speaking countries to be almost synonymous with "microscopic anatomy." In Germany, Holland and other countries, however, emphasis is still laid on the nature of the tissue under consideration (including origin, development and characteristics), so that textbooks are commonly entitled: "Text-book of Histology and Microscopic Anatomy." Thus in the microscopic study of an organ such as the lung, the form, position, etc., of alveoli, vestibules, capillaries and so on is strictly speaking a matter of microscopic anatomy, whereas consideration of the component tissue—epithelium, endothelium, collagen, muscle fibres and so on—is a matter of histology. As the function of the various tissues may properly be considered under the wider use of the term histology, its study in some medical schools is more closely linked with physiology than with anatomy.

History.—As the history of the subject will be taken up under other headings, it will not be discussed here (see HOOKE; GREW; SWAMMERDAM; LEEUWENHOEK; MALPIGHI; BICHAT; SCHLEIDEN AND SCHWANN; VIRCHOW).

Histological Methods.—The ideal of histological technique should be to prepare tissues with a minimum deviation from the condition in the living state and yet with a differentiation permitting a maximum recognition and study of the various component elements. Needless to say neither of these desiderata has yet been attained—new methods are frequently being invented and there is still widespread difference of opinion as to the best methods to be used in attaining a desired purpose.

Fresh Material.—Preparations may be scraped or teased (with two mounted needles) either dry on a slide, or in an indifferent fluid, such as physiological salt solution. Though not in much demand today, this method is useful, with the addition of caustic potash, for, e.g., the demonstration of fungi. Maceration with appropriate fluids will in rare cases give the best demonstration of the structures being studied, as in the scroll-like structure of heart muscles or the vascular supply of an organ. Very thin sections of fresh tissues, formerly done with a hand razor or crude instrument, can be prepared with modern instruments on frozen tissue with almost the same accuracy and perfection as with hardened embedded material. With the greater speed avail-

able, this method is therefore considered by some to be preferable to the use of fixed tissues in pathology, both because quicker diagnosis of the diseased tissue is possible and also because less distortion has occurred. In skilful hands, such sections can be cut, stained and ready for examination within a very few minutes, though in some pathological laboratories preliminary partial fixation in heated formalin for a few hours is considered preferable. In some surgical clinics this method is employed while the operation is still in progress as a routine in doubtful cases of malignant disease; in others it is felt that tissues, doubtful to the surgeon on gross examination, deserve the more thorough examination that fixation permits.

Fixed Tissues.—For proper examination with the modern microscope (magnifying up to 1,500 diameters) tissues must be cut so thin that after appropriate staining they can be accurately examined by transmitted light and without the confusion of several superposed layers of cells. The vast majority of histological materials are prepared for microscopic examination by preliminary "fixation," hardening, sectioning, staining and mounting, processes which altogether require from 2 to 10 days, depending on which of the innumerable methods is used. The purpose of the fixing fluid (formalin, Zenker's, Orth's, Bouin's, Müller's, etc., etc.) is to penetrate and kill the tissues quickly, so that the various tissue elements, and especially the cell nuclei, are preserved as lifelike and undegenerated as possible. If, for instance, the natural process of "mitosis" (important in tumour diagnosis) may be completed in twenty minutes, the need for quick fixation becomes at once apparent.

As hardening fluids, formalin and alcohol are preferred and both can be subsequently used indefinitely as preservatives, though, especially with the latter, distortion by shrinkage occurs.

To get sufficiently even and thin (e.g., one thousandth of a millimeter) sections with the microtome (introduced by Purkinje and His), the tissue must by gradual transitions be imbedded in paraffin wax or celloidin, the former having the advantage that "ribbons" of serial sections can be more easily obtained. The paraffin sections, fastened with egg albumin to glass slides and rid of their impregnated paraffin, may be stained and counterstained in the greatest variety of ways, depending on the microchemical result to be obtained. (See EHRLICH.) Then after further transitions through alcoholic and oily fluids, the preparations are permanently mounted beneath a coverslip in a reagent such as balsam or damar, which harden with a refraction index similar to that of the microscope lenses, and thus minimize distortion. The celloidin technique, used especially in the examination of the nervous system, is similar and simpler yet more time-consuming.

Smears or Spreads.—The cellular contents of the blood and various body fluids may be spread in thin films, and like sections of body tissues, be examined either fresh, stained or unstained, or after fixation with a great variety of stains, designed to bring out diverse properties or pathological changes. (See hematological treatises such as Ferrata's "Emopatie" or any textbook of clinical microscopy or pathology.)

Vital Stains.—In recent years, methods of intra-, supra- and post-vital staining have developed a considerable technique for the study of living cells and tissues. Here dyes are used which enter but do not kill the cell. They usually select certain parts of the cell (nuclei, granules, vacuoles, mitochondria, etc.) and the cell only becomes diffusely stained after it has died. Such dyes may be injected in the living organism and the cells which have selected the stain studied, or may be applied to cells withdrawn from the body but still alive. Such procedures are comparatively free from the objection that death of the tissue may introduce artefacts in the form of the cell or tissue and also have the advantage of permitting the study of the differentiated components under varying experimental living conditions. It must be recognized, however, that even such stains are toxic to a greater or less degree, so that the cells being studied are to a corresponding degree abnormal.

Tissue Cultures.—The cell being the important unit of animal tissue, methods are constantly being sought by histologists to study it under relatively normal conditions. The discovery by Ross Harrison in 1907 that nerve cells would survive, function

and reproduce in suitable media outside the body ("tissue culture" or "tissue growth in vitro") has been applied to practically every cell in the body. It has proved to be of such wide application that a special journal has for several years been devoted to the subject. By this method Carrel has kept fibroblasts from mice alive and healthy for over 15 years, far beyond the natural term of life of the animal, suggesting the potential immortality of animal tissue. Though this method can subject cells to microscopic examination while still alive, they exist under conditions that are far from normal. Carrel's rather complicated technique reduces this disadvantage to a minimum.

Examination of Living Tissues Under Normal Conditions.—The classic studies of Cohnheim of the phenomena of inflammation in the living mesentery or tongue of the frog at once come to mind; but greatly improved methods have recently become available. The Clarks' method of studying the living tadpole's tail permits microscopic examinations, indefinitely repeated, over weeks, whereby normal growth or reaction to various tests or injuries can be studied in a way hitherto impossible. Repeated examination of the same living cell or vessel *ad libitum* without extraneous damage is bound to furnish information of fundamental value. Very recently Sandison has applied the same principle to a window inserted in a rabbit's ear, so that mammalian tissue is now also subject to examination under these favorable conditions, even with the oil immersion lens.

The Tissues.—Tissues are composed of *cells* (see CYTOLOGY) and *intercellular substances*, the latter in most cases formed from the cells and aiding in their support. In epithelial tissues there is a meagre "cement substance" the origin and nature of which is but poorly understood. In connective tissue, the intercellular substances (collagenous fibres, elastic fibres and reticulum) constitute the bulk of the material and the same is true of the cartilage matrix and the calcareous substance of bone. Intercellular elements exist in the three types of muscle but much remains to be learned of their status. In the nervous system, the glia fibres of the supporting neuroglia bear the same relation to the glia cells as the fibres of connective tissue to their parent cells.

The elementary tissues of the body may be more or less arbitrarily subdivided into: 1, epithelial (of various types and including such modifications as hair, nails, tooth enamel, glands, etc.); 2, nervous tissue; 3, connective tissue (including fibrous and elastic tissue, fat tendon, bone, cartilage, dentine); 4, muscular tissue (voluntary, involuntary and cardiac). The vascular system (including lymphoid tissue) is sometimes considered an elementary tissue as a matter of convenience, though, more strictly speaking, it is a combination of elements of the other tissues mentioned. The blood is also sometimes spoken of as a tissue, though, more strictly speaking, its cellular elements are mobile, functioning cast-offs from various fixed sources.

These elementary tissues are derived from the three primary blastodermic layers of the embryo (with trifling exceptions) as follows: 1 from ectoderm and endoderm; 2 from ectoderm; and 3 and 4 from the mesoderm.

Epithelial tissue serves chiefly as a protective covering and for secretion and excretion. According to shape, epithelial cells are called: flat or squamous (covering skin, adjacent mucous membranes, alveoli of the lungs, some kidney tubules, etc.); or columnar (lining the respiratory and digestive tract, the ducts of glands, uterus and oviducts, forming the secreting cells of glands); pyramidal, etc. They may occur in single layers or stratified and various modified forms are found, such as "ciliated" (uterus, bronchi, etc.), "goblet" (upper respiratory tract, stomach, colon), "transitional" (parts of urinary system) and greatly modified for special uses (as in the retina, ear, taste buds). The single-layered flat cells lining the vascular system and the large enclosed body spaces (pleura, etc.) are called endothelial cells (or endothelial and mesothelial respectively).

Connective tissue is found in such forms as the embryonal jelly of the umbilical cord, mucous, reticular, loose fibro-elastic or areolar, dense fibrous, elastic tissue, cartilage and bone. (For details, see appropriate sections.) It contains a variety of cells

such as fibroblasts, lymphocytes, plasma cells, macrophages (clasmatocytes), giant cells, eosinophiles, mast cells, etc.

Muscle tissue (*i.e.*, a form of protoplasm in which the property of contractility predominates) is of three main types: 1. smooth or involuntary; 2. striated or voluntary; 3. cardiac. Some striped muscle, such as oesophagus and diaphragm, is only partly voluntary. Smooth muscle, consisting of elongated pointed cells with central oval nuclei, mitochondria, granules, etc., is found in the following systems; alimentary, respiratory, genito-urinary, vascular, and in glandular ducts, the capsules of the spleen and lymph nodes, the skin and some eye muscles. Voluntary muscle, distinguished by definite longitudinal and cross striae, a complex system of lines and cross discs, and a peripheral nucleus, is of obvious distribution through the body. Cardiac muscle (structurally intermediate between the other two) forms a close meshwork with complete loss of the original cell boundaries, and centrally placed nuclei. Myofibrils pass beyond the "intercalated discs," structures the nature of which is still in doubt.

Nervous tissue, receiving, originating and conducting nerve impulses, is made up of the neuron (or nerve cell in its broadest sense) and the supporting neuroglia, previously mentioned. While details may be found under the heading NERVOUS SYSTEM, a few examples of the many kinds of nerve cells may be given. The giant pyramidal cell of Betz in the cerebral cortex, the lesser ganglion cells of wide distribution (unipolar, bipolar and multipolar), the characteristic Purkinje cells of the cerebellum, the various types of Golgi cells, the ependymal cells and long and short rayed astrocytes of the glial tissue (to say nothing of these cells in various stages of immaturity found in tumour tissue), will indicate the great variation of structure to be found, though unfortunately there is still a tremendous lack of correlation with function. While tigroid bodies, axone, dendrites, medullated sheath, neurolemma and terminal arborizations are common properties of most nerve cells, their infinite variety adds still further to the complexity of this subject. (*See* EPITHELIAL, ENDOTHELIAL AND GLANDULAR TISSUES; NERVOUS SYSTEM; CONNECTIVE TISSUE; CYTOLOGY.)

Organs are formed from combinations of the various units of these tissues, sometimes of two units, usually of several. The separate subjects are to be found further described under appropriate headings.

Morbid Histology.—The microscopic study of the structural changes produced in the tissues by disease is a subject of great importance. (*See* PATHOLOGY.) It will suffice here to say that the microscopic study of tissues removed at autopsy not only serves to confirm the gross anatomical diagnosis or to give the necessary information where a gross diagnosis was impossible, but also gives an accurate picture of the condition at time of death of all the organs examined. An evaluation of the morbid process is thus constructed, which would otherwise be impossible. Morbid histology also performs a great practical service in the examination and diagnosis of "biopsy" material, *i.e.*, tissue removed from the living body (*e.g.*, in suspected neoplasms) in order to make a diagnosis. While this method is not infallible, and its value is vastly different in the hands of skilled and unskilled pathologists, it has proved to be the only scientific method of diagnosing diseased tissue of doubtful nature. The method is also of prognostic value in determining, according to more or less arbitrarily adopted standards, the "degree of malignancy" of the neoplasm under consideration.

HISTORICAL ARTICLES. Under this head we give a general guide to the arrangement of these articles in the *Encyclopædia Britannica*.

ANCIENT HISTORY

In addition to the guide here given, *see* ARCHAEOLOGICAL ARTICLES, COMPARATIVE RELIGION (articles on), LITERATURE (classical), PHILOSOPHY (articles on) and the article MEDITERRANEAN.

Non-classical History.—For this *see* the articles BABYLONIA AND ASSYRIA, MESOPOTAMIA, BABYLONIAN LAW, EGYPT, PHOENICIA, PALESTINE, PERSIA; and smaller articles such as PERSIS, MEDIA, PARTHIA, ELAM and EDESSA. *See also* AEGEAN CIVILIZATION, CNOSSUS, CRETE and MYCENAE; ETRUSCANS and HITTITES; SCYTHIA; and the ancient history sections of such articles as GERMANY, IRELAND or WALES.

Greek History.—The main account of Greek history will be found under GREECE, *History*. But this should be supplemented by reference to the special articles on constitutional and State questions, of which the chief are ARCHON, AREOPAGUS, BOULE, CONSTITUTION OF ATHENS, ECCLESIA, ORACLE, STRATEGUS, GREEK LAW. There are also articles on the most important towns, leagues, etc., such as ACHAEAN LEAGUE, AEGINA, ATHENS, BYZANTIUM, CORINTH, DELIAN LEAGUE, SICILY, SPARTA, SYRACUSE, THEBES, and tribes such as AMAZONS, ACHAEANS, DORIANS, IONIANS and PELASGIANS.

HERODOTUS, ARISTOPHANES, DEMOSTHENES, THUCYDIDES, and all other ancient Greeks of importance have their biographies, which should be consulted; the history of the latest period of Greece should be also studied under the headings HELLENISM, MACEDONIAN EMPIRE and such biographies as that of ALEXANDER.

Roman History.—In Roman history the chief article is to be found under ROME. Under ITALY will be found pre-Roman history. All figures in Roman history or legend of any importance have biographical articles, from ROMULUS to ROMULUS AUGUSTULUS. The organization of the Roman State is systematically explored under the heads AERARIUM, CENSOR, COMITIA, CONSUL, EQUITES, MUNICIPIUM, PATRICIANS, PRAEFECT, PRAETOR, PROVINCE, QAESTOR, SENATE, TRIBUNE, etc. There are other minor headings and the articles AGRARIAN LAWS and ROMAN LAW should be consulted.

The chief tribes of the Roman world have each a separate article. We may mention HELVETII, HUNS, MESSAPII and VOLSCI. Every province, etc., of the republic or empire has a separate article, in particular, AFRICA (ROMAN), BITHYNIA, BRITAIN (ROMAN), CAPPADOCIA, CILICIA, DACIA, GALATIA, GAUL, ILLYRIA, LIMES GERMANICUS, LYCIA, LYDIA, MAURETANIA, PALMYRA, PAN- NONIA, PHRYGIA, PONTUS, SPAIN, SYRIA, THRACE; *see also* CARTHAGE.

Military History.—The military history of the ancient world is dealt with in articles which, on the one hand, cover the outstanding military organizations and, on the other, the chief campaigns and battles. In the first class come the articles MACEDONIAN ARMY and ROMAN ARMY. The second class enables the reader not merely to study the course of the great conflicts but to trace the evolution of warfare and its methods. Beginning with the GRAECO-PERSIAN WARS, the thread passes through the PELOPONNESIAN WAR, then through such illustrative battles as CUNAXA, LEUCTRA, MANTINEA, and on by Alexander's battles, GRANICUS, ISSUS, GAUGAMELA and HYDASPES, as well as the biographical article on ALEXANDER. DIADOCHI, WARS OF THE, shows the decline of his system, and the next stage is reached with the PUNIC WARS (*see also* HANNIBAL and SCIPIO). TRASIMENUS and CANNAE show Hannibal's art, as CARTAGENA, ILIPA and ZAMA show Scipio's. Thereafter come Caesar's battles and sieges, among them ALESIA, ILLERDA, PHARSALUS and THAPSUS, and as CARRHAE reveals a weakness in the Roman legionary organization, so ADRIANOPLE marks its fall from military supremacy.

MEDIAEVAL HISTORY

In addition to the guide here given reference should also be made to articles under the various biographical articles and to the headings connected with Archaeology, Church History, Economics, Law and Literature.

For Europe *see* DARK AGES; MIDDLE AGES; EUROPE. For articles on subjects concerning Europe generally, *see also*:—COM-

MUNE; CRUSADES; FEUDALISM; GOTHs; GUILDS; LOMBARDS; PAPACY; ROMAN EMPIRE, LATER; SERFDOM; VANDALS; VIKINGS; VILLAGE COMMUNITIES;VILLEINAGE. For histories of individual countries and peoples of Mediaeval Europe, *see* articles under names of countries except England, which is under **ENGLISH HISTORY**.

For England, in addition to **ENGLISH HISTORY**, *see* such articles as **ANGLO-SAXONS**; **BRITAIN**; **DANELAW**; **EAST ANGLIA**; **ESSEX**; **HWICCE**; **JUTES**; **KENT**; **NORTHUMBRIA**; **SUSSEX**; **STRATHCLYDE**; **WESSEX**, etc. And also articles on constitutional problems and particular subjects, for example: **BAYEUX TAPESTRY**; **CHURL**; **CLARENDON, CONSTITUTIONS OF**; **DOMESDAY BOOK**; **FRANKPLEDGE**; **FYRD**; **HIDE**; **JUSTICIAR**; **LOLLARDS**; **MAGNA CARTA**; **NORTHAMPTON, ASSIZE OF**; **OXFORD, PROVISIONS OF**; **PIPE ROLLS**; **PURVEYANCE**; **RAPE**; **SCUTAGE**; **TALLAGE**; **TRINODA NECESSITAS**; **WAPENTAKE**; **WITAN**; **VASSAL**.

In addition to article **FRANCE**, *see* articles on chief divisions of Mediaeval France, *e.g.*, **ARTOIS**; **BRITTANY**. *See* also **ANTRUSTION**; **CAGOTS**; **DAUPHIN**; **JACQUERIE, THE**; **CHATELAIN**; **PARLEMENT**; **PRAGUERIE**; **FRENCH LAW AND INSTITUTIONS**; **FRANKS**; **MAYOR OF THE PALACE**; **MEROVINGIANS**; **MISSI DOMINICI**.

In addition to article **GERMANY**, *see* articles on:—**EMPIRE**; **AULIC COUNCIL**; **DIET**; **FEHMIC COURTS**; **IMPERIAL CHAMBER**; **DIET**; **GOLDEN BULL**; **HANSEATIC LEAGUE**; **HUSSITES**; **SWABIAN LEAGUE**; and articles on the principal divisions of **GERMANY**.

In addition to the article **ITALY**, *see* **CAROCIO**; **GUELPHS AND Ghibellines**; **LOMBARD LEAGUE**; **PODESTA**; **RAVENNA, EXARCHATE OF**; **ROME**; **PAPACY**; **VENICE**; **DODGE**; **SICILY**; **VESPERS, SICILIAN**.

In addition to articles **SPAIN** and **PORTUGAL**, *see* articles on the mediaeval divisions of Spain.

For **Flanders** (*q.v.*) *see* also **BRABANT**; **FRISIANS**; **GELDERLAND**; **HAINAUT**; **HOLLAND, COUNTY OF**; **JOYEUSE ENTREE**; **NETHERLANDS**.

For the Scandinavian countries, in addition to **DENMARK**, **NORWAY**, **SWEDEN**, *see* articles **VIKINGS**; **VINLAND**.

For the **NEAR EAST**, *see* **AUSTRIA-HUNGARY**; **BULGARIA**; **CUMANS**; **PETCHENEGS**; **PERSIA**; **SLAVS**; **VLACHS**; **GREECE**; **TURKEY**; **ISLAM**; **ISLAMIC LAW**; **ISLAMIC INSTITUTIONS**.

For the **Jews**, *see* **BOSTENAI**, **EXILARCH**, **Ghetto**, **Jews**, **RITUAL**, **MURDER**.

The development of the methods and means of warfare in Mediaeval history is covered in the historical parts of such general articles as **ARMY**; **CAVALRY**; **FORTIFICATION AND SIEGECRAFT**; **GUN**; **INFANTRY**; **MILITIA**; and **TACTICS**. For special light on certain periods and on certain military organizations which markedly influenced the course of mediaeval history *see* **MOHAMMEDAN CAMPAIGNS**, **MONGOL CAMPAIGNS**, **HUNDRED YEARS' WAR**, **SWISS WARS**, etc. The thread of evolution is also traced through the separate narrations of the more famous battles of each period, such as **DARAS**, **TRICAMERON**, **TAGINAE** and **MANZIKORT**, **COURTRAI**, **ACRE**, **ARSAF** and **BOUVINES**, **MURAT**, **BOUCOMTO** and **TAGLIA-COZZO**, **BANNOCKBURN**, **DUPPLIN**, **HALIDON HILL**, **CRECY**, **POITIERS** and **AGINCOURT**, **RAVENNA** and **MARIGNANO**. More isolated but immortal incidents, for example the battles of **Chalons**, **Tours** and **Hastings**, and the siege of **Constantinople, 1453**, have also individual treatment.

MODERN HISTORY

The history of the various countries will be found under their respective names with the following exceptions: the history of England is under the title **ENGLISH HISTORY**; the history of Ireland is to be found under **IRELAND** until the date 1921, but afterwards under **IRELAND, NORTHERN**, and **IRISH FREE STATE**; the post-war history of "Iraq" is given under that title: for earlier history *see* **MESOPOTAMIA**. There is also a comprehensive article under the title of each continent. There are separate articles on all the British colonies and dominions as well as a long general article **BRITISH EMPIRE**. The article **SOUTH AFRICA, UNION OF**, contains the complete history of the territory embraced by the Union; but there are also separate articles on its component parts, *e.g.*, **CAPE COLONY**, **NATAL**, **TRANSVAAL**, etc. The officially recog-

nized names **Nyasaland** and **French Equatorial Africa**, are used in this edition in place of the older names **British Central Africa** and **French Congo**.

The events of the World War and its consequent problems are dealt with in such articles as **SERBIA** and **DIMITRIEVIC**, which discuss the **Serajevo murder**; **WORLD WAR**; **EUROPE**; **PARIS, CONFERENCE OF**; **VERSAILLES, TREATY OF**; **LEAGUE OF NATIONS**; **FOURTEEN POINTS**; **SECURITY**; **DISARMAMENT**; **REPARATIONS AND THE DAWES PLAN**; **MINORITIES**; **SAAR TERRITORY**; **RUHR**; **SANCTIONS AND GUARANTEES**; **LOCARNO**; **WAR GUILT**, etc.

A great number of articles deal with questions of government and administration, *e.g.*, **CABINET**; **PRIVY COUNCIL**; **PRIME MINISTER**; **STAR CHAMBER**; **GOVERNMENT**; **GOVERNMENT DEPARTMENTS**; **MINISTRY**; **SPEAKER**; **ELECTORAL SYSTEMS**; **PAYMENT OF MEMBERS**; **WOMEN'S SUFFRAGE**.

Most important treaties, political documents, and congresses have entries of their own, *e.g.*, **BERLIN, CONGRESS AND TREATY OF**; **BILL OF RIGHTS**; **EDICT OF NANTES**, etc. Political parties, etc., are dealt with under such headings as **COMMUNISM**; **SOCIALISM**; **CHARTISM**; **FASCISM**; **MAFIA**; **CARBONARI**; **CONSERVATIVE PARTY**; **LIBERAL PARTY**; **LABOUR PARTY**; and under the titles of the principal parties of the French Revolution. Movements of historic importance have special articles of their own, *e.g.*, **REFORMATION**; **RENAISSANCE**; **FRENCH REVOLUTION**; **REFORM MOVEMENT**; **EASTERN QUESTION**; **SCHLESWIG-HOLSTEIN QUESTION**; **PAN-GERMANISM**; **PAN-SLAVISM**; **CHURCH AND STATE**. The Czech National Movement in Bohemia, Moravia, Silesia, and Slovakia, is included in the article **BOHEMIA**. There are also various articles on special subjects related to history such as **DIPLOMACY**; **RECORD**; **DIPLOMATIC**; **TRADE ROUTES**.

The history of the Church will be found under **PAPACY**; **CHURCH HISTORY**; **ROMAN CATHOLIC CHURCH**; **INQUISITION**, etc., and under the separate headings of denominations, *e.g.*, **UNITARIANISM**; **BAPTISTS**, etc., where the rise and development of each movement is traced. In some isolated articles, *e.g.*, **MONGOLS**, a sketch of history is given as an essential indication of the influence of such peoples on surrounding nations. The Mohammedan religious world is treated in the article **ISLAM**, the history of Mohammedan Law is found under **ISLAMIC LAW** and the articles **ISLAMIC INSTITUTIONS** and **CALIPHATE**, give an indication of Mohammedan influence on Europe. The religious history of Further Asia is treated under **BUDDHISM**; **BRAHMANISM**; **SHINTOISM**; **TAOISM**; **HINDUISM**; etc., and the individual biographical articles, *e.g.*, **CONFUCIUS**; **BUDDHA**, etc.

All the principal historical characters have their own biographical articles. There are also certain general family articles, *e.g.*, **BOURBONS**; **HABSBURGS**; **HOHENZOLLERNS**; **ROMANOFFS**.

The great wars of modern history are all fully described and arranged in articles under their own headings—**THIRTY YEARS' WAR**; **GREAT REBELLION**; **DUTCH WARS**; **GRAND ALLIANCE**; **SPANISH SUCCESSION**; **AUSTRIAN SUCCESSION**; **SEVEN YEARS' WAR**; **AMERICAN REVOLUTION**; **FRENCH REVOLUTIONARY WARS**; **NAPOLEONIC CAMPAIGNS**; **PENINSULAR WAR**; **WATERLOO CAMPAIGN**; **ITALIAN WARS 1848-1870**; **CRIMEAN WAR**; **AMERICAN CIVIL WAR**; **SEVEN WEEKS' WAR, 1866**; **FRANCO-GERMAN WAR**; **RUSSO-TURKISH WAR**; **RUSSO-JAPANESE WAR**; **BALKAN WARS**, and finally the **WORLD WAR**. The military history of Great Britain's overseas expansion and defense of her territories may be traced in such articles as **QUEBEC**; **SIKH WARS**; **BURMESE WARS**; **INDIAN MUTINY**; **EGYPT AND SUDAN CAMPAIGN**; and **SOUTH AFRICAN WAR**. The chief battles of all these wars have special articles, and these rise in scale as we approach the determining military events of recent history. Thus **ATLANTA**, **BULL RIVER**, **FREDERICKSBURG**, **GETTYSBURG**, the **SEVEN DAYS** and **VICKSBURG**, in the American Civil War have extensive treatment, as also such particular phases as the **PETERSBURG**, **SHENANDOAH VALLEY**, and **WILDERNESS** campaigns. Similarly with **WORTH**, **METZ** and **SEDAN** in 1870. The events of the World War have been brought into historical perspective, the main battles of the Western, Eastern and Italian fronts, in particular **MARNE**, **YPRES**, **SOMME**, **VERDUN**, **CAPORETTO**, **CAMBRAI**, **ST. QUENTIN**, **AMIENS**, **HINDENBURG LINE**, and **MEUSE-ARGONNE**, having separate articles, in

which fresh light is shed on their origin and course, and their conduct is examined with frank and impartial regard for historical truth which documentary and personal evidence has made possible and the lapse of time has made suitable. The course of events in subsidiary theatres is described in such articles as CAUCASUS; DARDANELLES; PALESTINE; MESOPOTAMIA; SALONIKA; SERBIAN, and EAST AFRICAN campaigns.

For more detailed information on the development of the instruments and methods of warfare during modern history, the reader should consult such articles as AIR COMBAT; AIR WARFARE; AMMUNITION; ARMY; ARTILLERY; BRIDGING; CAMOUFLAGE; CHEMICAL WARFARE; CONSCRIPTION; CROSS-COUNTRY TRANSPORT; FORTIFICATION AND SIEGECRAFT; GUERRILLA WARFARE; INFANTRY; MEDICAL SERVICE; MOTOR TRANSPORT; MOUNTAIN WARFARE; ORDNANCE; SMALL ARMS; SIGNALLING; SMOKE IN WARFARE; STAFF; STRATEGY; SUPPLY AND TRANSPORT; TACTICS; TANKS and WAR.

HISTORICAL METHOD. This term is used in a variety of meanings which have not much in common. Sometimes it denotes the whole complex of methods employed in historical investigations, a subject being said to be treated by the historical method when an historical account is given of it. Sometimes a subject is said to be treated by the historical method when all that is given is a chronological survey of the different views that have been entertained about it. By an ambiguity not altogether unnatural the term "historical method" is also used instead of "evolutionary method" or "genetic method" or even "comparative method," although the story of the development of a natural species, etc., has not the chronological character of a "history" in the strict sense. Perhaps a vague reminiscence of the older use of the term "history" is partly responsible for the loose employment of the term "historical method." Originally "history" meant any kind of descriptive account of a thing, and this use still survives in the expression "natural history," to say nothing of the titles of various classics of science from Aristotle's "History of Animals" to Bacon's and Boyle's "histories" of all sorts of non-historical subjects. J. S. Mill, again, used the term "historical method" in quite another and peculiar sense, applying it to that form of the combined method of deduction and induction (or the Deductive-Inductive Method) in which the facts are first investigated inductively, and the result then confirmed by deductive reasoning from the nature of the case and in the light of truths already accepted. See SCIENTIFIC METHOD; A. Wolf, *Essentials of Scientific Method* (1928); J. S. Mill, *A System of Logic* (1890, etc.).

HISTORY. The word "history" is used in two senses. It may mean either the record of events or events themselves. Originally limited to inquiry and statement, it was only in comparatively modern times that the meaning of the word was extended to include the phenomena which form or might form their subject. It was perhaps by a somewhat careless transference of ideas that this extension was brought about. Now indeed it is the commoner meaning. We speak of the "history of England" without reference to any literary narrative. We term kings and statesmen the "makers of history," and sometimes say that the historian only records the history which they make. History in this connection is obviously not the record, but the thing to be recorded.

History in the wider sense is all that has happened, not merely all the phenomena of human life, but those of the natural world as well. It includes everything that undergoes change; and as modern science has shown that there is nothing absolutely static, therefore the whole universe, and every part of it, has its history. This idea of universal activity has in a sense made physics itself a branch of history. It is the same with the other sciences—especially the biological division, where the doctrine of evolution has induced an attitude of mind which is distinctly historical.

But the tendency to look at things historically is not merely the attitude of men of science. Our outlook upon life differs in just this particular from that of preceding ages. We recognize the unstable nature of our whole social fabric, and are therefore more and more capable of transforming it. In short, the historical spirit of the age has invaded every field. The world-picture pre-

sented in the *Encyclopædia Britannica* is that of a dynamic universe, of phenomena in process of ceaseless change. Owing to this insistent change all things which happen, or seem to happen, are history in the broader sense of the word. The *Encyclopædia Britannica* itself is a history of them in the stricter sense—the description and record of this universal process. This narrower meaning is the subject of the rest of this article.

The earliest prose origins of history are the inscriptions. Their inadequacy is evident from two standpoints. Their permanence depends not upon their importance, but upon the durability of the substance on which they are inscribed. Sealed to all but those who know how to read them, they lie forgotten for centuries while oral tradition flourishes—being within the reach of every man. Next to the inscriptions (sometimes identical with them) are the early chronicles frequently preserved in temples. These were of various kinds: simple religious annals, votive tablets recording miracles accomplished at a shrine, lists of priests and priestesses, accounts of benefactions, of prodigies and portents. In some cases, as in Rome, the pontiffs kept a kind of register, not merely of religious history, but of important political events as well. Down to the time of the Gracchi (131 B.C.) the Pontifex Maximus inscribed the year's events upon annual tablets of wood which were preserved in the Regia, the official residence of the pontiff in the Forum. These pontifical "annals" thus came to be a sort of civic history.

The first historians were the logographi of Ionian cities; men who carried their inquiry (*historiē*) beyond both written record and oral tradition to a study of the world around them. Their "saying" (*logos*) was gathered mostly from contemporaries, and upon the basis of a widened experience they became critics of their traditions. They were the forerunners of the "father of history," Herodotus (*q.v.*). It is easy for the student now to show the inadequacy of his sources, yet the work of Herodotus remains a scientific achievement as remarkable for its approximation to truth as for the vastness of its scope. It was his chief glory to have joined to this scientific spirit an artistic sense which enabled him to cast the material into the truest literary form. In Thucydides a higher art than that of Herodotus was combined with a higher science. He scorned the story-teller "who seeks to please the ear rather than to speak the truth," and yet his rhetoric is the culmination of Greek historical prose. He withdrew from vulgar applause, conscious that his narrative would be considered "disappointing to the ear," yet he recast the materials out of which he constructed it in order to lift that narrative into the realm of pure literature. Speeches, letters and documents are re-worded to be in tone with the rest of the story. It was his art, in fact, which really created the Peloponnesian war out of its separate parts. And yet this art was merely the language of a scientist. The "laborious task" of which he speaks is that of consulting all possible evidence and weighing conflicting accounts. It is this which makes his rhetoric worth while, "an everlasting possession, not a prize competition which is heard and forgotten."

From the sublimity of Thucydides and Xenophon's straightforward story, history passed with Theopompus and Ephorus into the field of rhetoric. A revival of the scientific instinct of investigation is discernible in Timæus the Sicilian, at the end of the 4th century; but his attack upon his predecessors was the text of a more crushing attack upon himself by Polybius, who declares him lacking in critical insight and biased by passion. Polybius' comments upon Timæus reach the dignity of a treatise upon history. He protests against its use for controversial pamphlets which distort the truth. "Directly a man assumes the moral attitude of an historian he ought to forget all considerations, such as love of one's friends, hatred of one's enemies. . . . He must sometimes praise enemies and blame friends. For, as a living creature is rendered useless if deprived of its eyes, so, if you take truth from History, what is left but an unprofitable tale" (bk. xii. 14). These are the words of a Ranke. Unfortunately Polybius, like most modern scientific historians, was no artist. His style is the very opposite to that of Isocrates and the rhetoricians. It is often only clear in the light of inscriptions, so closely does it keep to the sources. The style found no imitator; history passed from Greece

to Rome in the guise of rhetoric. In Dionysius of Hancarnassus the rhetoric was combined with an extensive study of the sources; but the influence of the Greek rhetoricians upon Roman prose was deplorable from the standpoint of science. Cicero, although he said that the duty of the historian is to conceal nothing true, to say nothing false, would in practice have written the kind of history that Polybius denounced. History for him is the mine from which to draw argument in oratory and example in education. It is not the subject of a scientific curiosity.

History-writing in Rome (except for the Greek writers resident there) was until the first half of the 1st century B.C. in the form of annals. Then came rhetorical ornamentation—and the Ciceronian era. The first Roman historian who rose to the conception of a science and art combined was Sallust, the student of Thucydides. The Augustan age produced in Livy a great popular historian and natural artist and a trained rhetorician (in the speeches). From Livy to Tacitus the gulf is greater than from Herodotus to Thucydides. Tacitus is at least a consummate artist. His style ranges from the brilliancy of his youth to the sternness and sombre gravity of age, passing almost to poetic expression in its epigrammatic terseness. Yet in spite of his searching study of authorities, his keen judgment of men, and his perception of underlying principles of moral law, his view was warped by the heat of faction, which glows beneath his external objectivity. After him Roman history-writing speedily degenerated. Suetonius' *Lives of the Caesars* is but a superior kind of journalism. But his gossip of the court became the model for historians, whose works, now lost, furnish the main source for the *Historia Augusta*. The importance to us of this uncritical collection of biographies is sufficient comment on the decline of history-writing in the latter empire. Finally, from the 4th century the epitomes of Eutropius and Festus served to satisfy the lessening curiosity in the past and became the handbooks for the middle ages. The single figure of Ammianus Marcellinus stands out of this age like a belated disciple of Tacitus. But the world was changing from antique to Christian ideals just as he was writing, and with him we leave this outline of ancient history.

THE CHRISTIAN ERA

Early Christian History.—The 4th and 5th centuries saw a great revolution in the history of history. The story of the pagan past slipped out of mind, and in its place was set, by the genius of Eusebius, the story of the world force which had superseded it, Christianity, and of that small fraction of antiquity from which it sprang—the Jews. Christianity from the first had forced thinking men to reconstruct their philosophy of history, but it was only after the Church's triumph that its point of view became dominant in historiography. Three centuries more passed before the pagan models were quite lost to sight. But from the 7th century to the 17th (from Isidore of Seville and the English Bede for a thousand years) mankind was to look back along the line of Jewish priests and kings to the Creation. Egypt was of interest only as it came into Israelite history, Babylon and Nineveh were to illustrate the judgments of Yahweh, Tyre and Sidon to reflect the glory of Solomon.

Christian history begins with the triumph of the Church. With Eusebius of Caesarea the apologetic pamphlets of the age of persecutions gave way to a calm review of three centuries of Christian progress. Eusebius' biography of Constantine shows what distortion of fact the father of church history permitted himself, but the ecclesiastical history was fortunately written for those who wanted to know what really happened, and remains to-day an invaluable repository of Christian antiquities. With the continuations of Socrates, Sozomen, and Theodoret, and the Latin manual which Cassiodorus had woven from them (the *Historia tripartita*), it formed the body of church history during all the middle ages. An even greater influence, however, was exercised by Eusebius' *Chronica*. Through Jerome's translation and additions, the scheme of this world's chronology became the basis for all mediaeval world chronicles. It settled until our own day the succession of years from the Creation to the birth of Christ, fitting the Old Testament story into that of ancient history. Henceforth

the Jewish past (that one path back to the beginning of the world) was marked out by the absolute laws of mathematics and revelation.

From the first, Christianity had a philosophy of history. Its earliest apologists sought to show how the world had followed a divine plan in its long preparation for the life of Christ. From this central fact of all history, mankind should continue through war and suffering until the divine plan was completed at the judgment day. This idea received its classic statement in St. Augustine's *City of God*. The terrestrial city, whose eternity had been the theme of pagan history, had just fallen before Alaric's Goths. Augustine's explanation of its fall passes in review not only the calamities of Roman history (combined with a pathetic perception of its greatness) but carries the survey back to the origin of evil at the Creation. The Roman Empire (the last general form of the earthly city) must at last yield to the heavenly. This is the main thread of Augustine's philosophy of history. The historical demonstration of its truth was left by Augustine for his disciple, Paulus Orosius (*q.v.*), whose *Seven Books of Histories against the Pagans*, written as a supplement to the *City of God*, was the first attempt at a Christian "World History."

The commonest form of mediaeval historical writing was the chronicle. Utterly lacking in perspective and dominated by the idea of the miraculous, they are for the most part a record of the trivial or the marvellous. Individual historians sometimes recount the story of their own times with sober judgment, but seldom know how to test their sources when dealing with the past. Contradictions are often copied down without the writer noticing them, and since the middle ages forged and falsified so many documents (monasteries, towns, and corporations gaining privileges or titles of possession by the bold use of them) the narrative of mediaeval writers cannot be relied upon unless we can verify it by collateral evidence. Some historians, like Otto of Freising, Guibert of Nogent, or Bernard Gui, would have been scientific if they had had our appliances for comparison. But even men like Roger Bacon, who deplored the inaccuracy of texts, had worked out no general method to apply in their restoration. Toward the close of the middle ages the vernacular literatures were adorned with Villani's and Froissart's chronicles. But the merit of both lies in their journalistic qualities of contemporary narrative. Neither was a history in the truest sense.

The Renaissance marked the first great gain in the historic sense, in the efforts of the humanists to realize the spirit of the antique world. They did not altogether succeed; antiquity to them meant largely Plato and Cicero. Their interests were literary, and the un-Ciceronian centuries were generally ignored. Those in which the foundations of modern Europe were laid, which produced parliaments, cathedrals, cities, Dante and Chaucer, were grouped alike on one dismal level and at a later date christened the middle ages. History became the servant to literature, an adjunct to the classics. But if the literary side of humanism has been a barrier to the progress of scientific history, the discovery and elucidation of texts first made that progress possible. Laurentius Valla's brilliant attack on the "Donation of Constantine" (1440) and Ulrich von Hutten's rehabilitation of Henry IV. from monkish tales mark the rise of the new science. For a while it remained but a phase of humanism. It was north of the Alps that it parted company with the grammarians. Classical antiquity was an Italian past, the German scholars turned back to the sources of their national history. Aeneas Sylvius Piccolomini (Pius II.) had discovered Otto of Freising and Jordanes. Maximilian I. encouraged the search for manuscripts, and Vienna became a great humanistic centre. Conrad Celtes left his *Germania illustrata* unfinished, but he had found the works of Hroswitha. Conrad Peutinger gathered all sorts of Chronicles in his room in Vienna, publishing among them those of Gregory of Tours. This national movement of the 15th century was not paralleled in France or England, where the classical humanities reigned. The Reformation meanwhile gave another turn to the work of German scholars.

Influence of the Reformation.—The Reformation, with its heated controversies, seems a strange starting-point for science,

yet it, even more than the Renaissance, brought out scientific methods of historical investigation. It not only sobered the humanist tendency to sacrifice truth for aesthetic effect, it called for the documents of the Church and subjected them to the most hostile criticism. Luther himself challenged them. Then in the *Magdeburg Centuries* (1559-74) Protestantism tried to make good its attack on the mediaeval church by a great collection of sources accompanied with much destructive criticism. This gigantic work is the first monument of modern historical research. The reply of Cardinal Baronius (*Annales ecclesiastici*, 1588-1607) was a still greater collection, drawn from archives which till then had not been used for scientific history.

The movement back to the sources in Germany until the Thirty Years' War was a notable one. Collections were made by Simon Schard (1535-73), Johannes Pistorius (1576-1608), Marquard Freher (1565-1614), Melchior Goldast (1576-1635), and others. After the war Leibnitz began a new epoch, both by his philosophy, with its law of continuity in phenomena, and by his systematic attempt to collect sources through an association (1670). His plan to have documents printed as they were, instead of "correcting" them, was a notable advance. But from Leibnitz until the 19th century German national historiography made little progress—although church historians like Mosheim and Neander stand out among the greatest historians of all time.

France had not paralleled the activity of Maximilian's Renaissance historians. The father of modern French history, or at least of historical research, was André Duchesne (1584-1640), whose splendid collections of sources are still in use. Jean Bodin wrote the first treatise on scientific history (*Methodus ad facilem historiarum cognitionem*, 1566), but he did not apply his own principles of criticism; and it was left for the Benedictine monks of the Congregation of St. Maur to establish definitely the new science. The place of this school in the history of history is absolutely without a parallel. When Luc d'Achery turned from exegetics to patristics and the lives of the saints, as a sort of Christian humanist, he led the way to that vast work of collection and comparison of texts which developed through Mabillon, Montfaucon, Ruinart, Martène, Bouquet, and their associates, into the indispensable implements of modern historians. Here, as in the Reformation, controversy called out the richest product. Jean Mabillon's treatise, *De re diplomatica* (1681), was due to the criticisms of that group of Belgian Jesuits whose *Acta Sanctorum quotquot toto orbe coluntur* (1643, etc., see BOLLANDISTS) was destined to grow into the greatest repository of legend and biography the world has seen. In reply to D. Papebroch's criticisms of the chronicle of St. Denis, Mabillon prepared this manual for the testing of mediaeval documents. Its canons are the basis, indeed, almost the whole, of the science of diplomatic (*q.v.*), the touchstone of truth for mediaeval research. Henceforth even the mediocre scholar had a body of technical rules by which to sort out the vast mass of apocrypha in mediaeval documentary sources. Scientific history depends upon implements. Without manuals, dictionaries, and easy access to texts, we should go as far astray as any mediaeval chronicler. The France of the Maurists supplied the most essential of these instruments. The great "glossary" of Du Cange is still in enlarged editions the indispensable encyclopaedia of the middle ages. Chronology and palaeography were placed on a new footing by Dom Bernard de Montfaucon's *Palaeographia graeca* (1708), the monumental *Art de vérifier les dates* (3rd ed., 1818-31, in 38 vols.) and the *Nouveau Traité de diplomatique* (1750-65) of Dom Tassin and Dom Toustain. The collections of texts which the Maurists published are too many and too vast to be enumerated here (see C. Langlois, *Manuel de bibliographie historique*, pp. 293 seq. Dom Bouquet's *Historiens de la Gaule et de la France*—the national repertory for French historians—is but one of a dozen tasks of similar magnitude. During the 18th century this deep under-work of scientific history continued to advance, though for the most part unseen by the brilliant writers whose untrustworthy generalities passed for history in the salons of the old régime. Interrupted by the Revolution, it revived in the 19th century, and the roll of honour of the French École des Chartes

has almost rivalled that of St. Germain-des-Prés.

The father of critical history in Italy was L. A. Muratori (1672-1750), the Italian counterpart of Leibnitz. His vast collection of sources (*Rerum Italicarum scriptores*), prepared amid every discouragement, remains to-day the national monument of Italian history; and it is but one of his collections. His output is perhaps the greatest of any isolated worker in the whole history of historiography. The same haste, but much less care, marked the work of J. D. Mansi (d. 1769), the compiler of the fullest collection of the Councils. Spain, stifled by the Inquisition, produced no national collection of sources during the 17th and 18th centuries, although Nicolas Antonio (d. 1684) produced a national literary history of the first rank.

England in the 16th century kept pace with Continental historiography. Henry VIII.'s chaplain, John Leland, is the father of English antiquaries. Three of the most precious collections of mediaeval manuscripts still in existence were then begun by Thomas Bodley (the Bodleian, Oxford), Archbishop Matthew Parker (Corpus Christi, Cambridge), and Robert Cotton (the Cottonian collection, British Museum). In Elizabeth's reign a serious effort was made to arrange the national records, but until the end of the 18th century they were scattered in not less than 15 repositories. In the 17th and 18th centuries English scholarship was enriched by such monuments of research as William Dugdale's *Monasticon*, Thomas Madox's *History of the Exchequer*, Wilkins's *Concilia*, and Thomas Rymer's *Foedera*. But these works, important as they were, gave but little idea of the wealth of historical sources which the 19th century was to reveal in England.

MODERN PRACTICE

History as a Science.—In the 19th century the science of history underwent a revolution. The machinery of research was perfected. Workers or groups of workers grew into national or international associations, producing from archives collections of material to be worked up into the artistic form of history. These faithful workers (devoting their lives to the cataloguing of archives and libraries, to the publication of material, and then to the gigantic task of indexing what they have produced) have made it possible for the student to master in a few hours in his library sources of history which baffled the long years of research of a Martène or Rymer.

Every science which deals with human phenomena is in a way an implement in this great factory system, in which the past is welded together again. But the real auxiliary sciences to history are those which deal with those traces of the past that still exist, the science of language (philology), of writing (palaeography), of documents (diplomatic), of seals (sphragistics), of coins (numismatics), of weights and measures, and archaeology in the widest sense of the word. These sciences underlie the whole development of scientific history. Dictionaries and manuals are the instruments of this industrial revolution. Without them the literary remains of the race would still be as useless as Egyptian inscriptions to the fellaheen. Archaeology itself remained but a minor branch of art until the machinery was perfected which enabled it to classify and interpret the remains of the "prehistoric" age.

This is the most remarkable chapter in the whole history of history—the recovery of that past which had already been lost when our literary history began. The old "providential" scheme of history disintegrates before a new interest in the "gentile" nations to whose high culture Hebrew sources bore unwilling testimony. Biblical criticism is a part of the historic process. The Jewish texts, once the infallible basis of history, are now tested by the libraries of Babylon, from which they were partly drawn, and Hebrew history sinks into its proper place in the wide horizon of antiquity. The finding of the Rosetta stone left us no longer dependent upon Greek, Latin, or Hebrew sources, and now 50 centuries of Egyptian history lie before us. The scientific historian of antiquity works on the hills of Crete, rather than in the quiet of a library with the classics spread out before him. There he can reconstruct the splendour of that Minoan age to

which Homeric poems look back, as the Germanic epics looked back to Rome or Verona. His discoveries, co-ordinated and arranged in vast *corpora inscriptionum*, stand now alongside Herodotus or Livy, furnishing a basis for their criticism.

The immense increase in available sources, archaeological and literary, has remade historical criticism. Ranke's application of the principles of "higher criticism" to works written since the invention of printing (*Kritik neuerer Geschichtsschreiber*) was an epoch-making challenge of narrative sources. Now they are everywhere checked by contemporary evidence, and a clearer sense of what constitutes a primary source has discredited much of what had been currently accepted as true. This is true not only of ancient history, where last year's book may be a thousand years out of date, but of the whole field. Hardly an "old master" remains an authoritative book of reference. Old landmarks drop out of sight—e.g., the fall of the Western Empire in 476, the coming of the Greeks to Italy in 1450, dates which once enclosed the middle ages. The perspective changes—the Renaissance grows less and the middle ages more; the Protestant Revolution becomes a complex of economics and politics and religion; the French Revolution a vast social reform in which the Terror was an incident. The result has been a complete transformation of history since the middle of the 19th century.

Theories of History.—The Augustinian scheme of world history received its last classic statement in Bossuet's *Histoire universelle*. Voltaire's reply to it in the 18th century (*Essai sur les mœurs*) attacked its limitations on the basis of deism, and its miraculous procedure on that of science. But while there are foreshadowings of the evolutionary theory in this work, neither the *philosophes* historians nor Hume nor Gibbon arrived at a constructive principle in history which could take the place of the Providence they rejected. Religion, though false, might be a real historic force. History became the tragic spectacle of a game of dupes—the real movers being priests, kings, or warriors. The pawns slowly acquired reason, and then were able to regulate the moves themselves. But all this failed to give a satisfactory explanation of the laws which determine the direction of this evolution. Giovanni Battista Vico (1668–1744) was the first to ask why there is no science of human history. But his lonely life and unrecognized labours leave him apart from the main movement, until his works were discovered again in the 19th century. The first half of the century (apart from the scientific activity of Pertz, Guizot, etc.) was largely dominated by the Romanticists, with their exaggeration of the individual. Carlyle's "great man theory of history" is logically connected with the age of Scott. It was a philosophy of history which lent itself to magnificent dramatic creations; but it explained nothing. Carlyle stands to Bossuet as the saga to the myth. Hegel got no closer to realities. His idealistic scheme of history, which makes religion the keynote of progress, and describes the function of each (Judaism to typify duty, Confucianism order, Mohammedanism justice, Buddhism patience, and Christianity love) does not account for the facts of the history enacted by the devotees. It characterizes, not the real process of evolution, but an ideal which history has not realized. Besides, it does not face the question how far religion itself is a product or a cause, or both combined.

In the middle of the century two men sought to incorporate in their philosophy the physical basis which Hegel had ignored in his spiritism—recognizing that life is conditioned by an environment and not an abstraction for metaphysics. H. T. Buckle, in his *History of Civilization in England* (1857), was the first to work out the influences of the material world upon history, developing through a wealth of illustration the importance of food, soil, and the general aspect of nature upon the formation of society. Buckle did not, as is generally believed, make these three factors dominate all history. He distinctly stated that "the advance of European civilization is characterized by a diminishing influence of physical laws and an increasing influence of mental laws," and "the measure of civilization is the triumph of mind over external agents." Yet his challenge, not only to the theologian, but also to those "historians whose indolence of thought" or "natural incapacity" prevented them from attempt-

ing more than the annalistic record of events, called out a storm of protest from almost every side. Meanwhile the economists had themselves taken up the problem, and it was from them that the historians of to-day have learned it. Ten years before Buckle published his history, Karl Marx had already formulated the "materialist conception of history." Accepting with reservation Feuerbach's attack on the Hegelian "absolute idea," based on materialistic grounds (*Der Mensch ist, was er isst*), Marx was led to the conclusion that the evolution of society is conditioned by the economic circumstances of its existence. From this he went on to socialism, which bases its militant philosophy upon this interpretation of history. But the truth or falseness of Socialism does not affect the theory of history. In 1845 Marx wrote of the Young-Hegelians that to separate history from natural science and industry was like separating the soul from the body, and "finding the birthplace of history, not in the gross material production on earth, but in the misty cloud formation of heaven" (*Die heilige Familie*, p. 238). In his *Misère de la philosophie* (1847) he lays down the principle that social relationships largely depend upon modes of production, and therefore the principles, ideas, and categories which are thus evolved are no more eternal than the relations they express, but are historical and transitory products. In the famous *Manifesto of the Communist Party* (1848) the theory was applied to show how the industrial revolution had replaced feudal with modern conditions. But it had little vogue, except among Socialists, until the third volume of *Das Kapital* was published in 1894, when its importance was borne in upon Continental scholars. Since then the controversy has been almost as heated as in the days of the Reformation. It is an exaggeration of the theory which makes it an explanation of all human life, but the whole science of dynamic sociology rests upon the postulate of Marx.

The content of history always reflects the interests of the age in which it is written. Modern historians began with politics; but as the complex nature of society became more evident in the age of democracy they gradually realized that no one branch of history is more than a single glimpse at a vast complex of phenomena, most of which lie for ever beyond our ken.

This expansion of interest has intensified specialization. Each historian chooses his own epoch or century and his own subject, and spends his life mastering such traces of it as he can find. His work there enables him to judge of the methods of his fellows, but his own remains restricted by the very wealth of material which has been accumulated on the single subject before him. Thus the great enterprises of to-day are co-operative—the *Cambridge Modern History*, Lavis and Rambaud's *Histoire générale*, Lavis's *Histoire de France*, Hunt and Poole's *Political History of England*, and Oncken's *Allgemeine Geschichte in Einzeldarstellungen*. But even these vast sets cover but the merest fraction of their subjects. This limitation of the professed historian is made up for by the growingly historical treatment of all the sciences and arts. Indeed, for a definition of that limitless subject which includes all the phenomena that stand the stress of change, one might adapt a famous epitaph—*si historiam requiris, circumspice*.

BIBLIOGRAPHY.—For the general treatment of the problems of the historian, see Ernst Bernheim, *Lehrbuch der historischen Methode und der Geschichtsphilosophie* (6th ed., 1914); C. V. Langlois, *Manuel de bibliographie historique* (2nd ed., 1901–04), and James T. Shotwell, *Introduction to the History of History* (1922). For recent trend see J. H. Robinson, *The New History* (1912); for more exhaustive treatment and bibliographies see Harry E. Barnes, *The New History and the Social Studies* (1925) and his article "History" in the *Encyclopaedia Americana*.

For ancient history in general an old but important manual is that of C. Wachsmuth, *Einleitung in das Studium der alten Geschichte* (1895). For mediaeval historiography such works as W. Wattenbach's *Deutschlands Geschichtsquellen im Mittelalter* (6th ed., 1893–94) or A. Molinier's *Les sources de l'histoire de France* (1901–06), are adequate in their respective fields. No similar survey exists of English mediaeval historians. For the modern field E. Fueter's *Geschichte der neueren Historiographie* (1911; Fr. ed., 1914) covers the ground from Machiavelli to about 1870, while such works as G. P. Gooch's *History and Historians in the Nineteenth Century* (1913), or A. Guillard's *Modern Germany and Her Historians* (1915; Fr. ed., 1900), deal with important topics. For French history the series *Les sources*

de l'histoire de France, referred to above, is continued in the modern field by H. Hauser, and E. Bourgeois (1906-24).

For a philosophical survey see R. Flint's *History of the Philosophy of History, Historical Philosophy in France and French Belgium and Switzerland* (1894), which is preceded by a short general sketch. See also B. Croce's *Theory and History of Historiography* (trans., 1921), and F. J. Teggart, *The Theory of History* (1925). For more specific references see various historical articles. The output of historical literature is enormous, and the only way to follow it critically is by the aid of the great historical reviews, especially the *English Historical Review*, the *American Historical Review*, *La Revue historique*, and the most comprehensive and authoritative survey of all historical literature in the *Jahresberichte der Geschichtswissenschaft*, which has become an international undertaking in connection with the International Congress of Historical Sciences. (J. T. S.)

HIT, a town in Iraq on the right (western) bank of the Euphrates, on which it forms the limit of navigation, in 34° N. and 43° E., about 70 m. north-west of Baghdad. The town is of great antiquity and was the chief source of bitumen which was used in ancient times for binding the courses of brick buildings. There are bitter springs and lakes and abundant surface indications of oil, which has oozed from the surface here since time immemorial. Boats daubed with bitumen are still made here. The importance of the region to-day lies in its potential oil supplies, to utilize which however improved communications would be necessary, and a pipe line westwards has been suggested. The region is desolate in the extreme, although the town itself has a little fringing girdle of palm trees.

HITCHCOCK, EDWARD (1793-1864), American geologist and educator, was born at Deerfield, Mass., on May 24, 1793. After graduating from Yale Theological seminary in 1820 he became pastor of a Congregational church at Conway, Mass. An interest in science led him at the same time to pursue a course in chemistry and geology at Yale under the elder Silliman and also to undertake a scientific survey of the western counties of Massachusetts. In 1825 he became the first professor of natural history at Amherst college and until 1845 was the sole instructor in all scientific subjects at that institution. In 1845 he became the third president of the college, and from then until his death in 1864 was professor of geology and natural theology. As president his energetic efforts contributed greatly to the early success of the school.

In 1830 he was appointed State geologist of Massachusetts and conducted the first government geological survey of the State. A resurvey was also made by him from 1837 to 1841 when his final report was published. In 1836 he was appointed geologist of New York, but ill health prevented him from conducting any of the field work. In 1857 he was appointed State geologist of Vermont, and the results of his geological survey of that State were published in 1862. He made the first detailed study of the fossil footprints from Triassic sandstones of the Connecticut valley, and convinced eminent geologists that they were those of prehistoric birds, lizards, insects, etc. He also was active in the study of the drift phenomena and was one of the first in this country to support Agassiz in attributing it to the action of ice, though he could not believe glaciers wholly responsible. He died at Amherst on Feb. 27, 1864.

His son, **CHARLES HENRY HITCHCOCK** (1836-1919), aided him in the Vermont geological survey and became professor of geology at Dartmouth college. In 1911 he published *Hawaii and its Volcanoes*.

A bibliography of the books, pamphlets, periodicals and newspaper articles of Edward Hitchcock totalling several hundred titles is found in his book *Reminiscences of Amherst* (1863), which is largely autobiographical. Among his principal works were: *Geology of the Connecticut Valley* (1823); *Catalogue of Animals and Plants of Massachusetts* (1835); *Elementary Geology* (1840; 31st ed., 1860); *Fossil Footmarks in the United States* (1848); *Outline of the Geology of the Globe* (1853); *Illustrations of Surface Geology* (1856); *Ichthyology of New England* (1858).

See also J. P. Lesley, "Biographical Notice of Edward Hitchcock," National Academy of Science, *Biographical Memoirs*, I. (1877), and W. J. Youmans, *Pioneers of Science in America* (1896).

HITCHCOCK, GILBERT MONELL (1859-), American politician, was born at Omaha, Neb., on Sept. 18, 1859. He was educated at Omaha and Baden-Baden (Germany), and the

law school of the University of Michigan. He was admitted to the bar in 1881 and practised law in Omaha for four years. In 1885 he founded the *Omaha Evening World*, and four years later bought the *Omaha Morning Herald*, combining the two papers into *The World-Herald*. He was representative in Congress 1903-05 and 1907-11. He was elected United States Senator as a Democrat for the terms 1911-17 and 1917-23. After the sinking of the "Lusitania" in 1915, he believed that action on the part of America should be limited to a demand for reparation. In 1917, however, he supported the resolution for a declaration of war against Germany, and in 1918 became chairman of the Senate committee on foreign relations. When President Wilson submitted to the Senate the Treaty of Versailles, Senator Hitchcock led the administration forces by virtue of his office, giving strong support to the League of Nations.

HITCHIN, a market town in Hertfordshire, England, on the small river Hiz, 32 m. N. from London by the L.N.E.R. Pop. of urban district (1921) 13,525. It is the junction of the main line with the Cambridge branch, and with a branch to Bedford. The church of St. Mary is Perpendicular, with a fine porch and a painting of the Adoration of the Magi, attributed to Rubens. Hitchin priory is a mansion on the site of a Carmelite foundation of the early 14th century. A Gilbertine nunnery, founded later in the same century, stood adjacent to the church, and portions of the buildings appear in an existing block of almshouses. The grammar school (1632) was reconstituted in 1889 for boys and girls. Hide curing, and the cultivation and distillation of lavender and peppermint are carried on.

HITLER, ADOLF (1889-), Bavarian politician (Austrian by birth), was born at Braunau, Upper Austria on April 20, 1889. He was an architect's draughtsman by profession. He was a leader of the reaction in Bavaria, and founded, in 1919, the nationalist socialist workers' party, formed to oppose the social democrats, in reliance on a military organization known as the Hitler volunteers. On Nov. 8, 1923, he organized the revolt in Munich known as the Hitler *putsch*. The revolt was quashed on the next day, and Hitler was condemned, in April 1924, to five years' detention in a fortress. He was, however, released, in December, and in February of the next year re-organized the nationalist socialist labour party which then seceded from the *Deutsch-völkische Freiheitsbewegung*. The party was represented in the Reichstag by Dr. Frick and Ludendorff, but Hitler himself found no seat there. He became the editor of the *Völkische Beobachter* (Munich).

HITTITE LAW: see BABYLONIAN LAW.

HITTITES, THE. This ancient Oriental people ruled over a great part of Asia Minor and Syria between the years 2000 and 1200 before the birth of Christ, and imposed their own high degree of civilization upon those regions. Rivals of the old Egyptians and Assyro-Babylonians, in comparison with both these nations, the Hittites rank third in importance among the peoples of the ancient East. Modern research has proved that the ruling people of the Hittite kingdom spoke a language which is related to modern European languages.

THE HITTITE PROBLEM AND ITS SOLUTION

The Old Testament, Egyptian and Assyro-Babylonian Knowledge of the Hittites.—The Hittite race, "the sons of Heth" (Hebr. *Hittim*, *Benê Hêth*) was known to the writers of the Old Testament. In Gen. x. 15. Heth was a son of Canaan; in Gen. xxiii. "the sons of Heth" abode in Hebron, where Abraham traded with them for a grave for his wife Sarah; in Num. xiii. 29, the Hittites occupied the mountains of Canaan; in Gen. xxvi. 34, Esau married the Hittite women, Judith and Basemath. Also Uriah, whose wife David had appropriated (II Sam. xi.), is called a Hittite. In I Kings ix. 20, the Hittites, in conjunction with the Amorites, Hivites etc. were an important element in the population of Canaan. Yet according to the testimony of the Old Testament, Syria was the real home of the Hittites. In Joshua I. 4, the land of the Hittites reached to the Euphrates. In North Palestine, in the time of Solomon, the powerful kings of the Hittites ruled as sovereigns over separate Hittite states, besides

CHIEF HITTITE TOWNS, AND NEIGHBOURING DISTRICTS

the "kings of Arameans" (I Kings x. 29). From there King Solomon obviously brought his Hittite women (I Kings, xi. 1).

In confirmation and amplification of these Old Testament accounts, Egyptian evidence shows that in the time of the 18th to the 20th dynasties, between the years 1500-1190 B.C., a powerful northern kingdom *Kheta* sought perpetually to obtain political influence over Syria and therefore often fought with Egypt. Already the Pharaoh Thutmosis III. (1501-1447), who had conquered Syria as far as the Upper Euphrates, received presents from the prince of Kheta. Under the succeeding rulers of the 18th dynasty the Hittites established themselves in Syria. Bitter struggles took place between them and, especially, the Pharaohs of the 19th dynasty, Seti I. (c. 1313-1292) and Ramses II. (c. 1292-1225). About the year 1288 B.C. a great battle took place between the two hostile powers near Kadesh on the Orontes; after further combats, about the year 1272 Ramses II. established an alliance with the Hittite king Khattushilish III. and married, about the year 1259, one of his daughters; on this occasion the Hittite king visited Egypt in person. About the year 1190, the Hittite kingdom succumbed to the attacks of the so-called "sea nations."

The Cuneiform inscriptions also know a powerful kingdom and people *Khatti* who gave much trouble to the Babylonians, Assyrians and Egyptians during the II. and I. millenniums B.C. According to a Babylonian chronicle, about the year 1758 B.C. the *Khatti* people overwhelmed Akkad-Babylonia under the rule of King Samsuditana, and made an end of the Khammurabi dynasty. The increasing influence of the Khatti kingdom in Syria about 1400 B.C. is shown by the Amarna inscriptions. After the destruction of the Hittite empire in the 12th century B.C. the name Khatti is applied especially, according to the evidence of the inscriptions of the Assyrian kings, after Tiglath Pileser (cir. 1110 B.C.), to the kingdom of Carchemish on the upper Euphrates, but it also denotes the whole of Syria. Sargon II., it is true, made an end of the Khatti kingdom of Carchemish in 717 B.C., yet the New-Babylonian king, Nebuchadnezer II. (604-562), still used the name Khatti for Syria.

Hittite Monuments and Hieroglyphic Inscriptions.—The quoted information pointed to Syria and probably also to the adjoining regions of Asia Minor as the home of the Hittites. When during the 19th century, monuments of unusual style and inscriptions written in an unknown hieroglyphic script, were found in Syria and Commagene, as for example, at Hamah on the Orontes, at Aleppo, at Jerablus on the Euphrates, at Marash and Malatia, further in Cappadocia, as at Boghazkeui and Euyuk, as well as in the Taurus mountains, at Bor, Ivriz and Bulgarmaden, and finally also in western Asia Minor, at Siplyos near Magnesia, it was very natural to attribute them to the Hittites. The native monuments, together with the Egyptian reliefs representing Hittites, showed the physical characteristics of the Hittite race; in particular, the great curved nose and backward sloping forehead, which proved beyond any dispute that the Hittites were not Semites or Indo-Europeans. The hieroglyphic writing of the Hittites has nothing to do with the Egyptian hieroglyphic script. It is a pictographic script; but the original meaning of many of the signs is still obscure. In the course of time many signs developed a cursive form. The inscriptions are written *boustrophedon*; after a line written from right to left (or the reverse) there follows one from left to right (or the reverse), so that the figures and heads always face towards the beginning of the line. So far about 200 of the signs of this writing are known. In regard to the age of this writing, the Hittite Archives of Boghazkeui, for example a clay bulla bearing the seal of King Shuppiluliumash (about 1385 B.C.), the legend being written both in cuneiform and in hieroglyphics, proves that the latter was used as early as the 14th cent. B.C. Indeed this script may be much older, as is shown by its use in the very old Hittite sanctuary Yasili Kaya, not far from the chief Hittite city Khattushash-Boghazkeui. The invention of this writing may, therefore, be placed in the first half of the second millennium B.C. This script was employed by the Hittites on their rock and stone monuments especially, and upon seals made of stone and metal. It is their monumental writing; for their daily needs and especially for library and archive purposes, as the

archives of Boghazkeui show, they used cuneiform writing and clay tablets.

Much ingenuity has been employed in deciphering the Hittite hieroglyphics. Systems of deciphering were published by F. E. Peiser, A. H. Sayce, P. Jensen, A. Gleye, R. C. Thompson, A. E. Cowley and C. Frank, yet none of them was accepted by the scientific world. It seems that from all these systems only the interpretation of very few signs will prove true. The task is, in fact, very difficult, since bilingual inscriptions are still too few; those that have been discovered so far give but little help in decipherment owing to their brevity, obscurity or damaged condition. They are these: the silver seal of a king Tarkutimma-Tarkondemos of Metan (?), the seal cylinder of one Indilimma, which is, possibly, not bilingual, and the seal impressions of the Kings Shuppiluliumash and Arnuvansh IV.

The Hittite Royal Archives of Boghazkeui.—The discoveries of the 19th century failed to solve the very important problem of the affinities of the language of the Hittite people. A firm position was first reached, when in the course of his epoch-making excavations, 145 km. east of Angora, Hugo Winckler, the Berlin Assyriologist, found in the ruins of Boghazkeui a great mass of Hittite clay tablets inscribed with cuneiform characters. Winckler dug there in 1906-07 and in 1911-12, and found about 10,000 broken and whole cuneiform tablets which belonged to the archives of the kings of Khatti, and proved that the capital of the Hittite empire had been at Boghazkeui. Only a relatively small number of the clay tablets discovered in Boghazkeui are written in Babylonian cuneiform script and in Babylonian language. These are state treaties which the Khatti kingdom concluded with other ancient oriental states, and diplomatic letters of the Hittite kings. Babylonian, as the Tell-el-Amarna letters have shown, was the language of eastern diplomats, the ancient oriental French, in the second millennium B.C. The greatest number of the Boghazkeui clay tablets are written, it is true, in Babylonian cuneiform writing, but in the Hittite language. A closer examination of these Hittite documents soon showed the identity of the Hittite language with that of Arzawa (probably Cilicia Tracheia, Isauria and Southeast Lycaonia), which was already known through two letters from the cuneiform collection of Tell-el-Amarna in Egypt. (For the contents of the Hittite archives of Boghazkeui, now for the most part in the museum at Constantinople, some being in Berlin, see below.)

The Decipherment of Hittite.—After the premature death of Hugo Winckler in 1913, the German Oriental Society, under whose aegis the excavations at Boghazkeui had been carried out, entrusted the publication of the Hittite archives to a group of Assyriologists, one of whom, Professor Frederic Hrozný, of the Czech University at Prague (but then at the University of Vienna), succeeded in solving the riddle of the Hittite language, in writing the first Hittite grammar and establishing the Indo-European character of the structure of this language. About the same time E. F. Weidner declared the Hittite to be undoubtedly a Caucasian language. Hrozný's decipherment was founded upon the unilingual clay tablets of Boghazkeui: these inscriptions had to be interpreted only on their own content. For this task sentences containing proper names afforded valuable help, as well as those in which Sumero-Babylonian ideograms (word signs) occurred. The Sumero-Babylonian cuneiform writing (see CUNEIFORM) in which the Boghazkeui texts are written was indeed originally a picture-writing, from which later on a syllabic script was developed; but even in the later, more phonetic stage the cuneiform signs were used sometimes as word-signs (for example, the cuneiform sign , originally the picture of a fish , as the sign for the word "fish"). Even the Hittites employed these so-called ideograms in their cuneiform script so that these signs in a Hittite text were intelligible even without knowledge of the Hittite language. Moreover the Hittites also occasionally employed phonetically written Babylonian words as ideograms. Thus, in the middle of an unintelligible Hittite text the Babylonian word *a-du*, "father" is found: this Babylonian word was naturally read by the Hittites (as we now know) *attash*, but, by its Babylonian form, known to us, it helped us eventually, even without knowledge of

the Hittite reading, to penetrate at least in some degree into the sense of the Hittite sentence. A help was derived also from the method of combination which, progressing from the known to the unknown, by means of analogy, parallelism, resemblance of words, etc., endeavours to elucidate the unknown words. In this way, later on, Hittite sentences could be treated which were written only phonetically in Hittite.

Hittite—an Indo-European Language.—Hrozný, in the course of his researches, succeeded in identifying most forms of the Hittite language. On the basis of the structure of the language thus established he built his thesis that Hittite is an Indo-European language. He got this idea at first when he established that Hittite has a present participle, which in Nom. Sing. Masc. ends in *-anza*, in other cases in the Masc. in *-ant-* and *-and-*, thus resembling the Indo-European participle in *-nt-* (Lat. *ferens*, *ferentis*, Gr. *φέρων*, *φέροντος*). The idea of a relationship between Hittite and Indo-European languages soon took a stronger hold when, having established a complete paradigm of the Hittite participle in *-ant-*, as of other Hittite nouns, he discovered that almost all the case-endings have more or less precise counterparts in Indo-European languages. Thus the Hittite participle *khûmanza* "all" is declined:

Singular:	
Masc.-Fem.	Neuter
Nom. <i>khûmanza</i> (compare Lat. <i>ferens</i>)	<i>khûman</i> (compare <i>φέρων</i>)
Gen. <i>khûmandash</i> (compare <i>ferentis</i> , <i>φέροντος</i>)	
Dat.-Loc. <i>khûmantî,-î</i> (compare <i>ferenti</i> , <i>φέρωντι</i>)	
Accus. <i>khûmandan</i> (compare <i>ferentem</i> , <i>χρόνον</i>)	<i>khûman</i> (compare <i>φέρων</i>)
Abl. <i>khûmandas(a)</i> ¹	
Instr. <i>khûmantet</i> (compare <i>osk.</i> <i>praesentid?</i>) ¹	
Plural:	
Nom. <i>khûmantesh</i> (compare <i>ferentes</i> , <i>φέροντες</i>)	<i>khûmanda</i> (compare <i>φέροντα</i>)
Gen. <i>khûmandash²</i>	
Dat.-Loc. <i>khûmandash²</i>	
Accus. <i>khûmandush</i> (compare <i>lupos</i> , <i>λύκους</i>)	<i>khûmanda</i> (compare <i>φέροντα</i>)

The Hittite word for "Father" *attash* for example is declined in the same way:

Sing.: Nom. *attash*, Gen. *attash*, Dat.-Loc. *atti*, Acc. *attan*, Abl. *attaza*, Instr. not yet found would be *attil*;
Plural: Nom. *attêsh*, Gen. and Dat.-Loc. *attâsh*, Accus. *attush*.

Very important was the discovery of a declension which is especially characteristic of Indo-European languages. It is the declension of the Hittite word *vâdar* "water" whose meaning Hrozný succeeded in establishing with the help of the sentence: *nu NINDA-an ezzatteni vâdar-ma ekutteni*. In this sentence the meaning of the Sumero-Babylonian ideogram *NINDA* "bread" was all that was known. The following Hittite ending *-an* has been established as the termination of the Acc. Sing. from examples in other places. In one sentence speaking of bread also the word for "to eat" might possibly (though not necessarily) be expected, and as this meaning fitted for the Hittite root *ezza-* everywhere, Hrozný identified the Hittite *ezza-* and also *ad-* (*adanzi* "they eat") with the Latin *edo*, old High German *ezzan* "to eat," etc. Other passages showed him that *-teni* is the ending of the second Pers.

¹The ablative (not the locative as was originally assumed by Hrozný) in *-az(a)* is perhaps of the same origin as the Hittite instrum. in *-et*, *-it*. Compare *kallariit uddanaz* (*Keilschrift. aus Bogh. IV. 7, 60*) "from the disastrous thing," *sharkhuvantazshet* "from its belly" (Code Hittite par. 90), *KAP-laz-tet* "from thy left side" (KBo. 2482 II. 6) etc. Both the Hittite endings *-az(a)* and *-et*, *-it* are derived from the Indo-European ablative ending *-ōd*, *-ēd*; before the particle *-a* (from *-e*) the *d* is changed into *z* in Hittite. Thus two forms arise, *-az(a)* and *-et*, *-it*, which differ also in use: the first, as a rule, is used as the ending of the ablative, the second, chiefly as that of the instrumental.

²The origin of the ending *-âsh* is still obscure.

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

HITTITE RELIEFS AND HIEROGLYPHIC INSCRIPTIONS FROM CARCHEMISH

1. Hittite-Khurri sculpture of a warrior, one figure on a series of reliefs discovered at Carchemish, the modern Jerablus, on the west bank of the Euphrates.
2. Two men killing a lion. Another relief on basalt found at Carchemish. Head dress, beard and hair, as well as the turned-up toes, are characteristic of Hittite sculpture.
3. Hittite inscription, found on a monument at Carchemish. The hieroglyphic writing of the Hittites is a pictographic script which has not yet been deciphered.
4. Hittite-Khurri sculpture of bird-headed demons.

Pl. Pres.: *ezatteni* means consequently: "you eat, you will eat." As the sentence: *vâdarma ekutteni* was clearly in parallelism with the first one (*NINDA-an ezatteni*), it seemed possible to see in *vâdar*, which is parallel with "bread," also a simple vidual. A meaning as "water" was here very convenient and also other passages confirmed this interpretation. A surprising comparison with the English *water*, old Saxon *watar* "water," etc., offered itself and proved true. Then *ekutteni* that is parallel to *ezatteni* "you will eat" must signify: "you will drink"; and for the Hittite root *eku-, aku-* "to drink" and the cognate Hittite word *akuvanna* "drinking, drink" offered itself as a comparison with the Latin *aqua* "water." The Hittite sentence above thus runs when translated: "Now you will eat bread, further you will drink water."

Astonishing as was the discovery of a word for "water" similar to the English one in an ancient oriental language of the middle of the second millennium B.C. the discovery soon after of the declension of this Hittite word was still more so: Sing. Nom. *vâdar*, Gen. *vedenash*, Dat.-Loc. *vedeni*, Accus. *vâdar*, Abl. *vedenaz*, Instr. *vedenit*; Plural Nom. and Accus. *vidâr*. The Gen. Sing. of *vâdar* is not, as we might expect, *vâdarash*, but *vedenash*, with an alteration in the suffix (*n* for the *r*, used in the Nominative). The same very remarkable declension shows however also the quoted Indo-European word for "water" (Old Saxon *watar*, etc.): Gr. Nom. ὕδωρ, Gen. ὕδατος from ὕδν-τος. (Cf. Lat. *femur*, Gen. *feminis*.)

The Hittite pronouns, as established by Prof. Hrozný, also bear marked resemblance to Indo-European forms as shown in the following list in which the Hittite forms are set in italics at the beginning of each line or paragraph:

uga, *ug* "I," compare Lat. *ego*.
ammug, *ammuga* "to me, me," compare Gr. ἐμέγε.
ammêl "of me, my," which is similarly related, is connected through the Genitive ending *-êl* with the languages of Asia Minor and with Etruscan.
zig, *ziga* "thou," compare Gr. σὺγε or better perhaps according to Marstrand, the Accus. σέγε.
tug, *tuga* "to thee, thee," compare Goth. *thuk*.
tuêl "of thee, thy" with the Genitive ending *-êl*, is also connected.
vêsh "we," compare Goth. *weis*.
anzâsh "us," compare old High German *uns*.
anzel "our," compare Goth. *unsara*.
shumêsh, *shumâsh* "you," compare Gr. σὺεῖς.
-mu "to me, me," *-ia*, *-du* "to thee, thee," compare Gr. μοί, μέ, τοί, etc.
-mish "my," *-hish* "thy," compare Lat. *meus*, *tuus*.
enish, *annish* (compare *uni*) "that," compare old High German *ëner* "that," old Slav. *onû*.
kâsh "this," compare Oscan *e-kas* "these" (fem.)
shash "this," compare Sanskrit *sâ*.
kuiish "who, which," cf. Lat. *quis*.
kuit neuter "what, which," cf. Lat. *quid*.
kuwabi "where, whither," cf. Lat. *ubi*, *ne-cubi*.
kuiish *kuiish* "whoever," neuter *kuit* *kuit*, cf. Lat. *quisquis*, *quidquid*.
kuiishki, neuter *kuitki*, "somebody, something," cf. Lat. *quisque*, *quidque*.
kuwatka, "something, perhaps," cf. Lat. *quodque*.
kuwabikki "somewhere," cf. Lat. *ubique*, etc.

On the other hand, the Hittite pronoun *apâsh* "that" is connected with the languages of Asia Minor (see ASIANIC LANGUAGES); cf. Lycian *ebe* "this," Lydian *bis* "he."

Hrozný likewise proved that also the Hittite verb is essentially Indo-European. The present tense of the Hittite verb *jami* "I make" runs:

Hittite	Sanskrit	Greek
Sing. 1. <i>jami</i> "I make"	<i>yâmi</i> "I go"	τιθημι
2. <i>jashi</i>	<i>yâsi</i>	τιθης
3. <i>jazi</i>	<i>yâti</i>	τιθησι, τιθητι (Dor.)
Plur. 1. <i>javeni</i> (<i>javani</i> , <i>jauni</i>)	<i>yâmah</i> , cf. 1. pers. dual <i>yâvah</i>	τιθεμεν
2. <i>jatteni</i> (<i>jattani</i>)	<i>yâtha</i> , <i>yâthana</i>	τιθερε
3. <i>janzi</i>	<i>yânti</i>	τιθεασι, τιθευτι (Dor.)

(The forms enclosed in brackets are found, but from another verb—not yet from *jami*.)

The Hittite verb *dâkhkhe* "I take" for example presents a somewhat different paradigm for the present tense:

Sing. 1. *dâkhkhe*, *dâkhkhi* "I take" (comp. Lat. *fero*? The Hittite *kh* or *h* is, perhaps, as elsewhere frequently, secondary).

2. *datti* (comp. 2. Pers. pret. *dâtta*).
3. *dâi* (comp. *oêe*?).
- Plur. 1. (*dâveni*), *dâvani*.
2. *dâteni*, (*dattani*).
3. *dânzi*.

The Imperative Pres. Active runs:

Hittite

Sing. 1. *jallu* (KUB xiv. 27, 19); also (*jallut*, *jallit*)?
 Comp. *eshlut*, *eshlit* I will do.

Comp. for *jat*- old ecclesiastical Slav. Part. Pret.

Act. 11. *neslû*, umbr. Fut. ex. *apelust*, Armenian Part.

Pres. *berot*? -*u* is an Imperative ending, which is found also in Indo-Iranian.

The -*t* in *eshlut*, *eshlit* is perhaps of medial origin; see below especially the Preterite of the Hittite Medio-passive.

Sanskrit

- | | |
|------------------------|-----------------------------|
| 2. <i>ja</i> "make" | <i>yâhi</i> "go" |
| 3. <i>jaddu</i> | <i>yâtu</i> |
| Plur. 2. <i>jatten</i> | <i>yâtu</i> , <i>yâtana</i> |
| 3. <i>jandu</i> | <i>yântu</i> . |

The Preterite Active runs:

- | | |
|--|--|
| Sing. 1. <i>janun</i> "I made" (comp. <i>ἐπέπον</i>) | <i>dâkhkhun</i> "I took"
(Hittite <i>kh</i> is perhaps secondary); <i>tabarkha</i> "I reigned" (comp. <i>oêa</i> ?). |
| 2. <i>jat</i> (comp. <i>dâtta</i> 2. Pers. sing. and <i>jat</i> 3. p. sing.) | <i>dâtta</i> (comp. <i>oêtha</i>),
<i>dâsh</i> (from <i>dâsh</i> + <i>sh</i> ?). |
| 3. <i>jat</i> (comp. Sanskrit <i>âdhât</i>) | <i>dâtta</i> (? Comp. <i>jat</i> 3. pers. and <i>dâtta</i> 2. Pers. sing. ?)
<i>dâsh</i> (from <i>dâsh</i> + <i>t</i> ?). |
| Plur. 1. <i>javen</i> | <i>dâven</i> |
| 2. <i>jatten</i> | (<i>dâten</i>) |
| 3. <i>jêr</i> (comp. Lat. <i>fuêre</i>). | <i>dâir</i> ; also <i>dalugnula</i> "they have made long" (comp. for ex. Czech <i>neslû</i> ?). |

Very important is the proof of the existence of a Hittite Medio-passive form which frequently has an -*r* ending as exhibiting resemblance to the Latin verbal forms such as *amatur*, *amantur* and similar forms in Italo-Celtic and Tocharish. Besides -*r*, a medial -*ti*, -*t* is found as ending in the Hittite Medio-passive in other forms, especially in the Preterite; the forms with -*ti* are in the old Hittite more frequent than those with -*t*.

The present of the Hittite medial verb *jakhkhari*, "I go" runs:

- | |
|---|
| Sing. 1. <i>jakhkhari</i> (comp. Lat. <i>feror</i> ? Hittite <i>kh</i> is secondary?), (<i>jakhkhari</i>) "I go." See also Kurylowicz in <i>Symbola grammatica in honor. Rozwadowski</i> , p. 95-104. |
| 2. (<i>jatta</i> old Hittite), <i>jattati</i> (comp. <i>oêtha</i> and 3. Pers. sing. <i>jattati</i>)
Also <i>êstari</i> "thou sittest down," v. Götze, <i>Madduwattas</i> , p. 104, n. 12. |
| 3. <i>jattu</i> (comp. <i>ἐπέραι</i> , <i>ἐπέpero</i>), <i>jattari</i> , <i>jâtari</i> (comp. Lat. <i>amatur</i>), also <i>esha</i> , <i>eshari</i> , "he sits down" (comp. Umbrian <i>ferar</i>). |
| Plur. 1. (<i>javashita</i> , <i>javashat</i> , <i>javashtai</i>) (comp. Act. <i>javeni</i> , [<i>javani</i>], the pronoun <i>vêsh</i> "we" and 1. Pers. dual Sansk. <i>svâs</i> ?) |
| 2. <i>jadduma</i> (<i>jatumari</i> old Hittite) (comp. Sanskrit <i>abharadhvam</i> , old Avestic <i>mâzadadûm</i>). |
| 3. <i>janûa</i> , (comp. <i>ἐπεορται</i> , <i>ἐπεορτο</i>), <i>janûari</i> (comp. Lat. <i>amantur</i>). |

The medio-passive imperative of Hittite, whose endings for the most part show the imperative ending -*u*, already known to us, runs:

- | |
|--|
| Sing. 1. (<i>jakhkharu</i> , <i>jakhkharu</i>) "I will go." |
| 2. <i>jakhkhut</i> , (<i>jakhkhuti</i>) (stem with a secondary <i>kh</i> + - <i>u</i> of the Imperative + - <i>t</i> , - <i>ti</i> of the medium?) |
| 3. <i>jattaru</i> , also <i>esharu</i> . |
| Plur. 2. <i>jaddumai</i> , (<i>jaddumati</i>) (comp. 2. Pers. Plur. Pres. and Preterite.) |
| 3. <i>janûaru</i> . |

The Preterite of the Hittite medio-passive runs:

- | |
|--|
| Sing. 1. (<i>jakhati</i>), <i>jakhkhat</i> , <i>jakhkhakhat</i> "I went" (comp. 1. pers. Sing. present). |
| 2. (<i>jattati</i> , <i>jattat</i>) (comp. 2nd pers. sing. Pres. and 3rd sing. Pret.), also <i>kîshat</i> (comp. <i>kîshat</i> , <i>eshat</i> 3rd Sing.?) "thou becamest," besides <i>kîshat</i> . |

3. (*jatta?*), (*jattati*), *jattat* (comp. 3. Sing. pres.), also *eshati*, *eshat* (=3rd Sing. pres. *esha*+medial *-ti*, *-t?*), "he sat down," besides *eshit*.
 Plur. 1. (*javashitati*), (comp. 1. Plur. Pres.)
 2. (*jadumati*), *kishdumat*, "you became" (comp. 2. Plur. Pres.)
 3. (*jantati*), *jantat* (comp. 3. Plur. Pres.).

(Both Friedrich and Götze have been successful in the interpretation of some medio-passive forms of Hittite. However the paradigms cited above are given on the basis of independent researches of Hrozný with the only exception of the forms *javashita* and *javashit*[*i*], whose identification must be referred to Friedrich. Hrozný found also the form of the 1. Pers. sing. Imp. Act. independently of Friedrich.)

Among others, Hittite had also verb stems in *-shk-*, as for example *dashkishi*, "thou takest" (to the simple stem *dâ* "to take"), as also verb stems in *-nu*, as for example *arnumi* "I send for," to the simple stem *ar-* "come"; comp. Lat. *posco*, Greek *ῥοσσειν*, etc.

That all this correspondence of Hittite with Indo-European languages shows that in its construction Hittite is an Indo-European tongue, is the substance of Hrozný's decipherment of the Hittite language: of his preliminary report *Die Lösung des hethitischen Problems*—"The solution of the Hittite Problem" in the Transactions of the German Oriental Society (*Mitteilungen der deutschen Orientalgesellschaft*), No. 56 (1915) and especially of his Hittite grammar *Die Sprache der Hethiter, ihr Bau und ihre Zugehörigkeit zum indogermanischen Sprachstamm*—"The Language of the Hittites, its structure and its membership of the Indo-Germanic stock" (Leipzig, 1916-17). Within the Indo-European group of languages the Hittite, which treats the gutturals like the West Indo-European languages, the so-called Kentum group (see INDO-EUROPEAN LANGUAGES), appears to be related chiefly in respect of its medio-passive endings, such as *-tari*, with the Italo-Celtic languages and Tocharish. (In 1902 Knudtzon published the view that the Arzava language which, as we now know, is identical with Hittite, is an Indo-European language. But his opinion met with such severe and universal opposition from the Indo-European philologists that he withdrew it.)

Foreign Influences.—In the Hittite language, the remains of which date from the second millennium B.C., and which therefore is one of the oldest Indo-European languages, there can be observed a strange extensive simplification and attrition of the language, in spite of the survival of certain ancient features. Further at the present time only a small proportion of the Hittite vocabulary can be traced to Indo-European roots. This, it is true, is, perhaps in some extent due to the fact that the cuneiform script invented by the Sumerians is poorly adapted for rendering an Indo-European language. For this reason it is very difficult to set up a complete system of Hittite phonology. In Hittite words such as *khameshkhanza* "spring," *antukhshash*, *antuvakhkhash* "man," *idâlush* "evil," *karmalashai* "remains crippled," etc., are very numerous, for which a clearly defined Indo-European etymology is—at least at the present time—wanting. All these strange facts are best explained by the supposition that Hittite was largely influenced by other, non-Indo-European, languages. We find in Hittite words, borrowed from Assyro-Babylonian as, for example, the verb *khabalashai* "he smashes," which is borrowed from the Assyro-Babylonian verb *khâbâlu* "to destroy." The Hittite word for house *pir* has its origin perhaps in the old Egyptian word *per* "house," which is found also in the word Pharaoh, properly "great house, palace." For the far greatest number of such non-Indo-European words Hittite is however most probably indebted to the indigenous languages of Asia Minor, with which it was in close association for about 1,000 years. It is even possible that Hittite derives a not unimportant part of its foreign words from non-Indo-European tribes with whom the nation was in contact when it occupied its earliest Indo-European home. As the Hittites belong to the oldest Indo-European peoples, those who first left their earliest Indo-European home in the north, it must be supposed that they belonged to the borderland tribes of the earliest Indo-European home and, therefore, had already there come into contact with foreign peo-

ples. Later, probably in the second half of the third millennium B.C., when the Hittites, as a conquering apparently not very numerous people, forced their way over the Caucasus, or (less probably) across the Bosphorus, into Asia Minor, and overthrew the native inhabitants, also, the languages of the latter exercised considerable influence on the language of the Indo-European conquerors. At the same time the Hittites came into contact with the Assyro-Babylonian colonies in Asia Minor, from whom they took over cuneiform writing, many religious and cultural goods, and, naturally, many words of their language.

Hrozný's Decipherment and the Experts.—Relying chiefly on these foreign influences in Hittite, the philological experts (e.g., Bartholomae, Bork) in the beginning opposed and refused to accept both Hrozný's decipherment and his theory of the Indo-European character of Hittite. They even sometimes doubted the accuracy of his readings which were held to be tendentious. Hrozný himself provided a measure of support to these unfavourable criticisms since, while working out the Indo-European affinity of this language, he sometimes overshot the mark in his first public announcement. Scepticism as to Hrozný's decipherment was carried very far especially in England. But further investigations of Hittite material which achieved notable success, especially in Germany, demonstrated the futility of this criticism and thus obtained a complete victory for Hrozný's position. The first to maintain Hrozný's theory were the Assyriologist Holma (1916), the Indo-Germanist, Marstrand (1919) and the Assyriologist, Forrer (1919). Also the Indo-Germanist, F. Sommer, who learned cuneiform writing on account of Hittite, and thus convinced himself of the exactness of Hrozný's readings, "after long doubt" declared (1920) Hittite "to be by its flexional structure an Indo-Germanic language," and in 1921 the Indo-Germanists, Herbig and Debrunner joined him. The Indo-Germanic (Indo-European) theory won a very warm adherent in the Hittitologist J. Friedrich of Leipzig, an expert in Assyriology and Indo-Germanic learning. Also the assent of both the eminent Indo-Germanists, P. Kretschmer and H. Pedersen (1925-26) to the theory of the Indo-European character of Hittite is very important. Thus in 1924 Friedrich was able to assert that almost all serious students adhere to the theory that Hittite is a newly discovered Indo-Germanic language (Ebert, *Reallexikon der Vorgeschichte*, s.v. "Altkleinasiatische Sprachen").

OTHER HITTITE LANGUAGES

Khattish.—Not only the mixed character of the Hittite language, but also the physical characters of the "Hittite" race, its hyperbrachycephalous skull, the large hooked nose and sloping forehead, suggested the hypothesis that here an Indo-European nation is mingled with a non-Indo-European race. At the turn of the year 1919-20 this conjecture was confirmed by the independent and surprising discovery of Hrozný and Forrer that in the State archives of the Hittite kings had been preserved remains of one language which is totally different from the Indo-European Hittite and which these documents call *khattili*, that is, *khattish*. According to a collection of instructions an employe shall come out from the Palace and call "khattish" the word *tâkhaja*, whereby the word *tâkhaja* is said to be the "khattish" word for shaver. Also according to another text the doorkeeper calls the employes of the Palace by their "khattish" designations, and this same text gives also the Indo-European-Hittite versions of these titles. Sometimes the rituals composed in the Indo-European Hittite comprise litanies, prayers, exorcisms, etc., "in the Khattish language," "in the language of the town Khatti" (*khattili*); songs also were very frequently sung by the singers in the Khattish language during religious services. Khattish appears to have played an important rôle, especially in the religion of the Khatti land. The Khattish litanies were left sometimes without translation into the Indo-European-Hittite language, but they sometimes appear there also translated into Indo-European Hittite; in the latter case we have to do with true Khattish-Hittite bilingual texts. The population of the Khatti country therefore, in regard to physical and linguistic characteristics, was mixed and not pure, as was also the case in ancient Babylonia with its Sumerian and Baby-

Ionian peoples, and Sumerian used as the ecclesiastical language. We must assume that when the Indo-European Hittites invaded Asia Minor they found there an older population which they subdued, but were in return strongly influenced by them, both in blood and language. The long-nosed type already mentioned, and called "Hittite," also "Armenoid," especially described by the anthropologist von Luschan—so far as Eastern Asia Minor is concerned—goes indeed back to these original inhabitants of Eastern Asia Minor called "khattish" by the Boghazkeui texts. The same type is found also in Syro-Palestine, Mesopotamia, Armenia and Persia. In consequence of mixtures of peoples this large nosed race now speaks (as in antiquity) widely different languages, Indo-European languages, such as Armenian and Persian, and Semitic Hebrew (in antiquity the Semitic Assyrian also). (The so-called "Jewish" type belongs also to this ancient race.) According to the Hittite Boghazkeui texts, to the Khattish race element in the Hittite empire belonged especially, though not exclusively, the lower class of the towns, the minor officials and the craftsmen in temple and palace, a great part of the priesthood and probably also a part of the country people.

The Khattish (by Forrer called proto-khattish) language differs fundamentally from all others of the Khatti kingdom in its construction. It employs almost exclusively prefixes in its inflections and not suffixes; for example, the word *binu*, child, forms its plural *lê-binu*. Knowledge of this language with its astonishing abundance of curious prefixes, which is known to us only through texts of slight extent, is still in its infancy. It is as yet uncertain whether we should regard it, with Forrer, as related to the north-east Caucasian tongues, which also make use of prefixes. (Bleichsteiner [*Ber. d. Forsch.-Inst. f. Osten u. Orient*, 3, p. 102 and foll.] believes, on the contrary, that some analogies between Khattish and West Caucasian languages can be established. This also is uncertain.)

Contact between Indo-European Hittite and Khattish can also be established in the words borrowed from the latter tongue. As characteristic of Khattish we may mention the Khatti words *kâtte* "king," *nimkhutum* probably "woman" (Bo. 2039), *vin-duk-karam* "cup-bearer," in which the Minor Asiatic word *vin* "wine," occurs, *shakhtaril* (with the suffix *l*) "exorcist," *khan-tipshuvâ* "cook," and deal with the following Khattish fragment: *imâkhashâil ugga varvû shugga varvashkhab zipitpâil kâtti kur-kuvemma bidush kâbarvum vashkhavûm liggarân varišhemu kur-kubenna*, etc.

It proves therefore that the Hittites themselves designated as the speech of the capital city, and probably also that of the country Khatti—Khattish—the non-Indo-European language just described, that of the original inhabitants of their country. This language should therefore be called "Hittite," because the name "Hittite" goes back to the name Khatti through the Old Testament Heth. So far a name for the Indo-European Hittite, for the official language of the Hittite state, has not been discovered in the Boghazkeui texts; once only is the Hittite state language called *nâshili* which, however, according to Hrozný's interpretation, means no more than "our (language)"—comp. Lat. *nos* "us." In the Hittite religious services, according to the Hittite ritual texts, sometimes Khattish, sometimes Khurish (see below), sometimes Lûish (see below) singers took part, sometimes also singers from the city *Kanesh*, *Kanish*, in Asia Minor. Because these last singers probably used the Indo-European state language, Forrer would call this language the "Kanish language." But nothing else supports the supposition that the Indo-European Hittites called themselves "Kaneshites"; further so far, the expression *Kaneshili*="in Kaneshite (language)" never occurs. We must therefore continue the make-shift of designating the non-Indo-European speech as "Khattish" and the Indo-European, as hitherto, as "Hittite."

Lûish.—Another very important language of the Khatti kingdom is Lûish which Hrozný has also shown to be essentially Indo-European. Forrer, who falsely calls this language "Lûvish," regarded it at first as a Finno-ugrian language, but adopted later Hrozný's view that it, too, must be considered as Indo-European. Of this opinion are also, for example, Friedrich, Kretschmer, Ung-

nad and others. Lûish is closely related to Hittite as is demonstrated by the following passage, written in Lûish and Hittite:

Hittite: *Marduk... Innaravantash... eskhhanuanta kuêsh veshshantu Lûlakhiashshan*

Lûish: *Shantash... Annarummenzi... ashkhanuanta kuinzi vashantari Lûlakhiashshar*

English: *Shantash* (and) the *Innaravantash*-deities who put on mantles and the *Lûlakhi*-deities

Hittite: *khuprush kuêsh iskhkhijantish*

Lûish: *khupparaza kuinzi khishkhijanti*

English: who have tied on their pilgrim bottles(?).

Sentences such as *kuinzi vashantari* (medio-passive; comp. *amanur*) = Hitt. *kuêsh veshshanta* leave no doubt as to the Indo-European character of Lûish and its relationship to Hittite. Certainly in this example (and still more perhaps in others) Lûish appears to have been already more thoroughly transformed through the autochthonous languages of Asia Minor than Hittite. Unfortunately, Lûish passages in the Boghazkeui texts occur but so seldom that a thorough investigation of this language is beset with difficulties.

The name Lûish (Hittite *Lûili*) is derived from that of the country *Lûya*, which was also called *Arzava* and which may be possibly sought in West Cilicia, Isauria and South Lycaonia. Besides for *Lûya* itself the Lûish language is also attested for the capital Hittite city *Khatti* or *Kattushash* and for the State of Kizvatna, commonly identified with Pontus on the Black sea. Götze and Smith look for it on the Gulf of Issos, though with meagre justification. Thus, in the second millennium B.C., the Lûites were dispersed, though probably unequally, throughout the whole of Eastern Asia Minor, but because of their name, we must certainly seek the centre of their distribution in *Lûya*-*Arzava*, therefore southerly from the Khatti country. They are the Indo-Europeans who made the furthest advance into the South of Asia Minor in the second millennium B.C. They must—as the earliest Indo-European wave—have reached Asia Minor earlier than the Indo-European Hittites (about 3000 B.C.?). The language of this vanguard of the later Hittites was destroyed to a greater degree by the influence of the autochthonous tongues of Asia Minor than was the case with that of the true Hittites. On the contrary these Indo-European languages have also influenced the autochthonous tongues of Asia Minor, as is shown by the Indo-European elements in Lycian, Lydian, Etruscan, etc. Lûish appears to have been spoken in the Khatti kingdom—so far indeed as they did not use Khattish—by the peasants; their language was accounted barbaric by the Hittites. (It is also interesting that the employees, priests and workmen of the royal palace in Khatti-Khattushash were Khattish, its fire-men however Lûish.)

Khurish.—Besides the Hittite, Khattish and Lûish, still another language has been revealed by the inscriptions at Boghazkeui—Khurish (Hittite *khurili*), which is thus named after a people, empire and, apparently, also a city *Khurri*. The country *Khurri* (which properly means "hollows, caverns"), must be looked for in North Mesopotamia and the bordering Armenian mountains. The name both of this country and its people was formerly read as *Kharri* which, graphically, was also possible. The Mitanni country, the later Mygdonia on the rivers Djaghdjagh and Khabur in North Mesopotamia, formed one part of the *Khurri* country. Because the Aryan deities *Mitra*, *Varuna*, *Indra* and *Nâsatya* are named in the political treaties of Mitanni, Winckler associated the name *Kharri* with that of the Aryans. However, Hrozný has shown that the character *khar*, *khur* in the name *Khar-ri* can only be read *khur*, and this name itself therefore only *Khur-ri*; this is proved by the place-name *Bâd-Khu-u-ur-lu-ush-sha* (in the inscription Bo. 434), that is "The fortress of the *Khurri* people," where only the reading with *u* is possible. (Compare also the proper name *Hu-u-ur-lu-u* [i.e., "the *Khur-rite*"] in the inscription *Transact. of the Amer. Phil. Assoc.* 58, p. 24, 2. Hrozný regards the North Mesopotamian town *Urfa*, Gr. *Orrhoë*, *Edessa*, as the centre of the empire of *Khurri*. The name of this town and country in Aramaic is *Urhôî*, in Arabic *ar-Ruhû*; compare also the Arabes *Orrhoëi* or *Orroëi* of Pliny [n.h. V. 85, VI. 25, 117, 129]. In the letter of Tushratta

composed in Mittanish the Khurri country is called Khurvûkhe or Khurrûkhe, *i.e.*, the Khurriish. To a Hurrûhe, which may have been spoken with a weak *h*, can easily be traced *Urhôî, Orrhoë* [country *Orrhoëne*, later changed into *Osroëne*]; comp. *Khabur*, Gr. *Khaboras* and also *Aborras*. In Assyrian Urfa seems to be called *Khurra* [in an inscription of Adadnarâri I.]. As the name probably means "cavern[s]," it is perhaps possible to suppose that *Khurra-Urfa* received this name on account of the numerous caverns in the Nimrûd Dâgh of the surrounding country.)

As Hrozný has shown, the Khurriish language is not related to Aryan tongues, but to the entirely non-Aryan and non-Indo-European speech of Mitanni, which is represented by a long letter of the king Tushratta of Mitanni from Tell el-Amarna. The two languages are probably distinguished only by very slight dialectical differences. When, in Khurri-Mitanni the nom. sing. ends in *-sh* (as well as in *-l*), and the accus. in *-n*, the influence of the Aryan speech of the *Khurri-Mitanni* country (*see below*), can be perceived in it and, in some degree perhaps also that of Hittite. The genitive endings *-ve* and *-khe*, and the plural ending *-na* are, on the contrary, native to the language. When a genitive is dependent on a substantive, it receives also the ending of that substantive: *ilâni-na Shamûkhakhi-na*, "the gods of the city *Shamûkha*." This phenomenon occurs also in some Caucasian languages, especially in Old Georgian and Cakhurish (Bork). But no definite conclusion can be based as yet upon this isolated phenomenon. Wholly non-Indo-European also is the Khurriish-Mitannish verb which Messerschmidt, Bork, Forrer and Ungnad have studied carefully. In any case Khurriish and Khattish are not related. The following are chosen as examples of Khurriish-Mitannish words: *shena*, brother; *ashte*, wife; *tivi*, word; *katiu*, I will proclaim (Ungnad). The following specimen of the language may be quoted: *Teshubbutte shilallukhi shâla abkijâve annûn mirsi annûnmôn irâne annûn gaggari*, etc.

Khurriish litanies and prayers occur in the Hittite rituals but, unfortunately, without Hittite translations, and Khurriish singers (singers of the city Khurri) also sang in the religious services. This is the case especially in the eastern Khatti provinces, in Kizvatna and in the city *Shamûkha*, situated somewhere in Commagene or Melitene. But also in *Shamûkha* were found Hittites and Khatti.

A mixed population of Hittite, Khatti and Khurri was distributed throughout Syria, while in Khurri (Orrhoëne and South Armenia) and Mitanni (Mygdonia) the Khurriish-Mitannish were the preponderating race. Occasionally Khurri is synonymous with Syria generally. The country *Kharu*, more exactly *Khôr* of the Egyptian inscriptions, as also the Old Testament people, the Khorites (until now usually considered to be "dwellers in the caverns") who, according to Gen. xiv. 6, Deut. ii. 12 and 22, inhabited the land of Edom before the Edomites, is identical with this *Khurri*. The Khurri-Khorites also belong, like the Khatti, to the large-nosed Armenoid race which has influenced, physically, the later Semitic (Assyrian, Hebrew, etc.) and Indo-European (Armenian) population of these countries. Not a little literature must have been written in Khurriish, as the fragments of the Gilgamesh epic and also other poetical texts in the same tongue, found in Boghazkeui, testify. Ungnad suggests the name Subarian for Mitannish (and Khurriish), derived from the geographical term Subartu used for the countries lying north and north-west of Babylonia.

In the Boghazkeui inscriptions a language of the country *Palâ* (*palâumûli*) is mentioned occasionally. This must be sought, perhaps, somewhere in Syria (?). Unfortunately, no sure records of this language have, so far, come to light. Two insignificant fragments, published by Forrer, if really written in *Palâ*, suggest perhaps a Lûish-Khattish mixed language.

If, as suggested above, Hittite, Khattish, Lûish and Khurriish were spoken in the Hittite area, and if the cuneiform writing was used for all these languages, it is very likely to suppose, that also in the monumental writing of the Hittites, that is in the Hittite hieroglyphs, several languages—presumably Hittite, Khattish and Khurriish—occur. If so, the decipherment of this script becomes still more difficult, since the language in which any given

inscription is written must first be determined.

Aryans (Earliest Indians) in Syria and Mesopotamia.—The Boghazkeui inscriptions show that, besides the Hittites and the Lûish, there was also in the second millennium B.C. another Indo-European people within the Hittite area: an Aryan conquering people which formed the governing class in the kingdoms of Khurri and Mitanni and—probably in consequence of a former expansion of the Khurri kingdom in Syria-Palestine—not seldom supplied Syrian and Palestinian cities with their Dynasties. In the treaty of the Hittite king Shuppiluliumash (*cir.* 1380 B.C.) with the king of Mitanni, Mattivaza, among the gods of Mitanni, also the gods *Mitrashshil* (Mitra gods), *Arunashshil* (Aruna gods), *Indara* and *Nashattijanna* are invoked as witnesses of the oath, which are surely identical with the Indian gods *Mitra*, *Varuna*, *Indra* and *Nāsātya*. In the Boghazkeui archives four tablets (originally there were still more) have also been discovered of a manual written in Hittite on the management of horses and chariot races of which a certain Kikkuli from Mitanni was the author, and in which expressions used in chariot racing in Indian language occur: *aikavartanna* "in one turning," *teravartanna* "in three turnings," *panzavartanna* "in five turnings," *shattavartanna* "in seven turnings," etc. (comp. old Indian *ēka-h*, one, *trāy-ah*, three, *pañca*, five, *saptā*, seven, *vartanam*, the turning). In addition the inscriptions mention a class of military nobility, the so-called *marianu* who play an important rôle in Syria and Khurri-Mitanni, and whose name is derived from the old Indian *mārya*—"young man, hero." Finally, in the inscriptions of Tell el-Amarna and Boghazkeui, names of Palestinian, Syrian and Mesopotamian kings and princes, of Aryan character, are preserved as, for example, the names of the kings of Khurri and Mitanni, *Artatama* (probably old Indian *Rta-tama*, "the most pious"), *Tushratta*, *Mattivaza*, the name of the Palestinian prince *Shubandu* (old-Indian *su-bandhu*—"who has good kinsmen"), and others.

It is to be supposed, that in the course of their wandering to India the earliest Indians, or, at least, a part of them, touched Mesopotamia and Syria, where the Khurri-Mitanni kingdom was their centre, in the second and even the third millennium B.C. At the present time, Kretschmer pleads for a longer sojourn of all Indians in Near Asia particularly on the ground of his hypothesis that the Indians borrowed the deities *Varuna* and *Indra* from the Hittites; cf. the Hittite *arunash*, sea, and the Hittite god *Inar*, *Inarash*. (That the Hittites had a god of the sea *Arunash*, whose name was in the cuneiform writing written with the determinative for gods, is now shown—[which could not have been known to Prof. Kretschmer]—by the text *Keilschr.-Urk. aus Bogh.* XX., 1, 32 and 2, 5, and also by Bo. 3206, II. 16.) On the other hand the Hittite god *Aknish* or *Agnish*, discovered by Hrozný (*Rev. d'assyriol.* 1921) may perhaps have been derived from the old Indian god of fire *Agni*. Iranians also may have taken part in this immigration of Aryan stock in the Near Asia. Forrer's proposal to name the Aryan language of Khurri-Mitanni as Mandaean is impossible, for even if the name "Manda-people, Manda-warriors" of the paragraph 54 of the Hittite Codex of Laws really denoted the Aryans of Khurri-Mitanni, the Assyrian-Babylonian collective expression *Ummân-Manda* "troops of peoples" for the hostile, mostly—as it is to be supposed—Indo-European north peoples obviously could not be employed to designate the speech only of one of these peoples. It is also doubtful if the name of the country Mitanni (also Metan?) has anything to do with the Medes. On the other hand it is sure that the horse which appears in Near Asia somewhere about 2000 B.C., was there introduced by the Aryans now in question.

HISTORY OF THE HITTITES

The earliest information concerning Asia Minor relates to the first half of the third millennium B.C. Eastern Asia Minor was already inhabited by the non-Indo-European Khatti. The rich natural resources of the country attracted the Sumero-Babylonians and Assyrians, who founded colonies and kingdoms there. About 2635 B.C. the powerful ruler, Sargon of Akkad, undertook a campaign against the city *Purushkhanda*, in Asia Minor, governed by a king with the Accadian name *Nûr-Dagan*. According to text

of uncertain historical value the most powerful of the successors of Sargon of Akkad, King Narâmsin (25th century B.C.), fought a victorious battle against a coalition of 17 kings which included *Pamba*, king of Khatti (now Boghazkeui), *Zipani*, king of Kanesh (now Kara Euyuk and Kultepe near Caesarea), and *Khuvâruvash*, king of Amurru in Southern Syria. It is not certain whether it is permitted to infer from the name *Khuvâruvash*, of wholly Hittite character, that the invasion of Asia Minor, even of Syria, by the first Indo-Europeans, the Lûites (in part also the true Hittites?) took place as early as the first centuries of the third millennium B.C. Narâmsin had also to defend his empire against the attack of the *Ummân-Manda* "troops of peoples" which came from the North, and in which then, as later, are to be seen in the first line Indo-European, Aryan peoples. One of these peoples may have been the later Aryans of Khurri-Mitanni.

Further light on the most ancient history of Asia Minor is thrown by the old Assyrian (also called Cappadocian), cuneiform tablets of Kultepe-Kanesh, which date from the 21st century and which were discovered partly by the secret diggings of natives, and partly by the official excavations of Hrozný in 1925. The original stock of the population is Khatti; the native prince of Purushkanda? (or Khatti) is called *Labarsha*, in an inscription found by Hrozný's expedition. This name is Khattish (cf. the later Khatti-Hittite royal name and kingly title *Labarna-Tabarna*.) Meanwhile the Assyrian empire had become very powerful; Eastern Asia Minor was subject to it. In the cities resided rich Assyrian merchants who were organized in *gâru*'s "Bazaars" and carried on a flourishing trade in the products of Asia Minor. The Indo-European Hittites had already invaded this territory as is shown by distinctly Indo-European names, such as *Inar* (cf. *ἀνῆρ* "man"), also *Inarava*, *Khalkiashu* (cf. Indo-Eur.-Hittite *khalkish* "corn") and others. While the political centre of the Khatti was the city Khatti and the first Indo-Europeans, the Lûites, were concentrated in the South, in Arzava-Lûya, it may be that the Indo-European Hittites, at first (probably however after 2000 B.C.), had settled mainly around the cities Kanesh and Kushar. Inscriptions do not state that the city Kanesh was once also a political centre of the Indo-European Hittites. Probably the invasion of the Indo-European Hittites in the 20th century B.C. made an end of the Assyrian rule in Cappadocia. Eastern Asia Minor was subdivided again, as for example in the time of the kings of Akkad, into a number of small mutually hostile states, over which the Indo-European conquering people, called by us Hittites, now attempt to rule. One of the important rulers, of this time, the great king *Anittash*, of *Kushshar*, about the beginning of the 19th century B.C. vanquished *Pijushitish*, then king of the town Khatti (himself, possibly, also a Hittite), then the king of *Nêshash*, the king of the city *Zalpuva* (*Zalpa*), situated apparently somewhere in the coastal region, and rulers of *Purushkanda* and *Shalativara*.

Some generations later, about 1800 B.C., there ruled in Kushshar the great conqueror *Tlabarnash*, whose name is written *Tabarnash* or *Labarnash*, and who extended his kingdom as far as to the sea. His successes are so great that his name and that of his wife, *Tlabarnash* and *Tavannannash*, were used as titles of honour by the later Hittite kings and queens. The kingdom, thus greatly enlarged, later on undertook military expeditions beyond Asia Minor. In Mesopotamia, Syria and South Armenia, in the first half of the second millennium B.C., the effect of the invasion of the East Indo-European peoples—of the Aryans of Khurri-Mitanni—becomes more evident. A series of Aryan-Khurritish states arose here: among which the most notable are *Khanigalbat* (= *Khurri-Mitanni*) in Mesopotamia and the great kingdom *Khalap* (now Aleppo) in Syria. The great king *Khattushilish I.*, a son of *Tlabarnash*, who lived in Kushshar, but apparently also in *Khattushash-Boghazkeui* fought against Khalap successfully. His successor *Murshilish I.* who transferred the seat of the Hittite Dynasty to *Khattushash*, succeeded about the year 1758 B.C. in vanquishing not only Khalap and the Khurri, but even Babylon itself, and overthrew the Khammurabi dynasty in Babylonia. During the remainder of the 18th and the 17th–15th centuries B.C. the Hittites were engaged in internal disorders and

external campaigns, especially against the Khurri. From the Syrian Khurri, who were strongly mingled with Khatti, Hittite and Semite elements, went out the people, known as the Hyksos, who took possession of Egypt about 1685 B.C. (The Hyksos names are probably partly of Semitic and partly of Syrian-Asiatic origin. Only the name of the Hyksos king *Khendder* or *Khenddel*, may be here mentioned, which is of linguistic interest as recalling the name of the Hittite king *Khantilish*, the successor of *Murshilish I.*) The great king *Telepinush* attempted, about 1600 B.C., to reorganize the shattered kingdom. The Hittite rulers of the 15th century B.C. may still be reckoned as belonging to the Old Empire, though the forerunners of the New one. *Tudkhaliash II.* succeeded in reuniting the kingdom and breaking the power of the confederate kingdoms of *Khanigalbat* (*Khurri-Mitanni*) and *Khalap*; but still some time after this, *Khattushilish II.* fought successfully against *Khalap* and *Mitanni*.

The New Empire which begins about 1385 B.C. with the brilliant Hittite king *Shuppiluliumash*, son of *Tudkhaliash III.*, embraced the last two centuries of the Hittite kingdom. During this time the Khatti kingdom exercised the most profound influence on the destiny of the Near East. It may certainly be considered as, for some time, the first military and political power of the East at that epoch. The united Hittite kingdom sought to extend its sphere of influence in all directions, by means of wars, alliances and treaties with vassals, as well as by dynastic marriages. A powerful confederation of States came into existence, which, however, composed of very dissimilar elements, could not be of long duration. The resurrection of the Indo-European Hittite empire was facilitated by the decay of the Khurri kingdom, ruled over by an Aryan dominant class which took place in the 14th century B.C. The Khurri kingdom, *Khanigalbat* dissolved into two enemy states, *Khurri* and *Mitanni* (with the capital *Vashshugganni*), which we may seek perhaps in Râs el-Ain in North Mesopotamia: cf. Opitz in *Zeitschr. f. Assyriol.* 1927, 299 *et seq.*, against which *Shuppiluliumash* was able to fight. The king *Tushratta* ruled in *Mitanni* at this time. *Shuppiluliumash* established his power almost over the whole of Syria, where he successfully checked the Egyptian influence. His armies advanced thence as far as the territory of Lebanon. He also subdued the people of *Gashga* between the Euphrates and the Halys, and by means of alliances and marriages, bound *Khajasha* on the Upper Euphrates and *Arzava* in southern Asia Minor to the Hittite empire, with which *Kizvatna-Pontos* was also very closely allied. After the death of the Pharaoh *Bibkhururiash* (= *Tutankhamen*?) his widow sought to marry one of the sons of *Shuppiluliumash*, but the Hittite prince was murdered by Egyptians on his way to Egypt. The political and military activities of the Hittite kingdom were conducted on the same lines with many vicissitudes, in the reign of the successors of *Shuppiluliumash* which however can not be described here in detail. His son and second successor *Murshilish II.* (about 1340 B.C.) belongs to the most enterprising and warlike rulers not only of the Hittite kingdom, but even of the ancient East as a whole. This great king also took special interest in Western Asia Minor, where he came into touch with the Greeks as *Forrer* was the first to point out, though his views as *Friedrich* specially has shown, are in many instances untenable. The city and the country *Akhkhiyavâ*, which now appear in the Hittite inscriptions and which are there named together with *Lazpash*, perhaps = *Lesbos*, can be probably connected with Gr. *Ἀχλαπᾶ* and the Achaeans (*q.v.*), which are for the rest mentioned in an inscription of Pharaoh *Menneptah* (c. 1240 B.C.). It is, however, impossible (with *Forrer*) to seek this *Akhkhiyavâ* in Greece. It is probably a country situated on the coast of Western Asia Minor near the island *Lesbos*. Further both on linguistic and real grounds, it is not possible to identify *Tavagalavash*, who at the time of *Murshilish* was perhaps a vassal of *Akhkhiyavâ*, and who wished to become a vassal of the Hittites, with the mythical king *Eteokles* (Ἐτεόκλης) of *Orchomenos* in *Boeotia*. To identify *Antaravash*, mentioned in an oracle text, which names also *Akhkhiyavâ* and *Lazpash*, with *Andreas*, the father of *Eteokles* of *Orchomenos*, is also very risky. Again, *Forrer* has failed to prove that the king *Attarishshijash* of *Akhkhiyâ* (probably = *Akhkhi-*

yavâ), an opponent of the Hittite king *Tudkhaliyash IV.* (cir. 1240 B.C.) is the same as *Atrous*, king of Mycenae and father of Agamemnon. Forrer's opinion that the Hittite word *ajavalash* means Aeolian and that Troy might be recognized in Hittite inscriptions in the name *Taruisha*, which Forrer reads *Troisa*, which however should be read *Tarvisha*, is also erroneous.

At the present time we may reasonably admit only the existence of an Achaian state in Asia Minor, represented by *Akhkhiyavâ* and *Lazpa* (probably not to be identified with *Zalpa*), and await further information from the future. (Kretschmer [*Glotta* 12] compares the king *Alakshandush* [cir. 1300 B.C.] of Vilusha-Elaiussa with the Homeric Alexandros-Paris.) On the relations between the Hittites and the Greeks, see also below the chapter on the Hittite myths.

Other powerful Hittite rulers of this age were the sons of *Murshilish II.*, *Murattalish* (*Muttalish*) about 1300 B.C., who vanquished at Kadesh the Egyptian Pharaoh Rameses II. (see above), and *Khattushilish III.*, who concluded an alliance with the same Pharaoh about the year 1272 B.C. (See also above.) *Tudkhaliyash IV.* (cir. 1240 B.C.), son of *Khattushilish III.*, apparently still extended his kingdom westwards by successful wars. But already about the year 1190 B.C. under his second successor *Tudkhaliyash V.*, the Hittite kingdom fell under the attack of the so-called sea peoples and that of the Indo-European Thracians, Phrygians and Armenians, who followed in their train and forced their way into Asia Minor. Shortly before this the Mitanni kingdom was conquered by the Assyrians. Subsequently small Hittite-Khurriish states arose in Syria, such as Carchemish and Kunulua. Yet these too were gradually overthrown by the Assyrians; Carchemish itself fell under the attack of Sargon II. in 717 B.C.

HITTITE CIVILIZATION

Generalities. Law.—The cuneiform inscriptions of Boghazkeui show that Hittite civilization had reached a high level. In this civilization the cuneiform script and many other elements were borrowed from Babylon, yet the invention of a native hieroglyphic script, the rich and original Hittite cuneiform literature, the art monuments and other manifestations of Hittite culture, all prove that in spite of all borrowings, due to their comparatively late entry into the civilization of Asia, the Hittites are in no way inferior to the Babylonians and Egyptians.

In the state archives of Boghazkeui, there was found a series of so-called vocabularies, a kind of lexicon, with Sumerian in the first column, Babylonian in the second and Hittite in the third; for example: Sumerian *gû* = Babylonian *rêshu* "head" = Hittite *khalanta* (cf. Latin *calva*, Armenian *xalam* "skull"). If we add Khattish, Lûish and Khurriish to these three languages, we perceive that there were writers and scholars in the Hittite kingdom, who were masters of six languages.

The historical literature of the Hittites is rich and varied. There exist extremely important State treaties of the great Hittite kings with their vassals, and other powers abroad, diplomatic correspondence; annals of the Hittite kings, their proclamations, which treat the problems of politics and administration (for instance: the succession of the throne, disputes between individual cities, etc.), deeds of royal gifts and so on.

The strict military and political organization of the new Hittite kingdom is clearly portrayed in these documents. The same picture of an administration, ordered and regulated to the smallest details, is presented to us by the preserved prescriptions for different palace and temple employes. A well organized kingdom must also have its code of laws. The Hittite code (published by Hrozný) in two parts, containing about 200 paragraphs, gives us a deep insight into Hittite justice. In regard to punishment it is much milder than that of Khammurabi, Assyria or the Israelites. Mutilations and the death penalty were only seldom imposed in the Hittite kingdom; the Hittite code was very indulgent to certain sexual crimes which throws a not very favourable light on the sexual morality of this nation. A longer section of the Hittite code of laws, regulating prices in the Hittite kingdom is in the economic regard very important. Partly from this, partly from other texts, we learn that the Hittites, like other nations of the

ancient East, cultivated especially barley, *Triticum dicoccum* (a kind of spelt) and wheat; that they brewed beer from barley malt after the manner of the Babylonians, and that wine also played an important part among them. The whole economic position of the Hittite kingdom was founded on agriculture and the raising of cattle; beekeeping was zealously cultivated. Silver pieces, which were weighed according to the Babylonian system (*manû*, etc.) were used as circulating medium. In the domain of material civilization, the Babylonians were in many things the teachers of the Hittites who arrived in Asia much later than they.

The Hittite Pantheon.—The numerous religious texts in the archives of Boghazkeui familiarize us with the religion of the Hittites. The Hittite Pantheon, which is known also to us from the State treaties, where all possible gods, "a thousand gods" are summoned as witnesses and in support of the treaty, and which may be here assembled for the first time in its principal divinities, is very mixed. Sumerian-Babylonian, Assyrian, Khurriish, Indo-European-Hittite, Lûish and Indian elements are here bewilderingly blended together. The Weather god and the Sun goddess are the chief divinities. We do not know the names they bore in the proper Khatti territory; in the Khurriish-Mitannish country they were called *Teshub* and *Khepit* (*Khepa*). The weather gods of *Nerig* and *Zippalanda* are the sons of the weather god of *Khattushash* and the sun goddess of the city Arinna (= Euyuk [?]); this is also the case with the god of the fields, *Telepinush*, to whom can be traced back the hero *Telephos*, specially honoured in Mysia and Lycia; the goddess *Mezzullash* is daughter to this divine pair, the goddess *Zentukhish* or *Zindukhijash* is the grandchild. The exact position of the goddess *Lelvanish* in this family circle is uncertain. (By this analysis of the Hittite Pantheon the chief Hittite gods on the rock reliefs at Yasili-Kaya can now be successfully identified. From left to right they are: the Storm-god, Sun-goddess, *Telepinush*, *Mezzullash* and *Zentukhish* [or *Lelvanish* ?]. The hieroglyphs which accompany the names of these gods can be now adequately interpreted). The wife of *Telepinush* is called *Khatepinush*. The sacred bulls of the weather god of *Khattushash* are called *Sherish* and *Khurriish*. Of secondary origin in this circle is the goddess *Khepit*. The very important god of male virtues, *Inar* or *Inarash*, is certainly of Indo-European origin (of period Skt. *NARA*, Gr. *ἀνῆρ*, "man"); according to a conjecture of Kretschmer he was borrowed by the early Indians (cf. *Indara-Indra*) from the Hittites. The Hittite god *Indra*, *Indara*, may be found—as may here be established for the first time—also in the Egyptian Rameses treaty in the form *ntrj* which, according to Lexa, is probably the Egyptian word for "goddess." Coptic *NTWPE*. Apparently the Egyptians simply identified the name of the god *Indara*, which was unknown to them, with this Egyptian word. Possibly all the divinities of this kind are comprehended in the name *Inmaravantash* (probably Plur.; Sing. *innaravanza*, Keilschr.-Urk. aus Bogh. 17, Nr. 20, 11.3), Lûish *Anmarummenzi*. For the other Hittite deities, who are also adored by the Indians *Arunash* "Sea" (cf. Ind. *Varuna*) and *Agnish* (cf. Ind. *Agni*) see also above. Besides the "Great Sea" which also plays an important part in the Hittite myths, the Hittites worshipped also the Heavens, the Earth, mountains, rivers, wells, winds and clouds. A deity of field fruits is apparently *Khalkish*, sometimes named with *Telepinush* and probably of Indo-European origin. Another god who bears probably an Indo-European name, is *Vashdulashkish* whose name is derived from the Hittite *vashdul* = "transgression, sin." (Cf. Lat. *vasto*.)

Another Hittite divinity is the father of the gods, *Kumarbish*, who may have been borrowed from the Khurriish *Kumarve*, and who plays also an important part in the Hittite mythology. He is sometimes identified with the Babylonian Earth god *Enil*, but is also worshipped beside him. His messenger is called *Mukishanush* (of Babylonian origin?). Related to the god *Inarash* are probably the gods *Alash* (who must not be confounded with the goddess *Alâsh*), *Zitkhariyash*, whose cult arose in the city *Zitkhara*, *Karzish*, *Khapantalijash* or *Khapatalijash*, and perhaps also the god *Pirinkir* or *Pirakar*. According to a text the god *Inarash* was worshipped under no less than 112 forms. Others are the

deities *Birvash* (comp. the Syrian deity *Biruva*, Rawl. III. 66, Rev. I. 19), *Mâlijash*, "the mother" *Kamrushepash* or *Kammarushepash*, who appears in Hittite myths, and the goddess (or god?) *Ashkashepash*. The goddesses *Nenattash* or *Ninattash* and *Kulittash* may be regarded as connected to a certain degree with the goddesses *Ishtar* and *Ishkhara*; *Ninattash* is probably borrowed from the Sumerian-Babylonian goddess *Nina*, while again, *Kulittash* can be traced back to the Sumerian-Babylonian goddess *Gula*, the "great lady doctor"; instead of *Kulittash*, also *Gulittash* may be read. (Comp. the Syrian goddesses *Ninitum* and *Kulittum*, Rawl. III. 66, Rev. I. 27. 28.) Of great importance are the Hittite tutelary deities of the house and of the grave, *Kulshesh* or *Kulashshesh* and *MAH-nesh*. From the first name are probably derived the names of the Etruscan deities *Culsân*, who was the protector of the gates, and of *Culû*, the goddess of the nether world. (For the relations of the Etruscans to the Hittites see Hrozný in *Zeitschrift für Assyriologie*, 1928.) To the Hittite tutelary deities belong also *Zukkish* (or *Zunkish*) and *Anzilish*. The following deities may also be named here: *Khullash*, *Jarrish*, *Zappanash* (*Zampanash*, *Zapnash*), *Khashammilish* or *Khashmilish*, *Khilashshish*, *Târavash*, *Jajash*, *Pentarukhshish*, *Nârash* (originally a Babylonian river god?), *Namsharash* or *Napsharash* (of Sumerian-Babylonian origin? Comp. the Sumerian-Babylonian primeval gods *Ninshar*, *Enmeshara*, *Ninmeshara*?), *Minkish* or *Munkish*, *Ammu(n)kish*, *Tukhushish* or *Tushshish* (related to the Hittite word *antukhshish*, "man"?), *Ammezadush*, *Alalush* (of Sumerian-Babylonian origin), and *Apantum* (originally Babylonian??).

Other aboriginal Sumerian-Babylonian divinities in the Hittite Pantheon are: the Heaven god *Anush* and his wife *Antum*, the Earth god *Enlil* and his wife *Ninlil*, the Sea god *Êa* and his wife *Damkina* and his son *Marduk*, the Moon god *Sin* and his wife *Ningal*, *Nikkal*, the god of the underworld *Nergal* and his wife *Ereshkigal* or *Allatum*, the goddesses *Ishtar* and *Ishkhara*, the war god *Zababa*, and others. Many of the Babylonian divinities were included in the Hittite Pantheon only because the Hittite priests diligently studied the religious literature of the Babylonians: their existence in the realm of the Hittite gods, is therefore somewhat theoretical. On the other hand not a few of the Babylonian names of divinities in Hittite inscriptions may in reality be only ideograms, expressing the names of Hittite native gods. The influence of Babylonia upon the religion of the Hittites, though certainly great, may therefore have been much less than seems to be the case, on the first glance, on the basis of the graphical impression of the names of deities.

Among the numerous local Hittite gods whose names are of interest, the following may be mentioned: *Khantidashshush* of the city *Khurma*, *Katakhhkhash*, also *Khatakhhkhash* or *Khataggash* of *Ankura*, the goddess *Shartijash*, the "queen" (Babylonian in origin; but cf. also Hittite *shardijash* "helper"?), of *Katapa*, *Mammash* or *Ammanmash* of *Takhurpa*, *Khallarash* of *Dunna*, *Gazbâja* (Babylonian in origin?) and *Khuvashshannash* of *Khûbishna*, *Tapishuva* of *Ishkhuipitta*, *Bilat* or *Bêti* (Babylonian) and *Kumijavannish* of *Lânda* (cf. *Laranda*), *Zashkhabûndash* or *Zakhabunash* or *Zakhibunash* of *Kashtama*, *Khâshigashnavanza* (comp. the name of the city *Khashshikkashanavanta*) and *Mullijarash* of *Lavvazantiya* (cf. *Lauzados*), the goddesses *Alâsh* of *Karakhna*, *Zûlimash* of *Shugazziya*, *Tashimish* of *Likhshina*, *Lushitish* of *Nenashsha*, *Shakhhkhashsharash* of *Tuvanuva* (= Tyana), *Shuvanzipash* of *Shuvanzana*, *Navatijalash* of *Zarvisha*, *Vashkhalijash* of *Kharziuna*, *Zandusa* of *Shallapa*, *Ammamash* of *Khakhana*, *Katakhhkhash* of *Tavinija*, *Karmakhish* of *Kalimuna*, *Karunash* of *Kariuna*, *Tamishshijash* of *Tabikka* (cf. the modern *Bâik* in Syria), *Bishanukhish* of *Kumanni* (Comana) and *Apârash* of *Shamûkha* in the so-called "Upper Land."

Notice also these names of Hittite gods: *Kharishtashshish*, *Kattishkhashish* (Khattish), *Tashimmet* (Khattish? or comp. Babylonian *Tashmêtu*?), *Vaşezzel* (Khattish), *Valizilish* or *Valizalish* (Khattish), *Teteshkhashish* (Khattish), *Shullinkatish* (Khattish), *Apish*, *Aduntarish*, *Zulkish*, *Irbitigash*, *Karmakhilish*, *Zilibûrish*, *Negmish*, *Menkishurish*, *Zibavâ* or

Zabavâ (in *Palâ*) etc.

The worship of the gods *Shantash* (cf. *Sandon*) and *Tarkhunza* (cf. *Tarku*) was characteristic of *Lûya-Arzava* especially; for *Anmarumenci*. In *Arzava* was also the deity *Ullijashshish*, in the apparently *Lûish* city *Ishtanura* or *Ashtanura* among other divinities also *Shuvashunash*, *Vandush*, *Jashallashshish* or *Yashalla* worshipped. *Teshup* and *Khepit* (*Khepa*) were worshipped in *Khurri-Mitanni*. For the Aryan gods of these countries and for *Kumarve* see above. Among the other gods of these countries were the goddess *Shausghash*, further *Shimegi*, *Easharri* (Babylonian), *Shâlush* (Babylonian), *Lellûrish*, etc. The Pantheon of *Shamûkha* is also closely related. Hittite-Khattish, *Lûish*, *Khurri* and Babylonian elements are mingled in the Pantheon of *Kizvatna*.

Hittite Mythology.—Among the numerous, though mostly badly preserved Hittite mythological texts, the first to be mentioned may be that of the disappearance of the offended god of vegetation *Telepinush*, who brings bad growth, sterility and famine in his train, and of his reappearance, which produces a new fruitfulness. The connection of this myth with the ancient oriental myths of *Tammuz*, *Adonis*, *Attis*, etc. is plainly evident. It is interesting, that the gods have *Telepinush* sought among others also by an eagle and even a bee. Another myth relates to the struggle between the weather god and the serpent *Illujankash*, and still another relates to the sea (?) serpent *Khedammush* (Sumerian-Babylonian? cf. *Khedimme-azag*, the daughter of the Ocean, resp. *Êas*) and the goddess *Ishtar*. Another myth, though not completely preserved, is that of the goddess *Ashertush*, identical with the west-Semitic goddess *Ashirtu-Ashera*, who attempts to seduce the weather god. On his refusal *Ashertush* contrives that the refusal should appear to be on her side; evidently a parallel to the Old Testament story of *Potiphar's wife*! The storm-god then betakes himself to *Elkunirshash*, husband of *Ashertush*, and relates what has happened. Another badly preserved myth is that related of *Gurpa-Aranzakhush*, probably king of a city *Ailanura*, situated, evidently in *Asia Minor*, who married *Tatizulish*, the daughter of King *Impa-akrush* of *Accad* in *Babylonia*, and who resides at the court at *Accad*, and is there sought for by the river-god *Aranzakhush*, the personification of the water from the weather god's head. This myth may be a feeble reflection of some historical event. Another myth relates the story of a rich man, *Abbush* (is the name Babylonian?), who lives in the *Lulluvaja* country in the city of *Shudul*, situated on the sea-shore, to whom nothing is wanting (*Heth. vaḫḫari*; cf. Lat. *vaco*!) but a son and a daughter. In his trouble he seeks the help of the sun-goddess. *Abbush*, apparently, then has two sons, one good and one bad, who later on divide the paternal inheritance and separate; but this text also is very incompletely preserved.

In Hittite countries the Babylonian myth of *Gilgamesh* was much in favour. Fragments of the *Gilgamesh* Epos have been discovered in *Boghazkeui*, written in Babylonian, Hittite and *Khurri*. There existed also indigenous adaptations of this grateful material, inasmuch as *Khuvavaish-Khumbaba* of the *Gilgamesh* Epos, who dwells in the cedar wood, appears to have belonged originally to *Khurri-Syria*. Not less than 15 (possibly still more) tablets in *Khurri* existed of the "Songs of *Keshshesh*," i.e., of *Gilgamesh* (called in *Khurri* also *Galgamishul*). The myth of *Gilgamesh* was related and songs of this hero were sung over the whole of *Asia Minor*. The Greeks of *Asia Minor* also were certainly familiar with the *Gilgamesh* epic, traces of which may be found in the *Odyssey*. It is not impossible that the name of *Odysseus* or *Olyseus*, Lat. *Ulixes* (as *Gemser* suggests in the *Archiv f. Orientforschung* III. 184) may be traced back to the Hittite name *Ullush* (from the Babylonian *Ullû*, i.e., "carried away, distant") of the hero of the deluge story who dwelt apparently in the city *Idlash* (at the mouth of the rivers?). *Khattish* has a *tl*-sound, which is sometimes represented by *t*, at others by *l* (see above, the king's name *Tabarnash*).

Religious Worship, Exorcisms, Omens.—We can learn much concerning the Hittite forms of worship, sacrifices, religious festivals, etc., from the archives of *Boghazkeui*. Rituals for various temple feasts and other occasions of the public and private

life, which request the intervention of the priest, recorded by priests and priestesses who are named by their names, have been preserved. Purifications, sacrifices, prayers and oaths are the chief features of Hittite worship, whereby many connections with and borrowings from Babylonia can be established. Illnesses and epidemics, famines, evil demons, domestic quarrels, etc., are banished from believers by the exorcists and sacrificial priests. Before every considerable undertaking the future and the will of the gods were ascertained by consulting them; the liver of the sacrificial animals was examined; the flight of birds was observed, a prophetess was questioned, etc. Here the influence of Babylon is unmistakable. Clay models of livers used in hepatoscopy have been discovered in Boghazkeui, bearing Hittite or Babylonian inscriptions. The will of the gods was also revealed to men by appearances in the heavens, and all kinds of unusual occurrences on earth. All these signs and omens were interpreted by competent priests. The manuals used by these priests in the interpretation of omens are mostly of Babylonian origin. The Babylonian influence and origin are disclosed by the astronomical-astrological inscriptions of the Hittites, and by their medical treatises, written in both Hittite and Babylonian, which have been discovered at Boghazkeui. Here it may be remarked that also deeds of landed property and clay tablet catalogues have been found in Boghazkeui.

Hittite Art.—It is certain that, like the script documents, the artistic monuments, generally attributed to the Hittites, which have been discovered in the country between Smyrna and Tell Halaf on Khabur in Mesopotamia, are the work of not one, but of the several peoples described above. In the West the monuments are essentially Khatti-Hittite, in the East, Khurri-Mitanni; in Syria both spheres met and later on also Aramaic influence can be stated there. In the first centuries of the first millennium B.C. Assyrian influence was felt in the East, while late Assyrian art was not a little influenced by the Hittite-Khurish. That this Hittite-Khurish art in its beginning was dependent to a wide extent on Sumerian-Babylonian art, is obvious. Egyptian influence was added in the second millennium B.C. But in spite of all these external influences, Hittite-Khurish art has its independent nature, which is of value for the history of art. Hittite-Khurish artistic remains can never be confused with those of either Egypt or Babylonia. If Hittite-Khurish monuments give a more naïve and awkward impression than the Egyptian or Babylonian, this can be explained chiefly by the relatively short duration of Hittite-Khurish civilization, which rendered impossible the attainment of a higher perfection. Hittite art motifs are also found in Greek art.

The application of whole series of reliefs to gates, accesses and bases of palace walls, as well as the use of wooden columns on stone bases are characteristic of Hittite-Khurish building and architecture.

HITTORF, JOHANN WILHELM (1824–1914), German physicist, was born at Bonn, on March 27, 1824. He studied at Bonn and Berlin, and became *privatdozent* in the academy of Münster. When this institution became the university of Münster, Hittorf became professor of physics and chemistry; in 1879 the physics and chemistry departments were separated, and he became director of the physical laboratories. Hittorf retained this post until 1889 when he had to resign because of ill-health. After a rest his health improved, and he continued his research work. He died at Münster on Nov. 28, 1914.

Hittorf's early investigations were on the allotropy of selenium and phosphorus. His most important work on the migration of ions during electrolysis appeared in the *Annalen der Physik* between 1853 and 1859. He investigated the changes in concentration in the electrolyte and from this worked out the "transport numbers" for the migrating ions. Hittorf was associated with his teacher Plücker in a series of investigations on the spectra of gases and vapours. He made a number of investigations on the passage of electricity through gases, he discovered a number of properties of cathode rays and observed the Crookes' dark space. Other investigations were on the passivity of metals.

His monograph, *Ueber die Wanderung der Ionen während der Elektrolyse*, was republished by Ostwald in 1903–04.

See obituary notices by Arrhenius in *Zeitschrift für Electrochemie*, 21 (1915) and by Heydweiller in *Physikalische Zeitschrift* 15 (1915).

HITTORFF, JACQUES IGNACE (1792-1867). French architect and archaeologist, was born at Cologne on Aug. 20, 1792, and died in Paris on March 25, 1867. After apprenticeship to a mason in Cologne, he went in 1810 to Paris to study at the Academy of Fine Arts under Bélanger, the Government architect, whom Hittorff succeeded in his post in 1818. Thereafter he designed many important buildings, both public and private, in Paris and the south of France. His principal work is the basilica of St. Vincent de Paul (1830-44). His books are: *Architecture antique de la Sicile* (1826-30 and 1866-67); *Architecture Moderne de la Sicile* (1826-35); *Architecture polychrome chez les grecs* (1830); *Restitution du temple d'Empédocle à Sélinunte* (1851).

See T. L. Donaldson, "J. I. Hittorff," *R.I.B.A. Journal* (London, April, 1867).

HITZACKER, a town in the Prussian province of Hanover at the influx of the Jeetze into the Elbe, 33 m. E.S.E. of Lüneburg by the railway to Wittenberge. Pop. (1925) 823. It has an old castle and other mediaeval remains. There are chalybeate springs in the town. The famous library, originally founded here by Augustus, duke of Brunswick (d. 1666) was removed to Wolfenbüttel in 1643.

HITZIG, FERDINAND (1807-75), German biblical critic, was born on June 23, 1807, at Hailingen, Baden, and studied theology at Heidelberg, Halle and Göttingen. Returning to Heidelberg he became *Privatdozent* in theology in 1829, and in 1831 published his *Begriff der Kritik am Alten Testamente praktisch erörtert*, in which he explained the critical principles of the grammatico-historical school, and his *Des Propheten Jonas Orakel über Moab*, an exposition of chapters 15 and 16 of Isaiah attributed by him to the prophet Jonah mentioned in 2 Kings xiv. 25. In 1833 he went to Zürich as professor of theology, and in 1861 to Heidelberg, where he died on June 22, 1875. As a Hebrew philologist Hitzig holds high rank; and as a constructive critic he is remarkable for acuteness and sagacity. As a historian, a number of his speculations have been considered fanciful.

His chief works include commentaries on Isaiah (1833), on the Psalms (1835, 2nd ed., 1863-65); on the minor prophets (1838, 3rd ed., 1863); on Jeremiah (1841, 2nd ed., 1866); archaeological monographs, the *Gesch. des Volkes Israel* (1869), *Zur Kritik paulinischer Briefe* (1870) and *Sprache u. Sprachen Assyriens* (1871). See Herzog-Hauck's *Realencyklopädie*.

HIUNG-NU, HIONG-NU, HEUNG-NU, a people who about the end of the 3rd century B.C. formed, according to Chinese records, a powerful empire from the Great Wall of China to the Caspian. A theory which seems plausible is that which assumes them to have been a heterogeneous collection of Mongol, Tungus, Turki and perhaps even Finnish hordes under a Mongol military caste, though the Mongolo-Tungus element probably predominated. Towards the close of the 1st century of the Christian era the Hiung-nu empire broke up. Their subsequent history is obscure. De Guignes suggests that they were the ancestors of the Huns, and many ethnologists hold that the Hiung-nu were the ancestors of the modern Turks.

See *Journal Anthropological Institute* for 1874; Sir H. H. Howorth, *History of the Mongols* (1876-80); 6th Congress of Orientalists, Leyden, 1883 (*Actes*, part iv. pp. 177-195); de Guignes, *Histoire générale des Huns, des Turcs, des Mongoles, et des autres Tartares occidentaux* (1756-58); F. Hirth, *The Ancient History of China* (1911).

HJORRING, an ancient town of Denmark, in the northern insular part of the peninsula of Jutland. Pop. (1925) 11,093. It lies 7 m. inland from Jammer Bay, a stretch of coast notoriously dangerous to shipping. The church of St. Catherine dates from 1300, St. Hans from 1600 and St. Olai from 1200. Great fires have destroyed many beautiful buildings. The principal industries include textiles and engineering, the making of bricks, tiles and tobacco.

HKAMTI LÔNG (called Kantigyi by the Burmese, and Bor Hkampti by the peoples on the Assam side), a collection of seven Shan states subordinate to Burma. It lies between 27° and 28° N. and 97° and 98° E., and is bordered by the Mishmi country on the north, by the Patkai range on the west, by the Hukawng valley on the south and east, and indeed all round by various Chingpaw or Kachin communities. The country was visited by T. T.

Cooper, the Chinese traveller and political agent at Bhamo, where he was murdered; by General Woodthorpe and Colonel Macgregor in 1884, by Mr. Errol Grey in the following year, and by Prince Henry of Orleans in 1895. For long the hill-girt plain lay outside British administered districts but the need for protecting the Shan community and of checking the irruption of the Kachins or Chingpaw resulted in the setting up of a British district (Putao) with its administrative centre at Putao or Fort Hertz—over 100 miles by mule track from railhead at Myitkyina. In the census of 1921 the district is given a nominal area of 200 square miles and a population of 7,673. The Putao district was later absorbed into the Myitkyina district of which it now forms part. From its northern situation, winters are colder than in most parts of Burma and the rainfall is heavy, evergreen dipterocarp forests surrounding the Hkamti plain itself. Hkamti was no doubt the northernmost province of the Shan kingdom, founded at Mogaung by Sam Lông-hpa, the brother of the ruler of Kambawsa, when that empire had reached its greatest extension.

HLOTHHERE, king of Kent, succeeded his brother Ecgbert in 673, and appears for a time to have reigned jointly with his nephew Eadric, son of Ecgbert, as a code of laws still extant was issued under both names. Neither is mentioned in the account of the invasion of Aethelred in 676. In 685 Eadric, who seems to have quarrelled with Hlothhere, went into exile and led the South Saxons against him. Hlothhere was defeated and died of his wounds.

See Bede, *Hist. Eccl.* (Plummer), iv. 5, 17, 26, v. 24; *Saxon Chronicle* (Earle and Plummer), s.a. 685; Schmid, *Gesetze*, pp. 10, sqq.; Thorpe, *Ancient Laws*, i. 26, sqq.

HOADLY, BENJAMIN (1676-1761), an English bishop, who was born at Westerham, Kent, on the 14th of November, 1676. In 1691 he entered Catharine Hall, Cambridge, where he graduated M.A. and was for two years tutor, after which he held from 1701 to 1711 the lectureship of St. Mildred in the Poultry, and along with it from 1704 the rectory of St. Peter-le-Poor, London. His first important appearance as a controversialist was against Edmund Calamy "the younger" in reference to conformity (1703-1707), and after this he came into conflict with Francis Atterbury, first on the interpretation of certain texts and then on the whole Anglican doctrine of non-resistance. His principal treatises advocating civil and religious liberty were the *Measures of Submission to the Civil Magistrate* and *The Origin and Institution of Civil Government discussed*. In 1710 he was presented by a private patron to the rectory of Streatham in Surrey. In 1715 he was appointed chaplain to the king, and the same year he obtained the bishopric of Bangor. He held the see for six years, but never visited the diocese. In 1716, in reply to George Hickes (q.v.), he published a *Preservative against the Principles and Practices of Nonjurors in Church and State*, and in the following year preached before the king his famous sermon on the text, "My Kingdom is not of this world," in which he maintained that Christ had not delegated his powers to any ecclesiastical authorities. The sermon was immediately published by royal command. The bishops at once resolved to proceed against him in convocation. The king therefore prorogued the assembly, a step which had vital consequences on the history of the Church of England, since from that period Convocation ceased to transact business of a more than formal nature.

As Convocation was thus debarred from taking action against Hoadly, the dispute took the form of a war of pamphlets known as the Bangorian Controversy, in which the main issues of the dispute were concealed almost beyond the possibility of discovery. But however vague and uncertain might be the meaning of Hoadly in regard to some of the questions around which he aroused discussion, he was explicit in denying the power of the Church over the conscience, and its right to determine the conditions of grace. His own most important contribution to the controversy was his *Reply to Representation of Convocation*. William Law was his ablest opponent; others were Andrew Snape, provost of Eton, and Thomas Sherlock, dean of Chichester. In July 1717 as many as seventy-four "Bangorian" tracts appeared. Hoadly, being not unskilled in the art of flattery, was translated

in 1721 to the see of Hereford, in 1723 to Salisbury and in 1734 to Winchester. He died at his palace at Chelsea on April 17, 1761. His controversial writings are vigorous if prolix and his theological essays have little merit.

The works of Benjamin Hoadly were collected and published by his son John in 3 vols. (1773). To the first volume was prefixed the article "Hoadly" from the supplement to the *Biographia Britannica*. See also L. Stephen, *English Thought in the 18th Century*.

HOAR, SAMUEL (1778-1856), American lawyer, was born in Lincoln (Mass.), on May 18, 1778. He graduated at Harvard in 1802, was admitted to the Massachusetts bar in 1805, and began practice at Concord. His success was immediate, and for half a century he was one of the leading lawyers of Massachusetts. He was in early life a Federalist, later an ardent Whig. He was a member of the State Senate in 1825, 1832, and 1833 and of the U.S. House of Representatives in 1835-37, during which time he made a notable speech in favour of the constitutional right of Congress to abolish slavery in the District of Columbia.

In November 1844 he went to Charleston (S.C.) to test in the courts of South Carolina the constitutionality of the State law which provided that "it shall not be lawful for any free negro, or person of colour, to come into this State on board any vessel, as a cook, steward, or mariner, or in any other employment," and that such free negroes should be seized and locked up until the vessels on which they had come were ready for sea, when they should be returned to such vessels. His visit aroused great excitement; he was threatened with personal injury; the State legislature passed resolutions calling for his expulsion, and he was compelled to leave early in December. In 1848 he was prominent in the Free Soil movement and assisted in the organization of the Republican Party. In 1850 he served in the Massachusetts house of representatives. He died at Concord (Mass.), on Nov. 2, 1856.

See a memoir by his son, G. F. Hoar, in *Memorial Biographies of the New England Historic Genealogical Society*, vol. iii. (1883); the estimate by R. W. Emerson in *Lectures and Biographical Sketches* (1903); and "Samuel Hoar's Expulsion from Charleston," *Old South Leaflets*, vol. vi. No. 140.

His son, **EBENEZER ROCKWOOD HOAR** (1816-1895), was born at Concord (Mass.), on Feb. 21, 1816. He graduated at Harvard in 1835 and at the Harvard Law school in 1839, and was admitted to the Massachusetts bar in 1840. From 1849 to 1855 he was a judge of the Massachusetts court of common pleas, from 1859 to 1869 a judge of the State supreme court, and in 1869-70 as attorney-general in the cabinet of President Grant, fought unmerited "machine" appointments to offices in the civil service until, at the pressure of the "machine," Grant asked for his resignation. In 1871 he was a member of the joint high commission which drew up the Treaty of Washington. In 1872 he was a presidential elector on the Republican ticket, and in 1873-75 was a representative in Congress. He died at Concord on Jan. 31, 1895.

Another son, **GEORGE FRISBIE HOAR** (1826-1904), was born in Concord (Mass.), on Aug. 29, 1826. He graduated at Harvard in 1846 and at the Harvard Law school in 1849. He settled in the practice of law in Worcester (Mass.), and became a partner of Emory Washburn (1800-77). In 1852 he was elected as a Free Soiler to the Massachusetts house of representatives, and subsequently thereto became the leader of his party. He was active in the organization of the Republican Party in Massachusetts and in 1857 was elected to the State Senate. During 1856-57 he worked for the Free State cause in Kansas. He was a member of the U.S. House of Representatives, 1869-77. A defender of the Freedman's Bureau, he took a leading part in later reconstruction legislation and in the investigation of the Crédit Mobilier scandal, and in 1876 was one of the House managers of the impeachment of Gen. W. W. Belknap, Grant's secretary of war.

In 1877 he was a member of the electoral commission which settled the disputed Hayes-Tilden election. From 1877 until his death he was a leader of the Republican Party in the U.S. Senate. From 1882 until his death he sat on the important judiciary committee, of which he was chairman in 1891-93 and in 1895-1904.

His most important piece of legislation was the Presidential Succession Act of 1886. He was a delegate to every Republican national convention from 1876 to 1904 and presided over that at

Chicago in 1880. He was a Conservative, and although he did not leave his party he disagreed with its policy in regard to the Philippines and spoke and voted against the ratification of the Spanish Treaty. He died at Worcester (Mass.), on Sept. 30, 1904. A memorial statue has been erected there.

See his *Recollections of Seventy Years* (1903).

HOAR-FROST is formed and deposited when the water vapour in the atmosphere is solidified without passing through the liquid state. (See **FROST**.)

HOATZIN, a tropical South American bird, *Opisthocomus hoatzin*, remarkable for the keel, only developed on the posterior part of the sternum; for a very capacious crop resembling a gizzard, and for the claws on the young birds' wings.

Appearing about the size of a small pheasant, though actually much smaller, the hoatzin has a strong, curiously denticulated beak; prominent eyelashes set in a bare space round the eye; a long pendant crest of yellow feathers; and an olive body above, varied with white; below it is dull bay. The wings are short, the tail long and tipped with yellow. The legs are short, the claws long. It lives in bands, feeding on leaves and fruits. On account of its strong smell, it is called the "stink-bird" in British Guiana. The nest is built of sticks in some tree and contains three or four yellowish-white eggs, blotched with red. The young have well-developed claws on the first and second fingers of the wing, with which they can climb; they can also swim.

See H. W. Bates, *Naturalist on the River Amazon*; C. W. Beebe, *Naturalist in Guiana*.

HOBART, GARRET AUGUSTUS (1844-1899), vice-president of the United States 1897-99, was born at Long Branch, N.J., on June 3, 1844. He graduated at Rutgers College in 1863, was admitted to the bar in 1869, practised law at Paterson, N.J., and rose to prominence in the State. He was long conspicuous in the State republican organization, was chairman of the N.J. State republican committee from 1880-90, became a member in 1884 of the Republican National Committee, and was the delegate-at-large from New Jersey to five successive Republican national nominating conventions. He served in the N.J. Assembly in 1873-74, and in the N.J. Senate in 1877-82, and was speaker of the Assembly in 1874 and president of the Senate in 1881 and 1882. He was also prominent and successful in business and accumulated a large fortune. He accepted the nomination as vice-president in 1896, on the ticket with President McKinley, and was elected; but while still in office he died at Paterson, N.J., on Nov. 21, 1899.

See the *Life* (1910) by David Magie.

HOBART PASHA, AUGUSTUS CHARLES HOBART-HAMPDEN (1822-1886), English naval captain and Turkish admiral, 3rd son of the 6th duke of Buckinghamshire, was born in Leicestershire on April 1, 1822. He entered the navy in 1835, and served with distinction until 1862, when he retired with the rank of post-captain. His first engagement was against slave-traders off Brazil in 1835. During the American Civil War, he took command of a blockade-runner. He ran the blockade eighteen times, conveying war material to Charleston and returning with a cargo of cotton. In 1867 Hobart entered the Turkish service, and was immediately nominated to the command of the fleet, with the rank of "Bahrie Limassi" (rear-admiral). He helped to suppress the insurrection in Crete, and was rewarded by the Sultan with the title of Pasha (1869). In 1874 Hobart, whose name had, on representations made by Greece, been removed from the British Navy List, was reinstated; his restoration did not, however, last long, for on the outbreak of the Russo-Turkish war he again entered Turkish service. In command of the Turkish squadron he completely dominated the Black Sea, blockading the ports of South Russia and the mouths of the Danube, and paralysing the action of the Russian fleet. In 1881 he was appointed Mushir, or marshal, being the first Christian to hold that office. He died at Milan on June 19, 1886.

See his *Sketches of My Life* (1886), which must, however, be used with caution, since it contains many proved inaccuracies.

HOBART, the capital of Tasmania, in the county of Buckingham, on the southern coast of the island. Pop. (1925), including

suburbs, 58,740. It occupies a site of great beauty, standing on a series of low hills at the foot of Mount Wellington (4,166 ft.) which is snow-clad for many months in the year. The town faces Sullivan's Cove, a bay opening into the estuary of the river Derwent, and is nearly square in form and is well planned. It is the seat of the Anglican bishop of Tasmania, and of the Roman Catholic archbishop of Hobart. The public buildings include Houses of Parliament, to which an excellent library is attached; the town hall, built of brown and white Tasmanian freestone in Italian style; the museum and national art gallery. Government House is the residence of the governor of Tasmania. The botanical gardens adjoin. Among the parks are the Queen's Domain (700 ac.) and Franklin Square, named after the famous explorer and former governor. The University of Tasmania, established in 1890, and opened in 1893, has its headquarters at Hobart. The harbour is easy of access, well sheltered and deep, with wharf accommodation for vessels of the largest tonnage. It is a port of call for several intercolonial lines from Sydney and Melbourne, and for lines from London to New Zealand. The exports consist mainly of fruit, hops, grain, timber, minerals and wool; while manufactured goods, tea, sugar, tin and coal are imported. The industries comprise saw-milling, iron-founding, flour-milling, tanning and the manufacture of woollen goods. Hobart is the centre of a large fruit-growing district. The city was founded in 1804 and takes its name from Lord Hobart, then secretary of state for the colonies. It was created a municipality in 1853, and a city in 1857; and in 1881 its name was changed from Hobart Town to the present form. The chief suburbs are Newton, Sandy Bay, Wellington, Risdon, Glenorchy, Bellerive and Beltana.

HOBBEMA, MEYNDERT (1638-1709), Dutch landscape painter, was born at Amsterdam in 1638 and lived there all his life. He was a friend, and probably the pupil, of Jacob van Ruisdael. The two artists made sketching tours together and often painted the same views. Thus Ruisdael's "Water Mill" at Amsterdam, and Hobbema's "Water Mill" in the Widener collection; Ruisdael's "Ruins of the Castle of Breberode" in the Northbrook collection, and Hobbema's on the same subject in the Wallace and Frick collections. These were painted during 1661-63. In Oct. 1668, Ruisdael was a witness to the marriage between Hobbema and the cook of the Burgomaster of Amsterdam. This marriage marked the end of Hobbema's artistic career, for through the position and influence of his wife he received a municipal appointment. He had henceforth to gauge the casks, in which wine was imported into Holland, and estimate their contents in the Amsterdam measure; and he had no more time for painting. He was, however, not able to amass a fortune, for when his wife died in 1704 she was buried as a pauper, and Hobbema himself was buried in December 1709 in the pauper section of the Westerkerk cemetery at Amsterdam.

Hobbema's artistic activity was confined to his youth. Unlike Ruisdael, who liked to paint the sea, the mountain torrent and rocky landscape, Hobbema's favourite motive is the countryside, more or less thickly studded with trees, with houses, churches and ruined castles. A peaceful stream with a water-mill enlivens the landscape. His pictures are rich in attractive details. His masterpiece is "The Avenue, Middelharnis," in the National Gallery, London. It is signed and dated 16-9. The mutilated third figure, according to Hofstede de Groot, was 6 and not 8 as suggested in the catalogue. But external evidence such as the height of the trees, which were planted in 1664, and the beacon at the harbour entrance, which was introduced in 1682 according to local records, seem to favour the allocation of the picture to a later date, although on stylistic evidence it seems improbable that anyone who had abandoned painting at the age of 30 should at the age of 50 be capable of producing such a masterpiece. Hobbema's other masterpieces were painted between 1663-69. Among them are "a wooded landscape with two cows," in the collection of O. Beit, London. The cows are painted by Adrian van de Velder. A similar landscape is in the Morgan collection. New York. "The Mill" is in the Louvre, and there are various examples in the Wallace collection and in the National Gallery.

He is represented in most European galleries and in many private collections. There are from 180 to 200 works by the master extant.

See Hofstede de Groot, *Catalogue of Dutch Painters* (1912).

HOBBES, THOMAS (1588-1679), English philosopher, second son of Thomas Hobbes, vicar of Westport and Charlton, Wilts, was born, prematurely, at Westport, now part of Malmesbury, on April 5, 1588. His premature birth was due to his mother's fright at the reports of the Armada, and Hobbes attributed his own timorous disposition to the circumstances of his birth. His father caused a scandal by engaging in a brawl at the church-door, and disappeared, leaving the three children to be brought up by his brother, a well-to-do glover in Malmesbury. Thomas Hobbes went, at four years of age, to the church school at Westport, then to a private school kept by Robert Latimer, and at 15 to Magdalen hall, Oxford. He took little interest in the scholastic philosophy taught there, and devoted his leisure to books of travel and the study of maps and charts.

On graduating (Feb. 5, 1608) he became private tutor to William Cavendish (1591?-1628), afterwards 2nd earl of Devonshire, and began the connection with the Cavendishes which lasted, with interruptions during the Civil War, until the end of his life. He was a little older than his pupil, was his companion in sport, and in 1610 made a tour in Europe with him. On his travels he found a general revolt against scholasticism, and devoted himself to a closer study of the classics, beginning, after his return to England, the translation of Thucydides, which he published in 1629. The publication was inspired by the troubles of the time, for Hobbes thought the history of the Athenian Commonwealth offered many pertinent lessons for his fellow-citizens.

After his patron's death, Hobbes remained for a short time in the Cavendish household, without being employed, but in 1629 went abroad again, as travelling companion to the son of Sir Gervase Clinton. In 1631 he was called home from Paris to teach the young earl of Devonshire, William Cavendish (1617-84), son of his late patron. He took his pupil to France and Italy in 1634. This third stay abroad is important for Hobbes's intellectual development. He was already known in intellectual circles in Paris, and now became a regular habitué of the group which gathered round the monk-philosopher, Mersenne, the friend of Descartes. In 1636 he met at Florence Galileo, for whom he always retained the profoundest admiration. At some time between his first and second visits abroad, he had for a short time acted as amanuensis to Bacon. He was later to make the acquaintance of Descartes and of Gassendi. He had, therefore, immediate contact with the great leaders of the revolt against scholasticism. But he does not seem to have been influenced by Bacon, whose inductive method he opposed, and with Descartes his relations were, as will be seen later, unfortunate.

His philosophic awakening is described by Aubrey (*Lives*, p. 604) as being due to picking up a copy of *Euclid* and opening it at the 47th proposition of the first book. "By God," he exclaimed, "this is impossible." But he read the proof and "fell in love with geometry." He himself describes, in his Latin verse autobiography, how he was in company with learned men in Paris when the question was asked, "What is sense?" On thinking over the subject it occurred to him that if material things and all their parts were always at rest or in uniform motion there could be no distinction of anything and consequently no perception, and he concluded that the cause of all things must be sought in diversity of motion. He therefore was driven to geometry to examine the modes of motion. This awakening to physical science may be placed in his second journey on the Continent between 1629 and 1631; on his third journey the new interest became an overpowering passion, and he was able to discuss his ideas with Mersenne's circle in Paris and with Galileo in Florence. He now determined to embody his doctrines in a threefold treatise: *De Corpore*, to show that physical phenomena were explicable in terms of motion; *De homine*, to show what specific bodily motions were involved in the phenomena of sensation and knowledge; and *De cive*, discussing social relations and the proper regulation of society.

The orderly treatment of these subjects was interrupted first

by the Civil War and then by the many controversies in which he was engaged. The three treatises were eventually written, but they did not cover the intended ground.

He returned home in 1637 to find king and parliament in the thick of the constitutional struggle. He set to work to prove that certain prerogatives disputed by the parliament were inseparably annexed to the sovereignty, which the parliament did not then deny to the king. By 1640 he had ready a treatise on *The Elements of Law, Natural and Politique*, in two parts, *Human Nature* and *De corpore politico* which were published separately ten years later. In this book his characteristic political doctrine is already crystallized. He maintained that under the social compact implicit in the constitution of the State it is the people, in virtue of the implicit contract, who rule; by that contract every man's natural right was transferred to the monarch. But in his view sovereignty was derived from the people, and he fell foul of both parties, the believers in the divine right of kings and the opponents of the monarchy. He thought the State should be as strong as possible, and that absolute obedience was required of the subject. Necessarily Hobbes made many modifications and explanations which cannot be given here.

The treatise was privately circulated, and when the strife became acute in 1640 and Laud and Strafford were sent to the Tower, Hobbes, who was naturally timid, thought he was a marked man, and fled to Paris. Probably his fears were exaggerated. In any case the next 11 years were spent in exile, chiefly in Paris, where he was soon in contact with later fugitives from England. He rejoined the Mersenne circle, and Mersenne showed him the *Meditations* of Descartes. Hobbes put in writing certain objections to the *Meditations* and later to the *Dioptrique* without disclosing the identity of authorship of the two documents. Descartes then refused correspondence with him. In 1642 he completed his *De cive*, in which he laid down more explicitly than in the treatise of 1640 the doctrine that peace required that the Church should be completely subordinated to the State. Hobbes's pronounced Erastianism was due to experience of the evil results of sectarian controversy in England and France. He feared anarchy above all else. The *De cive* was privately circulated, and was not printed until 1647. He now began the preparation of his great work, *The Leviathan; or the Matter, Form and Power of a Commonwealth, Ecclesiastical and Civil*, a comprehensive statement of his doctrine of sovereignty. The State might be regarded as a great artificial man or monster, with a life traceable from its generation through human reason under pressure of human needs to its dissolution through civil strife. He was concerned not so much with the power of the sovereign as with the power of the State and its claim on men's allegiance. Incidentally it must wield all sanctions, supernatural as well as natural, against the pretensions of any clergy, Catholic, Anglican or Presbyterian, to the exercise of an *imperium in imperio*.

Hobbes represented the reaction against the Renaissance and the Reformation. Freedom of conscience had brought anarchy; men must submit to the ruling of the State so that peace and order might be restored. By the time the *Leviathan* appeared (1651), Charles I. was dead and the Commonwealth established. In the "Review and Conclusion" at the end of the book he had sought to define the circumstances under which submission to a new sovereign becomes legitimate. For this he was later on, freely accused of time-serving. He was, in fact, following out the logic of his original position. So little was he conscious of any disloyalty that he presented a ms. copy, "engrossed in vellum in a marvellous fair hand" (probably the copy in the British Museum, Egerton, mss. 1910) to Charles II. on his return to Paris after the battle of Worcester. Charles had been his pupil in mathematics in 1646-48, but now he was denied audience. The exiled prince's political and clerical advisers were appalled by the *Leviathan*, though Charles himself bore no malice against his former tutor. Barred from the English exile's court, he was suspected by the French authorities for his attack on the papacy. He fled at the end of 1651, in the middle of a severe winter, to England. His patron, the duke of Devonshire, had submitted in 1646 to the parliament. Hobbes also made his submission to the

Commonwealth and was allowed to live quietly in London. He had received a small pension from the earl of Devonshire, and Harvey had left him a small legacy. His house was in Fetter lane, and he took pains to find a church where he could receive the Sacrament according to Anglican rites. His conformity was probably due to his loyalty to the monarchy. His personal view on religion was that we can form no idea of God. It lay with the State, now that the time of miracles was past, to decide religious questions. Religion is not philosophy, but law. Not reasoning, but obedience was demanded.

Hobbes was now 63 years of age, but was to retain his vigour for another quarter of a century. He worked at his *De corpore*, but his difficulty in meeting the objections to his solutions of mathematical problems delayed its publication until 1655. *De homine* appeared in 1658, but instead of being the comprehensive treatise on psychology which he had originally meditated, it was a mere makeshift; it included some unpublished work on optics. Meanwhile he was involved in a controversy with Bramhall, bishop of Londonderry, on free-will. He replied to the bishop's *Defence of the True Liberty of Human Actions by Questions concerning Liberty, Necessity and Chance* (1656), in which he gave a clear exposition and defence of the psychological doctrine of determinism. The bishop replied in a treatise with an appendix entitled "The Catching of Leviathan the Great Whale." Hobbes took no notice at the time, but ten years later he replied to the charge of atheism of which he says he now heard for the first time.

It is unfortunate that Hobbes was drawn away from his philosophical and political studies to make excursions into mathematics, in which he had had no training. He was more sensitive to attacks on his solutions of mathematical conundrums, like squaring the circle, than on his political and philosophical positions. He had made enemies at Oxford by attacking in the *Leviathan* the university system as being founded originally for the support of the papal against the civil authority, and as still working social mischief by adherence to the old learning. Oxford was therefore quick to avail itself of the opportunities for criticism offered by *De corpore* (1655) and its English translation *Concerning Body* (1656). Hobbes was involved in a long quarrel with Seth Ward, Savilian professor of astronomy, and John Wallis, author of the great treatise, *Arithmetica infinitorum*. In this long controversy Hobbes was decidedly worsted. He replied to the attacks on him in *Six Lessons to the Professors of Mathematics, one of Geometry, the other of Astronomy, in the University of Oxford* (*English Works*, vol. vii.) in 1656. After more rough thrusts on both sides, Hobbes determined to remain silent; but after his *De homine* (1658) was through the press, he again prepared for the fray.

In the spring of 1660, he made an onslaught on the new-fangled methods of mathematical analysis in five dialogues entitled *Examinatio et emendatio mathematicae hodiernae qualis explicatur in libris Johannis Wallisii*, with a sixth dialogue so-called, consisting entirely of 70 or more propositions on the circle and cycloid. In the *Dialogus physicus, sive De natura aëris* (*Latin works*, iv. 233-296) he fulminated in 1661 against Boyle and other friends of Wallis who were now forming themselves into a society (incorporated as the Royal Society in 1662) for experimental research, to the exclusion of himself personally, and in direct contravention of the method of physical enquiry enjoined in the *De corpore*. Wallis retorted in the scathing satire *Hobbius heautontimorumenos* (1662). He had apparently been stung to fury by a wanton allusion in Hobbes's latest dialogue to a passage of his former life (his deciphering for the parliament of the king's papers taken at Naseby). Professing to be roused by the attack on his friend Boyle, when he had scorned to lift a finger in defence of himself against the earlier dialogues, he tore them all to shreds with an art of which no general description can give an idea. He roundly charged Hobbes, quite unjustly, with having written *Leviathan* in support of Oliver's title, and deserting his royal master in distress. Hobbes's answer to these charges took the form of a letter about himself in the third person addressed to Wallis in 1662, under the title of *Considerations upon the Reputation, Loyalty, Manners and Religion of Thomas Hobbes*

(*English works*, iv. 409-440). In this piece, which is of great biographical value, he told his own and Wallis's "little stories during the time of the late rebellion" so effectively that Wallis, like a wise man, attempted no reply. Thus ended the second bout.

After a time Hobbes began a third period of controversial activity, which did not end, on his side, till his 90th year. *De principiis ratiocinatione geometrarum* (1666) (*Latin works*, iv. 385-484), was designed to show that there was no less uncertainty and error in the works of the geometers than in those of physical or ethical writers. *Quadratura circuli, Cubatio sphaerae, Duplicatio cubi* (1669) gave Hobbes's solution of these famous problems; and, in spite of Wallis's refutations he worked them up again in later publications. In 1674, at the age of 86, he published his *Principia et problemata aliquot geometrica, ante desperata nunc breviter explicata et demonstrata* (*Latin works*, v. 150-214), containing in the chapters dealing with questions of principle not a few striking observations, which ought not to be overlooked in the study of his philosophy. His last piece of all, *Decameron physiologicum* (*English works*, vii. 69-180), in 1678, was a new set of dialogues on physical questions.

All these controversial writings on mathematics and physics represent but one-half of his activity after the age of 70; though, as regards the other half, it is not possible, for a reason that will be seen, to say as definitely in what order the works belonging to the period were produced. From the time of the Restoration he acquired a new prominence. Two or three days after Charles's arrival in London, Hobbes drew in the street the notice of his former pupil, and was at once received into favour. The king relished his wit (he used to say, "Here comes the bear to be baited"), and did not like the old man the less because his presence at court scandalized the bishops or the prim virtue of Chancellor Hyde. He even bestowed on Hobbes a pension (not always paid) of £100, and had his portrait hung in the royal closet. But "Hobbism" was freely regarded as equivalent to freethinking and even to atheism, for Hobbes's attack on the Church was regarded as subversive of all religion. His enemies were many and powerful. His eagerness to defend himself against Wallis's imputation of disloyalty, and his apologetic dedication of the *Problemata physica* to the king, are evidence of the hostility with which he was being pressed by the Church party as early as 1662; but it was not till 1666 that he felt himself seriously in danger. In that year the House of Commons embodied the general superstitious fear arising from the calamities of the Plague and the Great Fire in a bill against atheism and profanity. On Oct. 17 it was ordered that the committee to which the bill was referred "should be empowered to receive information touching such books as tend to atheism, blasphemy and profaneness, or against the essence and attributes of God, and in particular the book published in the name of one White, and the book of Hobbes called the *Leviathan*, and to report the matter with their opinion to the House." (The *De medio animarum statu* of Thomas White, a heterodox Catholic priest, who contested the immortality of the soul. White [d. 1676] and Hobbes were friends). Hobbes, then verging upon 80, burnt such of his papers as he thought might compromise him, and set himself to enquire into the actual state of the law of heresy. The results of his investigation appeared in three short dialogues added (in place of the old "Review and Conclusion," for which the day had passed) as an appendix to his Latin translation of *Leviathan* (*Latin works*, iii.). In this appendix, as in the posthumous tract, *An Historical Narration concerning Heresy and the Punishment thereof* (1680, *English works*, iv. 385-408), he maintained that, since the High Court of Commission had been put down, there remained no court of heresy at all to which he was amenable, and that even when it stood nothing was to be declared heresy but what was at variance with the Nicene Creed, as he maintained that the doctrine of *Leviathan* was not.

After the parliamentary scare Hobbes could never afterwards get permission to print anything on ethical subjects. His Latin works (in 2 vols.) appeared at Amsterdam in 1668, because he could not obtain the censor's license for its publication at London, Oxford or Cambridge. Other writings were not made public till after his death—the king apparently having made it the price of

his protection that no fresh provocation should be offered to the popular sentiment. The most important of the works, written about 1670, and thus kept back, is the spirited dialogue *Behemoth: the History of the Causes of Civil Wars of England and of the Counsels and Artifices by which they were carried on from the year 1640 to the year 1660*. (*English works*, vi. 161-418. Though *Behemoth* was kept back at the king's express desire, it saw the light, without Hobbes's leave, in 1679 before his death.) To the same period probably belongs the unfinished *Dialogue between a Philosopher and a Student of the Common Laws of England* (*English works*, vi. 1-160), a trenchant criticism of the constitutional theory of English government as upheld by Coke. The two thousand and odd Latin elegiac verses in which he gave his view of ecclesiastical encroachment on the civil power may also date from this period; they were first published, nine years after his death, under the title *Historia ecclesiastica* (*Latin works*, v. 341-408).

For some time Hobbes was not allowed to utter a word of protest, whatever might be the occasion that his enemies took to triumph over him. But no Englishman of that day stood in the same repute abroad, and foreigners, noble or learned, who came to England, never forgot to pay their respects to the old man, whose vigour and freshness of intellect no progress of the years seemed able to quench. Among these was the grand-duke of Tuscany (Ferdinand II.), who took away some works and a portrait to adorn the Medicean library.

The autobiography in Latin verse, with its playful humour, occasional pathos and sublime self-complacency, was thrown off at the age of 84. In 1673, he sent forth a translation of four books of the *Odyssey* (ix.-xii.) in rugged but not seldom happily turned English rhymes; and, when he found this *Voyage of Ulysses* eagerly received, he had ready by 1675 a complete translation of both *Iliad* and *Odyssey* (*English works*, x.), prefaced by a lively dissertation "Concerning Virtues of an Heroic Poem," showing his unabated interest in questions of literary style. Even as late as Aug. 1679 he was promising his publisher "somewhat to print in English." He died at Hardwick Hall on Dec. 4 of that year, and was buried in the neighbouring church of Ault Hucknall.

Hobbes was tall and erect in figure. He shaved his beard to avoid the appearance of a venerable philosopher. He used to say that he had been drunk about a hundred times, but he lived a temperate life; after he was 70 he drank no wine and ate no meat. His favourite exercise was tennis, which he played regularly. Socially he was genial and courteous, though in argument he occasionally lost his temper. As a friend he was generous and loyal. Intellectually bold in the extreme, he was timid in ordinary life, and is said to have had a horror of ghosts. He read little, and often boasted that he would have known as little as other men if he had read as much. He appears to have had an illegitimate daughter, for whom he made generous provision. In the National Portrait Gallery there is a portrait of him by J. M. Wright, and two others are in the possession of the Royal Society.

HIS PLACE IN PHILOSOPHY

It cannot be allowed that Hobbes falls into any regular succession from Bacon; neither can it be said that he handed on the torch to Locke. He was the one English thinker of the first rank in the long period of two generations separating Locke from Bacon, but there is no true relation of succession among the three. It would be difficult even to prove any affinity among them beyond the disposition to take sense as a prime factor in subjective experience: their common interest in physical science was shared equally by rationalist thinkers of the Cartesian school, and was indeed begotten of the time. Backwards, Hobbes's relations are rather with Galileo and other enquirers who, from the beginning of the 17th century, occupied themselves with the physical world in the manner that has come later to be distinguished by the name of science in opposition to philosophy.

But even more than in external nature, Hobbes was interested in the phenomena of social life as displayed in an age of political revolution. While he was unable, by reason of imperfect training and too tardy development, with all his pains, to make any original

contribution to physical science or to mathematics, and was easily worsted by Wallis in mathematical controversy, he attempted a task which no other adherent of the new "mechanical philosophy" conceived—nothing less than such a universal construction of human knowledge as would bring society and man (at once the matter and maker of society) within the same principles of scientific explanation as were found applicable to the world of Nature. The attempt was premature, but it is Hobbes's distinction to have conceived it, and he must be classed with those philosophers who have sought to order the whole domain of human knowledge. Upon every subject that came within his system, except mathematics and physics, his thoughts have been productive of thought. As the first storm of opposition died down, thinkers of real weight, beginning with Cumberland and Cudworth, were moved by their aversion to his analysis of the moral nature of man to probe anew the question of the natural springs and the rational grounds of human action; and thus it may be said that Hobbes gave the first impulse to the whole English movement of ethical speculation. In politics the revulsion from his particular conclusions did not prevent the more clear-sighted of his opponents from recognizing the force of his supreme demonstration of the practical irresponsibility of the sovereign power, wherever seated, in the State; and, when in a later age the foundations of a positive theory of legislation were laid in England, the school of Bentham—James Mill, Grote, Molesworth—brought again to general notice the writings of the great publicist of the 17th century, who, however he might, by the force of temperament, himself prefer the rule of one, based his whole political system upon a rational regard to the common weal. Finally, the psychology of Hobbes, though too undeveloped to attract Locke, when essaying the scientific analysis of knowledge, came in course of time (chiefly through James Mill) to be connected with the theory of associationism developed from within the school of Locke, in different ways, by Hartley and Hume; nor is it surprising that the later associationists, finding their principle more distinctly formulated in the earlier thinker, should sometimes have been betrayed into affiliating themselves to Hobbes rather than to Locke. For his ethical theories see ERNICKS. Höffding (*Hist. of Mod. Phil.*, i., p. 264) summed up Hobbes's contribution to philosophical thought as follows: "Hobbes is an acute and energetic thinker. He instituted the best thought-out attempt of modern times to make our knowledge of natural science the foundation of all our knowledge of existence. The system he constructed is the most profound materialistic system of modern times. Moreover, Hobbes's works, which are distinguished by their powerful and clear exposition, contain many interesting observations on logic and psychology. He may be called the founder of English psychology, that is, of the English school of philosophy. It was his ethical and political views, however, which exerted the greatest influence on his contemporaries. His sturdy, although one-sided, naturalism, challenged men's opinions and brought them into a state of flux. In the sphere of mental science he effected a breach with scholasticism similar to that instituted by Copernicus in astronomy, Galileo in physics, and Harvey in physiology. Hobbes, with justifiable pride, ranges himself alongside of these men as the founder of sociology: this science (as he remarks in the preface to the *De corpore*), is no older than his own *De cive*. The naturalistic basis which he gave to ethics and politics originated a movement which has been strikingly compared to that inaugurated by Darwin in the 19th century."

BIBLIOGRAPHY.—Sufficient information is given in the *Vitae Hobbianae auctarium* (*Latin works*, i. p. 65 seq.) concerning the early editions of Hobbes's separate works and the works of his opponents to the end of the 17th century. In the 18th century, after Clarke's *Boyle Lectures* of 1704–05, the opposition was less express. In 1750 *The Moral and Political Works* were collected, with life, etc., by Dr. Campbell, in a folio edition. In 1812 the *Human Nature and the Liberty and Necessity* (with supplementary extracts from the *Questions* of 1656) were edited by Philip Mallet, and in 1839–45 by Molesworth. *The Elements of Law* was printed by F. Tönnies from the oldest ms. in 1888. There are numerous reprints of the *Leviathan*. Of translations may be mentioned *Les Éléments philosophiques du citoyen* (1649) and *Le Corps politique* (1652), both by S. de Sorbière, conjoined with *Le Traité de la nature humaine*, by d'Holbach, in 1787, under the general title *Les Oeuvres philosophiques et politiques de Thomas Hobbes*; a translation of the first section, "Computatio

sive logica," of the *De corpore*, included by Destutt de Tracy with his *Éléments d'idéologie* (1804); a translation of *Leviathan* into Dutch in 1678, and another (anonymous) into German (Halle, 1794, 2 vols.); a translation of the *De cive* by J. H. v. Kirchmann (Leipzig, 1873). Important later editions are those of Ferdinand Tönnies, *Behemoth* (1889), on which see Croom Robertson's *Philosophical Remains* (1894), p. 451; *Elements of Law* (1889).

Three accounts of Hobbes's life were first published together in 1681, two years after his death, by R. B. (Richard Blackbourne, a friend of Hobbes's admirer, John Aubrey), and reprinted, with complimentary verses by Cowley and others, at the beginning of Sir W. Molesworth's collection of the Latin Works: (1) *T. H. Malmesb. vita* (pp. 13–21), written by Hobbes himself, or (as also reported) by T. Rymer, at his dictation; (2) *Vitae Hobbianae auctarium* (pp. 22–80), turned into Latin from Aubrey's English; (3) *T. H. Malmesb. vita carmine expressa* (pp. 81–99), written by Hobbes at the age of 84 (first published by itself in 1680). The *Life of Mr. T. H. of Malmesbury*, printed among the *Lives of Eminent Men* in 1813, from Aubrey's papers in the Bodleian, etc. (vol. ii. pt. ii. pp. 593–637), contains some interesting particulars not found in the *Auctarium*. All that is of any importance for Hobbes's life is contained in G. Croom Robertson's *Hobbes* (1886) in Blackwood's *Philosophical Classics*, and Sir Leslie Stephen's *Hobbes* (1904) in the "English Men of Letters" series, both of which cover his philosophy. See also F. Tönnies, *Hobbes Leben und Lehre* (1896), *Hobbes-Analekten* (1904); G. Zart, *Einfluss der englischen Philosophie seit Bacon auf die deutsche Philosophie des 18ten Jahrh.* (1881); G. Campion, *Outlines of Lectures on Political Science* (1895); M. Frischeisen-Köhler, *Zur Erkenntnislehre und Metaphysik des Thomas Hobbes* (1914); H. Höffding, *Hist. of Modern Philosophy*, vol. i. (1900). Full bibliography in Ubesweg, *Grundriss der Gesch. der Phil.*, bd. iii. (1914).

HOBHOUSE, ARTHUR HOBHOUSE, 1ST BARON (1819–1904), English judge, fourth son of Henry Hobhouse, permanent under-secretary of State in the Home Office, was born at Hadspen, Somerset, on Nov. 10, 1819. Educated at Eton and Balliol, he was called to the bar at Lincoln's Inn in 1845, and rapidly acquired a large practice as a conveyancer and equity draftsman; he became Q.C. in 1862, and practised in the Rolls Court, retiring in 1866. He was an active member of the charity commission and urged the appropriation of pious bequests to educational and other purposes. In 1872 he began a five years' term of service as legal member of the council of the governor-general of India, his services being acknowledged by a K.C.S.I.; and in 1881 he was appointed a member of the judicial committee of the privy council, on which he served for 20 years. He was made a peer in 1885, and consistently served the Liberal party in the House of Lords. He died on Dec. 6, 1904, leaving no heir to the barony.

His papers read before the Social Science Association on the subject of property were collected in 1880 under the title of *The Dead Hand*.

HOBHOUSE, LEONARD TRELAWNEY (1864–1929), British sociologist, was educated at Oxford; he became fellow of Merton college in 1887, and of Corpus Christi in 1890. He served for five years on the staff of *The Manchester Guardian*. An active Liberal, he was secretary of the Free-Trade Union in 1903–05 and published several political works, notably *The Labour Movement* (1893; 2nd ed., 1898) and *Democracy and Reaction* (1904), showing strong sympathy with collectivism, which he maintained to be not inconsistent with Liberalism. In 1907 he was appointed Martin White professor of sociology in the university of London, and next year became editor of *The Sociological Review*. Thenceforth, except for a few war publications, he devoted his energies to writing and lecturing on ethical, psychological and sociological subjects. His principal works are *The Theory of Knowledge* (3rd ed., 1921); *Mind in Evolution* (2nd ed., 1915); *Morals in Evolution* (2 vol., 3rd ed., 1915); *Development and Purpose* (1913); and *Principles of Sociology* in four separate sections (1918–24); the social application of ethical principles; in collaboration with G. C. Wheeler and M. Ginsberg, *The Material Culture and Social Institutions of the Simpler Peoples* (1915); and with J. L. Hammond, *Lord Hobhouse; a Memoir* (1905). He died June 21, 1929.

HOBOKEN, town of Belgium on the right bank of the Scheldt about 4 m. above Antwerp. It is an important industrial centre and has the ship-building yard of the Cockerill firm of Seraing.

Many wealthy Antwerp merchants have villas here, and it is the headquarters of several of the leading rowing clubs on the Scheldt. Pop. (1925) 27,790.

HOBOKEN, a city of Hudson county, N.J., U.S.A., on the Hudson river, adjoining Jersey City on the south, opposite the lower part of New York city, with which it is connected by the Hudson River tunnels, four ferries, and (through Jersey City) the Vehicular tunnel. It is served by the Hudson and Manhattan and the Lackawanna railways, and for freight also by the Erie, the Lehigh Valley, the Pennsylvania, the West Shore and the Hoboken Manufacturers railways and steamship lines. The population was 68,166 in 1920 (34.5% foreign-born white, over half from Italy and Germany). The city has a restricted area of 1.3 sq.m. Its water-front of 1.3 m. is lined with piers, including those of the United States line, the North German Lloyd, Lamport and Holt, the Munson, the Scandinavian American and the Holland-American lines and other steamship companies. Much of the surface has been filled in, to raise it above the level of high tide. Castle Point, rising 100 ft. above the river near the centre of the shoreline, is occupied by Hudson park, formerly the residence and private estate of the founder of the city, John Stevens (1749-1838), and the Stevens Institute of Technology (opened 1871), endowed by his son, Edwin A. Stevens (1795-1868). The city has numerous and varied manufacturing industries, with an output in 1925 valued at \$59,536,561. The assessed valuation of property for 1926 was \$100,089,371. Bank deposits on June 30, 1925, amounted to \$159,221,734.

Hoboken was an Indian word, meaning tobacco-pipe. The site of the city was bought by the Dutch West India company in 1635 for \$1,040, and was occupied by 1640 by a Dutch farm, which was laid waste by the Indians in 1643. In 1658 the land was deeded by the Indians to Peter Stuyvesant. In 1711 Samuel Bayard, a New York merchant, acquired title to it and built his summer residence on Castle Point. The property was confiscated in 1780 by the state of New Jersey from his descendant, a loyalist, and in 1784 it was bought (for \$90,000) by John Stevens, the inventor. He laid it out as a town in 1804, and for the next 35 years its Elysian Fields were a famous pleasure resort of New York city. Hoboken was incorporated as a town in 1849 and as a city in 1855. In 1860 the population was 9,662. In the next decade, and again in the 20 years 1870-90, it more than doubled, and in 1910 it reached 70,324. The city has a commission form of government.

HOBSON'S CHOICE, *i.e.*, "this or nothing," an expression that arose from the refusal of the Cambridge-London carrier, Thomas Hobson (1544-1630), when letting his horses on hire, to allow any animal to leave the stable out of its turn. Among other bequests made by Hobson, and commemorated by Milton, was a conduit for the Cambridge market-place. See *Spectator*, No. 509, Oct. 14, 1712.

HOBY, SIR THOMAS (1530-1566), English diplomatist and translator, son of William Hoby of Leominster, was born in 1530. He entered St. John's college, Cambridge, in 1545, but in 1547 he went to Strassburg, where he was the guest of Martin Bucer, whose *Gratulation . . . unto the Church of Englande for the restitution of Christes Religion* he translated into English. He then proceeded to Italy, visiting Padua and Venice, Florence and Siena, and in May 1550 he had settled at Rome, when he was summoned by his half-brother, Sir Philip Hoby (1505-58), then ambassador at the emperor's court, to Augsburg. The brothers returned to England at the end of the year, and Thomas attached himself to the service of the marquis of Northampton, whom he accompanied to France on an embassy to arrange a marriage between Edward VI. and the princess Elizabeth. Shortly after he returned to England he started once more for Paris, and in 1552 he was engaged on his translation of *The Courtyer of Count Baldessar Castilio*, printed in 1561. The *Cortegiano* of Baldassare Castiglione, which Dr. Johnson called "the best book that ever was written upon good breeding," exercised an immense influence on the standards of manners throughout Europe, and was the recognized authority for the education of a nobleman. Thomas Hoby married in 1558 Elizabeth, the learned daughter

of Sir Anthony Cook, who wrote a Latin epitaph on her husband. He was knighted in 1566 by Elizabeth, and was sent to France as English ambassador. He died on July 13 in the same year in Paris, and was buried in Bisham Church. The authority for Thomas Hoby's biography is a ms., "Booke of the Travaile and lief of me Thomas Hoby, with diverse things worth the noting." This was edited for the Royal Historical Society by Edgar Powell in 1902. Hoby's translation of *The Courtyer* was edited (1900) by Prof. Walter Raleigh for the "Tudor Translations" series. See also Sir Walter Raleigh, *Some Authors* (1923).

HOCHÉ, LAZARE (1768-1797), French general, was born near Versailles on June 24, 1768. He enlisted in the *Gardes françaises* and soon obtained promotion. When the *Gardes françaises* were broken up in 1789 he served in various line regiments up to the time of his receiving a commission in 1792. He served with credit in the operations of 1792-1793 on the northern frontier of France. When Dumouriez deserted to the Austrians, Hoche, with le Veneur and others, fell under suspicion of treason; but after being kept under arrest for some months he took part in the defence of Dunkirk, and in the same year (1793) he was promoted successively *chef de brigade*, general of brigade, and general of division. During his command in Lorraine he was defeated by the Prussians at Kaiserslautern (Nov. 28, 30, 1793), but the Committee of Public Safety valued his services enough to leave him in command; in December, after he had stormed the lines of Fröschweiler the Army of the Rhine was also put under him, and he pursued his success, sweeping the enemy before him to the middle Rhine in four days. Before the following campaign opened, he married Anne Adelaïde Dechaux at Thionville (March 11, 1794). Ten days later he was suddenly arrested, on charges of treason preferred by Pichegru, the displaced commander of the Army of the Rhine. Hoche escaped execution, though imprisoned in Paris until the fall of Robespierre. On Aug. 21, 1794 he was appointed to command against the Vendéans and made the peace of Jaunay (Feb. 15, 1795) when the war was renewed by the royalists. Hoche inflicted a crushing blow on the royalist cause by capturing de Sombreuil's expedition at Quiberon and Penthievre (July 16-21, 1795). Before the summer of 1796 he had pacified the whole of the west, which had for more than three years been the scene of a pitiless civil war. In December 1796 he was appointed to organize the invasion of Ireland, but the expedition was driven back by bad weather. Hoche was at once transferred to the Rhine frontier, where he defeated the Austrians at Neuwied (April), though operations were soon afterwards brought to an end by the Preliminaries of Leoben. Later in 1797 he was minister of war for a short period, but, finding himself the dupe of Barras and technically guilty of violating the constitution, he returned to his command on the Rhine frontier. But his health grew rapidly worse, and he died probably of consumption at Wetzlar on Sept. 19, 1797. He was buried by the side of his friend Marceau in a fort on the Rhine, and was mourned throughout France.

Martin, *Hoche et Bonaparte* (1875); Dutemple, *Vie politique et militaire du général Hoche* (1879); Escaude, *Hoche en Irlande* (1888); Cunéo d'Ornano, *Hoche* (1892); A. Chuquet, *Hoche et la lutte pour l'Alsace* (a volume of this author's series on the campaigns of the Revolution, 1893); E. Charavay, *Le Général Hoche* (1893); A. Duruy, *Hoche et Marceau* (1885).

HOCHHEIM, a town in the Prussian province of Hesse-Nassau, situated on the Main, 3 m. above its influx into the Rhine and on the railway from Wiesbaden to Frankfort-on-Main. Pop. (1925) 4,704. Hochheim is mentioned in the chronicles as early as the 7th century. It was the scene of a victory gained here in 1813 by the Austrians over the French. It trades in wine (see Hock).

HÖCHST, town of Germany, in the Prussian province of Hesse-Nassau on the Main, 6 m. by rail W. of Frankfort-on-Main. Pop. (1925) 31,439. Höchst belonged formerly to the electors of Mainz who had a palace here; this was destroyed in 1634 with the exception of one fine tower which still remains. It has large dye-works and manufactures of machinery, armour, chemicals, furniture and leather. Brewing is carried on and there is a con-

siderable river trade. The Roman Catholic church of St. Justinus is a fine basilica originally built in the 9th century.

Höchst is also the name of a small town in Hesse. This has some manufactures, and was formerly the seat of a Benedictine monastery.

HÖCHSTÄDT, a town of Bavaria, Germany, in the district of Swabia, on the left bank of the Danube, 34 m. N.E. of Ulm by rail. Pop. (1925) 2,156. It has a castle flanked by walls and towers and some small industries, including malting and brewing. Here Frederick of Hohenstaufen, vicegerent of the Empire for Henry IV., was defeated by Hermann of Luxemburg, in 1081; it came into Bavarian possession in 1266, in 1703 the Imperialists were routed here by Marshal Villars in command of the French; and in August 1704 Marlborough and Prince Eugene defeated the French and Bavarians, this battle being usually known as that of Blenheim.

There is another small town in Bavaria named Höchstädt. Pop. (1925) 2,108. This is on the river Aisch, not far from Bamberg, to which bishopric it belonged from 1157 to 1802, when it was ceded to Bavaria.

HOCK. From a very early date, certainly not later than the 11th century, the German traders from the hanseatic cities, who had a "hanse" or headquarters in London, brought to England some of the wines of the Rhine. In all official documents relating to the importation and taxation of wine in England from the earliest times until the end of the 17th century all wines from Germany are named "Rhenish wines," but they were known to the public under the name of hock as early as the 16th century. Although no actual evidence has as yet come to light to place beyond dispute the origin of the name hock, it was probably first used to designate the wines from Hochheim, a village surrounded by vineyards, situated upon the right bank of the river Main, close to where it flows into the Rhine. The name hock, short for Hochheim, being a name easy to pronounce and to remember, would quite naturally be used by most people in place of so many long and difficult names of German vineyards; so in time hock was used to designate all wines which were shipped to England from the Rhine, whether red or white. As a matter of fact, the output of red Rhine wines is so small, and the demand for them is so much greater in Germany than the supply, that they are hardly ever exported and the name "hock" is, in practice, restricted to the white wines of the Rhine.

Rhinegau.—The finest hocks are those from the Rhinegau vineyards, which are situated upon the right bank of the Rhine from Rüdesheim, opposite Bingen, to the hills of Rauenthal. It is within that comparatively small area that are to be found the most famous Rhinegau vineyards: *Rüdesheim*, *Geisenheim*, *Winkel*, *Mittelheim*, *Oestrich*, *Johannisberg*, *Volrads*. A little farther east are the no less celebrated hills of *Steinberg*, whilst nearer the Rhine are the famous growths of *Hattenheim*, *Marco-brunn*, *Erbach* and *Eltville*.

Rhinchesse.—Upon the opposite bank of the Rhine, in Hesse, from Bingen to Mayence and from Mayence to Worms, there are far more extensive vineyards than those of the Rhinegau, but they do not produce wines of the same high degree of excellence: the best wines of Hesse are those of *Nierstein* and *Oppenheim*, from vineyards situated a few miles south of Mayence, and those of *Liebfraumilch* grown near Worms, close to the southern boundary of Hesse.

Palatinate.—Hocks which are quite distinctive in character, possessing more breed and bouquet than the Hesse wines, and more sweetness than those of the Rhinegau, are made in the Palatinate, the best being those of *Deidesheim*, *Forst*, *Durkheim*, *Wackenheim* and *Ruppertsberg*.

In Franconia, in quite another part of Bavaria, farther east and north, we find the *Stein* wines, which are very characteristic and in good years are also very fine.

HÖCKERT, JOHAN FREDRIK (1826–1866), Swedish painter, was born at Jonköping on Aug. 26, 1826. He studied in Munich and in Paris, where he came under the influence of Delacroix's Romanticism, and afterwards went from place to place, working in Spain, Tunis and Naples. The experience thus gained gave him an unusually broad outlook, and on his return he upset all the traditions of the Swedish-Düsseldorf school by painting for the sake of art and not for the anecdote or historical incident which provided the subject. His great merit lies in the fact that he was first among his countrymen to adopt this attitude. Both his "Divine Service in Lapland" and "Interior of a Lapland Hut" were exhibited in Paris and afterwards found their way to the museums at Lille and Stockholm respectively. His last important work, "The Burning of the Castle of Stockholm" (1866) is an example of his vivid colouring (Museum of Stockholm). All three pictures are admirably composed.

See T. Chasrel, "Études sur la Musée de Lille," in *L'Art*, vol. iv. p. 261 (1877); R. Muther, *The History of Modern Painting* (authorized Eng. ed., 2 vols. 1907; rev. ed., enlarged, 4 vols., 1907).

HOCKEY, a game played with a ball by two opposing sides, using hooked or bent sticks with which each side attempts to drive it into the other's goal.

A crude form of a stick-game was played by the ancient Persians, from whom it was acquired by the Greeks, who in turn passed it on to the Romans. A discovery made at Athens in 1922 gives reason to believe that a form of stick-game came from the East. This was a bas-relief found in the wall built by Themistocles (514–449 B.C.), which depicts six youths taking part in a game resembling hockey, and shows what is termed a "bully" in the modern game, but with the hooked sticks pointing downward instead of upward. Traces of a sort of stick-game have also been found in America, as played by the Aztec Indians, and there is evidence to show that probably most, if not all, of the Indian tribes in America have played a rough sort of stick-game for some thousand years. But neither these, nor the "London Balle Playe" mentioned by Fitzstephen in 1175, seem to have born more than a general resemblance to modern hockey.

Modern Hockey.—About 1875 a game resembling modern hockey began to be played. No goal could be scored if hit from a distance of more than 15yd. from the nearest goal post, but players did not for a time realize the need of a definite marked out circle. A landmark in the progress of the game was the formation of the famous Wimbledon Club in 1883. The members at first used a string ball and light ash sticks. A few more clubs soon came into being in the London area and the game spread to the Midlands, west and north of England. The real birthday of modern hockey was however Jan. 18, 1886, the date of the formation of the Hockey Association and of the adoption of the striking circle. The following year the first county match was played; this was Surrey v. Middlesex, and out of this match there arose the question of a county qualification. It was decided by the Hockey Association that actual residence should be the sole qualification, but later this rule was amended, the Division being empowered to make their own rules in regard to this matter. By 1890 the Hockey Association had 26 southern clubs affiliated to it, and in addition the recently formed Northern Counties Hockey Association. It was in this year that the first divisional match was played, the North meeting the South in Jan. 1890 at Queen's Club, London, when the South won by 6 goals to nil. At this time there was trouble over the vexed question of "cup ties," and an application for affiliation by the Northamptonshire Hockey Association was granted by the Hockey Association only on the express understanding that they abolished all cups or prize competitions. That has always been the parent body's policy. Consequently hockey is one of the few games into which no trace of professionalism has entered. The Midland Counties Divisional Association came into being in 1894 and a year later the first international match was played between England and Ireland, resulting in a win for the former by 5 goals to nil. About this time the West started an association of its own, and the first of its series of matches with the Midlands was played, though it was not until several years later that the other divisions arranged fixtures with the West.

WOMEN'S FIELD HOCKEY

1. Player on a Surrey ladies' hockey team, showing one method of fielding the ball with the foot. Player holds stick uplifted to hit ball
2. Southern Counties' Women's Tournament at Bournemouth, Hants. View of Surrey first team versus Oxfordshire. Surrey attacking opponents' goal
3. The Push Pass. Right hand is well below the left to give leverage
4. Correct position at start of the "Roll In." Ball is held in the right hand, ready for forward swing. Stick used to brace body
5. The "Job," stroke used when the ball is too far away to hit. The arm

is stretched out to its full extent, with the back of the stick laid on the ground, face uppermost. A series of quick thrusts at the ball will keep the player in touch with it until she is near enough for a hit

6. International Ladies' Hockey Match, score England 5 versus Wales 1, at Merton Abbey, Surrey. Action shows "bully off" at goal line
7. Southern Counties' Women's Hockey Association match: South versus Midlands at Merton Abbey. A fine run down field by Midland forward, showing ball inside goal line

The Welsh Hockey Association was formed in 1897, England meeting Wales in the spring of 1898 and winning by 7 goals to nil. Ireland had, however, started international matches with Wales three years previous to this. About 1900 the need was realized of having an international committee to frame and amend the rules of the game, and the governing bodies of Ireland and Wales were each asked to send two representatives to meet three from the Hockey Association. Later this body was called the International Hockey Board, its membership being increased by two on the formation of the Scottish Hockey Association in 1902.

The organization of the game was now nearing completion, and it was brought a step nearer on the formation of the Eastern Counties Hockey Association and the Army Hockey Association. The Royal Navy soon followed the leaders. The growth of the game in England may be gauged by the fact that whereas on the formation of the Hockey Association in 1886 there was a mere handful of clubs, the number had in 1926 increased to over 1,000, many of them having a large membership. Hockey has not, however, flourished to the same extent in Wales or Scotland, although it is very popular in Ireland. Over a period of 32 years (excluding the years 1915 to 1919) England has played 73 matches against Ireland, Scotland and Wales, winning 63, losing 5, and drawing 5. This pre-eminence is due partly to the far larger numbers of players at her command, and partly to the fact that an increasing number of the public schools devote a term to hockey, and that there is a great number of players at the universities of Oxford and Cambridge.

The Game Throughout the World.—Although hockey is not played to anything like the same extent as football among the nations of Europe, yet since the beginning of the 20th century the game has become more popular. In parts of France inter-regional matches are held. International matches between England and France were begun in 1907. In 1913 England also played Germany, winning easily. Other hockey-playing countries are Belgium, Denmark, Holland, Spain, Austria and Switzerland, and these arrange to have international contests as opportunity offers. From time to time the Hockey Association sends out teams abroad, and during the Christmas and Easter holidays several English teams go on tour. In Australia and New Zealand the game is making headway, and the Hockey Association of the latter country has twice invited the Hockey Association to send over a team to tour there, but this invitation it has unfortunately been impossible to accept. In South Africa, a federation was formed in 1925 and gradual progress is being made. But in no country in the world is hockey so extensively played as in India. It is computed that there are about 3,000 teams, and recently an All-India Federation was formed to include the 24 provinces. Japan is a newcomer to hockey and has formed an association including some 50 clubs. The Japanese army and navy have also included the game in their athletic curriculum and there are several Service teams. In America, where the game is frequently played, the rules are similar to those of England. See also ICE HOCKEY.

The Game.—The game is played by two teams of eleven players on a rectangular ground, 100yd. long, and not more than 60yd. nor less than 55yd. wide, marked with white lines, the longer boundary lines are the side lines, the others the goal lines. Inside

A HOCKEY STICK, SHOWING BLADE, MADE OF ASH, AND HANDLE OF CANE, WHICH MAY BE WITH OR WITHOUT RUBBER INSERTIONS

the ground, at a distance of 7yd. and running parallel with the side lines, a dotted line is marked, called the 7yd. line. In front of each goal there is drawn a white line, 4yd. long, parallel to and 15yd. from the goal-line. This line is continued each way to meet the goal-line by quarter circles having the goal posts as centres. The space thus enclosed is called the striking-circle. For a goal to be scored the ball must pass over the goal-line between the goal posts, and whilst within the striking-circle must have been hit by or glanced off the stick of an attacker. The ball is an ordinary cricket ball painted white. A hockey stick has a flat face on the left side of the head and is rounded on the right, and the ball may only be struck with the flat side. The diameter must not exceed 2in. nor the weight 28 oz. The curved head of the stick is made of ash and the handle of pieces of cane with thin strips of rubber let in. At the start of the game two players (one from each side) "bully" the ball in the centre of the ground. To "bully" the ball each player taps first the ground on his own side of the ball and then his opponent's stick three times alternately, after which one of these two players must strike the ball before it is in general play. Each side then endeavours, by means of striking, passing and dribbling, to drive the ball into its opponent's goal. The ball may be caught (but not held) or stopped by any part of the body, but may not be picked up, carried, thrown, kicked or knocked on, except with the stick. Each goal-keeper is, however, allowed to kick the ball in his own striking-circle. Hooking of sticks is permissible within striking distance of the ball. A player must not obstruct by interposing himself between an opponent and the ball. Penalties for infringing rules are of three classes: "free hits," "penalty-corners" and "penalty bullies." If the ball is hit over the goal line (not between the goal posts) by one of the attacking team from any part of the field or unintentionally by one of the defending team, from outside the 25yd. line, it is brought out 25yd. in a direction at right angles to the goal-line where it crossed the line, and there "bullied." But if the ball is unintentionally hit over the goal-line from within the 25yd. line by one of the defenders, the attacking side is given a "corner," or if, in the opinion of the umpire, the ball has intentionally been hit over the goal-line, a "penalty-corner" is awarded. A "corner" is a free hit taken within 3yd. of a corner flag and a "penalty-corner" from any point on the goal-line, at a distance of not less than 10yd. from the nearer goal post. In each case the defending team must be behind their own goal-lines. In no case can a goal be scored direct from a free hit. When the ball passes over the side line, it is rolled in from the point where it crossed the side line by one of the team opposed to the player who last touched the ball. It may be rolled (not thrown) in any direction, but all players must stand outside the 7yd. line until the ball shall have left the hand of the roller-in. When striking the ball players are not allowed to raise the stick above the shoulder, and intentional undercutting of the ball is disallowed.

From small beginnings, hockey has become a popular game at not a few of the public schools, at the universities and with the middle classes. To be an adept the essentials are a good eye, strong wrists, footwork, pace and ball control. Hockey suffers if played on a rough and uneven ground, as then accurate stick-work is very difficult, and the game is slowed up by reason of foot or hand being used to stop the ball; speed, which is one of the principal charms of the game, thus cannot be attained. ICE HOCKEY is the subject of a separate article under that title.

Haslam, *How to Play Hockey* (1923); All England Women's Hockey Assoc.: *Hints to Umpires* (1923); *Authorized Rules of the Game of Hockey* (1923-24).

HOCKING, SILAS KITTO (1850–), English novelist, was born at St. Stephens, Cornwall, on March 24, 1850, and educated at the local grammar school. He was ordained a Free Church minister in 1870 but resigned his pastorate in 1896. Both he and his younger brother JOSEPH HOCKING (b. Nov. 7, 1860), who had a similar upbringing for the Nonconformist ministry,

became prolific writers of widely read novels with a distinct religious note. Among those of Silas Hocking were *Alec Green* (1878); *Who Shall Judge?* (1910); *His Own Accuser* (1917), and *Watchers in the Dawn* (1920). Among those of Joseph Hocking were *Jabez Easterbrook* (1891); *Zillah* (1892); *The Scarlet Woman* (1899); *Tommy and the Maid of Athens* (1917), and *The Pomp of Yesterday* (1918).

HOCK-TIDE, an ancient general holiday in England, celebrated on the second Monday and Tuesday after Easter Sunday. Hock-Tuesday was an important term day, rents being then payable, for with Michaelmas it divided the rural year into its winter and summer halves. No trace of the word is found in Old English, and "hock-day" appears first in the 12th century. The characteristic pastime of hock-tide was called binding. On Monday the women, on Tuesday the men, stopped all passers of the opposite sex and bound them with ropes till they bought their release with a small payment, or a rope was stretched across the highroads and the passers were obliged to pay toll. The money thus collected seems to have gone towards parish expenses. Many entries are found in parish registers under "Hocktyde money." The hock-tide celebration became obsolete in the beginning of the 18th century. At Coventry a play called "*The Old Coventry Play of Hock Tuesday*" was suppressed at the Reformation.

HOCUS, a shortened form of "hocus pocus," used in the 17th century in the sense of "to play a trick on any one," to "hoax," which is generally taken to be a derivative. "Hocus pocus" appears to have been a mock Latin expression first used as the name of a juggler or conjurer.

HODDEN, a coarse kind of cloth made of undyed wool, formerly much worn by the peasantry of Scotland. It was usually made on small hand-looms by the peasants themselves. Grey hodden was made by mixing black and white fleeces together in the proportion of one to 12 when weaving.

HODDESDON, an urban district of Hertfordshire, England, near the river Lea, 17 m. N. from London by the L.N.E. railway. Pop. (1921) 5,409. Hoddesdon was a famous coaching station on the Old North Road; and the Bull posting-house is mentioned in Matthew Prior's "Down Hall." The Lea has been a favourite resort of anglers from the time of Izaak Walton, in whose book Hoddesdon is specifically named. The church of St. Augustine, Broxbourne, is a fine example of Perpendicular work, and contains an altar tomb with enamelled brasses of 1473. Hoddesdon probably covers the site of a Romano-British village.

HODEIDA (HODEDA, HADEDA), a town in Arabia situated on the Red Sea coast 14° 48' N. and 42° 57' E. It lies on a beach of muddy sand exposed to the southerly and westerly winds. Steamers anchor more than a mile from shore, and merchandise is carried by means of native boats. But Hodeida has become the chief centre of the maritime trade of Yemen and is known as the "Key to San'a." The population is estimated at 35,000 and is cosmopolitan in character. Services are maintained with Aden, and with Suez, Massaua and the other Red Sea ports. Coffee and dates are the principal exports. After the war of 1914-18 Hodeida came under the influence of the Idrisi Seyyid Ali b. Mohammed.

HODGENVILLE, a town of central Kentucky, U.S.A., on Federal highway 68 and the Illinois Central railroad, 50m. S. of Louisville; the county seat of Larue county. The population was 1,100 in 1920. Three miles south-west of the town, in a log cabin on the Big South Fork of Nolin's Creek, Abraham Lincoln was born on Feb. 12, 1809. The cabin is now enclosed in a memorial hall, and is kept as a national shrine.

HODGES, FRANK (1887-), British politician, was born at Woolaston, Gloucestershire. At the age of 14 he entered the Vivian Colliery at Abertillery, South Wales. In 1912 he was elected a miners' agent and six years later secretary of the Miners' Federation of Great Britain. He became a civil lord of the Admiralty in the Labour ministry of 1924. He lost his seat at the election of that year; and in 1925 was made general secretary of the International Miners' Federation. He resigned in 1927, and then became a member of the Central Electricity Board.

See his *My Adventures as a Labour Leader* (1925).

HODGKIN, THOMAS (1831-1913), British historian, son of John Hodgkin (1800-1875), barrister, was born in London, on July 29, 1831, and died on March 2, 1913. Having been educated as a member of the Society of Friends and taken the degree of B.A. at London university, he became a partner in the banking house of Hodgkin, Barnett & Co., Newcastle-on-Tyne, a firm afterwards amalgamated with Lloyds Bank. Hodgkin devoted a good deal of time to historical study, and became a leading authority on the history of the early middle ages.

His chief works are, *Italy and her Invaders* (1880-99); *The Dynasty of Theodosius* (1889); *Theodoric the Goth* (1891); and an introduction to the *Letters of Cassiodorus* (1886). He also wrote a *Life of Charles the Great* (1897); *Life of George Fox* (1896); the opening volume of Longman's *Political History of England* (1906); and a few religious books from a Quaker standpoint. See L. Creighton, *Life and Letters of Thomas Hodgkin* (1917).

HODGSON, BRIAN HOUGHTON (1800-1894), English administrator, ethnologist and naturalist, was born at Lower Beech, Cheshire, on Feb. 1, 1800. In 1816 he obtained an East Indian writership, went out to India in 1818 and in 1820 was appointed assistant to the resident at Katmandu. In 1833 he became resident in Nepal, and succeeded in concluding a satisfactory treaty in 1839 with the court to which he was accredited; but in 1842 his imperious policy towards the native Government was upset by the interference of Lord Ellenborough. Hodgson disobeyed the latter's instructions; he was continued in office for a time, but was recalled in 1843. He died at Alderley Grange in the Cotswold hills, on May 23, 1894.

Hodgson did much to throw light on Buddhism as it exists in Nepal. He presented his collection of Sanskrit manuscripts to the East India Office. He also became the greatest authority on the flora of the Himalayas. He wrote 184 philological and ethnological, and 127 scientific papers, and some pamphlets on native education. His principal work, *Illustrations of the Literature and Religion of Buddhists* (1841) was republished with other writings in 1872-80.

See his *Life* by Sir W. W. Hunter (1896).

HODGSON, SHADWORTH HOLLOWAY (1832-1912), English philosopher, was born at Boston, Lincs., on Dec. 25, 1832, and educated at Rugby and Corpus Christi college, Oxford. He devoted himself from 1858 onwards to the study of philosophy, and helped to found in 1880 the Aristotelian Society of London, of which he was the first president (1880-94). He died on June 13, 1912, in London. Besides numerous contributions to *Mind*, Hodgson published *Time and Space* (1865); *The Philosophy of Reflection* (1878) and *The Metaphysic of Experience* (1898), an exposition of his philosophy.

HODLER, FERDINAND (1853-1918), Swiss painter, was born at Gurzelen in the canton of Berne on March 14, 1853. He received his early education in drawing from Ferd. Sommer-Collier, a Swiss landscape painter at Thun, but his artistic career began at Geneva in 1872, where he worked under Barthelémy Menn, at the same time studying at the university. In 1874 he won the Calame prize for a landscape. After various journeys, notably in Spain, which explains the Spanish influence in much of his earlier work, he settled down in Geneva where, with a few intervals, he remained until his death. Among his most important pictures are the "Cortège des lutteurs" (1887), "La Nuit" (1891), "Las de vivre" (1892), "L'Elu" (1894), "Eurythmie" (1895), "L'Emotion," "La Vérité" (1905), "Le Jour," "L'Amour" (1908). He also executed numerous portraits, landscapes, water colours and lithographs. He died on May 20, 1918. He was a protagonist of the expressionist movement. The best display of his work is in the Kunsthauus at Zürich. See E. Bender, *Die Kunst Ferdinand Hodlers* (1920).

HÓDMEZŐ-VÁSÁRHELY, a Hungarian town in the county of Csongrád. Lying near the right bank of the Tisza and protected from normal floods by a large dike, the town is on the edge of a very fertile alluvial plain and is essentially the centre of extensive agriculture and stock-rearing, being particularly noted for grapes and melons and the fine breeds of horned cattle and horses. Much of the surrounding plain (383 sq.m.) is owned by the municipality. Pop. (1920), 60,922.

HODOGRAPH. If from any point O a vector OP be drawn representing at any instant in magnitude and direction the velocity of a particle P , which is moving in any manner whatever, the locus of P is the hodograph of the path of P . (Cf. the definition of radial curve under **CURVES, SPECIAL**.) A fundamental property of this curve is that the velocity of any point P of the hodograph is equal to the acceleration of the corresponding point P' ; also that the direction of motion of P is that of the direction of acceleration of P' . The hodograph of the orbit of a planet or a comet, considered as in a Newtonian field, is always a circle, whatever may be the form and dimensions of the orbit. The pole O is inside, on, or outside the circle, according as the orbit is an ellipse, a parabola or a hyperbola. The idea of the hodograph originated with Möbius (1843) and, independently, with Sir William Rowan Hamilton (1846) to whom the name and certain original developments of the theory are due. If a particle describes a logarithmic spiral about the pole as a centre of force, the hodograph is also a logarithmic spiral; the same result holds true for sinusoidal spirals (Schouten). If a particle starts from rest at the vertex of a perfectly smooth inverted cycloid and oscillates under the action of gravity, the hodograph of the motion is a circle through the pole, described with constant velocity. An important improvement in nautical charts by A. Smith (*Proc. Roy. Soc.*, vol. xv., 1867) introduced a curve which has been called a tidal hodograph (Thomson and Tait).

HODSON, WILLIAM STEPHEN RAIKES (1821-1858), known as "Hodson of Hodson's Horse," British leader of light cavalry during the Indian Mutiny, son of a clergyman, was born on March 19, 1821 at Maisemore Court, near Gloucester. He was educated at Rugby and Cambridge, and became a cadet in the Indian army at twenty-three. Joining the 2nd Bengal Grenadiers he went through the first Sikh War, and was present at the battles of Moodkee, Ferozeshah and Sobraon. In one of his letters home at this period he calls the campaign a "tissue of mismanagement, blunders, errors, ignorance and arrogance" and outspoken criticism such as this brought him many bitter enemies throughout his career.

In 1847, through the influence of Sir Henry Lawrence, he was appointed adjutant of the corps of Guides, and in 1852 was promoted to the command of the Guides with the civil charge of Yusafzai. In 1855 he was charged with having arbitrarily imprisoned a Pathan chief named Khadar Khan, on suspicion of being concerned in the murder of Colonel Mackeson. The man was acquitted, and Dalhousie removed Hodson from his civil functions and remanded him to his regiment. He was also accused of malversation in the funds of his regiment. He was tried by a court of inquiry, who found that his system of accounts was "calculated to screen peculation and fraud." A later inquiry carried out by Major Reynell Taylor, found Hodson's accounts to be "an honest and correct record . . . irregularly kept." This particular charge may be declared "not proven." Other irregularities in money matters were from time to time charged against him.

Hodson's career seemed ruined when the Indian Mutiny broke out. At the outset of the campaign he made his name by riding with despatches from General Anson at Karnal to Meerut and back again, a distance of 152 m. in all, in seventy-two hours, through a country swarming with the rebel cavalry. He was then empowered to raise a regiment of 2,000 irregular horse, famous as Hodson's Horse, and was placed at the head of the Intelligence Department. In his double rôle of cavalry leader and intelligence officer, Hodson played a large part in the reduction of Delhi and consequently in saving India.

Hodson had the defects of his qualities. During the siege of Delhi a native, said to be an enemy of Bisharat Ali, to whom Hodson owed money, informed Hodson that Bisharat had turned rebel and had just reached Khurkhouda, a village near Delhi. Hodson thereupon took out a body of his sowars, attacked the village, and shot Bisharat Ali and several of his relatives. Again, after the fall of Delhi, Hodson obtained from General Wilson permission to ride out with fifty horsemen to Humayun's tomb, 6 m. out of Delhi, and bring in Bahadur Shah, the last of the Moguls. This he did with safety in the face of a large and threatening crowd. Next day with 100 horsemen he went out to the same tomb and obtained the unconditional surrender of the three princes, who had been left behind on the previous occasion. A crowd of 6,000 persons gathered, and Hodson ordered them to disarm, which they proceeded to do. He sent the princes on with an escort of ten men, while with the remaining ninety he collected the arms of the crowd. On galloping after the princes he found the crowd once more threatening an attack; and fearing that he would be unable to bring his prisoners into Delhi he shot them with his own hand. This is the most bitterly criticized action in his career. Furthermore he gave the king a safe conduct, which was afterwards seen by Sir Donald Stewart, before he left the palace. He was freely accused of looting at the time, but the charge is difficult to reconcile with the fact that he died a poor man, his effects being sold for £170. Hodson was killed on March 11, 1858 in the attack on the Begum Kotee at Lucknow.

The controversy relating to Hodson's moral character is very complicated and unpleasant. Upon Hodson's side see Rev. G. Hodson, *Hodson of Hodson's Horse* (1883), and L. J. Trotter, *A Leader of Light Horse* (1901); against him, R. Bosworth Smith, *Life of Lord Lawrence*, appendix to the 6th edition of 1885; T. R. E. Holmes, *History of the Indian Mutiny*, appendix N to the 5th edition of 1898, and *Four famous Soldiers* by the same author, 1889; and General Sir Crawford Chamberlain, *Remarks on Captain Trotter's Biography of Major W. S. R. Hodson* (1901).

HOE, RICHARD MARCH (1812-1886), American inventor, was born in New York city on Sept. 12, 1812. He was the son of Robert Hoe (1784-1833), an English-born American mechanic, who with his brothers-in-law, Peter and Mathew Smith, established in New York city a manufactory of printing presses, and used steam to run his machinery. Richard became head of Robert Hoe and Company on his father's death. He had considerable inventive genius and set himself to secure greater speed for printing presses. He discarded the old flat-bed model and placed the type on a revolving cylinder, a model later developed into the Hoe rotary or "lightning" press, patented in 1846, and further improved under the name of the Hoe web perfecting press (see **PRINTING**). He died in Florence, Italy, on June 7, 1886.

See *A Short History of the Printing Press* (1902) by his nephew Robert Hoe (1839-1909).

HOE: see **CULTIVATING MACHINERY**.

HOE CULTURE: see **AGRICULTURE, PRIMITIVE**.

HOEFNAGEL, JORIS (1542-1600), Dutch painter, designer and traveller, the son of a diamond merchant, was born at Antwerp. He was a pupil of Jan Bol. He travelled abroad often in the company of the famous geographer Abraham Ortelius, studying and making drawings of countries, the people, their costumes and customs. He visited France, Spain, England and Italy. He was afterwards patronized by the elector of Bavaria at Munich, where he stayed eight years, and by the Emperor Rudolph II. at Prague. He is famous for his miniature work, especially on a missal in the Imperial library at Vienna; he painted animals and plants to illustrate works on natural history; and his illustrations (especially for Braun's *Civitates orbis terrarum*, 1572), give him a place among early topographical draughtsmen.

HOETZSCH, OTTO (1876-), German historian, was born at Leipzig on Nov. 14, 1876, and was educated at the Thomas gymnasium of that city and the University of Munich. He became, in 1913, professor of history at Berlin, and in 1920 a member of the *Reichstag*. Hoetzsch made a special study of east European politics, and edited, from 1910 onwards, the *Zeitschrift für Osteuropäische Geschichte*. His works include *Russland* (1913; 2nd ed., 1917), and *Der Krieg und die grosse Politik* (3 vols., 1917-18).

HOF, town of Germany, in the province of Upper Franconia, situated on the Saale, on the north-eastern spurs of the Fichtelgebirge, 103 m. S.W. of Leipzig. Pop. (1925) 41,377. Hof, originally called Regnitzhof, built about 1080, was sold by the dukes of Meran in 1373 to the burgraves of Nuremberg. Cloth manufacture introduced in the 15th century, and the manufacture of veils begun in the 16th century, greatly helped it, but it has suffered severely in various wars. In 1810 it was incorporated with Bavaria. In 1823 the greater part of the town was destroyed by fire. It has a town hall of 1563, and a hospital founded in 1262. It is the seat of woollen and cotton spinning, and the manufacture of cotton and half-woollen fabrics. It has also dye-works, flourmills, sawmills, breweries, ironworks, and manufactures of machinery, iron and tin wares, chemicals and sugar. In the neighbourhood there are large marble quarries and extensive iron mines.

HOFFER, ANDREAS (1767–1810), Tirolese patriot, was born on Nov. 22, 1767, at St. Leonhard, in the Passeier valley. There his father kept the inn "am Sand," which Hofer inherited, whence the popular nickname of "Sandwirth." In the wars against the French (1796–1805) he took part, first as a sharp-shooter and afterwards as a captain of militia. By the Treaty of Pressburg (1805) Tirol was transferred from Austria to Bavaria and Hofer soon became a leader of the agitation against Bavarian rule. In 1808 with others he visited Vienna at the invitation of the Archduke John to concert a rising in 1809. Hofer defeated the Bavarians heavily, enabling the Austrians to re-occupy Innsbruck temporarily, and a month later won two further victories on the Iselberg, drove back the Bavarians, who had advanced again, and entered Innsbruck in triumph. An autograph letter of the emperor Francis assured him that no peace would be concluded by which Tirol would again be separated from Austria, and Hofer, believing his work accomplished, returned home.

By the armistice of Znaim, however (July 12), Austria unconditionally surrendered Tirol and Vorarlberg. French and Bavarian troops, numbering 40,000, again invaded the country, which rose once more. Hofer (on whose head a price had been placed), placed himself at the head of the movement. After defeating the French on the Iselberg, Hofer again entered Innsbruck which he saved from sack. Hofer was now elected *Oberkommandant* of Tirol and for two months ruled the country in the emperor's name. He preserved the habits of a peasant, and his administration, while shrewd, was marked chiefly by a pious solicitude for details of faith and morals. On Sept. 29 Hofer received from the emperor a chain and medal of honour, which encouraged him in the belief that Austria did not intend again to desert him; but the Treaty of Schönbrunn (Oct. 14) again ceded Tirol to Bavaria. The French re-entered the country, and, an amnesty having been stipulated in the treaty, Hofer and his companions submitted to France, though not to Bavaria. On Nov. 12, however, deceived by false reports of Austrian victories, Hofer attempted to renew the revolt. The regular forces proved too strong and Hofer had to take refuge, but his hiding-place was betrayed and on Jan. 27, 1810, he was captured by Italian troops and sent to Mantua, where he was shot. This brutal act which inflamed popular sentiment against France, was attributed to Napoleon's direct orders. Napoleon, however, denied this. The most ignominious part was certainly played by the Austrian emperor Francis, who used Hofer and sacrificed him cynically. In 1823 Hofer's remains were removed from Mantua to a Franciscan church in Innsbruck.

See *Leben und Thaten des ehemaligen Tyroler Insurgenten-Chefs Andr. Hofer* (1810); Hormayr, *Geschichte Andr. Hofer's Sandwirths auf Passeyr* (Leipzig, 1845); Weidinger, *Andreas Hofer und seine Kampfgenossen* (3rd ed. Leipzig, 1861); Stampfer, *Sandwirth Andreas Hofer* (Freiburg, 1874); Schmolze, *Andreas Hofer und seine Kampfgenossen* (Innsbruck, 1900); I. Caracciolo, *Andrea Hofer nella Insurrezione anti-bavarese del 1809* (Bologna, 1928). His history has supplied the materials for tragedies to B. Auerbach and Immermann, and for numerous popular ballads (see Franke, *Andreas Hofer im Liede*, Innsbruck, 1884).

HÖFFDING, HARALD (1843–), Danish philosopher, was born and educated in Copenhagen where he became a professor in 1883. For Höfding the chief problems of philosophy are (a) the problem of knowledge (the logical problem); (b) the

problem of existence (the cosmological problem); (c) the problem of the estimation of worth (the ethico-religious question); (d) the problem of consciousness (the psychological problem); and these stand out in his best known works, the *Hist. of Modern Philosophy* (Eng. trans., 2 vols., 1900); *The Problems of a Philosopher* (Eng. trans., 1905), and *Philosophy of Religion* (Eng. trans., 1906). Höfding himself is averse to metaphysics. In psychology he is an associationist claiming that synthesis belongs to the nature of consciousness, and stressing the primacy of the will. His ethics, which is evolutionary and teleological, is based on religion, the essence of which he regards as the reaction of mind to the sense of value.

Höfding's other writings, which also exhibit his extensive knowledge of philosophy and science, include: *Den engelske Filosofi i vor Tid* (1874); *Etik* (1876); *Psychologi i Omrids paa Grundlag af Erfaring* (ed. 1892); *Charles Darwin* (1889); *Kontinuiteten i Kants filosofiske Udviklingsgang* (1893); *Det psykologiske Grundlag for logiske Domme* (1899); *Rousseau und seine Philosophie* (1901); *Mindre Arbejder* (1899); *Danske Filosofer* (1909); *Bergson's Filosofie* (1914); *Modern Philosophers* (1915); *Oplevelse og Tydning* (1918); *Spinoza's Ethica* (1918) and *Erkenntnistheorie u. Lebensauffassung* (1926); *Udvalgte Skrifter* (Copenhagen, vii. bd. 1902 foll.).

See E. Rindom, *H. Höfding* (Copenhagen, 1913); G. Schott, *H. Höfding als Religionsphilosoph* (Munich, 1913).

HOFFMAN, MALVINA (1887–), American sculptor, was born in New York city on June 15, 1887. She studied sculpture in New York with Herbert Adams and Gutzon Borglum, and in Paris with Auguste Rodin. After obtaining recognition in Paris, where she was awarded a first prize at the Salon in 1911 for "Russian Dancers," she settled in New York. Her memorial group, "The Sacrifice," presented to Harvard university by Mrs. Robert Bacon, but placed temporarily in the cathedral of St. John the Divine, New York city, is considered the finest of her works. Three portraits by her of Paderewski, when exhibited in New York in 1920, attracted great admiration. Other works are "John Muir" in the American Museum of Natural History, New York city; "Modern Crusader" in the Metropolitan Museum of Art, New York city; "Bacchanale Russe" in the Luxembourg Musée, Paris, and "Gervase Elwes" in Queen's Hall, London. One of her latest commissions was a heroic size stone group over the entrance of Bush House, Strand, London. She was married to S. B. Grimson on June 6, 1924, in New York city.

HOFFMANN, AUGUST HEINRICH (1798–1874), known as **HOFFMANN VON FALLERSLEBEN**, German poet, philologist and historian of literature, was born at Fallersleben, Lüneburg, Hanover, on April 2, 1798, the son of the mayor of the town. Educated at the universities of Göttingen and Bonn, he was custodian of the university library at Breslau (1823–38), extraordinary professor of German language and literature at Breslau (1830), and ordinary professor (1835). He was deprived of his chair by the Prussian authorities in 1842 in consequence of his *Unpolitische Lieder* (1840–41). He then became a naturalized citizen of Mecklenburg, and after the revolution of 1848 was enabled to return to Prussia. In 1860 he was appointed librarian to the Duke of Ratibor at the castle of Corvey, where he died on Jan. 19, 1874. Fallersleben was among the earliest and most effective of the political poets who prepared the way for the revolutionary movement of 1848. He composed melodies for many of his songs, which were sung all over Germany. Among the best known is *Deutschland, Deutschland über Alles*, written at Heligoland (Aug. 26, 1841).

The best of his poems is his *Gedichte* (1827; 9th ed., Berlin, 1887); but there is great merit also in his *Alemannische Lieder* (1826; 5th ed., 1843), *Soldatenlieder* (1851), *Soldatenleben* (1852), *Rheinleben* (1865), and in his *Fünfzig Kinderlieder*, *Fünfzig neue Kinderlieder*, and *Alte und neue Kinderlieder*. As a student of ancient Teutonic literature Hoffmann ranks among the most persevering and cultivated of German scholars. *Die deutsche Philologie im Grundriss* (1836) was at the time of its publication a valuable contribution to philological research, and his *Geschichte des deutschen Kirchenliedes bis auf Luther* (1832; 3rd ed., 1861),

Unsere volkstümlichen Lieder (3rd ed., 1869) and *Die deutschen Gesellschaftslieder des 16. und 17. Jahrh.* (2nd ed., 1860) are all important works.

BIBLIOGRAPHY.—In 1868–70 Hoffmann published an autobiography, *Mein Leben: Aufzeichnungen und Erinnerungen* (an abbreviated ed. in 2 vols., 1894); his *Gesammelte Werke* were edited by H. Gerstenberg in 8 vols. (1891–94); his *Ausgewählte Werke* by H. Benzmann (1905, 4 vols.). See also *Briefe von Hoffmann von Fallersleben und Moritz Haupt an Ferdinand Wolf* (1874); J. M. Wagner, *Hoffmann von Fallersleben, 1818–1868* (1869–70); Berneisen, *Hoffmann von Fallersleben als Vorkämpfer deutscher Kultur in Belgien und Holland* (1915).

HOFFMANN, ERNST THEODOR WILHELM (1776–1822), German romance-writer, who was also a composer, theatrical manager, lawyer and many other things in the course of his diversified career, was born at Königsberg on Jan. 24, 1776. For the name Wilhelm he himself substituted Amadeus in homage to Mozart. His parents lived unhappily together, and when the child was only three they separated. He was brought up by an uncle, who had neither understanding nor sympathy for his dreamy and wayward temperament. He studied law at Königsberg, and began to practise in the town in 1795. He then removed to Glogau, in 1798 to Berlin, and in 1800 received an official legal appointment (*assessor*) at Posen, which he lost, however, through having offended the authorities by his caricatures. He was sent to a little country town, Plozk, into virtual banishment. There he spent his leisure in musical composition, which was, throughout his life, his chief delight. In 1804 he received an appointment at Warsaw, where, through Zacharias Werner, he became acquainted with the work of Novalis, Tieck, Wackenroder and other romanticists. He was happy in Warsaw, where he wrote the music of Brentano's *Lustige Musikanten* and Werner's *Kreuz an der Ostsee*; also an opera *Liebe und Eifersucht*, based on Calderon's drama *La Banda y la Flor*. The French invasion (1806) put an end to this peaceful existence, and Hoffmann lived an uncertain and troubled life until 1814. He was for a short time musical director of a theatre at Bamberg, then at Dresden, and wrote the sketches in the *Allgemeine musikalische Zeitung*, ultimately collected, with others, in the *Phantasiestücke in Callots Manier* (4 vols., 1814).

In 1814 he resumed his legal profession in Berlin, and two years later he was appointed councillor of the court of appeal (*Kammergericht*). Hoffmann had the reputation of being an excellent jurist and a conscientious official; he had leisure for literary pursuits and belonged to the circle of Romantic poets and novelists who gathered round Fouqué, Chamisso and his old friend Hitzig. He had a great musical success with his opera *Undine* (1816), to libretto by Fouqué, and, under the name of "Johannes Kreisler, Kapellmeister," he wrote the excellent musical criticisms on J. S. Bach—at that time almost forgotten—on Beethoven and others, which inspired Schumann's *Kreisleriana*. To his Berlin period belong the great series of tales which have placed Hoffmann in the short list of great story-tellers of the strange and grotesque. Unfortunately, the habits of intemperance which, in earlier years, had thrown a shadow over his life, grew on him, and his health was speedily undermined by the nights he spent in the wine-house. He died of locomotor ataxy on July 24, 1822.

The *Phantasiestücke*, with a preface by Jean Paul, were followed by the gruesome novel—to some extent inspired by Lewis's *Monk*—*Die Elixiere des Teufels* (1816), and the even more gruesome stories which make up the *Nachtstücke* (2 vols., 1817). The full range of Hoffmann's powers is first clearly displayed in the collection of stories (4 vols., 1819–21) *Die Serapionsbrüder*, this being the name of a small club of Hoffmann's more intimate literary friends. *Die Serapionsbrüder* includes not merely stories in which Hoffmann's love for the mysterious and the supernatural is to be seen, but novels in which he draws on his own early reminiscences (*Rat Krespel*, *Fermate*), finely outlined pictures of old German life (*Der Artushof*, *Meister Martin der Küfner und seine Gesellen*), and vivid and picturesque incidents from Italian and French history (*Doge und Dogaresa*, the story of Marino Faliero, and *Das Fräulein von Scuderi*). The last-mentioned story is usually regarded as Hoffmann's masterpiece. *Klein Zaches*,

genannt Zinnober (1819) and *Lebensansichten des Katers Murr, nebst fragmentarischer Biographie des Kapellmeisters Johannes Kreisler* (1821–22), are good examples of his powers as a humorist.

Hoffmann is one of the master novelists of the Romantic movement in Germany. He combined with a humour that reminds us of Jean Paul the same warm sympathy for the artist's standpoint towards life shown by early Romantic leaders like Tieck and Wackenroder; but he was superior to all in the almost clairvoyant powers of his imagination. His work abounds in grotesque and gruesome scenes; but the gruesome was only one outlet for Hoffmann's genius, and even here the secret of his power lay, not in his choice of subjects, but in the wonderfully vivid and realistic presentation of them. Every line he wrote leaves the impression behind that it expresses something felt or experienced; every scene, vision or character he described seems to have been real and living to him. It is this realism, in the best sense of the word, that made him the great artist he was, and gave him so extraordinary a power over his contemporaries. His influence in France and in England was, in fact, as great as in his own country.

With respect to his work as a composer, his *Undine* still holds the stage in Germany as a minor classic of its period, though he will probably be longest remembered by musicians in having provided the inspiration and the book for Offenbach's *Les Contes d'Hoffmann* ("Tales of Hoffmann"), based on three of his fantastic stories.

The first collected edition of Hoffmann's works appeared in 10 vols. (*Ausgewählte Schriften*, 1827–28); to these his widow added 5 vols. in 1839 (including the 3rd ed. of J. E. Hitzig's *Aus Hoffmanns Leben und Nachlass*, 1823). There are good modern editions by E. Grisebach (15 vols., 1900), W. Harich (15 vols., 1925), and others. There are many editions of selections, as well as cheap reprints of the more popular series. His writings on musical subjects were edited by Istel (1907) and his musical compositions by Becking (2 vols., 1923). All Hoffmann's important works—except *Klein Zaches* and *Kater Murr* have been translated into English; *The Devil's Elixir* (1824), *The Golden Pot*, by Carlyle (in *German Romance*, 1827); *The Serapion Brethren*, by A. Ewing (1886–92), etc. In France Hoffmann was even more popular than in England; cf. G. Thureau, *Hoffmanns Erzählungen in Frankreich* (1896). An edition of his *Oeuvres complètes* appeared in 12 vols. in Paris (1830). For bibliographies see Goedeke, *Grundriss zur Geschichte der deutschen Dichtung*, 2nd ed., vol. viii, pp. 468 seq. (1905), and G. Salomon, *E. T. A. Hoffmann, Bibliographie* (Weimar, 1924). See also G. Ellinger, *E. T. A. Hoffmann* (1894); O. Klinke, *Hoffmanns Leben und Werke vom Standpunkte eines Irrenarztes* (1903); W. Harich, *Das Leben eines Künstlers* (1921); W. Mausolf, *E. T. A. Hoffmanns Stellung zu Drama und Theater* (1920); H. von Wolzogen, *E. T. A. Hoffmann und R. Wagner* (1906), and *E. T. A. Hoffmann, der deutscher Geisterseher* (1922); R. von Schaukal, *E. T. A. Hoffmann* (Zürich, 1923); V. Ljungdörf, *E. T. A. Hoffmann och ursprung till hans konstnärskap* (Lund, 1924).

HOFFMANN, FRIEDRICH (1660–1742), German physician, a member of a family that had been connected with medicine for 200 years before him, was born at Halle on Feb. 19, 1660. On the founding of Halle university in 1693, he received the primarius chair of medicine, and he was charged with the framing of the statutes for the new medical faculty. He filled also the chair of natural philosophy. With the exception of four years (1708–1712) which he passed at Berlin in the capacity of royal physician, Hoffmann spent the rest of his life at Halle in instruction, practice and study, interrupted now and again by visits to different courts of Germany, where his services procured him honours and rewards. His fame became European. He died at Halle on Nov. 12, 1742.

Of his numerous writings a catalogue is to be found in Haller's *Bibliotheca medicae practicae*. The chief is *Medicina rationalis systematica*, undertaken at the age of 60, and published in 1730. It was translated into French in 1739, under the title of *Médecine raisonnée d'Hoffmann*. A complete edition of Hoffmann's works, with a life of the author, was published at Geneva in 1740, to which supplements were added in 1753 and 1760.

HOFFMANN, JOHANN JOSEPH (1805–1878), German scholar, was born at Würzburg on Feb. 16, 1805. From the traveller, P. F. von Siebold (1796–1866) he acquired the rudiments of Japanese. He then learned Chinese, and became Japanese translator to the Dutch Colonial Ministry. Eventually he received a chair of Oriental languages at Leyden. He died at The Hague on Jan. 23, 1878. Hoffmann's chief work was his unfinished Japanese dictionary, begun in 1839 and afterwards continued by

L. Serrurier. Unable at first to procure the necessary type, he set himself to the cutting of punches, and even when the proper founts were obtained he had to act as his own compositor as far as Chinese and Japanese were concerned. His Japanese grammar (*Japanische Sprechlehre*) was published in Dutch and English in 1867, and in English and German in 1876.

HOFFMANN, MAX (1869–1927), German general, was born at Homburg on Jan. 25, 1869. He spent many years in Russia, and was sometime general staff officer in the provinces of Posen and East Prussia. In 1914 he was general staff officer to the VIII. Army, was present at Tannenberg, became quarter-master-general of the Eastern command, and in 1916 succeeded Ludendorff as chief of the general staff in the East, under Prince Leopold of Bavaria. From that time he was mainly responsible for the operations on the Eastern front. In Dec. 1917 he conducted, on the German side, the negotiations with the Russians at Brest-Litovsk, and in February signed the treaty with the Ukraine. After the war he engaged in a lively controversy with Ludendorff. The rift seems to have dated from Jan. 1918, when Hoffmann read to the Emperor, William II., a memorandum condemning Ludendorff's scheme of Polish annexations. He sharply criticized the German high command in his book (1923), *Der Krieg der versäumten Gelegenheiten* (the War of Lost Opportunities), which, in spite of the evident animus against Hindenburg, Ludendorff and Falkenhayn, is a document of considerable importance to the student of the war. In *Tannenberg wie es wirklich war* (1927) he impugned the official account of the victory of Tannenberg, which was, he says, due to strategic orders drawn up before Hindenburg and Ludendorff arrived, and to the tactics of Gen. François, who commanded the I. Corps, and went his own way in defiance of Ludendorff's orders. Gen. Hoffmann is credited with a scheme for military intervention in Russia in 1922, and he wrote a book against Bolshevism, entitled *An allen Enden Moskau* (1925). He died on July 8, 1927.

HOFMANN, AUGUST WILHELM VON (1818–92), German chemist, was born at Giessen on April 8, 1818. He first read law and philosophy at Göttingen and then studied chemistry under Liebig. He acted for a short time as *Privatdozent* at Bonn and then, in 1845, accepted the invitation, made at the suggestion of the Prince Consort, to become the first director of the new Royal College of Chemistry, London. In 1864 he returned to Bonn, and in the following year he succeeded E. Mitscherlich as professor of chemistry and director of the laboratory in the University of Berlin. He continued his excellent work there as teacher and researcher until his death on May 5, 1892. In 1868 Hofmann founded the German Chemical Society and he was for many years its President.

Hofmann's work covered a wide range of organic chemistry; his first research, carried out in Liebig's laboratory at Giessen, was on coal-tar, and his investigation of organic bases established the nature of aniline. His perception of the analogy between it and ammonia led to his famous work on the amines and organic ammonium bases and the allied phosphorus compounds, while his researches on rosaniline, which he first prepared in 1858, formed the first of a series of investigations on colouring matters which culminated in the discovery of quinoline red in 1887. Hofmann is also known for his discovery of allyl alcohol (with Cahours), of formaldehyde, hydrazobenzene and the iso-nitriles. He discovered a method of converting an amide into an amine containing one carbon atom less and this important reaction is now known by his name. Hofmann's method for determining molecular weight of liquids by means of vapour densities was an important contribution to chemistry. In addition to the investigations for which he was responsible he exercised considerable influence on chemical progress through the valuable work of his pupils. As a teacher, besides the power of accurately gauging the character and capabilities of those who studied under him, he had the faculty of infecting them with his own enthusiasm, and thus of stimulating them to put forward their best efforts. In the lecture-room he laid great stress on the importance of experimental demonstrations, paying particular attention to their selection and arrangement, though, since he himself was a somewhat clumsy

manipulator, their actual exhibition was generally entrusted to his assistants. He was the possessor of a clear and graceful, if somewhat florid, style, which showed to special advantage in his numerous obituary notices or encomiums (collected and published in three volumes, *Zur Erinnerung an vorangegangene Freunde*, 1888).

See *Mem. "Hofmann Memorial Lecture," Journal of the Chemical Society* (1896).

HOFFMANN, JOSEF CASIMIR (1876–), pianist and composer, was born at Cracow, Poland, Jan. 20, 1876. At seven he attracted Rubinstein's attention, becoming his pupil. Touring Europe at nine, he went to the United States two years later, giving 52 concerts, but was compelled to stop by the Society for Prevention of Cruelty to Children. He returned to Europe, studied further under Rubinstein, Urban and Moszkowski, and resumed public performances in 1894. When the Curtis Institute of Music, Philadelphia, was endowed in 1924, he was invited to head the piano department. He became the director in May 1927, not long after his naturalization as an American citizen. His compositions include a symphony, two concertos, five piano sonatas, an orchestral suite, *Mignonettes*, four *Old Dutch Songs*, *Trois Impressions* (M. Dvorsky) and *Valse Caprice*. He is the author of *Piano Playing* (1898) and *Piano Questions* (1900).

HOFMANN or HOFFMANN, MELCHIOR (c. 1498–1543/4), anabaptist, was born at Hall, in Swabia. He was a furrier of Livonia, and with others travelled to Sweden, preaching as he went. Fervid attacks on image worship led to expulsion, and Hofmann thereafter went from place to place in the Baltic States and in Germany, meeting Luther at Wittenberg. Frederick I. of Denmark appointed him a preacher at Kiel. He developed a Zwinglian view of the Eucharist; Luther was alarmed, and at a colloquy of preachers in Flensburg (April 8, 1529) Hofmann, John Campanus and others were put on their defence. Refusing to retract, he was banished, and at Strasbourg, to which he now turned, he was well received till his anabaptist development became apparent. Journeying to East Friesland (1530) he founded a community at Emden (1532). Despite the warning of John Trypmaker he returned in 1533 to Strasbourg, which was to be the seat of the New Jerusalem, and was arrested. He denied that he had made common cause with the anabaptists, but refused the articles of faith proposed to him by the provincial synod. The last notice of his imprisonment is on Nov. 19, 1543; he probably died soon after.

His works (*Weissagung vsz heiliger göttlicher geschrieff* [1530] and *Prophecey oder Weissagung vsz warer heiliger göttlicher schrieff* [1530]) influenced Menno Simons and David Joris. He has been claimed as a pioneer of some of the positions of Servetus. He maintained that all are elected to salvation, only the regenerate may receive baptism, and those who sin after regeneration sin against the Holy Ghost, and cannot be saved. His followers were known as Hofmannites or Melchiorites.

See G. Herrmann, *Essai sur la vie et les écrits de M. Hofmann* (1852); F. O. zur Linden, *M. Hofmann, ein Prophet der Wiedertäufer* (1885); H. Holtzmann, in *Allgemeine deutsche Biographie* (1880); Hegler in *Hauck's Realenzyklopädie* (1900).

HOFMANNSTHAL, HUGO VON (1874–1929), Austrian poet, was born in Vienna on Feb. 1, 1874. He took the degree of Ph.D. at the University of Vienna and when still a school-boy originated the romantic school in Austria by his lyric and semi-dramatic poetry, which aroused much controversy at the time. He was not uninfluenced by Stefan Georg's example and Hermann Bahr's criticism, but the melody and colour of his language, and the art with which he gave poetic expression to complicated spiritual moods were new. He had genius for appreciating bygone cultures and a sensitive understanding of the beautiful in art and in nature.

Hofmannsthal is little indebted to contemporary realism, but his almost too susceptible personality is tinged by innumerable literary influences from the Attic tragedians down to Victor Hugo, Swinburne, Browning and D'Annunzio. This is especially noticeable in his dramatic poems, not a few of which are simply old plays of Sophocles, of Calderon, Molière and Otway cloaked

in modern form and spirit. Nevertheless he has an abiding place in the history of literature as founder of the whole German neo-romantic drama. Some of his dramas became known outside Austria and Germany through the music of his friend Richard Strauss, others through Reinhardt's Festival plays at Salzburg. His collected poems appeared in 1911, his collected prose began to appear in 1907. In later years he turned his attention to society comedy. The most characteristic of his original dramas are: *Gestern* (1891); *Der Tod des Tizian* (1892); *Der Tor und der Tod* (1893); *Der Abenteurer und die Sngerin* (1899); *Oedipus und die Sphinx* (1906); *Cristinas Heimkehr* (1910); and his libretti: *Elektra* (1903); *Der Rosenkavalier* (1911); *Ariadne auf Naxos* (1912); *Die Frau ohne Schatten* (1919); and *Der Unbestechliche* (1923). He died on July 15, 1929.

See monograph by Sulger-Gebing (1905) and pamphlet by Borchardt (1905).

HOFMEISTER, WILHELM FRIEDRICH BENE-DICT (1824-1877), German botanist, was born at Leipzig on May 24, 1824, was professor of botany at Heidelberg, and then at Tbingen. His first work was on the distribution of Coniferae in the Himalayas, but his attention was soon turned to the sexuality and origin of the embryo of Phanerogams, and he finally settled the question of the origin of the embryo from an ovum, as against the prevalent pollen-tube theory of M. J. Schleiden. His study of the embryology of Bryophytes and Pteridophytes led to his accounts of the germination of the spores and fertilization in *Pilularia*, *Salvinia*, *Selaginella*. His important *Vergleichende Untersuchungen der Keimung, Entfaltung und Fruchtbildung hherer Kryptogamen und der Samenbildung der Coniferen*, which appeared in 1851 (Eng. trans., 1862) demonstrated the life-story of liverworts, mosses, ferns, equiset, rhizocarps, lycopodiaceae and even gymnosperms, and the analogy between these higher cryptogams and the conifers. It is the typical work of an heroic age of plant-morphology. Hofmeister died at Lindau, near Leipzig, on Jan. 12, 1877.

See K. von Goebel, *Wilhelm Hofmeister* (1924, Eng. trs., 1926).

HOFMEYR, JAN HENDRIK (1845-1909), South African politician, was born at Cape Town on July 4, 1845. He was educated at the South African college. He was editor of the *Zuid Afrikaan* till its incorporation with *Ons Land*, and of the *Zuid Afrikaansche Tijdschrift*. By birth, education and sympathies a typical Dutch Afrikaner, he set himself to organize the political power of his fellow-countrymen, and, when in 1879, he entered the Cape parliament as member for Stellenbosch, he became the real leader of the Dutch party. He held office for six months—as minister without portfolio in the Scanlen ministry from May to Nov. 1881. He held no subsequent official post in the colony, though, with Sir Thomas Upington and Sir Charles Mills, he represented the Cape at the intercolonial conference of 1887. Here he supported the proposal for entrusting the defence of Simon's Town to Cape Colony, leaving only the armament to be provided by the imperial government, opposed trans-oceanic penny postage and favoured an imperial customs union. At the colonial conference of 1894 at Ottawa he was again a Cape representative. In 1888 and in 1889 he was a member of the South African customs conference.

His power was based on his influence over the Dutch in Cape Colony, and his control of the Afrikaner Bond. In 1878 he founded the "Farmers' Association," and, as the Cape farmers were almost entirely Dutch, the Association became a centre of Dutch influence. When the Bond was formed in 1882, with purely political aims, Hofmeyr obtained control of it, and in 1883 amalgamated the Farmers' Association with it. Under his direction the constitution of the Bond was modified by the elimination of provisions inconsistent with loyalty to the British Crown. But it remained an organization for obtaining the political supremacy of the Cape Dutch. (See *CAPE COLONY: History*.) His control over the Bond enabled him to make and unmake ministers and earned for him the name of "cabinet-maker of South Africa." Although officially the term "Afrikaner" was explained by Hofmeyr to include white men of whatever race, in practice the influence of the Bond was always exerted in favour of the Dutch,

and its power was drawn from the Dutch districts of Cape Colony. The sympathies of the Bond were thus always strongly with the Transvaal, as the chief centre of Dutch influence in South Africa. But Hofmeyr resented the reckless disregard of Cape interests involved in Kruger's fiscal policy; he feared that the Transvaal, after the gold discoveries of 1886, might overshadow all other Dutch influences in South Africa; above all he was convinced that the protection of the British navy was indispensable and he opposed Kruger's intention of acquiring an outlet to the sea in order to get into touch with foreign powers.

In 1890 Hofmeyr joined forces with Cecil Rhodes, who became premier of Cape Colony with the support of the Bond. But elements in the Bond grew alarmed at Rhodes's imperialism, and in 1895 Hofmeyr resigned his seat in parliament and the presidency of the Bond. Then came the Jameson raid. Once more Hofmeyr became president of the Bond. By an alteration of the provincial constitution, all power in the Cape branch of the Bond was vested in a vigilance committee of three, of whom Hofmeyr and his brother were two. As leader of the Cape Dutch, he protested against such abuses as the dynamite monopoly in the Transvaal, and urged Kruger to grant reasonable concessions rather than plunge into war. In July 1899 he went to Pretoria, and vainly supported the proposal of a satisfactory franchise law, combined with a limited representation of the Uitlanders in the *volksraad*, and in September urged the Transvaal to accede to the proposed joint enquiry. During the negotiations of 1899, and after the outbreak of war, the official organ of the Bond, *Ons Land*, was conspicuous for its anti-British attitude, and Lord Roberts suppressed it in the Cape Colony district under martial law. Hofmeyr never associated himself publicly with the opinions expressed by *Ons Land*, but neither did he repudiate them. His position was difficult, and shortly after the outbreak of war he withdrew to Europe. He refused to act on the "conciliation committee" which came to England in 1901 in the interests of the Boer republics.

Towards the close of the war Hofmeyr returned to South Africa and organized the Bond forces for the general election in Cape Colony in 1904, which resulted in the defeat of the Bond party. Hofmeyr retained his ascendancy over the Cape Dutch, but he was out of sympathy with the larger outlook on South African affairs taken by the younger Boer leaders in the Transvaal. In 1906 he offended the extreme section of the Bond by criticisms of the *taal* and his use of English in speeches. At the general election in 1908 the Bond, still largely under his direction, gained a victory at the polls, but Hofmeyr himself was not a candidate. In the renewed movement for the closer union of the South African colonies he advocated federation as opposed to unification. When, however, the unification proposals were ratified by the Cape parliament, Hofmeyr went to England as one of the Cape delegates in 1909 to submit the draft act of union to the imperial government. He died in London on Oct. 16, 1909.

See Jan Hendrick Hofmeyr, M.A. and Francis William Reitz, *The Life of Jan Hendrick Hofmeyr* (Cape Town, 1913).

HOGARTH, DAVID GEORGE (1862-1927), English archaeologist, was born on May 23, 1862, at Barton-on-Humber, Lincs, the son of a clergyman, and died at Oxford on Nov. 6, 1927. He had been president of the Royal Geographical Society since 1925 and keeper of the Ashmolean museum since 1909. He was not only one of the greatest scholars of his time but also a man of action who left his mark on the middle east through the magnificent work which he did as director of the Arab Bureau at Cairo during the World War.

Hogarth was educated at Winchester and Magdalen college, Oxford, of which he became a fellow in 1886. In 1893 he was elected a research fellow to carry out archaeological investigations in the Levant. He conducted explorations in Cyprus, Egypt, Ephesus, Carchemish and Crete (1887-1907). He was for a time director of the British school at Athens and in 1899 became director of the Cretan exploration fund.

In 1915 he was sent to Cairo by the director of naval intelligence with the temporary rank of lieutenant-commander to take charge of the communications with the Arab leaders which were intended

to lead to the Arab revolt against Turkish rule. Next year he began to build up at Cairo that Arab Bureau which drew into its service Gertrude Bell, Mark Sykes, T. E. Lawrence and other brilliant servants. He then returned to London to work there on Arab and middle-eastern problems, returning to Cairo in the last year of the war. In 1919 he was British commissioner at the Middle-East Commission of the Paris Peace Conference.

His works include *A Wandering Scholar in the Levant* (1896), which at once won for him the love of many readers; *Philip and Alexander of Macedon* (1897); *The Nearer East* (1902); *The Penetration of Arabia* (1904); *Carchemish I.* (1914); *The Wandering Scholar* (1925); *Kings of the Hittites* (1926); etc. etc.

HOGARTH, WILLIAM (1697-1764), the great English painter and pictorial satirist, was born at Bartholomew Close in London on Nov. 10, 1697. His father, Richard Hogarth, who died in 1718, was a school-master and literary hack, who had come to the metropolis to seek that fortune which had been denied to him in his native Westmorland. The son seems to have been early distinguished by a talent for drawing and an active perceptive faculty rather than by any close attention to learning. "Shows of all sorts gave me uncommon pleasure when an infant," he says, "and mimicry, common to all children, was remarkable in me. . . . My exercises when at school were more remarkable for the ornaments which adorned them than for the exercise itself." This being the case, he was apprenticed to a silver-plate engraver, Mr. Ellis Gamble, at the sign of the "Golden Angel" in Cranbourne street or Alley, Leicester Fields. For this master he engraved a shop-card which is still extant. His apprenticeship must have been concluded before the beginning of 1720, for in April of that year he appears to have set up as engraver on his own account. His desires, however, were not limited to silver-plate engraving. "Engraving on copper was, at 20 years of age, my utmost ambition." For this he lacked the needful skill as a draughtsman; and his account of the means which he took to supply this want, without too much interfering with his pleasure, is thoroughly characteristic. "Laying it down," he says, "first as an axiom, that he who could by any means acquire and retain in his memory, perfect ideas of the subjects he meant to draw, would have as clear a knowledge of the figure as a man who can write freely hath of the twenty-four letters of the alphabet and their infinite combinations (each of these being composed of lines), and would consequently be an accurate designer, . . . I therefore endeavoured to habituate myself to the exercise of a sort of technical memory, and by repeating in my own mind, the parts of which objects were composed, I could by degrees combine and put them down with my pencil." There is little doubt that his marvellous power of seizing expression owed less to patient academical study than to his unexampled eye-memory and tenacity of minor detail. But he was not without technical training, since he is known to have studied at Sir James Thornhill's then recently opened art school.

"His first employment" after he set up for himself "seems," says John Nichols, in his *Anecdotes*, "to have been the engraving of arms and shop bills." After this he was employed in designing "plates for booksellers." "Masquerades and Operas" (1724), the first plate he published on his own account, is a clever little satire on contemporary follies, such as the masquerades of the Swiss adventurer Heidegger, the popular Italian opera-singers, Rich's pantomimes at Lincoln's Inn Fields, and the exaggerated popularity of Lord Burlington's protégé, the architect painter William Kent, who is here represented on the summit of Burlington Gate, with Raphael and Michelangelo for supporters. This worthy Hogarth had doubtless not learned to despise less in the school of his rival Sir James Thornhill. Indeed almost the next of Hogarth's important prints was aimed at Kent alone, being that memorable burlesque of the unfortunate altarpiece designed by the latter for St. Clement Danes, which, in deference to the ridicule of the parishioners, Bishop Gibson took down in 1725. Hogarth's squib, which appeared subsequently, exhibits it as a very masterpiece of confusion and bad drawing. In 1726 he prepared twelve large engravings for Butler's *Hudibras*. These he himself valued highly, and they are the best of his book illus-

trations.

In 1727, Hogarth was engaged by Joshua Morris, a tapestry worker, to prepare a design for the "Element of Earth." Morris, however, having heard that he was "an engraver, and no painter," declined the work when completed, and Hogarth accordingly sued him for the money in the Westminster Court, where, on May 28, 1728, the case was decided in Hogarth's favour. It may have been the aspersion thus early cast on his skill as a painter (coupled perhaps with the unsatisfactory state of print-selling, owing to the uncontrolled circulation of piratical copies) that induced him to turn his attention to the production of "small conversation pieces" (i.e., groups in oil of full-length portraits from 12 to 15 in. high), many of which are still preserved in different collections. "This," he says, "having novelty, succeeded for a few years." Among his other efforts in oil between 1728 and 1732 were "The Wanstead Conversation," "The House of Commons examining Bambridge," an infamous warden of the Fleet, and several pictures of the chief actors in Gay's popular *Beggar's Opera*.

On March 23, 1729 he was married at old Paddington church to Jane Thornhill, the only daughter of Sir James Thornhill. The match was a clandestine one. We next hear of him in "lodgings at South Lambeth," where he rendered some assistance to the then well-known Jonathan Tyers, who opened Vauxhall in 1732 with an entertainment styled a *ridotto al fresco*. For these gardens Hogarth painted a poor picture of Henry VIII. and Anne Boleyn, and he also permitted Hayman to make copies of the later series of the "Four Times of the Day." In return, the grateful Tyers presented him with a gold pass ticket "*In perpetuum Beneficii Memoriam*." It was long thought that Hogarth designed this himself. Mr. Warwick Wroth (*Numismatic Chronicle*, vol. xviii.) doubts this, although he thinks it probable that Hogarth designed some of the silver Vauxhall passes which are figured in Wilkinson's *Londina illustrata*. The only engravings between 1726 and 1732 which need be referred to are the "Large Masquerade Ticket" (1727), another satire on masquerades, and the print of "Burlington Gate" (1731), evoked by Pope's *Epistle to Lord Burlington*, and defending Lord Chandos, who is therein satirized. This print gave great offence, and was, it is said, suppressed.

By 1731 Hogarth completed the earliest of the series of moral works which first gave him his position as an original genius. This was "A Harlot's Progress." Almost immediately afterwards he must have begun to engrave them—a task he had at first intended to leave to others. From an advertisement in the *Country Journal; or, the Craftsman*, Jan. 29, 1732, the pictures were then being engraved, and from later announcements it seems clear that they were delivered to the subscribers early in the following April, on the 21st of which month an unauthorized prose description of them was published. We have no record of the particular train of thought which prompted these story-pictures; but it may perhaps be fairly assumed that the necessity for creating some link of interest between the personages of the little "conversation pieces" above referred to, led to the further idea of connecting several groups or scenes so as to form a sequent narrative. "I wished," says Hogarth, "to compose pictures on canvas, similar to representations on the stage." "I have endeavoured," he says again, "to treat my subject as a dramatic writer; my picture is my stage, and men and women my players, who by means of certain actions and gestures are to exhibit a *dumb show*." There was never a more eloquent dumb show than this of the "Harlot's Progress." In six scenes the miserable career of a woman of the town is traced out remorselessly from its first facile beginning to its degraded end. Nothing of the detail is softened, the whole is acted out with the hard, uncompassionate morality of the age the painter lived in, while the introduction here and there of one or two well-known characters such as Colonel Charteris and Justice Gonsou give a vivid reality to the satire. It had an immediate success. To say nothing of the fact that the talent of the paintings completely reconciled Sir James Thornhill to the son-in-law he had hitherto refused to acknowledge, more than 1,200 names of subscribers to the engravings were entered in the artist's book. On the appearance of plate iii. the lords of the treasury trooped to the print shop for Sir John Gonsou's portrait which it contained.

The story was made into a pantomime by Theophilus Cibber, and by some one else into a ballad opera; and it gave rise to numerous pamphlets and poems. It was painted on fan-mounts and transferred to cups and saucers. Lastly, it was freely pirated. There could be no surer testimony to its popularity.

From the mss. of George Vertue in the British Museum (Add. mss. 23,069-98) it seems that during the progress of the plates, Hogarth was domiciled with his father-in-law, Sir James Thornhill, in the Middle Piazza, Covent Garden (the "second house eastward from James Street"), and it must have been thence that set out the historical expedition from London to Sheerness of which the original record still exists at the British Museum. This is an oblong ms. volume entitled *An Account of what seem'd most Remarkable in the Five Days' Peregrination of the Five Following Persons, vizt., Messieurs Tothall, Scott, Hogarth, Thornhill and Forrest. Begun on Saturday May 27th 1732 and Finish'd On the 31st of the Same Month. Abi tu et fac similiter. Inscription on Dulwich College Porch.* The journal, which is written by Ebenezer, the father of Garrick's friend Theodosius Forrest, gives a good idea of what a "frisk"—as Johnson called it—was in those days, while the illustrations were by Hogarth and Samuel Scott the landscape painter. John Thornhill, Sir James's son, made the map. This version (in prose) was subsequently run into rhyme by one of Hogarth's friends, the Rev. Wm. Gostling of Canterbury, and after the artist's death both versions were published. In the absence of other biographical detail, they are of considerable interest to the student of Hogarth. In 1733 Hogarth moved into the "Golden Head" in Leicester Fields, which, with occasional absences at Chiswick, he continued to occupy until his death. By December of this year he was already engaged upon the engravings of a second Progress, that of a Rake. It was not as successful as its predecessor. It was in eight plates in lieu of six. The story is unequal; but there is nothing finer than the figure of the desperate hero in the Covent Garden gaming-house, or the admirable scenes in the Fleet prison and Bedlam, where at last his headlong career comes to its tragic termination. The plates abound with allusive suggestion and covert humour.

"A Rake's Progress" was dated June 25, 1735, and the engravings bear the words "according to Act of Parliament." This was an act (8 Geo. II. cap. 13) which Hogarth had been instrumental in obtaining from the legislature, being stirred thereto by the shameless piracies of rival printsellers. Although loosely drawn, it served its purpose; and the painter commemorated his success by a long inscription on the plate entitled "Crowns, Mitres, etc.," afterwards used as a subscription ticket to the Election series. These subscription tickets to his engravings, let us add, are among the brightest and most vivacious of the artist's productions. That to the "Harlot's Progress" was entitled "Boys peeping at Nature," while the "Rake's Progress" was heralded by the delightful etching known as "A Pleased Audience at a Play, or The Laughing Audience."

Of the prints which followed the two Progresses, "A Modern Midnight Conversation," is an admirable drinking scene which comes between them in 1733, and the bright little plate of "Southwark Fair" although dated 1733, was published with "A Rake's Progress" in 1735. Between these and "Marriage à la mode," upon the pictures of which the painter must have been not long after at work, come the small prints of the "Consultation of Physicians" and "Sleeping Congregation" (1736), the "Scholars at a Lecture" (1737); the "Four Times of the Day" (1738), a series of pictures of 18th century life, the earlier designs for which have been already referred to; the "Strolling Actresses dressing in a Barn" (1738), which Walpole held to be, "for wit and imagination, without any other end, the best of all the painter's works"; and finally the admirable plates of the Distrest Poet painfully composing a poem on "Riches" in a garret, and the Enraged Musician fulminating from his parlour window upon a discordant orchestra of knife-grinders, milk-girls, ballad-singers and the rest upon the pavement outside. These are dated respectively 1736 and 1741. To this period also (*i.e.*, the period preceding the production of the plates of "Marriage à la mode") belong two of those history pictures to which, in emulation of the Haymans and Thornhills, the

artist was continually attracted. "The Pool of Bethesda" and the "Good Samaritan," "with figures 7 ft. high," were painted *circa* 1736, and presented by the artist to St. Bartholomew's hospital where they remain. They were not masterpieces; and it is pleasanter to think of his connection with Captain Coram's recently established Foundling hospital (1739), which he aided with his money, his graver and his brush, and for which he painted that admirable portrait of the good old philanthropist which is now loaned to the National Gallery, London.

In "A Harlot's Progress" Hogarth had not strayed much beyond the lower walks of society, and in "A Rake's Progress," his hero was taken from the middle classes. His masterpiece, "Marriage à la mode," successfully depicted, as the advertisement has it, "a variety of modern occurrences in high life." The countess's bedroom, the earl's apartment with its lavish coronets and old masters, the grand saloon with its marble pillars and grotesque ornaments, are fully as true to nature as the frowsy chamber in the "Turk's Head Bagnio," the quack-doctor's museum in St. Martin's Lane, or the mean opulence of the merchant's house in the city. The engravings of "Marriage à la mode" were dated April 1745. Although by this time the painter found a ready market for his engravings, he does not appear to have been equally successful in selling his pictures. The people bought his prints; but the richer and not numerous connoisseurs who purchased pictures were wholly in the hands of the importers and manufacturers of "old masters." In Feb. 1745 the original oil paintings of the two Progresses, the "Four Times of the Day" and the "Strolling Actresses" were still unsold. On the last day of that month Hogarth disposed of them by an ill-devised kind of auction, the details of which may be read in Nichols's *Anecdotes*, for the paltry sum of £427 7s. No better fate attended "Marriage à la mode," which six years later became the property of Lane of Hillingdon for 120 guineas. Something of this was no doubt due to Hogarth's impracticable arrangements, but the fact shows how blind his contemporaries were to his merits as a painter, and how hopelessly in bondage to the all-powerful picture-dealers. Of these latter the painter himself gave a graphic picture in a letter addressed by him under the pseudonym of "Britophil" to the *St. James's Evening Post*, in June 1737.

But if Hogarth was not successful with his dramas on canvas, he occasionally shared with his contemporaries in the popularity of portrait painting. For a picture, executed in 1746, of Garrick as Richard III. he was paid £200, "which was more," says he, "than any English artist ever received for a single portrait." In the same year a sketch of Simon Fraser, Lord Lovat, afterwards beheaded on Tower Hill, had an exceptional success.

Other important works are "The Stage Coach or Country Inn Yard" (1747); the series of 12 plates entitled "Industry and Idleness" (1747), depicting the career of two London apprentices; the "Gate of Calais" (1749), which had its origin in a rather unfortunate visit paid to France by the painter after the peace of Aix-la-Chapelle; the "March to Finchley" (1750); "Beer Street," "Gin Lane" and the "Four Stages of Cruelty" (1751); the admirable representations of election humours in the days of Sir Robert Walpole, entitled "Four Prints of an Election" (1755-1758); and the plate of "Credulity, Superstition and Fanaticism, a Medley" (1762), adapted from an earlier unpublished design called "Enthusiasm Delineated." Besides these must be chronicled three more essays in the "great style of history painting," viz. "Paul before Felix," "Moses brought to Pharaoh's Daughter" and the Altarpiece for St. Mary Redcliffe at Bristol. The first two were engraved in 1751-1752, the last in 1794. A subscription ticket to the earlier pictures, entitled "Paul before Felix Burlesqued," had a popularity far greater than that of the prints themselves.

In 1745 Hogarth painted that admirable portrait of himself with his dog Trump, which is now in the Tate gallery. In a corner of this he had drawn on a palette a serpentine curve with the words "The Line of Beauty." Much inquiry ensued as to the meaning of this hieroglyphic; and in an unpropitious hour the painter resolved to explain himself in writing. The result was the well-known *Analysis of Beauty* (1753), a treatise to fix "the fluctuating ideas of Taste," otherwise a desultory essay having

for pretext the precept attributed to Michelangelo that a figure should be always "Pyramidall, Serpent like and multiplied by one two and three." By the painter's adherents it was praised as a final deliverance upon aesthetics; by his enemies and professional rivals, its obscurities, and minor errors were made the subject of ridicule. Moreover, there were further humiliations in store for him. In 1759 the success of a little picture called "The Lady's Last Stake," painted for Lord Charlemont, procured him a commission from Sir Richard Grosvenor to paint another picture "upon the same terms." Unhappily on this occasion he deserted his own field of genre and social satire, to select the story from Boccaccio (or rather Dryden) of Sigismunda weeping over the heart of her murdered lover Guiscardo, being the subject of a picture in Sir Luke Schaub's collection by Furini which had recently been sold for £400. The picture, over which he spent much time and patience, was not regarded as a success; and Sir Richard rather meanly shuffled out of his bargain upon the plea that "the constantly having it before one's eyes, would be too often occasioning melancholy ideas to arise in one's mind." Sigismunda, therefore, remained upon his hands. It is now in the Tate gallery.

Hogarth's last years were embittered by an unhappy quarrel with his quondam friends, John Wilkes and Churchill the poet. Having succeeded John Thornhill in 1757 as serjeant painter (to which post he was reappointed at the accession of George III.), an evil genius prompted him in 1762 to do some "timed" thing in the ministerial interest, and he accordingly published the indifferent satire of "The Times, plate i." This at once brought him into collision with Wilkes and Churchill, and the immediate result was a violent attack upon him, both as a man and an artist, in the opposition *North Briton*, No. 17. The old artist was deeply wounded, and his health was failing. Early in the next year, however, he replied by that portrait of Wilkes which will for ever carry his squinting features to posterity. Churchill retaliated in July by a savage *Epistle to William Hogarth*, to which the artist rejoined by a print of Churchill as a bear, in torn bands and ruffles. "The pleasure, and pecuniary advantage," writes Hogarth manfully, "which I derived from these two engravings" (of Wilkes and Churchill), "together with occasionally riding on horseback, restored me to as much health as can be expected at my time of life." He produced but one more print, that of "Finis, or The Bathos," March 1764, a strange jumble of "fag ends," intended as a tail-piece to his collected prints; and on Oct. 26 of the same year he died at his house in Leicester Square. He was buried in Chiswick churchyard, where a tomb was erected to him by his friends in 1771, with an epitaph by Garrick. Not far off, on the road to Chiswick Gardens, still stands the little red-brick Georgian villa in which from Sept. 1749 until his death he spent the summer seasons. It was purchased in 1902 by Lieut.-Colonel Shipway of Chiswick, who turned it into a Hogarth museum.

As a painter Hogarth was harmonious in his colouring, wonderfully dexterous and direct in his handling, and in his composition. As an engraver his work is more conspicuous for its vigour, spirit and intelligibility than for finish and beauty of line. He desired that it should tell its own tale plainly, and in this he succeeded. But it is not as an engraver or a painter that he claims his unique position among English artists—it is as a humorist and a satirist upon canvas. Regarded in this light he has never been equalled, whether for his vigour of realism and dramatic power, his fancy and invention in the decoration of his story, or his merciless anatomy and exposure of folly and wickedness. If we regard him—as he loved to regard himself—as "author" rather than "artist," his place is with the great masters of literature,—with the Thackerays and Fieldings, the Cervantes and Molières.

BIBLIOGRAPHY.—The main body of Hogarth literature is to be found in the autobiographical *Memoranda* published by John Ireland in 1798, and in the successive *Anecdotes* of the antiquary John Nichols. Much minute information has also been collected in F. G. Stephens's *Catalogue of the Satirical Prints and Drawings in the British Museum*. But a copious bibliography of books, pamphlets, etc., relating to Hogarth, together with detailed catalogues of his paintings and prints, will be found in the *Memoir* of Hogarth by Austin Dobson. First issued in 1879, this was reprinted and expanded in 1891, 1897, 1902 and finally in 1907. A number of pictures by Hogarth are in private hands in Eng-

land and the United States; but most of the best-known works have permanent homes in public galleries. "Marriage à la mode," "Sigismunda," "Lavinia Fenton," the "Scene from the Beggar's Opera," the portraits of himself, his sister Mary and Dr. Hoadley are at the Tate gallery; the "Shrimp Girl," the "Gate of Calais," the "Family Group," the portraits of James Quin, his sister Ann, and his servants, are in the National Gallery; the "Rake's Progress" and the Election Series, in the Soane museum. There are also notable pictures in the Fitzwilliam museum at Cambridge and the National Portrait Gallery. At the print room in the British Museum there is also a very interesting set of 16 designs for the series called "Industry and Idleness," the majority of which formerly belonged to Horace Walpole. (A. Do.; X.)

HOG DEER (*Cervus porcinus*), a small reddish-brown deer, native to northern India, resembling a boar in its movements. It is hunted extensively and provides excellent sport. (See DEER.)

HOGG, JAMES (1770–1835), Scottish poet, known as "the Ettrick shepherd," was baptized at Ettrick, Selkirkshire, on Dec. 9, 1770. His ancestors had been shepherds for generations, and he himself was a shepherd from 1790 to 1799 at Yarrow to Mr. Laidlaw, who lent him books and encouraged his talent. On the recommendation of Sir Walter Scott, Constable published his miscellaneous poems (*The Mountain Bard*) in 1807. The proceeds of this book and of another on the treatment of sheep were invested by Hogg in a ruinous farming enterprise in Dumfriesshire, and the poet went to Edinburgh to make his living by writing. In 1817 he was provided by the duke of Buccleuch with a small farm at Altrive, Yarrow, and in 1820 he married Margaret Phillips. He died on Nov. 21, 1835, and was buried at his native place. Hogg is familiar to many readers as the "Shepherd" of Wilson's *Noctes Ambrosianae*, though the picture is no literal portrait. Hogg's most important volumes are: *Scottish Pastorals* (1801), *The Mountain Bard* (1807), *The Queen's Wake* (1813), *Evening Tales* (1820), *The Shepherd's Calendar* (1829) and *Lay Sermons* (1834).

See Hogg's "Memoir of the Author's Life, written by himself," prefixed to the 3rd ed. (1821) of *The Mountain Bard*; also *Memorials of James Hogg, the Ettrick Shepherd*, ed. by his daughter, Mrs. M. G. Garden (enlarged ed. with preface by Prof. Veitch, 1903), and Sir G. B. S. Douglas; *James Hogg in the "Famous Scots" series* (1899); also *The Poems of James Hogg*, selected by William Wallace (1903). See also Mrs. Oliphant, *Annals of a Publishing House*, vol. i. chap. vii., and G. Gilfillan, *First Gallery of Literary Portraits*.

HOGG, THOMAS JEFFERSON (1792–1862), English man of letters, was born in Norton, Durham. He was educated at Durham grammar school and at University college, Oxford, where he became the friend of Shelley, with whom in 1811 he was expelled from the university for refusing to disclaim connection with the authorship of the pamphlet *The Necessity for Atheism*. He then studied law at York for six months. Hogg's behaviour to Harriet Shelley interrupted his relations with her husband for some time, but in 1813 the friendship was renewed in London. In 1817 Hogg was called to the bar, and became later a revising barrister. In 1844 he inherited £2,000 under Shelley's will, and in 1855, in accordance with the wishes of the poet's family, began to write Shelley's biography. The first two volumes of it were published in 1858, but they proved to be far more an autobiography than a biography, and Shelley's representatives refused Hogg further access to the materials necessary for its completion.

HOGMANAY, the name in Scotland and some parts of the north of England for New Year's Eve, as also for the cake then given to the children. On the morning of Dec. 31, the children go from door to door singing:

Hogmanay
Trollolay
Gie's o' your white bread and nane o' your grey;

and begging for small gifts or alms. These usually take the form of an oaten cake. The derivation of the term is very doubtful.

HOGNOSE, the name applied to the three species of the North American genus *Heterodon* of colubrine snakes. The name is due to the blunt snout of the commonest species, *H. platyrhinus*, which may reach a length of 3 ft., and is a reddish brown above, with dark markings and whitish below. All species are harmless, feeding on small animals, eggs, etc. They are oviparous. *H. platyrhinus* is sometimes mistaken for the venomous copperhead (*q.v.*).

HOGSHEAD, a cask for holding liquor or other commodities, such as tobacco, sugar, molasses, etc.; also a liquid measure of capacity, varying with the contents. As a measure for beer, cider, etc., it equals 54 gallons. A statute of Richard III. (1483) fixed the hogshead of wine at 63 wine-gallons, i.e., 52½ imperial gallons. The etymology of the word is disputed.

HOHENASPERG, an ancient fortress of Germany, in the kingdom of Württemberg, 10 m. N. of Stuttgart, stands on a conical hill (1,100 ft.), overlooking the town of Asperg. It was formerly strongly fortified and was long the State prison of Württemberg. Hohenasperg originally belonged to the counts of Calw; it next passed to the counts palatine of Tübingen and from them was acquired in 1308 by Württemberg.

HOHENFRIEDBERG or **HOHENFRIEDEBERG**, a village of Silesia, about 6m. from the small town of Striegau. It gives its name to a battle (also called the battle of Striegau) in the War of the Austrian Succession (q.v.), fought on June 3, 1745, between the Prussians under Frederick the Great and the Austrians and Saxons commanded by Prince Charles of Lorraine.

HOHENHEIM, a village of Germany, in the kingdom of Württemberg, 7 m. E.S.E. of Stuttgart by rail. It came in 1768 from the counts of Hohenheim to the dukes of Württemberg, and in 1785 Duke Karl Eugen built a country house here. This house with grounds is now the seat of one of the most important agricultural colleges in Germany, founded in 1817, raised to the position of a high school in 1865, and now a technical high school with university status.

HOHENLIMBURG, a German town, on the Lenne, in the Prussian province of Westphalia, 30 m. by rail S. of Dortmund. Pop. (1925) 15,519. Iron and metal industries, dyeing, cloth-making and linen-weaving are carried on. It is the chief town of the county of Limburg, and formerly belonged to the counts of Limburg, a family which became extinct in 1508. The castle of Hohenlimburg overlooks the town.

HOHENLINDEN, BATTLE OF. In this battle on Dec. 3, 1800, Moreau turned the tables on the Austrians, who had planned his encirclement, and, destroying them by an able counter-manoeuver, struck the decisive blow of the campaign in Germany. The result, combined with Napoleon's victory at Marengo in Italy, led to the peace of Lunéville which ended the war of the Second Coalition. For an account of the battle see FRENCH REVOLUTIONARY WARS.

HOHENLOHE, a German princely family which took its name from the district of Hohenlohe in Franconia. At first a countship, its two branches were raised to the rank of principalities of the Empire in 1744 and 1764 respectively; in 1806 they lost their independence and their lands now form part of the kingdoms of Bavaria and of Württemberg. At the time of the mediatisation the area of Hohenlohe was 680 sq.m. and its estimated population was 108,000. The family is first mentioned in the 12th century as possessing the castle of Hohenloch, or Hohenlohe, near Uffenheim, and its influence was soon perceptible in several of the Franconian valleys, including those of the Kocher, the Jagst and the Tauber. Henry I. (d. 1183) was the first to take the title of count of Hohenlohe, and in 1230 his grandsons, Gottfried and Conrad, supporters of the emperor Frederick II., founded the lines of Hohenlohe—Hohenlohe and Hohenlohe-Braunegg. The latter became extinct in 1390, while the former was divided into several branches, only two of which, however, Hohenlohe-Weikersheim and Hohenlohe-Uffenheim-Speckfeld (extinct in 1412), need be mentioned here. Hohenlohe-Weikersheim, descended from Count Kraft I. (d. 1313), also underwent several divisions, that which took place after the deaths of Counts Albert and George in 1551 being specially important. In 1551 the lines of Hohenlohe-Neuenstein and Hohenlohe-Waldenburg were founded by the sons of Count George, from which are descended the existing branches of the Hohenlohe family.

The former of these became Protestant, while the latter remained Catholic. Of the family of Hohenlohe-Neuenstein, which underwent several partitions and inherited Gleichen in 1631, the senior line became extinct in 1805, while in 1701 the junior line divided itself into three branches, those of Langenburg, Ingel-

fingen and Kirchberg. Kirchberg died out in 1861, but members of the families of Hohenlohe-Langenburg and Hohenlohe-Ingelfingen are still alive, the latter being represented by the branches of Hohenlohe-Ingelfingen and Hohenlohe-Öhringen. The Roman Catholic family of Hohenlohe-Waldenburg was soon divided into three branches, but two of these had died out by 1729. The surviving branch, that of Schillingsfürst, was divided into the lines of Hohenlohe-Schillingsfürst and Hohenlohe-Bartenstein; other divisions followed, and the four existing lines of this branch of the family are those of Waldenburg, Schillingsfürst, Jagstberg and Bartenstein. The principal members of the family are dealt with under their separate titles.

HOHENLOHE-INGELFINGEN, FRIEDRICH LUDWIG, PRINCE OF (1746–1818), Prussian general, entered the Prussian service in 1768, and fought in the campaign on the Rhine in 1794. In 1806 Hohenlohe commanded the left-wing army of the Prussian forces opposing Napoleon, having under him Prince Louis Ferdinand of Prussia. Disputes soon broke out between Hohenlohe and the commander-in-chief, the duke of Brunswick, the armies marched hither and thither without effective results and finally Hohenlohe's army was almost destroyed by Napoleon at Jena (see NAPOLEONIC CAMPAIGNS). He surrendered the remnant of his army at Prenzlau on Oct. 28, a fortnight after Jena and three weeks after the beginning of hostilities. After two years spent as a prisoner of war in France Hohenlohe retired to his estates. He died on Feb. 15, 1818. He had, in Aug. 1806, just before the outbreak of the French War, resigned the principality to his eldest son, not being willing to become a "mediatized" ruler under Württemberg suzerainty.

HOHENLOHE-INGELFINGEN KRAFT, PRINCE OF (1827–1892), soldier and military writer, son of Prince Adolf of Hohenlohe-Ingelfingen (1797–1873), prime minister of Prussia from 1856 to 1862, was born at Koschentin in Upper Silesia. He joined the Prussian Guard artillery in 1845. In the bold advance of the Guard corps on the Austrian right wing at Königgrätz in 1866 (see SEVEN WEEKS' WAR), he led the Guard reserve artillery with great success, and after the short war ended he turned his energies to the better tactical training of the Prussian artillery. In 1868 he was made a major-general and assigned to command the Guard artillery brigade. In this capacity he served in the Franco-German War, distinguishing himself at Gravelotte and Sedan; he was in control of the artillery attack on the fortifications of Paris. He retired in 1879 and died near Dresden on Jan. 16, 1892.

See his *memoirs, Aus meinem Leben* (ed. W. von Bremen, 4 vols., 1897–1907; new ed., 1 vol., 1915).

HOHENLOHE-SCHILLINGSFÜRST, CHLODWIG KARL VICTOR, PRINCE OF (1819–1901), German chancellor, was born on March 31, 1819, at Schillingsfürst in Bavaria, of mixed Catholic and Protestant parentage, which perhaps accounts for his tolerance in religious matters. He studied law, and entered the Prussian civil service in 1844, but his accession, under a family distribution of the Hohenlohe estates, as reigning prince of Schillingsfürst, entailed his resignation from the Prussian service in 1846. He then took his seat in the Bavarian *Reichsrat*, but his liberal sympathies and his desire to see a united Germany compromised his chances of advancement at the Bavarian court. Prince Hohenlohe married, in 1847, a Russian heiress, the Princess Marie of Sayn-Wittgenstein-Berleburg. He spent much time at various European courts, and was in touch with important people in Vienna, St. Petersburg (now Leningrad), and London.

It was Wagner, apparently, who persuaded the Bavarian king to place Hohenlohe at the head of his Government (*Denkwürdigkeiten*, i. 178, 211), and on Dec. 31, 1866, the prince was duly appointed minister of the royal house and of foreign affairs and president of the council of ministers.

As head of the Bavarian Government Hohenlohe's principal task was to discover some basis for an effective union of the South German States with the North German Confederation, and during the three critical years of his tenure of office he was, next to Bismarck, the most important statesman in Germany. He re-organized the Bavarian army on the Prussian model, brought about the military union of the southern States, and took a lead-

ing share in the creation of the customs parliament (*Zollparlament*), of which on April 28, 1868, he was elected a vice-president. On the question of the Vatican council Hohenlohe took up an attitude of strong opposition to the ultramontane position. He believed that the policy of Pius IX. of setting the Church in opposition to the modern State would prove ruinous to both, and that the definition of the dogma of papal infallibility, by raising the pronouncements of the Syllabus of 1864 into articles of faith, would commit the Church to this policy irrevocably. This view he embodied into a circular note to the Catholic powers (April 9, 1869) drawn up by Döllinger, inviting them to exercise the right of sending ambassadors to the council and to combine to prevent the definition of the dogma. The only practical outcome of Hohenlohe's action was that in Bavaria the powerful ultramontane party combined against him with the Bavarian "patriots" who accused him of bartering away Bavarian independence to Prussia. The combination was too strong for him; a bill which he brought in for curbing the influence of the Church over education was defeated, the elections of 1869 went against him, and in spite of the continued support of the king he was forced to resign (March 7, 1870).

Though out of office, his personal influence continued very great both at Munich and Berlin, and had not a little to do with favourable terms of the treaty of the North German Confederation with Bavaria, which embodied his views, and with its acceptance by the Bavarian parliament. Elected a member of the German *reichstag*, he was, on March 23, 1871, chosen one of its vice-presidents, and was one of the founders of the Liberal Imperial Party (*Libérale Reichspartei*), the objects of which were to support the new empire, to secure its internal development on Liberal lines, and to oppose clerical aggression as represented by the Catholic Centre. Hohenlohe strenuously supported Bismarck's anti-papal policy, the main lines of which (prohibition of the Society of Jesus, etc.) he himself suggested.

In 1873 Bismarck chose Prince Hohenlohe to succeed Count Harry Arnim as ambassador in Paris. In 1878 he attended the Congress of Berlin as third German representative, and in 1880, on the death of von Bülow (Oct. 20), secretary of State for foreign affairs, he was called to Berlin as temporary head of the Foreign Office and representative of Bismarck during his absence through illness. In 1885 he was chosen to succeed Manteuffel as governor of Alsace-Lorraine. In this capacity he had to carry out the coercive measures introduced by the chancellor in 1887-88, though he largely disapproved of them; his conciliatory disposition, however, did much to reconcile the Alsace-Lorrainers to German rule. He remained at Strasbourg till Oct. 1894, when, at the urgent request of the emperor, he consented, in spite of his age, to accept the chancellorship in succession of Caprivi. The events of his chancellorship belong to the general history of Germany. In general, during his term of office, the personality of the chancellor was less conspicuous in public affairs than in the case of either of his predecessors. His appearances in the Prussian and German parliaments were rare, and great independence was left to the secretaries of State. What influence the tact and experience of Hohenlohe exercised behind the scenes on the masterful will and impulsive character of the emperor cannot as yet be generally known.

Prince Hohenlohe resigned the chancellorship on Oct. 17, 1900, and died at Ragaz on July 6, 1901.

Prince Hohenlohe's *Denkwürdigkeiten* (2 vols., Stuttgart and Leipzig, 1906) are singularly full and outspoken, the latter quality causing no little scandal in Germany and bringing down on his son, Prince Alexander, who was responsible for their publication, the disfavour of the emperor.

For the Hohenlohes generally see A. F. Fischer, *Geschichte des Hauses Hohenlohe* (1866-71); K. Weller, *Hohenlohisches Urkundenbuch*, 1153-1350 (Stuttgart, 1899-1901), and *Geschichte des Hauses Hohenlohe* (Stuttgart, 1904). See also Prinz Alex. Hohenlohe, *Aus meinen Leben* (edit. G. Anhäuser, 1925).

HOHENLOHE-WALDENBURG-BARTENSTEIN, LUDWIG ALOYSIUS, PRINCE OF (1765-1829), marshal and peer of France, was born on Aug. 18, 1765. In 1784 he entered the service of the Palatinate, which he quitted in 1792 in order to

take the command of a regiment raised by his father for the service of the emigrant princes of France. He fought under Condé in the campaigns of 1792-93, and then entered the service of Holland, and, when almost surrounded by the army of General Pichegru, conducted a masterly retreat from the island of Bommel. Napoleon offered to restore to him his principality on condition that he adhered to the confederation of the Rhine, but as he refused, it was united to Württemberg. After Napoleon's fall in 1814 he entered the French service, and in 1815 he held the command of a regiment raised by himself, with which he took part in the Spanish campaign of 1823. In 1827 he was created marshal and peer of France. He died at Lunéville on May 30, 1829.

HOHENLOHE-WALDENBURG-SCHILLINGSFURST, ALEXANDER LEOPOLD FRANZ EM-MERICH, PRINCE OF (1794-1849), priest and reputed miracle-worker, was born at Kupferzell, near Waldenburg, on Aug. 17, 1794. He was ordained priest in 1815, and in the following year he went to Rome, where he entered the society of the "Fathers of the Sacred Heart." He acquired a reputation as a miracle-worker at Munich and Bamberg, and great crowds were attracted. Ultimately the authorities interfered with his operations, and he went in 1821 to Vienna and then to Hungary, where he became canon at Grosswardein and in 1844 titular bishop of Sardica. He died at Vöslau near Vienna on Nov. 17, 1849. His writings were collected by S. Brunner in 1851. (*Aus dem Nachlasse des Fürsten Aloysius von Hohenlohe.*)

HOHENSTAUFEN, a German princely family which derived its name from a village and ruined castle near Lorsch in Swabia, now in Württemberg. Its members were emperors or German kings from 1138 to 1208, and again from 1214 to 1254. The earliest known ancestor was Frederick, count of Büren (d. 1094), whose son Frederick built a castle at Staufen, or Hohenstaufen, and called himself by this name. He supported the emperor Henry IV., who granted him the dukedom of Swabia in 1079, and gave him his daughter Agnes in marriage. In 1081 he remained in Germany as Henry's representative, but only secured possession of Swabia after a struggle lasting twenty years. In 1105 Frederick was succeeded by his son Frederick II., called the One-eyed, who, together with his brother Conrad, afterwards the German king Conrad III., held south-west Germany for their uncle the emperor Henry V. Frederick inherited the estates of Henry V. in 1125, but failed to secure the throne. He opposed the new emperor, Lothair the Saxon, who claimed some of the estates of the late emperor as crown property. A war broke out and ended in the complete submission of Frederick at Bamberg. In 1138 Conrad of Hohenstaufen was elected German king, and was succeeded in 1152, not by his son but by his nephew Frederick Barbarossa, son of his brother Frederick (d. 1147). Conrad's son Frederick inherited the duchy of Franconia which his father had received in 1115, and this was retained by the Hohenstaufen until the death of Duke Conrad II. in 1196. In 1152 Frederick received the duchy of Swabia from his cousin the German king Frederick I., and on his death in 1167 it passed successively to Frederick's three sons Frederick, Conrad and Philip. The second Hohenstaufen emperor was Frederick Barbarossa's son, Henry VI., after whose death a struggle for the throne took place between Henry's brother Philip, duke of Swabia, and Otto of Brunswick, afterwards the emperor Otto IV. Regained for the Hohenstaufen by Henry's son, Frederick II., in 1214, the German kingdom passed to his son, Conrad IV., and when Conrad's son Conradin was beheaded in Italy in 1268, the male line of the Hohenstaufen became extinct. Daughters of Philip of Swabia married Ferdinand III., king of Castile and Leon, and Henry II., duke of Brabant, and a daughter of Conrad, brother of the emperor Frederick I., married into the family of Guelph.

See F. von Raumer, *Geschichte der Hohenstaufen und ihrer Zeit* (Leipzig, 1878); B. F. W. Zimmermann, *Geschichte der Hohenstaufen* (Stuttgart, 1st ed., 1838; 2nd ed., 1865); F. W. Schirrmacher, *Die letzten Hohenstaufen* (Göttingen, 1871).

HOHENSTEIN (Hohenstein-Ernstthal), a town of Germany, in the republic of Saxony, on the railway Zwickau-Chemnitz,

12 m. N.E. of the former. Pop. (1925) 16,754. Industries include cotton weaving, the manufacture of machines, stockings, gloves and woollen fabrics, cotton printing and dyeing. There are copper and arsenic mines in the neighbourhood. Hohenstein was united to the town of Ernstthal in 1898. Another place of the same name is a town in East Prussia. Pop. (1925) 3,000. This Hohenstein was founded by the Teutonic Order in 1359.

HOHENZOLLERN DYNASTY. The Hohenzollerns were a German family of counts, who in the 11th century were living in comparative obscurity in the south-eastern corner of the empire, in the 12th received a Burgrafdom in Franconia, thanks to the friendship of one emperor, in the 15th were invested by another emperor with the electorate of Brandenburg, in the 17th acquired by marriage Prussia in the north-eastern corner of Germany, and at the same time fragments on the Rhine and the Ruhr, on its western frontier, in the 18th rounded off and enlarged their centrifugal possessions by conquest and also assumed the title of king, in the 19th outstripped the other German states by means of victorious wars, united them and thereby won the title of German emperors, and in the 20th, after an unsuccessful war, lost empire, kingdom, and markgraviate at a blow and abandoned their defeated country to its fate.

When they entered the German empire, it was a very shadowy entity. Up to the 19th century they were never interested in the empire, much less in a position to consolidate it. They remained immersed in the factions of rival German dynasties, until at last they achieved the hegemony in a whole so solid that their disappearance left it unshaken. For exactly five centuries they extended and increased their rule over northern Germany, seldom lost territory, and then only for short times, and gradually consolidated a State that was only a patchwork of scattered fragments, with no organic connection.

Thus their State could only be held together from above, by an army of soldiers and an army of officials, by severity, police and punctuality; it was often found necessary to suppress by force the centrifugal forces of certain parts which had been accustomed to other dynasties or other forms of State, and always felt themselves rather German than Prussian. The basic principle of this dynasty thus came to be absolutism, which survived here longer and more vigorously than in most parts of Europe, looked on its citizens to the last as subjects, was opposed to any democratic movement, and sought to impress obedience as the chief virtue. In the place of national sentiment there arose a spirit of caste, and interest in the State went no further than the wish to belong to the upper caste. On top of this came a militaristic system, more prominent in domestic than in foreign affairs; for the Hohenzollerns were by no means more warlike than the majority of ruling houses, and their subjects cared less for the pursuit of the laurel than many another nation. It was the necessity of unifying their scattered subject peoples that gained the Hohenzollerns their bellicose reputation; and this is how the sober and peaceable Prussian nation has acquired a name for brawling.

The fortuitous character of the origin of this State, the lack of a great guiding line of development, is reflected and in part influenced by the personal characters of the dynasty. Of the 20 rulers who reigned in Brandenburg and Prussia for five centuries, from the first elector to the last emperor-king, there were not more than eight who ruled with efficiency, industry and talent, while the rest were weak and vain, and squandered the money and success accumulated by their fathers; and these two types followed one another in almost regular alternation, grandfather often resembling grandson, while their country flourished or decayed alternately, according to the personal characters of these almost unrestricted autocrats.

As these princes were generally long-lived (their reigns averaged 25 years each) the shocks of abrupt changes of character were mitigated. Moreover, the two greatest rulers had each nearly half a century to impress his nature on the people. These two rulers, the Great Elector and Frederick the Great, were able, thanks only to their very long reigns, to draw the tatters of the land together into a real State. These two, with Frederick William I. and William I., incorporated the best characteristics of the family:

economy, industry, honesty, courage. Of them all, Frederick the Great alone showed any traces of genius.

Origins.—The name Hohenzollern, first borne by a certain Wezel of Zolorin, is derived from the word "Söller," a watch tower or castle. The family demesne in Swabia extends from the upper Neckar to the Lake of Constance. In the 12th century one of these counts was invested by the emperor, whose friend he was, with the Burggraviate of Nürnberg. His successors acquired further lands in the neighbourhood through purchase or marriage, and in the 14th century one of them was raised to the rank of prince of the empire. His son, the Burggraf Frederick, saved the life of the Emperor Sigmund, king of Hungary, in battle, and was appointed by him Imperial Governor in Brandenburg. The family thus divided, a secondogeniture was formed in Franconia, which ruled there from 1486 to 1791, when the territories in question became Bavarian. The original Swabian line, meanwhile, survived from 1251 to 1850. This line played a part in the outbreak of the war of 1870, one of its princes having come forward as candidate for the throne of Spain, a suggestion which France vetoed. His younger brother Charles (1839-1914) also aspired to a foreign throne, and became Prince and afterwards king of Rumania. His nephew and successor, Ferdinand of Rumania, the son of the prince intended for Spain, fought in the World War against Germany. The head of the Swabian line in 1919 was Prince William (b. 1867).

The Margraf Frederick, who became hereditary elector of Brandenburg in 1415, a brave and able man, was despised and opposed by the native, half-Slav nobles as a petty foreign prince, and felt so out of place that after ten years he returned home, leaving his son to rule in the desolate North. His successor, Frederick II. (1440-70) met with equally violent resistance from the nobles, and also from the towns, until, disregarding their ancient rights, he appeared with 600 horsemen before the gates of the young city of Berlin, took the city, built a castle on the Spree to overawe it, and made this new place in the middle of the sandy waste into his capital. He destroyed all old privileges, turned the citizens into subjects, deprived them of their courts, and in 1448, forced them to swear fealty to him, an oath which the people of Berlin kept until their first rebellion, 400 years later. This iron right hand of his knew not what his pious left hand was doing, for at the same time he founded an Order of holy living for noblemen; but at last, like his father, he abdicated in disgust—not before his reason had half given way.

Albert Achilles (1470-86), called by his contemporaries the "German Fox," and twice excommunicated by the pope, established a brilliant court, enslaved burgess and peasant (whose part consisted only of paying and serving), involved the country in unprofitable disputes—only to desert it in the end, like his two predecessors. All three, and their successors, the weak John (1486-99), who died young, and the brilliant, crafty Joachim I. (1499-1535) were hated in the land, which was still strange to them, although the family had now been ruling there for 100 years. Joachim, a strong opponent of Luther, was also the first to show a mystic side. He dabbled in astrology, pursued and encouraged education, founded the first university, in Frankfurt on the Oder, but also passed many cruel sentences and once had 38 innocent Jews burned in the centre of Berlin.

More unbridled still was the life of Joachim II. (1535-71), who during his long reign built churches and castles with a lavishness that verged on madness, sought to outshine all other princes, squandered the burgesses' gold on favourites, mistresses and the chase, forbidding them the while to wear trunk-hose or to hold rich wedding feasts, but forcing them five times to pay his debts, which ran into millions.

His son and opposite, John George (1571-98), an Evangelical Protestant, as his father had been before him, economical, pious, father of more than 20 children, tried to make up the 2,500,000 thalers of debts with which his predecessors had saddled the country, lived quietly and respectably, and managed, by clever marriages for his relatives, to secure important heritages. His successor, Joachim Frederick (1598-1608) lived staidly also, and was wise enough to fashion himself a staff for all questions

of government by empanelling nine learned men on his privy council—the actual beginning of the Prussian bureaucratic State.

After him, John Sigismund (1608–19) reaped the fruits of the marriage arranged by his grandfather, and for the first time enlarged the land very considerably through his wife's heritage; he became duke in Prussia, and at the same time lord of rich and storied lands on the Ruhr, the Maas and the right bank of the Rhine, for the sake of which he turned Calvinist. Thus, without merit of his own, but also without war, he extended the land "from the Maas to the Memel," as the song said; yet had no pleasure of these strange lands, but sat disgruntled in the middle of a long chain of provinces, linked together by nothing but a dynasty that was still feeble. Under his successor it all went to pieces; this George William (1619–40), another of the frivolous, showy sort, the hunters and carousers, had none of the qualities needed to weather the storms of the Thirty Years' War, for, as Gustavus Adolphus said, "a new livery, a handsome horse or a pair of greyhounds drove everything else out of his mind." He remained neutral in the war, which nevertheless brought famine and misery into his lands. Thereupon he left Berlin, and went to Prussia, the duchy in the far north-east, where there was better fare and sport, leaving everything in ruin behind him, and bequeathing to his son a hopelessly disorganized country.

The Great Elector.—This twenty-year old youth, Frederick William (1640–88), rightly called the Great Elector, began by repairing all the damage his father had done. In the confusion of the war, the end of which was still far away, he built up a solid army, and played the rival combatants off skilfully against each other until he had a trained force of 8,000 men; all in great secrecy, for he was a master of dissimulation although also personally brave. Thus playing the double game which the times forced upon him, and which was also native to his character, he won the trick every time, through the power of his ever-growing army, which he employed now for, now against his neighbours. First he allied himself with Sweden, then ten months later broke this alliance and joined Sweden's mortal enemies, the Poles. Nor had he any compunction in signing a secret treaty with the "Roi Soleil," promising the German Imperial crown for the Dauphin if he himself only got back Pomerania. When Louis XIV. failed to pay the promised subsidies, the elector forthwith joined the league against him.

An excellent general, he never spared himself in the fight, fought in person among his men at the great victory over the Swedes at Fehrbellin in 1675, and generally developed gifts and qualities possessed by none of his forefathers, and not more than one of his successors. It was only blended slyness and courage that enabled him to assert his authority in Prussia, after an involved struggle to rid himself of Poland's suzerainty, and thus become master in his own house. But scarcely had he overcome the enemy abroad, when he turned in the same absolutist spirit against the enemy within, and as his ancestor had subdued Berlin, two centuries before, so he forced Königsberg to submit to him, in the teeth of the constitution, compelled the recalcitrant towns and nobles to do him homage, cancelled the privileges of the Estates where they inconvenienced him, and threw into prison the leader of the burgesses, against his pledged knightly word.

On the other hand, after a reign of nearly 50 years, he left behind him a unity, created by violence, but surpassed in Germany only by the house of Habsburg, hundreds of villages new-built, new canals, dykes and roads, the State revenue increased five-fold, a first-class army 30,000 strong, and the general awe of his neighbours. Shortly before his death, by one of his cleverest inspirations, he had invited into his country the Protestants expelled from France. Only now and then, and of special purpose, did he make a brave outer show; his nature was simple; he loved to water the flowers himself in his palace garden, in which, and afterwards in the country, he planted the pioneer potatoes, went himself to the market and bought singing birds, enjoyed unsophisticated pleasures, and in an age which despised Burgess and peasant, was yet a fairly just ruler.

His son and successor was his opposite: a weak, vain and silly man, who tried to hide his hump back under a huge wig; affected, greedy and ungrateful. Frederick III. (1688–1713) had only one

passion: he wanted to be king. At the age of ten he founded his first Order, and went on playing to the day of his death with feasts, processions and problems of etiquette. Seeking to embellish the ever-growing castle on the Spree, he discovered a great artist, Andreas Schlüter. When he founded the Academy of Arts, its first and also its second task was: the coronation of the king.

His wife, Sophie Charlotte, an enlightened princess from Hanover, who laid out the castle and town of Charlottenburg outside the gates of Berlin, unluckily meddled in politics, which were in the excellent keeping, not of the king, but of his tutor and adviser, the grave and indefatigable Danckelman. She hated this man's honesty and not only hunted him out of his offices, after he had ruled the land with success for a decade, but set the law against him, threw him into prison, and only released him ten years later. His place was taken by thieving adventurers. The work of the Great Elector was ruined.

Meanwhile Frederick took umbrage at the glory in which his cousins of Orange and Saxony were sunning themselves as kings of England and Poland, negotiated for several years with the emperor, and at last, by great promise of military help for Spain, extorted from him the concession that he would raise no objection to his coronation as king. This took place on Jan. 18, 1701 in Königsberg, with unexampled pomp, and cost 4,000,000 thaler, or two years revenue. The elector, who placed the crown on his own head, called himself henceforward Frederick I., king in Prussia.

Now he began to play at Versailles, founded dozens of grades among the courtiers, and kept a mistress, although he neither needed her nor liked her, for the sole purpose of taking her out publicly, at regular hours, like the king of France. At the same time, as price for kingly rank, he sent a part of his subjects to the emperor, and the emperor sent them to Spain, to death. The rest groaned under the most fantastic taxes, including a tax on wigs, or had to hand in the bristles of the swine they slaughtered, the king proposing to start a trade in bristles. The peasant had to spare the wild swine which trod down his field for the new king to shoot, and antelopes and aurochs were imported into Prussia.

It was fortunate that the son was once more of the economic, efficient type. Frederick William I. (1713–40), unfairly overshadowed by the figure of his son, was one of the best rulers in Prussia. Short, fat, sound and active, pious, moral and thick-skulled, looking like a peasant whenever he laid uniform and pig-tail aside, he stood four-square in life and in the State, asking none, always commanding, but usually commanding the right thing. His first act was to clear away all the paternal luxury, to send the favourites packing, to order simplicity in all things; for he had only one idea—economy. Simple in manner, more of a burgess than a king, he liked thick soups, drank thin beer, smoked moderate shag in his pipe, and only now and then let his ministers invite him to delicacies on which he would fall half in mockery, half in enjoyment. His idea of his post was that of a father of a family—a despotic one, of course. He interfered in everything, took account of no laws, clapped his bad ministers of State into jail, woke up the porters who kept people waiting, forced the rich burgesses of Berlin to build houses, forced his generals to buy the bad portraits of them that he insisted on painting in the evenings; ran, rode and drove about from five in the morning to six in the evening, inspecting, giving orders, and always finding fault.

All the same, he was usually just, and was popular, did everything for the country, nothing for himself and little for the upper classes. Out of the nobles, in particular, he squeezed so many taxes that they complained to the imperial council in Vienna, and won their appeal. Yet the king went on threatening them: "I will stabilize the sovereignty and set the crown as fast as a rock of bronze! I am king and lord, and will do what I wish! Holiness is God's, but all else must be mine!" But his severity grew milder as it reached the lower classes, worthy burgesses might rise to high posts, bad counts were thrown out, the peasant prospered again throughout the land. Tax-farmers and officials were punished for abuses, sometimes even hanged for them. When ravaged districts were to be restored, the king gave the money himself, rewarded every man who built a new house there with a post.

enlarged Berlin, made his residence in Potsdam, cut out all the sinecures at court, founded the *Kammergericht*, a treasury department to check expenditure and most important of all, the State Exchequer.

It was iron discipline; but the land prospered and got back much of the power and solidity which the Great Elector had given it. Compulsory military service was introduced in 1726—although only for burgesses and peasants. This compulsion was hated most by the educated classes in the towns, especially as the rules of the service were pedantic. The Great Elector created the Prussian military, but his grandson must answer for the militarism, for then it was that the barrack-yard tone spread like a pestilence through the people, whom the endless years of service spoiled for any more genial regime, so that they tortured themselves and the rest with rudeness and exactitude.

The king had a weakness for "tall fellows," whom he mistakenly held to be the best soldiers. He had the tallest men pressed in all Europe, paid fantastic prices, up to £3,700 a man, for them, spent 12,000,000 thaler on this toy, sold offices for it, broke the law, had giants stolen and carried away from abroad, started a sort of slave traffic, came to the edge of wars—all over the passion which this short, fat man entertained for the tall and slender. Here his piety and his economy broke down.

As he looked after the state like a *pater-familias*, so in his house he played the king, and with the best will in the world, he would have broken up any family life. Aghast, he saw his children go over into inevitable opposition, the daughters reading French books, the son playing the flute in a silk dressing-gown, instead of practising musket-drill as he should have done, having been born, as it were, in uniform. Finding in the crown prince the weaknesses and vanities of his own father renewed, he saw that they must be destroyed, and thrusting a cruel hand into the tangled woof of a complex young soul, driving a young man to desperation, by that very act he saved just what his nature held of genius. But for the horrors endured in his youth, Frederick II. would never have become "the Great." His father served Prussia well in many respects, and not least in saving his son for the State and for history.

Frederick the Great.—For Frederick II. (1740–86) was decidedly what his father called him, an "effeminate fellow." Things came to a crisis over a marriage which the young prince was to have concluded with the daughter of the king of England, but his father spoiled it. Even before this, at 16, when on a visit to the court at Dresden, he had made the acquaintance of another world, and thereafter shunned military service, accumulated debts and scandals, till his father, in a rage, beat him in the presence of strangers and once came near running him through. Then the prince tried to escape over the frontier, at some manoeuvring in the west, was hailed back, thrown into jail, with a friend who had helped him was sentenced to be shot as a deserter, was pardoned, but forced to see Katte, his friend, beheaded before his eyes, and finally came out of this affair, after a time of complete spiritual collapse, a changed man. He had become a cynic.

At first he began to study the country only to please his father, but he learned to value a fruitful activity and when the king, in his last years, saw the prince busy about his future task, he relaxed the military fetters, allowed him, when his work was done, to occupy himself, generally far from his unloved wife, with the teachings of Voltaire, with giving concerts in his country palace; for the king looked on all this only as a sort of recreation, like his own, which he mostly took in a room full of tobacco smoke, among doxies and bawdy stories. So it came that when he died, he called himself fortunate to have left such a son behind.

The young king had no love for the people, whom he called the *canaille*, but still less for the nobles. He loved nothing at all, in fact, except wit and his dogs, and perhaps his sister and a few old soldiers. But he applied that great tolerance which he had learned from Voltaire and from the ideas of Locke, called himself and felt himself the first servant of the State, allowed complete freedom of the press, had a caricature of himself hung lower down in the window, so that the people might see it better, and proclaimed at once that his people were free to be happy in their own fashion.

He abolished the tall fellows at once, but strengthened and enlarged the army, and put a stop to pedantry and brutality. He saved up, and spent little when he built himself a solitary, one-storied country house, the *Sanssouci*, where the best wits, not, indeed, out of Prussia, but mostly out of France, foregathered at his table; for the king was fond of speaking French, which he did as badly as he did German.

As crown prince, mostly out of boredom, he had written a thesis against Macchiavelli's "Prince," based on misunderstandings, but containing some principles which he afterwards followed: "The Prince is not lord, but servant of the people, his power rests in the last end only on the people's choice. No man has the right to allow himself unlimited sway over his fellow-men. Only the tyranny of government brings the peoples to rebellion." These principles of domestic policy accorded with the age and his own ideas; in foreign policy Frederick behaved exactly like Macchiavelli, denying any morality in affairs of State, or any valid consideration except personal interest. Thus, scarcely had he begun to reign, when he provoked a war to conquer Silesia, on which he had no claim. "My age, the fire of my passion" he wrote to a friend. "the thirst for glory, even curiosity, to tell you the whole truth, in short, a secret instinct has torn me out of pleasant ease and the satisfaction of reading my name in the gazettes and the history-books has seduced me." In the first and second Silesian Wars he was able, with the help of his father's army, to conquer this land from Maria Theresa and retain it.

In the decade of peace that followed he lived as a man of the world, not a philosophical one by any means, adorned himself with Voltaire's presence, dabbled in the arts and sciences, kept up the best opera in Europe, was generous towards artists, and wrote his own history so quickly that in 1746 he was already dictating the events of 1745. But when he was half-way through the forties, the consequences of his youthful ambitions rose up before him like black shadows. He saw the revenge of the empress of Austria join hands with the disfavour of the tsarina, the hate of the king of Saxony and the pride of the king of France allied with them, and all at once half Europe stood united against him, to destroy this young kingdom, become too strong.

Frederick went into the Seven Years' War (1756–63) with about 200,000 men against twice the number. This third war, which he had provoked through the conquest of Silesia, brought the enemy as far as Berlin and Sanssouci, and Frederick himself to the verge of despair. In this war a million men fell to no purpose, for it ended on approximately the *status quo ante*. Half of this million were Prussians. Some 30 years after those candid words on thirst of glory and curiosity, Frederick wrote: "Glory is vain. Have men ever deserved praise? They have only been praised because they made a stir." At the Peace of Hubertusburg, Frederick gained nothing, but also lost not so much as a village, although his enemies had meant to break the new great Power into pieces. This result, shattering in both ways, must have shattered the king as well, like the conflict with his father when he was crown prince. For the second time he returned home a changed man.

Although only 52 years of age, he looked an old man; although an old man, he had 23 years before him still. Now he became great. The work of reconstruction to which his conscience, his experience, his age, his loneliness alike urged him, showed him the father of his fatherland; all for the peasant and the poor, all, where possible, against the noble, all always against the idle. He quarrelled with Voltaire and most of the other Frenchmen; his sister was dead, his oldest friends were ageing around him, the circle fell silent, dust lay on the flute; only the greyhounds loved him, lay in his chairs, in his bed, and when they died, he set up marble memorials to them. In his will he wrote that he wanted to be buried beside them. He could still be interested in the French spirit, but the German was foreign and unsympathetic to him. That Kant, a Prussian professor, was building up a new world, that Herder and Klopstock, Lessing and Wieland were writing quite near him, he was unaware, or else disliked it; he wrote a sneering pamphlet against Goethe's *Goetz von Berlichingen*; the fact was, he was neither philosopher nor poet, only a dilettante, and not even a good one.

On the other hand, he worked harder than any man in his State, harder, too, than any Hohenzollern before or after him. He drained morasses, planted woods, made roads, built countless houses, went on tours of inspection among his people, distrusted his officers, backed up the peasant against the count, even when he was in the wrong, and now lived truly in the heart of his people. At 70 he wrote, in the true spirit of Voltaire and the old Faust: "He who improves his land, makes waste land fruitful, and who drains swamps, he wins victories over barbarism."

Weak Monarchs.—His successor was one more of the bad sort. Frederick's nephew, Frederick William II. (1786-97), lazy and sensual, vacillating and romantic, managed in the single decade of his reign to squander on favourites, male and female, half of what his predecessors had spent seven decades in accumulating, and what chance brought him through a partition of Poland and a heritage in his own family was never assimilated and soon lost. The army soon became undisciplined, and when it was sent to fight the French revolution, it dared not even attack it. The day of Valmy, no victory for the French, yet made the deepest impression, for all Europe said that the army of Frederick the Great had ceased to fight.

The next one, too, was weak and without talent, although his life was simple, sober and respectable. Frederick William III. (1797-1840) imitated his ancestors' policy in the Thirty Years' War, and tried to preserve neutrality through the tempests of the Napoleonic Wars. He watched his neighbours' lands occupied, unperturbed, always spoke of "soothing" (which was not very appropriate) Napoleon, refused to listen to his wife, the talented and ambitious Queen Luise, and then suddenly found himself forced into war, after all, and at the Battle of Jena (1806) lost the fame of Frederick's army, and in the Peace of Tilsit lost more than half of his possessions—everything, in fact, west of the Elbe. He failed to recognize the natural saviour who offered himself to him, the Freiherr vom Stein, one of Prussia's two great statesmen, and when Stein made his entry into the Government conditional on the dismissal of the intriguing privy council, the king wrote to him: "You are a recalcitrant, stubborn, obstinate and disobedient servant of the State, full of your own genius and talents, and instead of looking to the good of the State, led only by caprices, swayed by passions and personal animosity."

All the administrative reforms which Stein and Hardenberg effected, were done in the king's despite; he was drawn into the Wars of Liberation and the alliance with Russia in 1813 against his will, he took no personal part in any battle, but entered conquered Paris in state. For all that, the popular struggle against France evoked the first democratic movement in Prussia. The towns got back the self-government filched from them 300 years before, in another form, the term of general military service was fixed at three years, the conduct of the State was concentrated in the hands of a ministry, which, however, was only empowered to debate, and not to decide. The grant of a constitution now could have bound together the disunited nations of the State, one third of which, into the bargain, were Catholics—a further point of difference. The king promised, indeed, in 1815, just before the last war against Napoleon, the rudiments of a constitution, which involved no losses for him, as the Estates envisaged were also only to have an advisory voice.

When the people had driven out the conquerors, it was quickly forgotten. The reaction, led by part of the Prussian nobility, fed by Metternich in Vienna, conquered in Prussia also; the Holy Alliance testified that kings were appointed by God, the fall of the Corsican willed by God, and the princes, therefore, infallible in their way. The king threw himself against the popular movement, dissolved athletic and students' associations, suppressed dangerous books and papers, dismissed professors, threw the most popular leaders into prison, punished every request for fulfilment of his promise as treasonable, filled the country with police and spies, or at least, was glad to let his servants do so.

The son was exactly such a failure as his father: Frederick William IV. (1840-61), a man of decided talent, but weak, confused, romantic; in person short-sighted, slovenly, thin-haired, he never dared do what he would, and only took a definite decision to

abandon it as soon as taken. Liberal, like all crown princes, before his accession, he soon disappointed the people. The guiding idea of the day, citizenship, the contract between prince and people, he dismissed as nonsense, the sovereignty of the people he described as the principle of evil in the world, and tried vainly to gloss over his hostility to the people by smooth phrases.

It was only seven years later that he began to notice the gathering storms, and under the pressure of public opinion, convoked, in the shape of the "united diet" (1847) the first parliament that Prussia had seen, graded on the caste system, but yet empowered to reject State loans or taxes. In his very first speech, however, the king took everything back, declaring it to be God's will that he should reign—he was always adept at hiding his own fear of the people under a mystic light. The diet was closed again immediately, with nothing accomplished; but the February revolution in Paris soon after strengthened the people's forces in Berlin. When revolution broke out there in March 1848, when the people of Berlin broke their oath of loyalty exactly 400 years after they had sworn it, the king hesitated, characteristically, assembled troops, but immediately afterwards, in his mortal fear, issued a Patent promising a Liberal Constitution, which he proclaimed in person from the balcony of his palace.

Those first shots which can never be prevented in any riot, were fired by the military. Two hours later, 200 barricades had been erected in Berlin. The troops had the upper hand in the fighting, but the next day the king issued a proclamation "to my dear Berlin," begging the people to disperse quietly, and withdrew his own troops. He sat in his palace, irresolute, listened to all councils, approved a citizens' defence corps, proclaimed an amnesty, ordered a new ministry, till the beaten bourgeoisie were turned into victors by the Crown's timidity. Three days later there appeared an unintelligible proclamation, saying "Prussia was to be absorbed in Germany" and the king would take his place at the head of Germany. Elections were held for a parliament for Prussia and one for Germany. When the latter, sitting in Frankfurt, elected the king German emperor, on April 3, 1849, those who were nearest to him did not know whether he would accept or refuse the crown. Up to the last moment his chief intimates believed that he would accept. Suddenly he refused.

Out of fear of a coalition which threatened to form against him under Austria's leadership, he dropped all plans for uniting Germany, but took the oath to the new Prussian Constitution before the two Chambers. This reproduced the principles of the modern constitutions of other countries; but the ministers were still responsible to the king alone, who enjoyed the sole right of appointing them, and also the sole right of concluding treaties with foreign powers, and declaring war or concluding peace at discretion. Only the spirit of an absolutism 400 years old was capable of burdening itself with this two-fold responsibility which the king of Prussia received, and indeed, really assumed for the first time before the whole people, without himself being responsible to anyone but God. At the same time, these two most dangerous clauses cut the people off from any attempt to educate themselves politically, and gave the citizens an excuse for living on as subjects. Only so can it be explained how these provisions lived on into the 20th century. The next decade passed in Prussia amid the growing discontent of the Liberals, and the growing irritability of the sick king, till the king, too late, was declared of unsound mind and his brother became regent, and afterwards successor to the throne.

The German Empire.—William I. (1861-88) ascended the throne as a man of almost 64 years of age, and no one could have anticipated that he would retain it till his 91st year. He was suspect to all Liberals on account of his attitude in the days of the revolution, when he had had to escape out of the country, and sealed his unpopularity when, in Sept. 1862, he could find no other way out of the internal impasse than to appoint the notorious Junker, Otto von Bismarck-Schönhausen, his minister. That he kept, on the whole, on friendly terms with this man for 26 years without a break, in spite of many conflicts of opinion, and although he was convinced that he ruled by Divine Grace and at heart felt no greater inclination towards intimacy with a Junker

than with any other mortal, cannot be explained only by the successes of his minister. It is also a proof that this truly honest and chivalrous old gentleman admitted to himself the superiority of his servant, who, indeed, treated him like a master, and sometimes too, being nearly 20 years the junior, like a son. Besides, William was past the vagaries of youth and the ambition of manhood, and would have liked best to yield to old age's need of rest, had not his minister's uncanny energy led him ever onward on the path of daring.

For the King began by objecting to all the three wars which Bismarck had decided to wage, to put Prussia at the head of Germany, and thus to solve the German question without and against Austria. In 1864, 1866 and 1870 he swore not to draw the sword, yet in the end his adviser wrung his consent from him. Before the Schleswig-Holstein war he said that he really had no rights at all to these two duchies; before the war against Austria, that he would never shed German blood; before the war against France he gave way to Napoleon's and Grammont's arrogant demands to the limit of what was possible. But when he was swimming on the full tide of victory, it was only with great difficulty that he could be restrained by Bismarck's foresight from impolitic immoderation. He neither understood nor liked Bismarck's consistent purpose, for if Bismarck cared more for Prussia's greatness than for Germany's unity, the king cared even less for Germany, and he refused for weeks to assume the imperial title, which he thought looked "like a major's title," while clinging to the insignia of Prussia, like his brother before him, who had also refused to become emperor.

None of the important steps in the king's career were due to his own initiative; in fact, at the decisive moments at Nikolsburg, Gastein and Versailles, Bismarck had always had to employ threats of resignation, nervous breakdowns and outbursts of tears, before he got his way. "I carried him on my shoulders on to the imperial throne," he said afterwards, and it was true. In the end the king was so angry with him over the whole emperor business, that when he descended from his throne in the Hall of Mirrors at Versailles, on Jan. 18, 1871, he walked past Bismarck without a word, when he went to thank his generals.

The old monarch long remained strange to his people, and it was only through the surprising elevation of his position, and especially through his more than patriarchal age, that he achieved a gradual and tardy popularity. He always remained simple and very economical, as he had been brought up to be in Prussia's lean years; slept and died in his iron camp bed, but left over 20,000,000 marks. But he had a really warm and tactful heart, and like a true king, always managed to leave his chancellor a free hand and all possible glory, without losing any of his own natural dignity. This, and the loyalty with which he stood by his chief minister, although the great nobles tried very hard for years, and his wife for decades, to separate them, the gratitude with which he heaped honours and riches on the founder of his empire—this combination of qualities was not to be found in any of his ancestors. For all his unsophisticated mind, for all his narrow upbringing, William I., with his courage, his piety and his kingly nature was always a true nobleman.

His son, who mounted the throne a dying man, and ruled only 100 days, as Frederick III., had won by his share in famous battles, his good looks, and above all, his sorrows, a popularity which he bore with exemplary patience. In character he belonged rather to the romantic type of the family; when the empire was being founded, he proposed that the other princes should be compelled to do homage; he adored old thrones and brilliant pageants, and only betrayed his domineering instincts so seldom as he did because the superior intelligence of his wife, Victoria of England, primed him with democratic demands or catch-words.

The Ambitions of William II.—William II. (1888-1918) inherited both his mother's great gifts and her dilettantism, with his father's love of display; together with other ancestral qualities which Bismarck, in his character-sketch of the last emperor, summed up as follows: "From Frederick I. he inherited love of display, vanity and an autocratic nature; from Frederick William I. only the taste for tall fellows; from Frederick the Great only

the love of interfering in his officials' business; from Frederick William II. a mystic turn and strong sexual impulses, from Frederick William IV. the desire to talk a lot."

The dangerous mixture of weaknesses and talents, in both of which William II. was rich, of vanity and timidity, both of which were equally strongly developed in him, is only partly to be explained by the withered arm which all his life he hid from the world and tried to overcome in his own soul by an exaggeratedly manly and military manner. An over-strict upbringing, keenly resented because of his physical defect, gave him, too, an unhappy youth reminiscent of the repression suffered by Frederick the Great. In this case, however, there was no instruction to mature the prince, no restraint to moderate him. On the contrary, fate willed it that at 29, suddenly and almost unprepared, he should inherit an empire which had grown steadily in power as he grew from boyhood to manhood. Could it be wondered at that the young monarch, impelled by the will to please, bemused with ideas of God's peculiar grace, inspired with the rise of his house, too long repressed, too suddenly master, began to follow the promptings of his vanity rather than of his duty? And how was a State whose constitution was still practically the same as in 1850, whose citizens had no political experience and in which the higher officials and officers had for centuries been drawn almost exclusively from the nobility—how was such a State suddenly to produce men with the courage to turn their backs on the throne, or even to warn the king? The empire was at its zenith. What could happen to it with the strongest army in the world, and an officialdom which ran as smoothly and as incorruptibly as a machine?

When the young emperor overthrew the old chancellor in March 1890, after 28 years' service, in the same brutal way as Frederick I. of old had cast aside his minister Danckelman and as William had suggested in talk among his friends, nothing hindered him from making himself supreme except lack of Frederick the Great's genius. He did not, indeed, like Frederick, unleash a war, for all his life, in natural and explicable fear he dreaded nothing so much as the danger of battle and war; but he dissolved the treaty with Russia on which Bismarck had bound the security of the empire. Almost at the same moment as William dismissed Bismarck, he cut the wire which linked Berlin to Petersburg, and so cleared away the obstacle which had kept the tsar aloof from a French *rapprochement*; and thus William opened the door for that war on two fronts which Bismarck, with an eye to Germany's unfavourable situation, had managed for three decades to prevent.

From now onward, the encirclement of Germany proceeded the more inevitably, as William, out of personal hatred of his uncle, Edward VII. of England, rejected every advance from England, even the offer of an alliance from Chamberlain, and instead of this aspired to colonies and began to build a great fleet—two things that Bismarck had avoided on the principle that Germany's dangerous situation forbade her from engaging in any adventures abroad. All these enterprises were accompanied by a flood of high-flown and even provocative speeches, the echoes of which made the cabinets of Europe, and the peoples too, uneasy for 25 years. To shout down his weakness, the emperor in these hundreds of public speeches proclaimed again and again his phrases of the shining armour, of the victorious German sword, of the mailed fist, Nibelungen loyalty and Neptune's trident, until the world he addressed held him for a warlike conqueror, only waiting for the moment to fall upon his neighbours.

In reality he was pushed on by the little military circle, that, in Prussia as everywhere else, was urging new wars after a generation of peace, called him a coward in secret, and thought out machinations how to bring him from words to deeds, from threats to mobilization. The middle classes listened with ironic smiles, paid less and less attention to these speeches every year, and buried themselves in business, which was flourishing everywhere. Only the workmen and Socialists, in their press, brochures and speeches uttered warnings, year after year, against the dangers of the ever-increasing boasting and court display. When the consequences of the imperial speeches became a national danger, in Nov. 1908, over an incautious interview in the *Daily Telegraph*, and all Germany arose and demanded a remedy, it was not the

Socialists, but members of the highest nobility who debated whether the emperor should not be put under control, as of unsound mind.

The murder of the Austrian heir to the throne in July 1914 was a personal blow to William, because the victim was his friend, and a prince by God's grace as well; his mind, too, appears at the time to have been in a state of maniac excitement, so that he encouraged the bellicose cabinet of Vienna with violent words, letters and marginal notes, and promised them help. Three weeks later, when all was lost, and his mind was passing through a state of less exaltation, his anger burned out, he shrank away from the threatening spectre of war, which he, oftenest of all men, had evoked, and sought at the last moment to avoid it. When the first signs of unrest began among a starving, bleeding people, he thought it could be crushed by force, as in peace. It was only when the general collapse began, in Oct. 1918, that in a memorable scene he sanctioned the new constitution, even as Frederick William IV. had not promised his till the first shots were heard in Berlin; and thus in the last weeks of his reign, against his declared will, yet founded that new democratic Germany in which ministers rule instead of kings, and are nominated by a people's parliament.

In vain first Wilson in America, then a section of public opinion in Germany, appealed to him to abdicate, to ease the situation of his country. He remained, until in the first days of November, the people rose in different cities and ports, and demanded his abdication. Even on Nov. 8, when his cousin and chancellor, Prince Max of Baden, himself proposed his abdication as a means of saving the monarchy, which could easily have been carried on by his grandson, a minor, the emperor refused, and in the end, when at last the capital itself rose, declared that he would abdicate as emperor, that is, from the empty title, but not from his place of real power as king of Prussia. But on the morning of the 10th, fear of sharing the fate of the tsar, and the advice of his Field-marshal Hindenburg sent him fleeing out of his country over the frontier into Holland.

Two hundred years earlier his forebear, the young Frederick the Great had planned to escape over the frontier, and had only been detained by a chance. Then his father's will had been that that prince should be shot for a deserter. Now the news that the Supreme War Lord had forsaken his country, in uniform, at the moment of her greatest need, evoked in the people neither hate nor rage, only an immense disappointment; for except the higher nobility, who knew the emperor's character, none of his enemies would have believed a Prussian king capable of such conduct. It destroyed the belief of the Prussians in the military basis of their State, which had been instilled into them for centuries as a maxim of morals and honour, and a great illusion fell shattered round the heads of loyal and faithful millions. Prussia and Germany became republics, not because the time was ripe, but because all their princes had become degenerate and defenceless, and vacated their 20 thrones without a blow.

Thus ended the dynasty of the Hohenzollerns, at the height of their power, after rising from burgrafs to emperors, from rulers of one million to 36,000,000, from a vassal state to the heads of Germany. Yet the deeds of the best Hohenzollerns were not in vain. It was only through their work and energy in welding the land together out of so many different parts that it was able to survive the fall of the dynasty without dissolving into its component parts; and only because Bismarck had united the many German states into one State could that *Reich* still survive, after the fall of so many dynasties, beaten in the field, compassed about by victorious enemies and temptations to secede. The best of the Hohenzollerns have their reward in history in the solidity of the German Republic as a national and linguistic unit. (E. LUD.)

HOKAN. This term unites as genetically related a number of North American Indian linguistic stocks, scattered over a large area and previously considered distinct. Dixon and Kroeber in 1913 (*Amer. Anthropologist*, vol. xv.) coined the name from the word for "two" in some north Californian dialects, including in the family Shasta (*q.v.*), Achomawi, Karok, Chimariko, Pomo (*q.v.*), Yana, Esselen, Yuman (*q.v.*), and subsequently Salinan, Chumash (*q.v.*), Washo, all in or near California, and Seri (*q.v.*) in Sonora and Tequistlatecan in southern Mexico. Sapir (*Intern. Journ. Am. Linguistics*, vol. i. 1920) added Coahuiltecan Karankawa, Tonkawa, and in 1925, (*Am. Anth.*, vol. xxvii.), Subtiaba in Nicaragua, suggesting further that Siouan, Muskogi, Caddo and Iroquois would ultimately prove to be related to Hokan-Coahuiltecan. The historic significance of these linguistic determinations, if confirmed, is considerable, but some authorities (Boas, Goddard, Michelson, Yhlenback) remain unconvinced of the validity even of the narrower Hokan family in California, though others (Rivet, W. Schmidt) accept the full findings. (A. L. K.)

HOKKAIDO, the Japanese name for the northern division of the empire (*Hoku*=north, *kai*=sea, and *do*=road), including Yezo, the Kuriles and their adjacent islets.

HOKUSAI KATSUSHUKA (1760-1849), the greatest of all the Japanese painters of the Popular School (*Ukiyo-ye*), was born at Yedo (Tōkyō) in the 9th month of the 10th year of the period Hōreki, i.e. Oct.-Nov. 1760. He came of an artisan family, his father having been a mirror-maker, Nakajima Issai. After some practice as a wood-engraver he, at the age of eighteen, entered the studio of Katsugawa Shunshō, a painter and designer of colour-prints of considerable importance. His disregard for the artistic principles of his master caused his expulsion in 1785; and thereafter—although from time to time Hokusai studied various styles, including especially that of Shiba Gokan, from whom he gained some fragmentary knowledge of European methods—he kept his personal independence. For a time he lived in extreme poverty, and, although he must have gained sums for his work which might have secured him comfort, he remained poor, and to the end of his life proudly described himself as a peasant. He illustrated large numbers of books, of which the world-famous *Mangwa*, a pictorial encyclopaedia of Japanese life, appeared in 15 volumes from 1812 to 1875. Of his colour-prints the "Thirty-six Views of Mount Fuji" (the whole set consisting of 46 prints) were made between 1823 and 1829; "Views of Famous Bridges" (11), "Waterfalls" (8), and "Views of the Lu-chu Islands" (8) are the best known of those issued in series; but Hokusai also designed some superb broadsheets published separately, and his *surimono* (small prints made for special occasions and ceremonies) are unequalled for delicacy and beauty. The "Hundred Views of Mount Fuji" (1834-1835), 3 vols., in monochrome, are of extraordinary originality and variety. As a painter and draughtsman Hokusai is not held by Japanese critics to be of the first rank, but this verdict has never been accepted by Europeans, who place him among the greatest artists of the world. He possessed great powers of observation and characterization, a singular technical skill, an unfailing gift of good humour, and untiring industry. He was an eager student to the end of his long life, and on his death-bed said, "If Heaven had lent me but five years more, I should have become a great painter." He died on May 10, 1849.

HOLBACH, PAUL HEINRICH DIETRICH, BARON D' (1723-1789), French philosopher and man of letters, of German origin, was born at Heidelberg in the Palatinate. Holbach kept

open house in Paris for Helvétius, D'Alembert, Diderot, Condillac, Turgot, Buffon, Grimm, Hume, Garrick, Wilkes, Sterne, and for a time J. J. Rousseau. For the great *Encyclopédie* he compiled and translated a large number of articles on chemistry and mineralogy, chiefly from German sources. In 1767 *Christianisme dévoilé* appeared, in which he attacked Christianity and religion as the source of all human evils. This was followed up by other works, and in 1770 by a still more open attack in his most famous book, *Le Système de la nature*, in which he was probably assisted by Diderot. Denying the existence of a deity, and refusing to admit as evidence all *a priori* arguments, Holbach saw in the universe nothing save matter in spontaneous movement. What men call their souls become extinct when the body dies. Happiness is the end of mankind. "It would be useless and almost unjust to insist upon a man's being virtuous if he cannot be so without being unhappy. So long as vice renders him happy, he should love vice." Not less direct and trenchant are his attacks on political government, which, interpreted by the light of after events, sound like the first distant mutterings of revolution. Holbach exposed the logical consequences of the theories of the Encyclopaedists. Voltaire hastily seized his pen to refute the philosophy of the *Système* in the article "Dieu" in his *Dictionnaire philosophique*, while Frederick the Great also drew up an answer to it. Though in some passages clear and eloquent, the style of the *Système* is diffuse and declamatory, and asserts rather than proves its statements. Its principles are summed up in a more popular form in *Bon Sens, ou idées naturelles opposées aux idées surnaturelles* (Amsterdam, 1772). In the *Système social* (1773), the *Politique naturelle* (1773-74) and the *Morale universelle* (1776) Holbach attempts to rear a system of morality in place of the one he had so fiercely attacked, but none of his later writings had a title of the popularity and influence of his earlier work. J. J. Rousseau is supposed to have drawn his portrait in the virtuous atheist Wolmar of the *Nouvelle Héloïse*. He died on Jan. 21, 1789.

For further particulars as to his life and doctrines see Grimm's *Correspondance littéraire*, etc. (1813); Rousseau's *Confessions*; Morellet's *Mémoires* (1821); Madame de Genlis, *Les Diners du Baron Holbach*; Madame d'Épinay's *Mémoires*; Avezac-Lavigne, *Diderot et la société du Baron d'Holbach* (1875); T. Morley, *Diderot* (1878); N. P. Cushing, *Baron d'Holbach* (1914); R. Hubert, *D'Holbach et ses Amis* (1928).

HOLBEACH, a market town in Holland, Lincolnshire, England, on the M. and G.N. railway, 23½ m. N.E. of Peterborough. Pop. of urban district (1921) 5,382. All Saints' Church, with a lofty spire, is late Decorated. The grammar school, founded in 1669, occupies a building erected in 1877. Roman and Saxon remains have been found, and the market dates from the 13th century. There is some work in textiles, while brewing and malting are carried on.

HOLBEIN, HANS, the elder (c. 1460-1524), belonged to a celebrated family of painters in practice at Augsburg and Basle from the close of the 15th to the middle of the 16th century. He was born at Augsburg between 1460 and 1470, the son of Michael Holbein, a tanner; the brother of Sigismund and the father of Ambrosius and of Hans Holbein the Younger, all three painters. His name appears in the books of the tax-gatherers of Augsburg from 1494 onwards. Previous to that date he was a painter of name, and he executed in 1493, for the abbey at Weingarten, the wings of an altar-piece representing Joachim's Offering, the Nativity of the Virgin, Mary's Presentation in the Temple, and the Presentation of Christ, which now hang in separate panels in the cathedral of Augsburg. In these pieces and others of the same period, for instance in the altarpiece from the Chapel of St. Afra at Augsburg (1496) two parts of which are in the bishop's palace at Eichstätt, and in the "Coronation of the Virgin" in the Museum of Basle, we mark the impress of the school of Van der Weyden. In 1501 Holbein went to Frankfurt to paint the high altar for the Dominican monastery. In this task he was assisted by his younger brother, Sigismund, and by Leonhard Beck (museum at Frankfurt). After this date there is a marked change of style due, it is suggested, to his coming in touch with Mathias Grünewald in Frankfurt. In later works, such as the Basilica of St. Paul (1504) in the gallery of Augsburg, the wane of Flemish

influence is apparent. But this altarpiece, with its quaint illustrations of St. Paul's life and martyrdom, is not alone of interest because its execution is characteristic of old Holbein. It is equally so because it contains portraits of the master himself, accompanied by his two sons, the painters Ambrose (c. 1494-c. 1519) and Hans the younger. Later pictures, such as the Passion series in the Fürstenberg gallery at Donaueschingen, or the "Martyrdom of St. Sebastian" in the Munich Pinakothek, contain similar portraits, the original drawings of which are found in old Holbein's sketch-book at Berlin. A self portrait in Silverpoint is in the museum at Chantilly.

After 1516 Hans Holbein the elder appeared as a defaulter in the registers of the tax-gatherers at Augsburg. He died at Issenheim in 1524. His art is distinguished for its delicate colour, its deep soft shadows; and for its lifelike portraiture. The elder Holbein belonged to the transition period, which preceded the Renaissance and in his later work he began to introduce Italian Renaissance ornaments. He was a prolific artist. Earlier than the Basilica of St. Paul, already mentioned, is the Basilica of St. Mary Maggiore, and a Passion in 11 pieces, in the Augsburg gallery, both executed in 1499. The Passion of Donaueschingen was finished after 1502, in which year was completed the Passion of Kaisheim, a conglomerate of 16 panels now divided amongst the galleries of Munich and Augsburg. Two altarpieces of the same class, commissioned for the monastery of St. Moritz at Augsburg in 1504-08, have been dispersed and lost. 1512 is the date of "The Miracle of St. Ulrich" for the Augsburg gallery. A portrait of an old man, dated 1513, is in the collection of Count Lanckoronski at Vienna. One of the most important works of the late period is "The Well of Life" (1519) in the museum at Lisbon. The sketch-books of Berlin, and the drawings at the museum of Basle give a lively picture of the forms and dress of Augsburg residents at the beginning of the 16th century. They comprise many portraits. He also made designs for glass painting. In the cathedral of Eichstätt in the churches of St. Ulrich at Augsburg and of St. James at Straubing windows designed by him are still to be seen.

See C. Glaser, *Hans Holbein der Ältere* (Leipzig, 1908).

HOLBEIN, HANS, the younger (1497-1543), German painter, son of Hans Holbein the elder, was born at Augsburg in 1497. He received the first lessons from his father. In 1515 he went to Basle with his brother Ambrosius and probably worked as an apprentice under Hans Herbst. One of his first patrons is said to have been Erasmus, for whom, shortly after his arrival, he illustrated with pen-and-ink sketches an edition of the *Encomium Moriae*, now in the museum of Basle. He designed titlepage-blocks and initials for new editions of the Bible and classics issued from the presses of Froben and other publishers; and executed some rough painter's work, a schoolmaster's sign in the Basle collection, a table with pictures of St. Nobody in the library of the University at Zurich. In contrast with these coarse productions, the portraits of Jacob Meyer and his wife in the Basle museum, one of which purports to have been finished in 1516, are miracles of workmanship. Two exquisite studies in silverpoint for these portraits are in the same collection. In 1517 Ambrosius matriculated in the guild of Basle; Hans went to Lucerne, where he was employed to paint in the house of Jacob Hertenstein. The portrait of young Benedict Hertenstein in the Metropolitan Museum of Art, New York, was executed at this time. In 1519 Holbein reappeared at Basle where he matriculated and, there is every reason to think, married.

Whether, previous to this time, he took advantage of his vicinity to the Italian border to cross the Alps is uncertain. Van Mander says that he never was in Italy; yet the spirit of Holbein's compositions for the Basle town hall, the scenery and architecture of his numerous drawings, and the cast of form in some of his imaginative portraits, make it likely that he should have felt the direct influence of north Italian painting. The Swiss at this period wandered in thousands to swell the ranks of the French or imperial armies fighting on Italian soil, and the road they took may have been followed by Hans on a more peaceful mission. The "Flagellation," and the "Last Supper" at Basle executed 1519-20 show

some acquaintance with Lombard methods of painting, whilst in other pieces, such as the series of the Passion in oil in the same collection, the modes of Hans Holbein the elder are agreeably commingled with a more modern, it may be said Italian, polish. The "Man of Sorrows and the Virgin" are set in Italian Renaissance architecture; the decoration of the walls of the house "Zum Tanz" with simulated architectural features of a florid character is Italian in conception; and his wall paintings in the town hall, if we can truly judge of them by copies, reveal an artist not unfamiliar with north Italian composition, distribution, action, gesture and expression. In his drawings too, particularly in a set representing the Passion at Basle, the arrangement, and also the perspective, form and decorative ornament, are Italian in spirit. Contemporary with these, however, and almost inexplicably in contrast with them as regards handling, are portrait drawings which are finished with German delicacy, and with a power and subtlety of hand seldom rivalled in any school. Curiously enough, the same contrast may be observed between painted compositions and painted portraits. The "Bonifacius Amerbach" of 1519 at Basle is acknowledged to be one of the most complete examples of smooth and transparent handling that Holbein ever executed. His versatility at this period is shown by a dead Christ (1521), a corpse in profile, and a set of figures in couples; the "Madonna and St. Pantalus," and "Kaiser Henry with the Empress Kunigunde" (1522), originally composed for the organ loft of the Basle cathedral, now in the Basle museum. Equally remarkable, but more attractive, though injured, is the "Virgin and Child between St. Ursus and a bishop," in the gallery of Solothurn. This picture is dated 1522, and seems to have been ordered for an altar in the minster of St. Ursus of Solothurn by Nicholas Conrad, a captain and statesman of the 16th century, whose family allowed the precious heirloom to fall into decay in a chapel of the neighbouring village of Grenchen.

Numerous drawings in the spirit of this picture, and probably of the same period in his career, might have led Holbein's contemporaries to believe that he would make his mark in the annals of Basle as a model for painters of altarpieces as well as a model for pictorial composition and portrait. He was gaining a freedom in draughtsmanship that gave him facility to deal with any subject. Though a realist, he was sensible of the dignity and severity of religious painting. His colour had almost all the richness and sweetness of the Venetians. Amongst the portraits which he executed in these years are those of Froben, the publisher, known only by copies at Basle and Hampton Court, and Erasmus, who sat in 1523, as he likewise did in 1530, in various positions, showing his face threequarters as at Longford, Basle, Parma and New York, and in profile as in the Louvre or at Hampton Court. Besides these, Holbein made designs for glass windows, and for woodcuts, including subjects of every sort, from the Virgin and Child with saints of the old time to the Dance of Death, from gospel incidents extracted from Luther's Bible to satirical pieces illustrating the sale of indulgences and other abuses denounced by reformers. Once only, after 1526, and after he had produced the "Lais" and "Venus and Amor," in the museum at Basle, did Holbein with impartial spirit give his services and pencil to the Roman Catholic cause. The burgomaster Meyer, whose patronage he had already enjoyed, now asked him to represent himself and his wives and children in prayer before the Virgin; and Holbein produced the celebrated altarpiece now in the palace of the ex-grand duke of Hesse at Darmstadt, the shape and composition of which are known to all the world by its copy in the Dresden museum. The

ONE OF THE 58 WOODCUTS DESIGNED BY HANS HOLBEIN, THE YOUNGER, FOR THE "DANCE OF DEATH"

drawings for this masterpiece are amongst the most precious relics in the museum of Basle.

The time now came when art began to suffer from unavoidable depression in all countries north of the Alps. Holbein saw that his chances were dwindling to nothing, and armed with letters of introduction from Erasmus to More, he crossed the Channel to England, where in the one-sided branch of portrait painting he found an endless circle of clients. Eighty-seven drawings by Holbein in Windsor castle, containing an equal number of portraits, of persons chiefly of high quality, testify to his industry in the years which divide 1528 from 1543. They are all originals of pictures that are still extant, or sketches for pictures that were lost or never carried out. Sir Thomas More, with whom he seems to have had a very friendly connection, sat to him for likenesses of various kinds. The drawing of his head is at Windsor. A pen-and-ink sketch, in which we see More surrounded by all the members of his family, is now in the gallery of Basle, and numerous copies of a picture from it prove how popular the lost original must once have been. At the same period were executed the portraits of Warham (Lambeth and Louvre), Wyatt (Louvre), Sir Henry Guildford (Windsor), Lady Guildford (New York), all finished in 1527; the astronomer Nicholas Kratzer (Louvre), Thomas Godsalue and his son (Dresden) in 1528. Of the portrait of Sir Bryan Tuke (undated) there are various replicas two of which claim to be original, one in London (Hugh Blaker), the other formerly with Miss Guest of Lunwood is in America. In 1528, Holbein returned to Basle, taking to Erasmus the sketch of More's family.

With money which he brought from London he purchased a house at Basle wherein to lodge his wife and children, whose portraits he now painted (1528). Of this time are the fine portrait drawing of a young man in a large soft hat (Basle), the miniature of Melanchthon (Hanover), and the Bible illustrations known as "Icones." He then witnessed the fury of the iconoclasts, who destroyed in one day almost all the religious pictures at Basle. The municipality, unwilling that he should suffer again from the depression caused by evil times, asked him to finish the frescoes of the town hall, and the sketches from these lost pictures are still before us. His "Rehoboam receiving the Israelite Envoys," and "Saul at the Head of his Array meeting Samuel," testify to Holbein's power, also proved at a later period by the "Triumphs of Riches and Poverty," executed for the Steelyard in London (but now lost).

The year 1530 saw him again on the move, and he landed in England for the second time. Here indeed political changes had robbed him of his earlier patrons. The circle of More and Warham was gone. But that of the merchants of the Steelyard took its place, for whom Holbein executed "The Triumphs of Wealth and Poverty" and the long and important series of portraits that lie scattered throughout the galleries and collections of England and the Continent, and bear date after 1532. The fine "Noli Me Tangere" at Hampton court dates from this period. Then came again the chance of practice in more fashionable circles. In 1533 the "Ambassadors" (London National Gallery), and the portrait of Thomas Cromwell (New York, Frick collection) were executed. Through Cromwell Holbein probably became attached to the court, in the pay of which he appears permanently after 1537. From that time onwards he was connected with all that was highest in the society of London. Henry VIII. invited him to make a family picture of himself, his father and family, which obtained a post of honour at Whitehall. His portrait of the king (Althorp, Earl Spencer) and the beautiful cartoon of a part of this fine piece at Chatsworth enables us to gauge its beauty before the fire which destroyed it in the 17th century. Then Holbein painted Jane Seymour in state (Vienna); he finished the "Southwell" (Uffizi), the "French Ambassador at the court of St. James, Sieur Morette" (Dresden), "Sir Thomas Le Strange" (London, Le Strange), "The Musician" (New York, Henry Goldman), and last, not least, Christine of Denmark (London National Gallery) who gave sittings at Brussels in 1538. During the journey which this worked involved, Holbein took the opportunity of revisiting Basle, where he made his appearance in silk and satin, and, *pro forma* only, accepted the office of town painter. His return to London in autumn enabled

him to do homage to the king in the way familiar to artists. He presented to Henry at Christmas a portrait of Prince Edward (Hanover). Again abroad in the summer of 1539, he painted with great fidelity the princess Anne of Cleves, at Düren near Cologne (Louvre). His portraits up to this time all display that uncommon facility for seizing character which his father enjoyed before him, and which he had inherited in an expanded form. No amount of labour, no laboriousness of finish—and of both he was ever prodigal—betrayed him into loss of resemblance or expression. No painter was ever quicker at noting peculiarities of physiognomy. Yet he was not a child of the 16th century, as the Venetians were, in substituting touch for line. We must not look in his works for modulations of surface or subtle contrasts of colour in juxtaposition. His method was to the very last delicate, finished and smooth, as became a painter of the old school.

Amongst the more important creations of Holbein's later time we should note his "Duke of Norfolk" at Windsor. A portrait of "Catherine Howard" discovered in 1909 is with J. H. Dunn in Canada. Two other portraits of 1541 (Berlin and Vienna), the Falconer at the Hague, and John Chambers at Vienna (1542), are noble specimens of portrait art; most interesting and of the same year is the likeness of Holbein himself, at the Pitti in Florence. Here Holbein appears to us as a man of regular features, with hair just turning grey, but healthy in colour and shape, and evidently well to do in the world. Yet a few months only separated him then from his death-bed. He was busy painting a picture of Henry the VIII. confirming the Privileges of the Barber Surgeons (Lincoln's Inn Fields), when he sickened of the plague and died after making a will, between Oct. 7 and Nov. 29, 1543 in London.

(J. A. C.)

The early authorities are Karel Van Mander's *Het leven d. Nederl. Schilders* (1617) and J. von Sandrart, *Accademia Todesca* (1675). A. F. G. A. Woltmann, *Holbein und seine Zeit* (1874); G. S. Davies, *Holbein* (1903); A. B. Chamberlain, *H. H. the Younger* (1913); P. Ganz, *H. H. der Jungere* (Stuttgart and Leipzig, 1912).

HOLBERG, LUDVIG HOLBERG, BARON (1684–1754), Scandinavian writer, was born at Bergen, Norway, on Dec. 3, 1684. He was early left an orphan, and though his early education was provided by relatives, had a hard struggle at the University of Copenhagen, supporting himself by occasional tutorships. In 1704 he set out on his travels with 60 thaler in his pocket, but fell ill at Aachen, and had to make his way home on foot. In 1706–08 he was at Oxford working in the libraries there. On his return to Copenhagen he began to lecture at the University, and presently received from the king the title of professor for his *Introduction to the History of the Nations of Europe* (1711). He then obtained the Rosenkrantz grant for travel abroad. The years 1714–16 were spent in Italy and France, visiting the great cities. Holberg was still excessively poor, and travelled chiefly on foot. After his return to Denmark in 1716 he published his *Introduction to Natural and Popular Law*, but lived in extreme poverty until in 1718 he was appointed professor of metaphysics, and in 1720 of public eloquence, at Copenhagen.

Hitherto he had written only on law, history and philology, although in a Latin controversy with the jurist Andreas Hojer of Flensburg his satirical genius had flashed out. But now, and until 1728, he created an entirely new class of humorous literature under the pseudonym of Hans Mikkelsen. The serio-comic epic of *Peder Paars*, the earliest of the great classics of the Danish language, appeared in 1719. This poem was a brilliant satire on contemporary manners, and enjoyed an extraordinary success. But the author had offended in it several powerful persons who threatened his life, and if Count Danneskjold had not personally interested the king in him, Holberg's career might have had an untimely close. During the next two years he published five shorter satires. In 1721 Holberg became director of the first Danish theatre in Grønnegade, Copenhagen, where, in Sept. 1722, a Danish translation of *L'Avare* was produced. Until this time no plays had been acted in Denmark except in French and German, but Holberg now determined to use his talent in writing Danish comedy. The first of his original pieces performed was *Den politiske Kandestöber* (The Pewterer turned Politician); and before the end of 1722 he produced *Den Vaegelsindede* (The

Waverer), *Jean de France*, *Jeppe paa Bjerget*, and *Gert the Westphalian*. Of these five plays, four are masterpieces. Holberg took no rest, and before the end of 1723 the comedies of *Barselstuen* (The Lying-in Room), *The Eleventh of July*, *Jakob von Thyboe*, *Den Bundesløse* (The Fidget), *Erasmus Montanus*, *Don Ranudo*, *Ulysses of Ithaca*, *Without Head or Tail*, *Witchcraft* and *Melampe* had all been written, and some of them acted. In 1724 the most famous comedy that Holberg produced was *Henrik and Pernille*. But in spite of this unprecedented blaze of dramatic genius the theatre had to be closed for lack of money. Holberg composing for the last night's performance, in Feb. 1727, a *Funeral of Danish Comedy*. This excessive labour for the stage had undermined the poet's health, and in 1725 he had determined to take the baths at Aachen; but instead of going thither he wandered through Belgium to Paris, and spent the winter there. In the spring he returned to Copenhagen with recovered health and spirits, and worked quietly at his protean literary labours until the great fire of 1728.

In the period of national poverty and depression that followed this event, a puritanical spirit, which was little in sympathy with Holberg's dramatic or satiric genius, predominated. He therefore closed his career as a dramatic poet by publishing in 1731 his acted comedies, with the addition of five which he had no opportunity of putting on the stage. He adopted the serious tone of the new age, and busied himself for the next 20 years with historical, philosophical and statistical writings. During this period he published his poetical satire called *Metamorphosis* (1726), and his *Epistolae ad virum perillustrem* (1727), his *Description of Denmark and Norway* (1729), *History of Denmark*, *Universal Church History*, *Biographies of Famous Men*, *Moral Reflections*, *Description of Bergen* (1737), *A History of the Jews*, and other learned and laborious compilations. The only poem he published at this time was the famous *Nicolai Klimii iter subterraneum* (1741), afterwards translated into Danish by Baggesen. When Christian VI. died in 1747, pietism lost its sway; the theatre was reopened and Holberg was appointed director, but he soon resigned this arduous post. The six comedies he wrote in his old age did not add to his reputation. His last published work was his *Epistles*, in 5 vols. the last of them posthumous (1754). In 1747 he was created by the new king Baron of Holberg. He died at Copenhagen on Jan. 28, 1754, in the 70th year of his age. He was buried at Sorø, in Zealand. He had never married, and he bequeathed all his property, which was considerable, to Sorø college.

Holberg was not only the founder of Danish literature and the greatest of Danish authors, but he was, with the exception of Voltaire, the first writer in Europe during his own generation. Neither Pope nor Swift, who perhaps excelled him in particular branches of literary production, approached him in range of genius, or in encyclopaedic versatility. Holberg found Denmark provided with no books, and he wrote a library for her. When he arrived in the country, the Danish language was never heard in a gentleman's house. Polite Danes were wont to say that a man wrote Latin to his friends, talked French to the ladies, called his dogs in German, and only used Danish to swear at his servants. The single genius of Holberg revolutionized this system. He wrote poems of all kinds in a language hitherto employed only for ballads and hymns; he instituted a theatre, and composed a rich collection of comedies for it; he filled the shelves of the citizens with works in their own tongue on history, law, politics, science, philology and philosophy, all written in a true and manly style, and representing the extreme attainment of European culture at the moment. Perhaps no author who ever lived has had so vast an influence over his countrymen, an influence that is still at work after 200 years.

The editions of Holberg's works are legion. Complete editions of the *Comedies* are too numerous to be quoted; the best is that brought out in 3 vols. by F. L. Lichtenberg, in 1870. Of *Peder Paars* there exist at least 23 editions, besides translations in Dutch, German and Swedish. The *Iter subterraneum* has been three several times translated into Danish, ten times into German, thrice into Swedish, thrice into Dutch, thrice into English, twice into French, twice into Russian and once into Hungarian. The life of Holberg was written by Welhaven in 1858 and by Georg Brandes in 1884. Among other works may be mentioned those by Robert Prutz (1857) and A. Legrelle (1864).

HOLBORN, a metropolitan borough of London, England, bounded north-west by St. Pancras, north-east by Finsbury, south-east by the City of London, south and west by the City of Westminster and St. Marylebone. Pop. (1921), 43,192. Area 405.1 acres.

The name of Holborn was formerly derived from Old Bourne, a tributary of the Fleet. Of the existence of this tributary there is no evidence, and the origin of the name is found in *Holebourne*, the stream in the hollow, in allusion to the Fleet itself. The fall and rise of the road across the valley before the construction of the viaduct (1869) was abrupt and inconvenient. In earlier times a bridge here crossed the Fleet, leading from Newgate, while a quarter of a mile west of the viaduct is the site of Holborn Bars, at the entrance to the City, where tolls were levied. The residential district is mainly within the parish of St. George, Bloomsbury (derived from William Blemund, a lord of the manor in the 15th century). In the 18th century Bloomsbury was a wealthy residential quarter. From the 17th century until modern times the parish of St. Giles in the Fields was notorious as a home of crime and poverty. Here occurred some of the earliest cases of the plague. The neighbouring thoroughfare of Hatton Garden, leading north from Holborn Circus, is a centre of the diamond trade.

Ely Place takes its name from a palace of the bishops of Ely, who held land here as early as the 13th century. The property was acquired by Sir Christopher Hatton, lord chancellor under Queen Elizabeth, though the bishopric kept some hold upon it until the 18th century. The chapel of St. Etheldreda, the only remnant of the palace, is a Decorated structure with a vaulted crypt, itself above ground-level. The present parish church of St. Giles in the Fields, between Shaftesbury avenue and New Oxford street, dates from 1734. Here was a leper's hospital founded by Matilda, wife of Henry I., in 1101. Its chapel became the parish church on the suppression of the monasteries. The church of St. Andrew was built by Wren, but there are traces of the previous Gothic edifice in the tower. Close to this church is the City Temple (Congregational).

Two of the four Inns of Court, Lincoln's Inn and Gray's Inn, lie within the borough. Of the first the Tudor gateway opens upon Chancery Lane. To the west lies the square, with public gardens, still called, from its original character, Lincoln's Inn Fields. Gray's Inn, between High Holborn and Theobald's Road, and west of Gray's Inn Road, is of similar arrangement. Of the former Inns of Chancery attached to these Inns of Court the most noteworthy buildings remaining are those of Staple Inn, of which the timbered and gabled Elizabethan front upon High Holborn is a survival of its character in a London thoroughfare; and of Barnard's Inn, occupied by the Mercer's School. Both these were attached to Gray's Inn. Among other institutions in Holborn are the British Museum, north of New Oxford Street, the Royal College of Surgeons, in Lincoln's Inn Fields, with museum; the Royal Colleges of Organists, and of Veterinary Surgeons. Holborn returns one member to parliament.

HOLBROOKE, JOSEF CHARLES (1878—), English composer, was born at Croydon on July 5, 1878, his father being a pianist, and his Scottish mother a professional singer. When his father settled in London Josef became a chorister at St. Anne's Soho, and also attended the church school. In 1893 he entered the Royal Academy of Music, where he obtained medals, prizes and scholarships. On leaving the R.A.M. in 1896 he became pianist to a touring company, later returning to London and taking pupils. In 1900 Manns played his symphonic poem *The Raven* at one of the Crystal Palace Saturday concerts and since then his works, always vigorous and unconventional, have been constantly performed. They include the symphonic poems (with voice parts) *Queen Mab* (1904) and *The Bells* (1907); *Homage to Poe* (dramatic choral symphony) (1908); *Apollo and the Seaman* (symphonic music to Herbert Trench's poem, 1908); the operas *Children of Don* (produced in London in 1911); *Dylan* (London, 1913); *Bromwen* and *The Wizard* (Chicago, 1915); and *The Enchanted Garden* (opera-ballet, 1915). He has also written concertos for pianoforte (*The Song of*

Gwyn ap Nudd) and violin, some five quartets, a horn trio, three quintets, four sextets and a quantity of smaller works.

See George Lowe, *Josef Holbrooke and his Work* (1920).

HOLCROFT, THOMAS (1745-1809), English dramatist, was born in London on Dec. 10, 1745, the son of a shoemaker who became a travelling hawk. Thomas became a stable boy at Newmarket, and in his evenings studied languages and music. After some experiments as a teacher, he became a player in 1771, and in 1778 produced a play, *The Crisis*, at Drury Lane. During a stay in Paris as correspondent of the *Morning Herald* he saw Beaumarchais's *Mariage de Figaro*, memorized it, and, on his return home, produced an English translation, *Follies of the Day*, at Drury Lane in 1784. His *Road to Ruin* (1791), a melodrama, was a great success and has been frequently revived.

Holcroft was in sympathy with the principles of the French Revolution, and became a member of the Society for Constitutional Information. On that account he was indicted for high treason in 1794, but was discharged without a trial. On returning, in 1802, from a two years' stay in Paris, he set up a printing business, which failed, like most of his financial undertakings. On March 23, 1809, Holcroft died. His self-education had been so creditable that he counted among his friends Coleridge, Charles Lamb, William Godwin and John Opie. Besides his numerous novels and plays, many of which were published anonymously, he produced able translations of plays, books on travel, political memoirs and scientific treatises.

Holcroft's *Memoirs written by Himself and continued down to the Time of his Death, from his Diary, Notes and other Papers*, by William Hazlitt, appeared in 1816, and have been re-edited in 1925 by E. Colby, who also published a bibliography of Holcroft's works in 1922.

HOLD. A nautical term applied to the interior or cargo-containing part of a ship, below the deck or lower-deck. The term hold-beam is applied to the beams crossing the ship above the hold. The derivation is not from the same root as the verb "to hold," but from the Dutch *hol*, a hole or cavity.

HOLDEN, SIR EDWARD HOPKINSON, 1ST BART. (1848-1919), English banker, was born on May 11, 1848, at Tottington, Lancashire. He became managing director (1898) and eventually chairman (1908) of the Birmingham and Midland Bank. He devoted himself to the development of the amalgamating policy of his bank, which ultimately became the London Joint City and Midland Bank (see BANKS AND BANKING). From 1898 he interested himself in international banking, and became as great an expert on foreign exchange questions as on home finance. He was the first of the larger London joint-stock bankers to open a foreign exchange department. In 1906 he was elected Liberal M.P. for the Heywood division of Lancashire and in 1909 received a baronetcy. In 1915 he went with Lord Reading to the United States on behalf of the Government and arranged there the Anglo-French loan. He died on July 23, 1919.

HOLDEN, SIR ISAAC, BART. (1807-1897), English inventor and manufacturer, was the son of Isaac Holden, a native of Cumberland, and was born at Hurlet, near Paisley, on May 7, 1807. His chief discoveries were his square motion wool-comber and a process for making genappe yarns, a patent for which was taken out by him in conjunction with S. C. Lister (Lord Masham) in 1847. The firm of Lister and Holden, which established a factory near Paris in 1848, carried on a successful business, and in 1859, when Lister retired, was succeeded by Isaac Holden and Sons, which became the largest wool-combing business in the world, employing upwards of 4,000 workpeople. In 1865 Holden entered parliament as Liberal member for Knaresborough; later he sat for the northern division of the West Riding, and for Keighley. He died at Oakworth House, near Keighley, on Aug. 13, 1897.

HÖLDERLIN, JOHANN CHRISTIAN FRIEDRICH (1770-1843), German poet and neo-Hellenist, was born on March 20, 1770, at Lauffen on the Neckar. He was destined for the church and studied theology at Tübingen. He was already the writer of occasional verses, and had begun to sketch his novel *Hyperion*, when he was introduced to Schiller, and obtained

through him the post of tutor to the young son of Charlotte von Kalb. A year later he went to Jena to attend Fichte's lectures, and to be near Schiller, who published some of his early writings in his periodicals *Die neue Thalia* and *Die Horen*. In 1796 Hölderlin became tutor in the family of the banker J. F. Gontard in Frankfurt-on-Main. For Gontard's beautiful and gifted wife, Susette, the "Diotima" of his *Hyperion*, he conceived a violent passion; and she became at once his inspiration and his ruin. At the end of two years, during which time the first volume of *Hyperion* was published (1797), the crisis came, and the young poet suddenly left Frankfurt. In spite of ill-health, he now completed *Hyperion*, the second volume of which appeared in 1799, and began a tragedy, *Der Tod des Empedokles*, a fragment of which is published among his works. His friends became alarmed by his nervous irritability, and he was induced to go to Switzerland, as tutor in a family at Hauptwill. There his health improved; and several of his poems, among which are *Der blinde Sänger*, *An die Hoffnung* and *Dichtermut*, were written at this time. In 1801 he returned home to arrange for the publication of a volume of his poems; but, on the failure of this enterprise, he was obliged to accept a tutorship at Bordeaux. "Diotima" died a year later, in June 1802, and the news is supposed to have reached Hölderlin shortly afterwards, for in the following month he suddenly left Bordeaux, and travelled homewards on foot through France, arriving at Nürtingen destitute and insane. Kind treatment gradually alleviated his condition, and in lucid intervals he occupied himself by writing verses and translating Greek plays. Two of these translations—the *Antigone* and *Oedipus rex* of Sophocles—appeared in 1804, and several of his short poems were published by Franz K. L. von Seckendorff in his *Musen Almanach*, 1807 and 1808. In 1804 Hölderlin obtained the sinecure post of librarian to the landgrave Frederick V. of Hesse-Homburg, and went to live in Homburg under the supervision of friends; but two years later becoming irremediably but harmlessly insane, he was taken in the summer of 1807 to Tübingen, where he remained till his death on June 7, 1843.

Hölderlin's writings are the production of a beautiful and sensitive mind; they are intensely, almost morbidly, subjective. His passion for Greek literature led him entirely to discard rhyme in favour of the ancient verse measures. He desired to see the Greek spirit embodied in German literature. His poems are all short pieces; of his tragedy only a fragment was written. *Hyperion, oder der Eremit in Griechenland* (1797-1799), is a romance in letters, in which the stormy fervour of the "Sturm und Drang" is combined with a romantic enthusiasm for Greek antiquity. The interest centres not in the story, for the novel has little or none—*Hyperion* is a young Greek who takes part in the rising of his people against the Turks in 1770—but in its lyric subjectivity and the dithyrambic beauty of its language.

Hölderlin's lyrics, *Lyrische Gedichte*, were edited by L. Uhland and G. Schwab in 1820; and his *Sämtliche Werke*, with a biography, by C. T. Schwab (2 vols. 1846); also *Dichtungen* by K. Köstlin (Tübingen, 1884), and (the best edition) *Gesammelte Dichtungen* by B. Litzmann (2 vols. Stuttgart, 1897). See also C. C. T. Litzmann, *F. Hölderlins Leben* (1890); A. Wilbrandt, *Hölderlin* (2nd ed. 1891); C. Müller, *Friedrich Hölderlin, sein Leben und sein Dichten* (Bremen, 1894); J. Claverio, *La Jeunesse d'Hölderlin jusqu'au roman d'Hyperion* (1922); E. Lehmann, *Hölderlins Lyrik* (Stuttgart, 1922); F. Sebas, *Hölderlin-Bibliographie* (Munich, 1922); M. Montgomery, *F. Hölderlin and the German Neo-Hellenic Movement* (Oxford, 1923, etc.); S. Zweig, *Der Kampf mit dem Dämon* (1925).

HOLDERNESSE, EARL OF, an English title borne by Sir John Ramsay and later by the family of Darcy. John Ramsay (c. 1580-1626), a member of the Scottish family of Ramsay of Dalhousie, was knighted for his share in rescuing James VI. from the hands of John Ruthven, earl of Gowrie, in Aug. 1600. In 1606 the king created him Viscount Haddington and Lord Ramsay of Barns, and in 1621 made him an English peer as earl of Holderness. Ramsay died in Feb. 1626, when his titles became extinct. In 1644 Charles I. created his nephew, Prince Rupert, earl of Holderness, but when the prince died unmarried in Nov. 1682 the earldom again became extinct. Conyers Darcy (1599-1689), who was made earl of Holderness in 1682 only a few days after the death of Rupert, was the son and heir of Conyers Darcy, Lord

Darcy and Conyers (c. 1571-1654). Robert Darcy, fourth and last earl of Holderness, died in 1778.

HOLDHEIM, SAMUEL (1806-1860), Jewish rabbi, a leader of reform in the German Synagogue, was born in Posen, and died in Berlin on Aug. 22, 1860. He was educated by his father and then at Prague and Berlin. He was rabbi at Frankfurt-on-the-Oder from 1836 to 1840 when he was transferred to the rabbinate of Mecklenburg-Schwerin. He then became an advocate of religious freedom and of reform within the Jewish community. At the rabbinical conferences of Brunswick (1844), Frankfurt-on-the-Main (1845) and Breslau (1846), Holdheim strongly advocated the modification of ritual, especially with regard to Sabbath observance, marriage laws and liturgical customs. In 1846 he was chosen rabbi of the new Berlin congregation.

Besides numerous contributions to periodicals and essays, Holdheim published *Gottesdienstliche Vorträge* (1839), *Der religiöse Fortschritt im deutschen Judenthume* (1840), *Die Autonomie der Rabbinen* (1843), *Vorträge über die Mosaische Religion für denkende Israeliten* (1844), *Das Ceremonialgesetz im Messiasreich* (1845), *Gesch. der jüdischen Reformgemeinde* (1857) and *Ma'amar La-Ishut* (1860).

See I. H. Ritter in the *Jewish Quarterly Review*, i. 202 and *Geschichte der jüdischen Reformation* (vol. 3, 1865); Graetz, *Gesch. der Juden*; and D. Philipson's *History of the Reform Movement in Judaism* (1906).

HOLDICH, SIR THOMAS HUNGERFORD (1843-1929), K.C.M.G. (1902), K.C.I.E. (1897), was born at Dingley, Northants, on Feb. 13, 1843. In 1862 he passed out of Woolwich into the Royal Engineers. He served with the Bhutan Expedition (1865), in Abyssinia (1867), in the Afghan War (1878-1880), and on many frontier commissions, being promoted brevet-colonel in 1891. In 1892, he was appointed superintendent of the frontier surveys in India, holding this post until 1898. He acted as H.M. commissioner for the Perso-Baluch boundary in 1896, and for the Argentine-Chile boundary in 1902-1903. He was for two years president of the Royal Geographical Society (1916-1918). He died on Nov. 2, 1929.

His publications include: *The Indian Borderland* (1901); *The Countries of the King's Award* (1904); *India* (1904); *Tibet* (1906); *The Gates of India* (1909); *Political Frontiers and Boundary Making* (1916); *Boundaries in Europe and the Near East* (1918).

HOLGUÍN, a town of the high plateau country in the interior of Oriente province, Cuba, about 65 m. N.W. of Santiago de Cuba. Pop. (1919 census) 13,768. The town is near the Marañon and Jigüé rivers, on a plain from which hills rise on all sides except the east, where it is open to the winds of the plateau. Holguín was long the principal acclimatization station for Spanish troops. The oldest public buildings are two churches built in 1800 and 1809 respectively. Holguín has trade in cabinet woods, tobacco, Indian corn and cattle products, which it exports through its port Gibara, about 25 m. N.N.E., with which it is connected by railway. Holguín was settled about 1720 and became a *ciudad* (city) in 1751. In the Ten Years' War of 1868-78 and in the revolution of 1895-98 Holguín was an insurgent centre.

HOLIDAY, originally the "holy day," a festival set apart for religious observances as a memorial of some sacred event or sacred person; hence a day on which the ordinary work or business ceases. For the religious sense see FEASTS AND FESTIVALS; SUNDAY; and WAKE. It will suffice to deal here with public holidays, the observance of which is prescribed by the State. In one respect these have been diminished, in so far as saints' days are no longer regarded as entailing non-attendance at the Government offices in England, as was the case at the beginning of the 19th century. But while the influence of religion in determining such holidays has waned, the importance of making some compulsory provision for social recreation has made itself felt. In England four days, known as Bank Holidays (*q.v.*), are set apart by statute to be observed as general holidays, while the sovereign may by proclamation appoint any day to be similarly observed. In the British colonies there is no uniform practice, but in some Arbor day, Labour day, etc., have been added.

In the United States there is no legal holiday in the sense of the English bank holidays. A legal holiday is dependent upon State and territorial legislation. It is usual for the President to proclaim the last Thursday in November as a day of thanks-

giving; this makes it a legal holiday only in the District of Columbia, and in the territories, but most States make it a general holiday. Independence day (July 4) and Labour day (first Monday in September) are legal holidays in most States. There are other days which, in connection with particular events or in remembrance of particular persons, have been made legal holidays by particular States. The following list gives the most important of these.

The chief legal or public holidays are:

Jan. 1—New Year's Day—all the States, Territories and colonial possessions.

Feb. 12—Lincoln's Birthday—birthday of Abraham Lincoln, sixteenth president of the United States, celebrated in Alaska, California, Colorado, Connecticut, Delaware, Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Jersey, New York, North Dakota, Ohio, Pennsylvania, South Dakota, Tennessee, Utah, Washington, West Virginia, Wyoming, and observed by governor's proclamation in Massachusetts.

Feb. 22—Washington's Birthday—birthday of George Washington, first president of the United States, celebrated in all the States, Territories and possessions.

Good Friday—movable religious holiday in memory of Christ's Crucifixion and death, celebrated legally in Connecticut, Delaware, Florida, Louisiana, Maryland, Minnesota, New Jersey, Pennsylvania, Philippines, Porto Rico and Tennessee. In Connecticut Good Friday is usually proclaimed by the governor as a day of fasting and prayer.

May 30—Memorial or Decoration Day—holiday observed in tribute to those who died in the military and naval service of the United States, observed on this date in all the States and possessions except Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, New Mexico, North Carolina, South Carolina and Texas. Most of the southern States have a corresponding memorial day but the date is not uniform.

July 4—Independence Day—anniversary of the signing of the Declaration of Independence of the thirteen original States from Great Britain, in 1776, celebrated throughout the United States and its possessions.

Labor Day—First Monday in September—set apart by the labor organizations in the United States to be observed as a holiday, every State and Territory except Alabama, Wyoming and the Philippines.

Oct. 12—Columbus Day—anniversary of the day on which Columbus first sighted islands of the New World, celebrated in Arkansas, Arizona, California, Colorado, Connecticut, Delaware, Florida, Idaho, Illinois, Indiana, Kansas, Kentucky, Louisiana, Maine, Maryland, Michigan, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Dakota, Ohio, Oregon, Pennsylvania, Rhode Island, Texas, Utah, Vermont, Washington, West Virginia and Porto Rico. In Arkansas and Kansas it does not affect notes or judicial proceedings.

Election Day—day of national and generally State elections (1st Tuesday after 1st Monday in November). Observed in every State and Territory except Alaska, District of Columbia, Hawaii, Illinois, Massachusetts, Mississippi, Ohio, Philippines and Vermont. In Illinois it is a legal holiday in Chicago and certain other cities. In Ohio it is a half holiday. In Maine it is a legal holiday only as to the courts.

Nov. 11—Armistice Day—anniversary of the signing of the Armistice in the World War, Nov. 11, 1918, observed in Alabama, Arizona, Arkansas, California, Colorado, Florida, Illinois, Iowa, Louisiana, Minnesota, Missouri, Montana, Nebraska, New Jersey, North Carolina, North Dakota, Pennsylvania, Rhode Island, South Dakota, Tennessee, Texas, Vermont, Virginia and Hawaii. In other States by governor's proclamation only.

Thanksgiving Day—last Thursday in November, a semi-religious day of giving thanks, instituted by the Pilgrim Fathers at the gathering of their first harvest in the New World 1621, and since 1863 set apart by presidential proclamation as an annual holiday throughout the United States and its possessions.

Dec. 25—Christmas Day—Christian holiday in memory of the birth of Christ, celebrated throughout the United States and its possessions.

See M'Curdy, *Bibliography of Articles relating to Holidays* (Boston, 1905). (T. A. I.)

HOLINSHED (or HOLLINGSHEAD), **RAPHAEL** (d. c. 1580), English chronicler, belonged probably to a Cheshire family, and may possibly be identified with the Holinshed who matriculated from Christ's college, Cambridge, in 1544. About 1560 he came to London and was employed as a translator by Reginald or Reynier Wolfe, who was engaged in the preparation of a universal history. Holinshed worked for some years on this undertaking; but after Wolfe's death in 1573 the scope of the work was abridged, and it appeared as the *Chronicles of England, Scotland, and Ireland* (2 vols., 1578). Holinshed received valuable assistance from William Harrison (*q.v.*) and others, while

the part dealing with the history of Scotland is mainly a translation of Hector Boece's *Scotorum historiae*. The chief interest of the work lies in the fact that it was largely used by Shakespeare and other Elizabethan dramatists; Shakespeare, who probably used the edition of 1587, obtaining from the *Chronicles* material for most of his historical plays, and also for *Macbeth*, *King Lear* and part of *Cymbeline*. Holinshed died about 1580.

A second edition of the *Chronicles*, enlarged and improved but without illustrations, which appeared in 1587, contained statements which were offensive to Queen Elizabeth and her advisers, and immediately after publication some of the pages were excised by order of the privy council. These excisions were published separately in 1723. An edition of the *Chronicles*, in accordance with the original text, was published in six volumes in 1808.

See W. G. Boswell-Stone, *Shakespeare's Holinshed. The Chronicle and the historical plays compared* (1896).

HOLISM. Holism (from the Gr. *Holos*, whole) is the theory which makes the existence of "wholes" a fundamental feature of the world. It regards natural objects, both animate and inanimate, as wholes and not merely as assemblages of elements or parts. It looks upon nature as consisting of discrete, concrete bodies and things, and not as a diffusive homogeneous continuum. And these bodies or things are not entirely resolvable into parts; in one degree or another they are wholes which are more than the sum of their parts, and the mechanical putting together of their parts will not produce them or account for their characters and behaviour. The so-called parts are in fact not real but largely abstract analytical distinctions, and do not properly or adequately express what has gone to the making of the thing as a whole.

Holism and Science.—Holism is therefore a view-point additional and complementary to that of science, whose keywords are continuity and mechanism. The ideal of science is continuity, and its method is based on the analysis of things into more or less constant elements or parts, the sum of whose actions account for the behaviour of these things. Things thus become mechanisms of their parts; and the interactions of their invariable parts in a homogeneous time and space according to the rules of mechanics are sufficient to account for all their properties. This mechanistic scheme applies even to living bodies, as their material structures determine the functions which constitute life characters. Mind is similarly, though much more doubtfully, based on physical mechanisms and functions. Life and mind are thus considered as derivative and epiphenomenal to matter. The validity of this simple scientific scheme of things has been commonly, but never universally, accepted even among scientists. The inferior position it assigns to mind has remained an insuperable difficulty. And many biologists have also viewed its account of life as inadequate, and have supported the plea for *vitalism* or for life as a real force or factor additional to those which operate on the physical plane. Finally the scientific scheme has been seriously undermined by the most recent discoveries in physical and mathematical science, which have resolved matter into variable energy, have destroyed the homogeneity of space and time, and have thereby shaken the whole basis of fixed standards and accurate measurements on which the mechanistic scheme is founded. The value of the mechanistic concept for research is not questioned, but it can no longer be considered as a true index of the concrete character of the universe and its contents. Holism is an attempt to explore an alternative scheme which will yet avoid the pitfalls of vitalism.

What Are Wholes?—What is involved in the concept of a whole? In the first place, in so far as a whole is considered as consisting of parts or elements, they cannot be fixed, constant, or unalterable. To be parts in a whole they must be pliant, flexible and mouldable. Their adjustment in a whole implies their flexibility and adjustability. It must be possible for the part to be different in the whole from what it is outside the whole; and in different wholes it must be different in each case from what it is in its separate state. The atoms of matter and the electrons and protons of atoms are on this view not constant and identical throughout, either in their isolated states or in the wholes of

atoms, molecules and compounds which they compose. They are variable, although the limits of variation may be too small for measurement or observation. In so far as physical substances are wholes, their elements cannot be constant and unalterable, as they must be adjustable to the pattern of these wholes. In the second place, in so far as the elements or parts cohere and coalesce into the structure or pattern of a whole, the whole must itself be an active factor or influence among them; otherwise it is impossible to understand how the unity of a new pattern arises from its elements. Whole and parts mutually and reciprocally influence and modify each other; the one is pliant to and moulded by the other; the parts are moulded and adjusted by the whole, just as the whole in turn depends on the co-operation of its parts. The adjustive, directive, controlling influence of the whole is just as real as the rôle which the parts play in the make-up of the whole.

Holism and Evolution.—The concept of the whole as applied to natural objects thus implies two great departures from the orthodox scientific scheme. In the first place, matter, life and mind do not consist of fixed, constant and unalterable elements. And in the second place, besides the parts or the elements in things, there is another active factor (the whole) which science does not recognize at all. The whole has an influence and an effect all its own. Natural objects, inanimate as well as animate, are flexible patterns in which whole and parts influence and mould each other, and constitute a mobile dynamic equilibrium of all the elements involved. And in the dynamic variation of patterns which we call evolution the complexity of texture and unity of type increase *pari passu* from the earliest chemical beginnings to the highest mental levels. Evolution is just this progressive complexifying of parts or co-operating elements, with a simultaneous increase in unity of pattern with which they are blended. It is thus a rising series of wholes, from the simplest material patterns to the most advanced, which involve a complication of material, physiological and psychical elements, but with the aspect of unity, inner direction and central control always increasing. In other words, wholeness or holism characterizes the entire process of evolution, in an ever-increasing measure. And the process is continuous in the sense that the older types of wholes or patterns are not discarded but become the starting-point and the elements of the newer, more advanced patterns. Thus the material chemical patterns are incorporated into the biological patterns, and both of them into the subsequent psychical patterns or wholes. Each series of wholes progresses both in complexity of elements and unity of pattern up to a point, when it more or less suddenly mutates or swings into a new rhythm or type of pattern, which again shows the same holistic development, until it in turn gives birth to a new and higher type. While the lower grades are more mechanical, and the higher grades more holistic, the movement throughout is towards more and ever more wholeness. The central feature or character of the cosmic movement is therefore towards wholeness or holism. Electrons and protons, atoms and molecules, inorganic and organic compounds, colloids, protoplasm, plants and animals, minds and personalities are but some steps in this movement of holism.

Holism in Biology.—Organisms or biological wholes are not isolated units, but are genetically related, and arise as variations from each other. And they do not exist apart from their surroundings (which are themselves complexes of wholes) but on the contrary are in continuous contact with them, and evolve and vary partly in response to the stimulus which comes from them. The evolving wholes are in close and responsive relation to their environment, the influence of which on them is in part temporary, and confined to the individual duration of each whole, and in part (in so far as the racial links or germ-cells are affected and stimulated) perpetuated through generations of wholes. Whether in any case this influence is temporary or hereditary is a question of fact, to be ascertained by observation, and not by theoretical reasoning, as many geneticists have argued. The view of organisms as wholes, instead of mere mechanisms, and of their variations and genetic evolution as holistic is important, and gives the right orientation for the solution of biological problems. Thus variations are not isolated products of individual factors or genes,

but are the expression of the total energy or developmental tendency of animals and plants (as wholes). The variation is holistic, that is to say, is the outcome of the total tendency of the organism, and not merely of a part of it. On no other principle is it possible to explain the interim survival of small or incipient variations, or of collateral variations emerging in associated groups, as they are too weak to fend for themselves; and can only be kept going by the entire weight of the organism behind them. In fact, the "selection" of the new variation is in such cases not the external natural selection to which Darwin attributed such importance, but the internal "holistic selection" due to the functioning of the animal or plant constitution as a whole. The subject is important but cannot be pursued further in this summary. (See *Holism and Evolution*, ch. viii.)

HOLISM AS CREATIVE ACTIVITY

So far in the above account holism has been put forward as a way out of some of the difficulties which, under the most recent scientific advances, arise on the orthodox mechanistic theory. But it is here further suggested as the solution of the greatest problem of all which has arisen from the more recent contact of science and philosophy. This is the problem of creativeness or epigenesis in evolution. It is a commonplace now that this is a growing evolving world, that new forms and types arise from the old, and that in the course of the history of the earth, the forms of life have progressed from the simplest and lowest to the very highly organized types of to-day, culminating in the human personality. The name "creative evolution" has in consequence been applied to this process. And the question arises as to the meaning of the term "creative" in this connection. There was the older philosophical view that the new is already existing in minutest shape, "preformed" in the old, and that the creative process is simply the unfolding or unpacking of the new forms already existing latent in the old forms. This "preformation" view has, however, been generally discarded by scientists, who have found it in conflict not only with the facts of the geological and palaeontological record, but also with those of embryology, which disclose the individual development as passing through the most curious phylogenetic phases. The creative or epigenetic view of evolution has in consequence been generally adopted, according to which the old gives rise to the genuinely new, to what cannot be reduced to the old and cannot be explained or accounted for by it alone. But this concept of creation or creativeness seems to involve a miracle: how can the higher arise from the lower, the more from the less, as this seems to imply that something can come from nothing? How can a variation or new species arise in some inexplicable unpredictable way from a lower simpler pre-existing state of affairs or species? Profs. Alexander¹ and Lloyd Morgan² accept the creative process "in natural piety" as an unaccountable fact. Prof. Boodin has somewhat fancifully suggested that the creatively new must in fact be an imported article, a new pattern imported to our world from another existing order of things in the universe.³

Where this order is to be found he does not say, though no doubt Sir Oliver Lodge would suggest the ether. Some again attempt to explain the riddle by virtually reading into the old what emerges in the new, and thus in effect returning to the "preformation" view,⁴ to which some other thinkers⁵ seem inclined in any case to return openly as the only way out. This is all very unsatisfactory, and the question arises whether we are forced to admit the existence of some mysterious irrational element within the central sphere of science. It would be most awkward for philosophy to make such an admission in respect of this key position of evolution. If science (so largely the product of reason) calls for the concept of creative evolution, and philosophy declares it a mystery beyond reason, philosophy appears to be stultified and virtually to abdicate her sovereign position. It is here suggested that the explanation is to be found in the concept of the whole. For this concept opens the door directly and simply to creative-

⁵Otto, *The Idea of the Holy*, ch. xiv.

ness. The whole is creative; wherever parts conspire to form a whole, there something arises which is more than the parts. It is the very nature and concept of a whole to be more than its parts, as we have seen. The origin of a whole from its parts is an instance of the more arising from the less, the higher from the lower, in a way which does no violence to reason, but on the contrary follows from reason, because the concept of a whole in relation to its parts is a product of reason. Creative evolution is therefore an inexplicable process, unless we link it on to the concept of wholes, and look upon the creative growing evolving universe as a universe of wholes. It is the making of wholes which makes this universe creative, and the creative universe is therefore necessarily the holistic universe.

Categories of Holism.—Not only is the intimate character of reality illuminated, if not expressed, by the concept of holism, but the categories which are used to describe or explain all natural happening also stand in very close relation to that concept. It is only necessary to refer to four pairs of these categories—cause and effect, freedom and necessity, individuality and mechanism, and the psycho-physical relation.

(A) *Cause and Effect.*—The usual conception of the causal relation establishes an exact equation between cause and effect, and thus makes the element of creation or advance in natural happening unintelligible. For if the effect is never more than the cause, if cause is and must always necessarily be an exact measure of effect, this cannot be a creative progressive universe, and the causal category in this sense makes creative evolution impossible. The accepted fact of creative evolution is a proof that the usual concept of cause is too abstractly and narrowly conceived, that in the universe effect can and sometimes does transcend cause, although usually on so small a scale as to create the illusion of their equality. Here again the idea of wholes gives the clue and explanation. In so far as causes operate holistically, that is to say, where several factors contribute towards the making of new wholes, their operation is creative, there is more in the effect than in the cause or combination of causes, and real creative advance results. Purely mechanical causation (which is perhaps a mere fiction) is equative and is correctly expressed by the ordinary causal concept. But holistic causation, which is the real process, makes possible the increase and advance which is actually the fact in nature.

(B) *Freedom and Determination.*—In the same way and on the same grounds, the concept of the whole and of holistic happening resolves the old controversy between freedom and determination in nature. The chain of necessity arises from the ordinary causal concept which equates cause and effect without remainder, and thus makes the cause determine the effect completely. If this causal concept is wrong, the inference of necessity becomes unjustified. So far as there is an undetermined creative element in the holistic effect, not attributable to the conspiring causal elements, to that extent there is indetermination and freedom, infinitesimally small and practically negligible in physical causation, but much more marked and appreciable in organic happening, and still more so in mental process. An element of freedom thus becomes recognized as inherent in nature, which increases with the progress of evolution, until on the human level it attains considerable dimensions, and becomes the basis for moral responsibility. Freedom is native to the holistic universe, and is not merely an attribute of the human will, in accordance with the usual view.

(C) *Individuality.*—The concept of wholes is also basic to the category of individuality. The organic unity which constitutes a whole is in fact the ultimate basis of individuality. Of this there are traces in inorganic nature already, but it is only on the organic level that individuality assumes practical importance. Plants are individuals, perhaps without having any real individuality, but among the higher animals the feature of individuality becomes of real importance. Dogs, horses and even lower animals have distinct character and individuality. With the emergence of conscious mind in man, the aspect of individuality becomes all-important, and becomes the basis for the latest and greatest whole of evolution, the human personality. In mental development there

are two aspects, the universal tendency, which culminates in the reason, creative of rational order and universal concepts and laws; and the contrasted individual tendency, which reaches an especial development in conscious mind, and constitutes the unique identity or self of the human personality. Individuality rising into personality is perhaps the chief differentia of the human level of evolution. Individuality and reason are the principal constituents of personality, and both are expressions of holism and have their roots in primitive holism.

(D) *Mind and Body.*—Throughout the evolutionary process, lower wholes have given birth to higher wholes and become incorporated with them. Thus material chemical patterns have produced life-patterns which have incorporated and not discarded the parent patterns. Mind is a new organ or pattern developed inside the earlier physical and biological structures; and the three, inextricably interwoven into a new pattern, constitute a new whole or personality. The three sets of patterns are not independent reals, superimposed on each other; they have arisen the one inside the other and are blended into the whole of personality, which constitutes and explains the unity and inter-relations existing between the three. These relations of mind and body would be inexplicable on mechanical grounds, and have in fact presented an insoluble problem to philosophy through all ages. But here again the whole supplies the key. Once we view personality as a real whole, containing earlier blended wholes as its parts, the unity of the whole is seen to underlie and make possible the relations between them, which however are not mechanical but "holistic." Holistic relations are such as exist, not externally as between different parts, but internally as different aspects of the same whole. In fact, we have here reached the point where we may restate the concept of the whole above set forth, and show it, not as the relations of parts in and to a whole (because this formulation is provisional and still savours of mechanical associations) but as the contrasted aspects of the whole from the outside or the inside, from an external standpoint or from its own standpoint. The parts represent its external aspect, which is mechanical; the whole is its aspect from its own standpoint, the view of the whole as a self, so to say. The relation of whole and parts is thus transformed into the relation of self and not-self, with which we are acquainted as the subject-object relation in psychology. Wholeness is itselfness. The concept of the whole therefore, when properly understood, enables us to describe the nature of reality in terms which satisfy the conditions both of physics and psychology, and at the same time disclose body and mind as different (external and internal) aspects of the same thing. This is the key to all their relations. The reality, the true whole, is human personality in each case; apart from it the human body is neither human nor a body. Similarly mind apart from the whole of personality, becomes a functionless abstraction. The whole as creative explains the relation between matter and life, between body and mind. It rules out both materialism and parallelism. In the whole, for instance, mind arises as a new factor X on the basis of neuroses or neural elements *a, b, c*, etc., which become fused and synthesized, and to the extent that X is new it is also, and for that very reason, without a neural correlate. The psychical is thus more than its physiological neural antecedents, although arising from them, and the overplus in mind has no direct neural correspondents. The patterns of the new emergent wholes are different from and transcend those of the elements or lower wholes from which they have arisen and cannot be discovered by searching of the lower patterns.

Transvaluation in Holism.—The transformation of the external into the internal or "self" aspect is not confined to the mental level but is seen already on the level of organic life. Thus in the process of metabolism, an organism continually takes up external material which it transforms, and assimilates into its own system. On the mental level we see this process of transformation vastly accentuated. External stimuli and impressions are continuously assimilated and transformed into psychical elements; what is object or other becomes subject and self. In the subtle creative chemistry of the personality, otherness is ceaselessly converted into selfness, the material into the mental, the

necessary into the free. The conditions which externally determined and bound me become incorporated into the pattern of myself and are thus converted into elements in my own self-determination and freedom. All this only confirms the impression that in the whole the external or material is but an aspect or phase which is continually being passed in the creative process. The world-process tends from matter through life to mind and spirit, from necessity to freedom, from the externality of elements to the inwardness and selfhood of wholes. In this sense the world is truly, as Keats finely said, the valley of soul-making; but we must recognize that souls are only its climax phase, and that lower wholes of many grades characterize its earlier phases. Whole-making, rather than soul-making, would thus be a correct description of the world-process.

HOLISM IN PSYCHOLOGY

When we come to apply the above ideas and principles to psychology and ethics, we find that the results of holism are in close agreement with the facts. In both we find a continual epigenesis as well as a whole-making tendency associated with mental activity. There is an increasing building-up of higher patterns out of lower ones. Thus on the basis of neural sense-stimuli, synthetic sensations with a psychic character are built; sensations again blend into higher perceptions in which it is no longer possible to disentangle the fused sensations. Similarly concepts, judgments, general laws and principles are reached as the result of the synthesis and fusion of innumerable percepts, images, concepts and judgments. Elements of feeling and emotion and will are added, and purposes, rules and ideals are evolved which embrace vast details and effect ever more complex pattern-wholes. Nothing could be more wrong than the old discarded association psychology which viewed mental products as aggregates mechanically formed out of small atoms or items of experience. There is no such atomicity about mind; its action is throughout massive and holistic. Even below the level of conscious mind the psychic processes have this massive and consolidative character, as we see in habits and instincts. On the conscious level, in spite of the analytic character of intelligence, the underlying and controlling processes are holistic, and systematically fuse lower structures of experience into higher, more complicated patterns, which have the character of wholes, irreducible to their original components. Mental activity is throughout characterized by epigenesis and wholeness. The results of the new "Gestalt" or configuration psychology have added force to these considerations. Research has shown clearly that mental activity in the higher animals as well as humans produce patterns or structures of experience, which behave as wholes, and enter into other experiences as undivided and indivisible wholes. In fact the broken pattern is dead and ineffective. Like a period or a rhythm, the mental pattern has only value and effect as a whole.

It must, however, be recognized that mental patterns, however holistic in structure, are not true wholes on a par with natural wholes such as organisms. Technically it would be better to call them holoids, as they have the structure and many of the characters of wholes, but lack the individual existence and power of self-reproduction which natural wholes possess. Their power however must not be underrated. Mental wholes, such as the blended percepts and concepts which denote objects, can be quite individual and distinct; while ideas and ideals when fused with emotion may attain a force which gives them more than the power of real things. The great slogans of science and politics and religion are dynamic realities and have repeatedly produced the most far-reaching effects on history. As higher animals we find a natural environment for our development. As mental and ethical beings we create our own spiritual environment which in the end becomes to us more real and valuable than our natural environment. Nothing could show more significantly the creative whole-making power of human personality. Thus arise the vast holistic structures of science, art, literature and religion, with the still greater wholes of truth, goodness, beauty and love pointing the way to the future.

Holism in Sociology.—If the theory of holism is capable of

illuminating the field of psychology and the other mental sciences, no less fruitful will be its application to the social sciences. The great structures of the State, the Church, and all the other institutions of society bear testimony to the whole-making power of human personality. In anthropology, sociology and politics, holism will not only simplify theory, but also bring those young sciences much nearer to the actual facts. The facts are essentially holistic and holism supplies the key for their interpretation. "We are members one of another" expresses truly the holistic nature of society. Here too, however, a word of warning is necessary. Just as in mental science, we are dealing here also with holoids rather than wholes. Society, the State, the Church and other social institutions are not real wholes, but structures on the analogy and with many of the properties of real wholes. The individuals who compose these structures are the real wholes, whose personalities are not suppressed or merged in the larger structures. On the contrary, the really important factor is and remains human personality, and its great creations in society have for their highest purpose the fostering and spiritual advancement of this supreme whole of personality which has been achieved in the course of evolution. This is not a mere matter of speculation, but one of the most far-reaching practical importance for the ordering of human society and the position of the individual in it.

Is Reality a Whole?—Going still farther afield, the question is raised whether reality itself is one and a whole, or whether it is a pluralistic structure in which individuality has full scope and an assured future. Here one can but ask the question without attempting to answer it. Perhaps in the end it will be found that no answer is possible. This is not a completed universe, but a universe in the making; and there may be wholes great and small in the making beyond the comprehension of our limited faculties. The destiny of the individual lies beyond human ken. Here is really a case for "natural piety."

Forms and Monads.—The concept of wholes is by no means unknown to philosophy or even to science, but no systematic use of it has been made by either of them. Science has on the whole followed the clue of mechanism, but is now getting to its limits. Philosophy more than once definitely approached the concept of the whole without however appreciating its real value. Thus Aristotle's remarkable doctrine of forms as the shaping element of matter is not far removed from the concept of the whole in relation to its parts. The monads of Leibnitz, again, approached the central concept of holism, but the time was not ripe for a full recognition, and the theory remained a metaphysical speculation. Holism is to-day in a happier position. It enthrones the idea of the whole in a setting prepared by science itself, and it appears therefore as a practical way out of very real difficulties both for science and philosophy.

Ethics and Metaphysics of Holism.—Although the theory of holism frankly accepts the material basis of the world and recognizes the natural order as idealism cannot, yet it fully justifies the claims of the spirit in the interpretation of the world. The concept of the whole enables us to overcome some of the most difficult and poignant contrasts in life and thought. We are constantly confronted with the opposition between matter and spirit, between the temporal and the eternal, between the phenomenal and the real. Holism shows these opposites as reconciled and harmonized in the whole. It shows whole and parts as aspects of each other; the finite is identified with the infinite, the particular with the universal. Eternity is contained in time, matter is the vesture and vehicle of spirit, reality is not a transcendent other-worldly order, but is immanent in the phenomenal. To attain to reality, we need not fly away from appearance; each little centre and whole in the world, however lowly, is a laboratory in which time is transmuted into eternity, the phenomenal into the real. The wondrous truth is everywhere; the plummet let down anywhere will reach to unknown depths; any cross-section in the world of appearance will reveal the very texture of reality. Everywhere the whole, even the least and most insignificant apparently, is the real wonder, the miracle which holds the secrets for which we are groping in thought and conduct. There is the within which is the beyond. To be a whole and to live in the whole becomes the

supreme principle, from which all the highest ethical and spiritual rules (such as the golden rule) follow. And it links these rules with the nature of things, for not only do goodness, love and justice derive from it, but also beauty and truth, which are rooted in the whole and have no meaning apart from it. The whole is in fact both the source and the principle of explanation of all our highest ideals, no less than of the earlier evolutionary structures already discussed.

HOLKAR, the family name of the Mahratta ruler of Indore (q.v.), which has been adopted as a dynastic title. The termination *-kar* implies that the founder of the family came from the village of Hol near Poona.

HOLL, FRANK (1845–1888), English painter, was born in London on July 4, 1845, and was educated chiefly at University College School. He was a grandson of William Holl, an engraver of note, and the son of Francis Holl, A.R.A. Entering the Royal Academy schools as a probationer in painting in 1860, he exhibited at the Academy in 1864 "A Portrait" and "Turned out of Church," a subject picture. "A Fern Gatherer" (1865); "The Ordeal" (1866); "Convalescent" (the somewhat grim pathos of which attracted much attention) and "Faces in the Fire" (1867), succeeded. Holl gained the travelling studentship in 1868; the successful work was characteristic of the young painter's mood, being "The Lord gave, and the Lord hath taken away." Holl was much below Millais in portraiture. The range of his studies and the manner of his painting were narrower than those of Josef Israels, with whom, except as a portrait-painter, he may better be compared than with Millais.

In 1878 he was elected A.R.A., and exhibited "The Gifts of the Fairies," "The Daughter of the House," "Absconded" and a very fine portrait of Samuel Cousins now in the National Gallery, London. This last canvas is a masterpiece. Holl was elected R.A. in 1883 and in 1886 he produced a portrait of Millais as his diploma work, but his health rapidly declined and he died at Hampstead, on July 31, 1888. Holl's portraits include likenesses of Lord Roberts, painted for Queen Victoria (1882); the prince of Wales, Lord Dufferin, the duke of Cleveland (1885); Lord Overstone, Bright, Gladstone, Chamberlain, Sir J. Tenniel, Earl Spencer, Viscount Cranbrook and many others.

HOLL, KARL (1866–1926), German church historian, born at Tübingen on May 15, 1866, is famous for his work on *Luther* (vol. i. of his *Gesammelte Aufsätze zur Kirchengeschichte*, 1921). This book is a classic work, showing a profound knowledge of the period and a remarkable insight into the character of Luther himself. Holl was professor at Tübingen, then at Berlin, and in the year before his death rector of the university of Berlin.

Holl's works include: *Die Sacra Parallela des Johannes Damascenus* (1897); *Enthusiasmus und Bussgewalt beim griechischen Mönchtum* (1898); and *Die Bedeutung der grossen Kriege für das religiöse und kirchliche Leben innerhalb des Protestantismus* (1917). See A. von Harnack and H. Lietzmann, *Karl Holl* (1926).

HOLLAND, CLIFFORD MILBURN (1883–1924), American engineer, was born at Somerset (Mass.), on March 13, 1883. He graduated at Harvard university in 1906, and was soon appointed assistant engineer of the Battery-Joralemon street tunnel, New York city. On the completion of this work in 1908, he was in charge of a portion of the Fourth avenue subway in Brooklyn. In 1914 he took direct charge of the Old Slip-Clark street and Whitehall-Montague street tunnels, and later of the Willoughby, 14th and 60th street tunnels in New York city, all, like the Battery-Joralemon street tunnel, connecting Manhattan and Long Island. On July 1, 1919, he became chief engineer of the New York and New Jersey interstate bridge and tunnel commissions for the construction of a vehicular tunnel under the Hudson river. He died on Oct. 27, 1924, at Battle Creek, Michigan. A short time after his death the Hudson river tunnel, connecting

lower Manhattan with Jersey City, was officially named the "Holland Tunnel."

HOLLAND, SIR HENRY, BART. (1788–1873), English physician and author, was born at Knutsford, Cheshire, on Oct. 27, 1788. He studied medicine at Edinburgh (1806–11). In 1816 he began to practise in London. In 1840 he became physician in ordinary to Prince Albert, and in 1852 to the queen. He was created a baronet in 1853. He died on Oct. 27, 1873.

Sir Henry Holland was the author of *General View of the Agriculture of Cheshire* (1807); *Travels in the Ionian Isles, Albania, Thessaly and Greece* (1812–13, 2nd ed., 1819); *Medical Notes and Reflections* (1839); *Chapters on Mental Physiology* (1852); *Essays on Scientific and other Subjects contributed to the Edinburgh and Quarterly Reviews* (1862); and *Recollections of Past Life* (1872).

HOLLAND, HENRY FOX, 1ST BARON (1705–1774), English statesman, second son of Sir Stephen Fox, was born on Sept. 28, 1705. Inheriting a large share of the riches which his father had accumulated, he squandered it soon after attaining his majority, and went to the Continent to escape from his creditors. He contracted a wealthy marriage which enabled him, in 1735, to enter parliament as member for Hindon, Wiltshire. He became the favourite pupil and devoted supporter of Sir Robert Walpole. He was surveyor-general of works from 1737 to 1742, was member for Windsor from 1741 to 1761; lord of the treasury in 1743, secretary at war and member of the privy council in 1746, and in 1755 became leader of the House of Commons, secretary of state and a member of the cabinet under the duke of Newcastle. In 1757, in the rearrangements of the government, Fox was ultimately excluded from the cabinet, and became paymaster of the forces. During the Seven Years' War, Fox devoted himself mainly to accumulating a vast fortune. In 1762 he again became leader of the House, with a seat in the cabinet, under the earl of Bute, and exercised his skill in cajolery and corruption to induce the House of Commons to countenance the Treaty of Paris of 1763; as a recompense, he was raised to the House of Lords with the title of Baron Holland of Foxley, Wiltshire. In 1765 he was forced to resign the paymaster generalship, and four years later a petition of the livery of the city of London against the ministers referred to him as "the public defaulter of unaccounted millions." The proceedings brought against him in the court of exchequer were stayed by a royal warrant and he justified the delays by appealing to custom. He died at Holland House, Kensington, on July 1, 1774. By his wife, Lady Georgina Caroline Lennox, he had four sons: Stephen, 2nd Lord Holland (d. 1774); Henry (d. an infant); Charles James (see FOX, CHARLES JAMES); and Henry Edward (1755–1811), soldier and diplomatist.

HOLLAND, HENRY RICH, 1ST EARL OF (1590–1649), 2nd son of Robert, 1st earl of Warwick, and of Penelope, Sir Philip Sidney's "Stella," daughter of Walter Devereux, 1st earl of Essex, was baptized on Aug. 19, 1590, educated at Emmanuel college, Cambridge, knighted in 1610, and returned to parliament for Leicester in 1610 and 1614. In 1610 he was present at the siege of Juliers. Favours were showered upon him by James I. He was made gentleman of the bedchamber to Charles, prince of Wales, and captain of the yeomen of the guard; and in 1623 he was raised to the peerage as Baron Kensington. In 1624 he was sent to Paris to negotiate the marriage treaty between Charles and Henrietta Maria. In September he was created earl of Holland, and in 1625 was sent on two further missions, first to Paris to arrange a treaty between Louis XIII. and the Huguenots, and later to the Netherlands with Buckingham. He held various places under Charles I., but deserted his cause in 1641. He was chosen by the parliament in March and July 1642 to communicate its votes to Charles, who received him with studied coldness. He was appointed one of the committee of safety in July, and joined Essex's army at Twickenham, where, it is said, he persuaded him to avoid a battle. In 1643 he appeared as a peacemaker, and after failing to bring over Essex, he returned to the king. His reception, however, was not a cordial one, and after the first battle of Newbury he once more returned to the parliament. Once again he renewed his allegiance to the king's cause; and after endeavouring to promote the negotiations for peace in 1645 and 1647 he took up arms in the second Civil War, received a com-

mission as general, and put himself at the head of 600 men at Kingston. He was defeated on July 7, 1647, captured at St. Neots shortly afterwards, and imprisoned at Warwick Castle. He was sentenced to death, and was executed together with Hamilton and Capel on March 9, 1649.

HOLLAND, HENRY RICHARD VASSALL FOX, 3RD BARON (1773-1840), was the son of Stephen Fox, 2nd Baron Holland, and his wife née Lady Mary Fitzpatrick. He was born at Winterslow House, Wiltshire, on Nov. 21, 1773, and his father died in 1774. He was admitted to the privy council in 1806, and on Oct. 15 entered the cabinet "of all the talents" as lord privy seal, retiring with the rest of his colleagues in March 1807. His loyalty as a Whig during the long subsequent period of opposition was rewarded by his appointment as chancellor of the duchy of Lancaster in the cabinet of Lord Grey and Lord Melbourne, and he died in office on Oct. 22, 1840. Lord Holland is notable, not for his unimportant political career, but as a patron of literature, as a writer, and as a leader in the Whig political and literary world of the time. Lady Holland (d. Nov. 16, 1845) made for herself in London the position filled in Paris during the 18th century by the society ladies who held "salons." Lord Holland's *Foreign Reminiscences* (1850) contain much amusing gossip from the Revolutionary and Napoleonic era. His *Memoirs of the Whig Party and Further Memoirs* (1852) are important contemporary authorities. Holland had two legitimate sons, Stephen, who died in 1800, and Henry Edward (d. 1859) 4th and last Lord Holland who edited his father's *Reminiscences* and *Memoirs*.

See *The Journal of Elizabeth, Lady Holland*, edited by the earl of Ilchester (1908); and Lloyd Sanders, *The Holland House Circle* (1908).

HOLLAND, HENRY SCOTT (1847-1918), English divine, was born at Ledbury, Hereford, on Jan. 27, 1847. He was educated at Eton and at Balliol college, Oxford; in 1872 he was ordained, becoming the same year a tutor at Christ Church. In 1882 he was senior proctor of the university, and the same year was made a canon of Truro and examining chaplain to its bishop. He was appointed a canon of St. Paul's in 1884, and in 1886 precentor. He refused the offer of the see of Norwich in 1893, but in 1910 was appointed regius professor of divinity at Oxford. He died at Oxford on March 17, 1918. Scott Holland was closely associated with the Christian Social Union for many years. He was a successful tutor and a popular professor; but it is as a preacher that he is most vividly remembered.

See his *Life*, by Stephen Paget (1921).

HOLLAND, JOHN PHILIP (1841-1914), American inventor, was born at Liscannor, County Clare, Ireland, in 1841. He was educated at Limerick, and was a schoolmaster in Ireland prior to migrating to the United States. He was teaching in New Jersey when the Civil War broke out and the conflict between the "Merrimac" and the "Monitor" suggested to him the idea of a submarine. He became a pioneer in this field and one of the most successful designers of submarine craft. The first boat, built in 1875, was a failure and it was not until his ninth attempt in 1898 that he produced a serviceable submarine. This boat was commissioned for the U.S. navy.

His great achievement was the furnishing of the submarine with two methods of propulsion, a 50 h.p. gasoline engine to be used when on the surface and electric storage batteries when submerged. The British admiralty acquired all the patents for Great Britain, although his avowed purpose had been to invent a craft that would overcome the British naval supremacy. Holland then turned his attention to the construction of submarines for sea-going purposes, and all his subsequent boats were built for the U.S. navy. He died at Newark (N.J.) on Aug. 12, 1914.

HOLLAND, JOSIAH GILBERT (1819-1881), American author and editor, was born in Belchertown (Mass.), July 24, 1819. He graduated in 1843 at the Berkshire medical college at Pittsfield (Mass.), and after practising medicine and making an unsuccessful attempt to establish a hospital for women, he taught for a while in Richmond (Va.), and Vicksburg (Miss.). In 1849 he became assistant editor under Samuel Bowles, and three years later one of the owners of the Springfield (Mass.) *Republican*. After travelling in Europe he moved to New York in 1870, where

he became editor and one-third owner of *Scribner's Monthly* (after 1881 *The Century*).

Dr. Holland's earlier books were published over the pseudonym "Timothy Titcomb." His highly popular writings include a *History of Western Massachusetts* (1855), and a *Life of Abraham Lincoln* (1865). He died Oct. 12, 1881.

See Mrs. H. M. Plunkett's *Josiah Gilbert Holland* (1894).

HOLLAND, PHILEMON (1552-1637), English scholar, "the translator-general in his age," was born at Chelmsford, Essex, the son of a clergyman, John Holland, who had been in exile with Miles Coverdale during the Marian persecution. Having become a fellow of Trinity college, Cambridge, he was incorporated at Oxford (July 11, 1585) and studied medicine. About 1595 he settled as a doctor in Coventry, but chiefly occupied himself with translations, which included Livy, Pliny's *Natural History*, Plutarch's *Morals*, Suetonius, Ammianus Marcellinus and Xenophon's *Cyropaedia*. He published also an English version, with additions, of Camden's *Britannia*. His Latin translation of Brice Bauderon's *Pharmacopaea* and his *Regimen sanitatis Salerni* were published after his death by his son, Henry Holland (1583-1650).

HOLLAND, RICHARD or RICHARD DE HOLANDE (fl. 1450), Scottish writer, author of the *Buke of the Howlat*, was secretary or chaplain to the earl of Moray (1450) and rector of Halkirk, near Thurso. He was afterwards rector of Abbreeochy, Loch Ness. He was an ardent partisan of the Douglasses, and on their overthrow retired to Orkney and later to Shetland. He was employed by Edward IV. in his attempt to rouse the Western Isles through Douglas agency, and in 1482 was excluded from the general pardon granted by James III. to those who would renounce their fealty to the Douglasses.

The poem, entitled the *Buke of the Howlat*, written about 1450, shows his devotion to the house of Douglas:—

On ilk beugh till embrace
Writtin in a bill was
O Dowglass, O Dowglass
Tender and trewe!

(ii. 400-403).

and is dedicated to the wife of a Douglas—

Thus for ane Dow of Dunbar drew I this Dyte,
Dowit with ane Dowglass, and boith war thei dowis,

but all theories of its being a political allegory in favour of that house may be discarded. The poem, which extends to 1,000 lines written in the irregular alliterative rhymed stanza, is a bird-allegory, of the type familiar in the *Parlement of Foules*.

The text of the poem is preserved in the Asloan and Bannatyne mss. Fragments of an early 16th century black-letter edition, discovered by D. Laing, are reproduced in the *Adversaria* of the Bannatyne club. Of the many editions see that by F. J. Amours in *Scottish Alliterative Poems* (Scottish Text Society, 1897), pp. 47-81. (See also Introduction, pp. xx-xxxiv.)

HOLLAND, SIR (THOMAS) ERSKINE (1835-1926), English international jurist, son of Thomas Agar Holland, poet, and rector of Poynings, Sussex, was born on July 17, 1835, and educated at Brighton college and Balliol college, Oxford. He studied Greek philosophy and was elected Fellow of Exeter college. In 1863 he was called to the Bar (Lincoln's Inn), joining the Home Circuit. In 1874 he was appointed Vinerian Reader in English Law at Oxford, and later in the same year, on the resignation of Dr. Bernard, Chichele Professor of International Law and Diplomacy, a post which he held for 36 years. In 1875 he became associate (and later member) of the Institut de Droit International, which held a meeting in Oxford on his invitation in 1880. The Naval Prize Act (1894) was drafted by him, and also the Admiralty Manual of Prize Law (1888). He was particularly interested in law in its scientific and literary aspects, and in 1894 gained the Swiney Prize for his *Elements of Jurisprudence* (13 editions). The War Office made use of his services in drafting orders for troops in the field, and these were subsequently co-ordinated and published under the title of *Laws of war on land* (1904). In 1903-5 he served on the Royal Commission on the Supply of Food in Time of War and attended the Geneva Conference (1906) as plenipotentiary. In 1917 he received his knight-

hood. He died on May 24, 1926. He had five sons, including Sir Robert Erskine Holland, and one daughter.

HOLLAND, officially the kingdom of the Netherlands (*Koninkrijk der Nederlanden*), a maritime country in the north-west of Europe commonly known as Holland. This name, however, is that of the former countship which was largely the political nucleus of the kingdom. North Holland and South Holland (*q.v.*) are but two of the 11 constituent provinces. Their geographical importance is partly indicated by their population, for they are the most densely populated political units.

Topography.—Holland is bounded eastward by Germany, south by Belgium, west and north by the North sea, and at the north-east corner by the Dollart. From slightly below Stevensweert to the south-west corner of Limburg the boundary line is formed by the river Maas or Meuse. At Maastricht, however, a portion lies beyond the left bank of the river, about 7,900 ft. from the outer glacis of the now dismantled fortress. The boundary is defined "*la ville de Maastricht . . . avec un rayon de territoire de douze cents toises à partir du glacis extérieur de la place*" (Item 2, Art. IV. of Treaty between Holland and Belgium, April 19, 1839). On the east a fairly continuous natural boundary is represented by the line of marshy fens extending along the borders of Overijssel, Drenthe and Groningen. South of this the line is less definite, but the Maas in its great swing between Roermond and Grave runs just west of the German frontier. The kingdom extends from 53° 33' (Rottum island off Groningen) to 50° 46' (South Limburg), and from 3° 22' (near Sluis, Zeeland) to 7° 13' (East Groningen). The greatest length from north to south is thus about 190 m.; its breadth varies considerably, the maximum from south-west to north-east entirely within its borders is about 160 miles. The area shows continual variation, diminishing by coastal erosion and increasing by diking and drainage operations. In 1926 the total land area was estimated at 12,593 sq.m. or, inclusive of inland waters 13,210 sq.m.; an estimate in 1920 gave 15,760 sq.m. for land, inland waters, gulfs and bays. In no other country of Europe have the inhabitants been so instrumental in modifying the character of their home territory.

Coast and Relief.—The surface features and sea boundaries of the Netherlands are profoundly influenced by the fact that the country largely consists of the delta portions of two rivers, that of the Maas, commencing at Liège beyond southern Limburg, and that of the Rhine, commencing at Bonn; these delta areas overlap in northern Limburg and North Brabant, and from there northwards Zeeland can be interpreted as a portion of the same deltas plus deltaic material from the Schelde. The deltas are the direct result of the convergence of the waters of the three rivers into a tidal-node area where crest neutralizes trough and produces non-scouring conditions. North of the Zeeland archipelago the tidal set is more definitely north-east as the flow is assisted by prevalent winds and by the non-tidal water drift; consequently the ebb set of the tide cannot return all material carried forward by the flow. In addition, Scandinavian inland ice swept southward with its limit, in the Netherlands, roughly along the north-west—south-east line Zaanvoort—Maartensdijk—Rhenen—Nijmegen. Dependent on the former presence of this ice-sheet are the existing glacial ridges which occur in Drenthe, Overijssel, and particularly in Gelderland, and which have not only acted as watersheds and materially affected the drainage of to-day but have also had important effects on natural and cultivated vegetation and on the related activities of the Dutch people.

The ridges, which run broadly north to south, are the result of tangential compression of the ice; they have a core of distorted and contorted fluvial material of southern origin, and their lower slopes are locally covered by boulder clay, northern boulders or fluvio-glacial debris. The last is sandy in character and frequently fills the hollows between the ridges. Five main ridges have been determined: Emmen to Groningen, Enschede to Gotmarsum, Lochem to Havelte, Arnhem to Hattem, Rhenen to Bussum. West of the last ridge the glacial deposits sink below sea level, but have been proved in North Holland by borings. (See "*Physiographic Regions of the Netherlands*" by P. Tesch, *Geographical Review* [New York, 1923] pp. 507–517.) The sum-

mit height occurs on the Gelderland ridge north of Arnhem, where Imbosch mound reaches 110 metres (361 ft.). The non-glaciated lands are low but show a slight increase of height south-eastward until south Limburg is reached; the increase there is rapid for that land, both geologically and orographically, belongs to the plateau bordering the north Ardennes. As a result of this it presents the Dutch with their only source of home coal. The summit height for all the Netherlands is in the extreme south-east corner, where Holland, Germany and Belgium meet; here "Four Countries View" (Moresnet [Eupen-Malmédy] now belonging to Belgium was the fourth) reaches 322 metres (1,057 ft.). The amount of land exceeding 1,000 ft. is microscopic and very little exceeds even 150 ft. More than 35% lies less than a metre above Amsterdam level. (Throughout the Netherlands, and also in adjacent German areas, the basis of the official measurement of altitudes is the *Amsterdamsch Peil* [A.P.]; i.e., Amsterdam average high-water level of the Y at the time when it was open to the Zuider Zee.) Fully a quarter of the country in the west, fortunately fringed by the sand dunes, is actually below Amsterdam Zero. Extreme depths reach 16–20 ft. below; nevertheless the land is cultivated.

The coast forms a bold sweeping curve, concave to the sea in its south-western part and convex in its north-eastern section, broken in the south at the Zeeland—S. Holland archipelago, and again in the north, where such channels as the Marsdiep, Vlie, and Friesche Gat among the West Frisian islands give entrance to the Zuider Zee (see IMPOLDERING) and to that water-land (wadden) which, extending along the Friesland-Groningen coast and beyond, is invaded by the sea at each flood. The characteristic features of the coast are the chains of sand dunes nearly 200 m. in total length fringed by a broad, sandy beach shelving gradually seaward. In general, the dunes seldom exceed 30–40 ft. though near Haarlem, i.e., in the centre of the unbroken strip, the High Blinkert is nearly 200 ft. above A.P.; northwards where the winds have a wider sweep over the open sea the dunes are themselves wider, even exceeding 2½ m. from west to east at Schoorl north-west of Alkmaar. The two main dune chains were formed in successive ages. The land bridge between Dover and Calais founded and tidal currents swept eastward carrying sandy fragments of England and France which were built up into submarine shelly sandbanks between Calais and Texel; the banks lengthened and joined, though gaps remained opposite to the river mouths; at low tide sand dunes were blown on to these banks. New dunes grew on new banks seaward and cradled little flats of old beach between their successive ridges. This phase ended probably much prior to A.D. 300, as suggested by archaeological evidence and proved by other lines of study; e.g., the upper parts have had all lime removed by weathering but lower down there are abundant small fragments of common shells, while still below these is the basal sand-bed with whole valves of the same shells. (These remnants are sufficiently valuable to be worth extraction as a source of building lime in a land where the main calcareous deposits are as remote as the chalky hills of south Limburg.)

The next and present period of dune-building was probably dependent on coast border changes near the Straits of Dover, or on local oscillations of the land and water levels, or on both. In any case, the upper portions of the basal sand-banks of the oldest, i.e., eastern, of the Old Dunes, are now several feet below A.P. of to-day, and certain Roman structures have been discovered below sea level. In some areas the Old Dunes have been entirely destroyed and the new dunes rest direct on new estuarine polder-clay, as in Zeeland-Flanders; along the greater part of the coasts of North Holland and South Holland both sets still exist with the newer on the seaward side though some new dune sands have been carried eastward and locally overlie the old dunes and the plains between them, and some have reached and even overwhelmed coastal patches on the Zuider Zee. This tendency to an eastward drift is artificially arrested by the planting of reed grass. The westward growth of the line of dunes has within recent times changed seaports to inland towns, and a new settlement has arisen on the new coast, e.g., Egmond and Egmond

PHOTOGRAPHS, ROYAL DUTCH AIRLINES, FROM ORIENT AND OCCIDENT

AERIAL VIEWS IN THE NETHERLANDS

1. One of the great dykes of the Zuyder Zee reclamation project under construction. It will extend from Medemblik (foreground) to the island of Wieringen, which is already connected with the mainland of North Holland province. This dyke will make it possible to transform a water area of about 76 square miles into fertile land
2. Pier and bathing beach of Scheveningen, Holland's most fashionable bathing resort, as seen from the sea. The centre building is the Kurhaus, or Grand Hôtel des Bains
- 3 and 4. Inland polder fields showing the canals, windmills and dykes by

means of which these fertile lands, which constitute a great part of Holland, have been recovered from the sea

- 5 and 6. Bulb-fields near Haarlem, the centre of Dutch bulb-growing. In spring, when the hyacinths and tulips are in bloom, this impoldered land presents a magnificent variety of colours. In June and July, after the flower season is over, the bulbs are brought to the bulb-barns (seen in the photographs) to be cleaned, sorted, dried and stored away. Vegetables are also widely cultivated in the rich land around Haarlem

aan Zee. (See NORTH HOLLAND.) There is thus a distinct west to east zoning in the Netherlands. The physical difference between adjacent strips has had important effects on the activities of the Dutch peoples. In the lee of the dunes are the dune pans, which are naturally marshy through the defective drainage of the clay-like soil, but the *geest* grounds where dune and pan meet can be planted with trees. The marshy pan is then gradually drained and cultivated, whilst the numerous springs at the dune base can be made to provide water for local use in the little settlement thus developed. Many old towns in North and South Holland, e.g., The Hague and Leyden have so originated. Modern developments have allowed the dune-base drinking water to be carried considerable distances—Amsterdam was so supplied in 1853, and other towns more recently. Beyond the *geest* lands are the low fens, usually still very marshy but gradually being reclaimed; still farther eastward, in North Holland, is the Zuider Zee, succeeded in turn by the eastern margin fenland, and finally by the elm and poplar patches, sandy heaths, high fens, and riverine meadow strips of the eastern frontier, which in every respect are much less typical of the accepted conception of Dutch scenery.

The entire drainage of the Netherlands is ultimately into the North sea. The principal rivers are the Rhine, the Maas (Meuse) and the Schelde (Scheldt), and each has its origin outside the country, whilst in the case of the Schelde only its two great sea channels are within the territory of the Netherlands. The Rhine in its course through this land is merely the parent stream, splitting up into Rhine and Waal above Nijmegen, Rhine and Yssel above Arnhem, Crooked Rhine and Lek (which takes most of the waters), near Wijk-by-Duurstede and at Utrecht into Old Rhine and Vecht, finally reaching the sea through the sluices at Katwijk. The Yssel and the Vecht reach the Zuider Zee; the other branches the North sea. The Maas, whose lower course is almost parallel to that of the Waal enters the Netherlands in the extreme south, forms the international boundary as far as Stevensweert, crosses Limburg to its north junction with North Brabant, and then closely follows the north boundary of North Brabant; from this province it receives its large lower tributaries, the Mark and the Dommel-Aa. Up to 1907 the main stream joined the Waal at Gorinchem and flowed to Dordrecht. From here Maas waters reached the sea by Old Maas and De Noord; the latter joining the Lek and reaching the sea as the New Maas. From Gorinchem the New Merwede (constructed in the second half of the 19th century) extends between dikes through the marshes of the Biesbosch to the Hollandsch Diep. These great slowly flowing rivers are very important waterways. In the Waal ordinary high-tide water reaches beyond Gorinchem; in the Lek the limit is at Vianen; in the Yssel, above the Katerveer, near Zwolle; and in the Maas near Heusden. During spring tides, in each case the effect is felt considerably farther up-stream; e.g., in the Lek to Culemborg.

Into the Zuider Zee there also flow the Eem from Utrecht province; the Vecht, with its tributaries Regge and Dinkel, from Overijssel; and numerous shorter streams from Friesland. The total length of navigable channels is about 1,200 m., diminished during summer on account of shallows. The smaller streams, except where they rise in the fens, often fertilize a strip of grassland in the midst of the barren sand, and are responsible for the existence of many villages along their banks. Artificial irrigation is also practised by means of some of the smaller streams, especially in the east and south-east, and in the absence of streams a canal system is sometimes specially constructed for the same purpose. The low-lying areas at the confluences of the rivers, being readily laid under water, have been frequently chosen as sites for fortresses, but probably the greatest value of the rivers, apart from their direct use as waterways for transport, is their indirect use in this respect, viz., to act as permanent water supplies for the numerous canals. Practically every stream of any size in the Netherlands functions in this capacity.

Lakes.—Obviously lakes are particularly numerous though small; the largest have been drained. (See IMPOLDERING.) Many existing ones are merely marshes or flooded peat-pits, while several

contain entrapped sea water. The typical "Lake District" is in Friesland. East of the Meppel-Leeuwarden line are several, e.g., Fleussen, Tjeuke Meer, Sloter Meer, Sneeker Meer, noted for their abundance of fish or for their beauty of situation.

Dikes.—Some of the earliest inhabitants of the Netherlands of whom there is definite record were the Free Frisians, living in the far north of the country. They were not subdued by the Romans until A.D. 47, and prior to this had settled long enough to build extensive mounds (*terpen* or *wierden*) on the marshes exposed to inundation. These at first were merely high enough to protect the few rude huts on their summits from the normal rise of the tide, but in course of time the accumulated debris of settlement and drifted material increased their height and extent, so that they became safe refuges during mildly abnormal rises of tide. The experience thus gained, together with the presence over a considerable area of northern erratic boulders (see RELIEF) allowed the early inhabitants to build primitive dikes at the coast edge. The increased food resources of these newer sites led to the abandonment of many of the inland mounds, though many of the older towns and villages of Friesland and Groningen each still occupies a separate *terp*. The primitive dikes were steadily improved and much more ambitious schemes were launched, both here and in other parts of the Netherlands, particularly in the 12th and 13th centuries when the steady sinking of the land, or rise of the sea, created such serious problems. During this period the great sand-dune fringed fresh-water basin, the *Flevo lacus*, of the Romans gradually increased in size, for the lower river channels which formerly carried the water seawards became the waterways by which the sea entered the sinking basin; about A.D. 1300 *Flevo lacus* had become a real southern sea bay, *Almare* of the North sea. Apparently this Zuider Zee inundation was more gradual than the catastrophic ones of A.D. 1277, when 30 villages in the lower Ems basin were destroyed on the formation of the Dollart, or the disastrous flood of 1421 when the Hollandsch Diep gave entrance to a sea which caused the destruction of 72 villages and more than 100,000 lives, and converted a prosperous agricultural colony into a forest of reeds—*Biesbosch*. Again, a century later (1532) the fertile east of South Beveland, with 3,000 inhabitants, was submerged in a single flood and to-day it remains as *Verdronken* (Drowned) land.

In view of the possibility of ever-recurrent even though minor inundations, e.g., in 1916, the Netherlands have wisely devoted much money and applied the talents of skilled engineers to the construction of protective works. These of necessity must be of enormous size. Westkapelle dike, situated between Westkapelle and Domburg, and the Hondsbossche Zeewering, from Kamperduin to near Petten, were built in the 15th century and were reconstructed and extended between 1860 and 1884; even such massive structures as these need constant inspection and maintenance, for although large blocks of basalt, as at Westkapelle, or of granite, as at the Helder, are used, yet gigantic wooden piles have been necessary to reach the more solid material below and to act as supports for the masonry. Many of the older piles had been riddled by the pile-worm (*Teredo navalis*), as its ravages were not detected until 1731. At the present day electrical treatment is used for the destruction of the pests, and the engineers also have available the more resistant ferro-concrete pile. A corps of engineers (*De Waterstaat*) is exclusively occupied on protection and reclamation works. In consequence, the detailed construction of the dike varies to meet the specific difficulties of different parts of the Netherlands. Probably Westkapelle is the finest of its type in the world; it is over 2 m. long, has a seaward sloping face of 300 ft., and on its ridge (39 ft. broad) carries a road and service railway. Many others are of interest, as the Helder dike, about 5 m. long, 12 ft. wide (carrying a road), with its end plunging 200 ft. into the sea at an angle of 40°. Such dikes as these are sea protection works; other dikes guide rivers and guard the adjacent lands.

Canals.—Parallel dikes either strengthen or replace the banks of rivers which are then deepened and kept permanently supplied with water. They then rank as canalized rivers, e.g., the New Merwede canal, from Amsterdam to the Rhine. In other

cases the dikes bound newly cut excavations in preparation for entirely artificial canals. Typical of the largest is the North Holland canal (1819-1825) 46 m. long, 130 ft. broad and 20 ft. deep, with its level at Buickloot, 10 ft. below the average level of the sea at half-tide. It runs from Amsterdam, where it is controlled by the vast sea-gates (Willems Sluis), to the Helder; another is the North sea canal (1865-76) which, 15 m. long, 65-110 yd. wide and 22-26 ft. deep runs from Amsterdam almost due west to the North sea. As the surface of this canal is 20 in. below mean water level at Amsterdam it has been provided with gigantic locks and ponderous sea-gates apart from protective piers and dams. The total of navigable canal in the Netherlands is about 2,000 m.

Dike-dams have also been thrown across rivers to control them, and several old towns owe their origin to such dams as Amsterdam (1257) across the Amstel, Edam across the Y, and many others. Dams with lock-gates are used to close the sea exits not only of canals but of rivers also. Those of the Old Rhine near Katwijk aan Zee were built in 1807 to control the river. As far back as A.D. 839 a hurricane closed the river's mouth by sand accumulation: for nearly 1,000 years the pent-back waters spread out forming a huge swamp; a canal was cut and three sets of locks were built with 2, 4 and 5 pairs of gates. These are closed during high tide (even during low tide with a strong on-shore wind) and are then successively opened to allow the accumulated water to escape, through the final control of the five pairs of seaward gates for 5-6 hr. at each ebb. The skill in dike and dam building manifests itself in the later erections of the great railway embankments such as those carrying the Flushing line over the island chain to the mainland, or the still more striking individual great bridge (1868-71) over the Hollandsch Diep which is 1½ m. wide.

Impoldering.—The presence of a dike is frequently sufficient in itself to cause an increase in the land available for occupation, as on the seaward face muds and sands are deposited by the sea. These become clad with vegetation and at certain states of the tide can be grazed; the area consolidates and another seaward dike can then be erected. Nevertheless, the big reclamation schemes generally result from the total enclosure of a marshy area by encircling dikes. The isolated area occasionally improves by the mere shutting out of further water, but usually the entrapped water is removed by pumping it into outside drainage channels or canals. In particularly difficult cases this may necessitate the lifting of the water to successive levels by a series of individual pumps. The land thus reclaimed, *polder*, is normally extremely fertile. Although a great part of the Netherlands has now been impoldered the practice, on any considerable scale, dates back only to the period when heavy pumping became possible. The windmill was first so used in the 14th century and showed a high degree of reliability on the wide wind-swept lowlands, but to-day with water control needed over much greater areas with an intricate system of canal and sluice, polder, dike and ditch, other pumping plants are being extensively used, such as steam and electrical. Fortunately, the more artistic windmill is likely to function for many years yet in this land deficient in coal and water power. Of the great and numerous impoldering schemes only a few can be selected.

The most spectacular have been carried out in North Holland and South Holland. Near Alkmaar is the Schermer polder, the drainage of which demanded channels at four different levels. Immediately south of it are the Beemster, Wormer and Purmer polders centring on Purmerend. Here the Beemster (1608-12) produced some of the most valuable agricultural land in the Netherlands. Still larger is the famous Haarlemmer polder. Up to 1840, Haarlemmer Meer was 18 m. long, 9 m. broad and 14 ft. deep, and had been produced by the ponding back of the Rhine in the 15th century and by the crumbling away of the banks of the Y. It began to imperil Amsterdam, Haarlem, Leyden and Utrecht, and its draining (1848-53) was largely a safety measure, nevertheless the reclaimed land, about 72 sq.m., has proved so valuable that the cost of the scheme (about £1,000,000) has already been repaid nearly threefold. Subsequently the Y

polder was reclaimed during the construction of the North sea canal.

The largest impoldering scheme on record has now been commenced. On June 14, 1918, a law was passed for the draining of part of the Zuider Zee. The work commenced in 1924 and is expected to take 15 years. The first stage will add four polders of a total area of about 820 sq.m. (nearly the size of Limburg) to the country, at an outlay cost of about £5½ millions. The main dike will extend from the island of Wieringen broadly north-east to the Friesland coast thus enclosing what will ultimately be a great fresh-water lake. The largest—the south-east polder (about 420 sq.m.) will extend from the coast, near Kampen, to south-west of Amsterdam, near Muiden; the north-east polder (about 200 sq.m.) will follow a curving course through the island of Urk but leaving the Yssel channel unobstructed; the south-west polder (about 123 sq.m.) will run north-east from Marken and sweep back north-west to near Enkhuizen; the north-west polder (about 76 sq.m.), running south-east from Wieringen, will practically fill the bay now existing north-west of Enkhuizen. Such giant schemes as this one and those already completed raise serious and somewhat technical questions, such as temporary storage of waters removed by pumping, the construction of permanent reservoirs for the canal schemes, and, above all, the complicated legal matters relating to drainage and water rights. For information on these, see the *Gedenboek uitgeven ter gelegenheid van het fiftig-jarig bestaan van het koninklijk Instituut van Ingenieurs* 1847-97 ('s Gravenhage, 1898).

Climate.—Neither in latitude nor in altitude has the country a wide range, for from north to south it is less than 3°, and very little land exceeds 300 ft.; hence the climate is somewhat similar throughout. Nevertheless, as the winter isotherms do tend to run due north and south, and the summer isotherms to parallel the coast, then the east is more extreme than the west and the Netherlands, as a whole, have a colder winter than east England between the same latitudes. The recorded absolute minimum is nearly -6° F (38° frost). Utrecht may be considered as roughly central; here the average for the coldest month (January) is 34.2° F, while farther east much of the traffic is ice-borne during winter. The average for the hottest month (July) at Utrecht is 62.6° F. The south-west winds prevail for about nine months annually raising the winter temperatures, but are replaced by the April-June north-west winds, which produce a cooler summer. As a consequence of the wind direction the west part of the country, particularly along the dunes, is wetter than the east. The annual total rainfall average for the whole country is not high, probably less than 28 in.; the figures for Utrecht are 27.5 in. annually, with July-Sept. (9.2 in.) as the three wettest months, and Feb.-April (4.7 in.) as the three driest. This early spring minimum results in actual shortage in the east during dry years and some of the canals are then used as irrigation channels. The mean annual number of "rain-days" slightly exceeds 200, but probably more important is the constant high degree of humidity (exceeding 80%) consequent on the large amount of standing water; marsh mists and sea fogs are frequent, and seem to have harmful effects in Friesland and Zeeland, where the medical statistics for pulmonary diseases suggest rather disquieting conditions.

Fauna.—In densely populated areas with no extensive forests, the fauna seldom present unusual varieties. In the Netherlands the otter, marten and badger are found, though rarely, but the weasel, ermine and pole-cat are more common. In the 18th century wolves roamed the country in large numbers; now they are unknown. Wild roebuck and deer are found in the drier wooded regions to the east of the country; here foxes are still plentiful. In the dunes and other sandy stretches the hare and rabbit occur in large numbers. Birds are unusually well represented; about 240 different kinds are regular inhabitants, although nearly 200 of these are migratory. The woodcock, partridge, hawk, water-ousel, magpie, jay, raven, various kinds of owls, pigeon, wren, lark, titmouse and others breed in the Netherlands while birds of passage include the buzzard, kite, quail, wild fowl of various kinds, thrush, wagtail, linnet, finch and nightingale. The beautiful plumaged heron haunts

the mud-flats and the protected house-stork with its large clumsy nest is a typical Dutch feature. Fish are important; eels are trapped and smoked as food reserves; flat-fish are a source of wealth in the Zuider Zee, herrings are netted in the North sea and shell-fish, chiefly oysters, are dredged in Zeeland.

Flora.—The four physiographical divisions, namely, the heath-lands, pasture-lands, dunes and coasts are characterized by different flora. Heath and ling cover the waste sandy regions in the east of the country. In the more damp and marshy meadow-lands the bottom is covered with marsh trefoil, carex, smooth equisetum, and rush, while common water-lilies, water-soldier, reed-mace, flag and bur-reed are seen in the ditches and pools. Dune flora types are usually stunted and meagre as compared with the same forms elsewhere. The most important plant, sown annually to bind the loose sand together, is the Dutch *helm*, or smooth reed-grass (*Arundo arenaria*). It is much used for mat-making in Drenthe and Overijssel. The dewberry bramble and the buckthorn also help to bind the sand together. Furze and common juniper, used as a flavouring in the "Hollands" gin of Schiedam, occur both on the dunes and on the eastern heaths. The most general of the other dune plants are thyme, small white dune-rose, wall pepper, fever-wort, common asparagus, sheep's fescue grass, Solomon-seal and the marsh orchis. Certain plants are specially cultivated to assist in consolidating the mud flats and in enlarging the littoral deposits; of these the sea-aster flourishes in the northern Wadden (*see* COAST) giving place nearer shore to sand-spurry and to floating meadow grass, which afford pasture for cattle and sheep. Along the coast of Overijssel and in the Biesbosch lake club-rush is extensively planted for the basketry and other plaiting industries. In the northern half of the Zuider Zee the common sea-wrack is gathered for trade purposes during the summer months. Except for the pollarded willows found along the rivers on the clay lands, nearly all the natural wood is confined to the sandy gravel soils; here copses of elm, poplar, birch and alder are common.

Colonies.—The colonial possessions of the Netherlands include territories in the East Indies and the West Indies. The former, the Dutch East Indies, dating back to 1602, consists of a large number of low-latitude Pacific islands of an approximate total area of 735,000 sq.m. with a population of over 51 millions (1925), in which oriental natives vastly predominate; for example in 1926 the remarkably densely populated islands of Java and Madura (717 persons per sq.m.) had less than 170,000 Europeans out of a total population of 37,000,000. The Dutch West Indies, dating back to 1667, consist of Surinam and Curaçao with the dependencies of the latter; the total area is less than 55,000 sq.m., and the population in 1926 was almost exactly 200,000, of whom very few were Europeans.

Population.—The following shows the area and population of the Netherlands according to the communal population lists of Dec. 31, 1926.

Province	Area in English sq.m. Dec. 31, 1926	Population, Dec. 31, 1926
North Brabant . . .	1,920	823,863
Gelderland . . .	1,940	798,580
South Holland . . .	1,133	1,814,536
North Holland . . .	1,065	1,420,098
Zeeland . . .	707	249,991
Utrecht . . .	526	384,574
Friesland . . .	1,248	401,388
Overijssel . . .	1,295	483,185
Groningen . . .	883	388,846
Drenthe . . .	1,028	222,785
Limburg . . .	847	508,760
Total . . .	12,593	7,526,606

The last census was taken in 1920—population 6,865,314 of whom 3,410,262 were males showing less disparity between the sexes than is the case in other non-belligerent European countries. Other census returns indicate a steady and considerable population increase. Approximate figures (to nearest one-eighth million) were 1829, 2½; 1849, 3; 1869, 3½; 1889, 4½; 1909, 5½. The 1926

communal returns indicate that South Holland and North Holland, with the high density of 1,628 and 1,333 persons to the sq.m. respectively, are the most populous provinces; at the other extreme are Drenthe with 217 and Friesland with 322. At the beginning of the 20th century the order was the same. The average density for the whole country during this period has increased from 404 to 597.7 per sq. mile. The most striking total increases in the provinces are South Holland from 981 and North Holland from 905, but the largest percentage increase is Limburg with 81%. No province has diminished in density, but Zeeland, with 313 in 1900 and 354 in 1926, has shown the least change. The townward movement continues and the percentage of rural population has fallen from 62.89 in 1889 through 56.27 in 1909, 54.37 in 1920 to 53.64 in 1926. The excess of births over deaths has shown a steady decrease in the period 1923–26 (inclusive) but has averaged about 109,000 per annum. Emigration (mostly to North America) has been slight in the same four years, averaging less than 4,000 per annum. The largest towns in 1926 were Amsterdam 726,527, Rotterdam 562,991, The Hague 408,634, Utrecht 151,055. Next in order between 50,000 and 100,000 were Groningen, Haarlem, Arnhem, Nijmegen, Tilburg, Leyden, Eindhoven, Maastricht, Apeldoorn and Dordrecht. In 1926, 47 towns in all had a population exceeding 20,000 each.

Constitution and Government.—The first Constitution of the Netherlands dates to 1814 (*see* HISTORY), but has been revised at intervals; most recently in 1917 and 1922. The important revisions of 1815 and 1840 were consequent on the addition and the secession, respectively, of the Belgian provinces. The Netherlands form a constitutional and hereditary monarchy, succession being in both the male and female line according to primogeniture, though female succession takes place only in default of male heirs. The widely-interpreted executive power of the State is vested exclusively in the sovereign, whose age of majority is 18 years. The whole legislative power rests conjointly in the king and the States-General (parliament). The upper chamber of parliament, 50 members, is elected for six years by the Provincial States (*see* LOCAL GOVERNMENT, below) and half retire, by rotation, at the end of three years. Each member not resident in The Hague, where the States-General meets, is allowed an expense grant of 10 guilders per day during the parliamentary session, but unless holding special office is otherwise unpaid. The sovereign's executive power is in part exercised by responsible ministers, who hold office at the pleasure of the sovereign. There are at present ten ministers controlling finance, foreign affairs, interior with agriculture, justice, colonies, war, public works (Waterstaat), marine, labour and instruction. The posts are salaried (16,000 guilders per annum), though an additional special grant, for representation, is made to the minister of foreign affairs. The lower chamber, which shares with the Government alone the privilege of initiating new bills and proposing amendments, consists of 100 deputies who are elected directly for four years and retire *en bloc*. Each deputy receives an annual salary of 5,000 guilders together with travelling expenses. Certain legislative and many executive matters are normally referred to a State council (*Raad van Staat*) consisting of 14 members appointed by the sovereign, who is also president of the council.

Since Dec. 12, 1917, suffrage has been universal for all Dutch subjects of 25 years of age, though reasonable exclusions are made in the case of certain civil disabilities. Elections are on a basis of proportional representation and the sovereign has the power to dissolve either or both chambers, subject to new elections within 40 days and a new assembly within two months.

Local Government.—Each of the 11 provinces has a local representative body—the "Provincial States," composed of members, not less than 25 years of age. All members are elected for four years by the inhabitants of the province who make use of the franchise system resembling that employed for selection of the lower chamber deputies. The Provincial States, which vary in size according to the number of inhabitants in the province, elect the members of the upper chamber of the States-General, collect local taxes and legislate on welfare schemes of special and peculiar importance to the province though all such financial

and legislative matters have to receive crown sanction. The Provincial States meet twice annually but their executive work and the daily administration of provincial affairs is in charge of 64 of their number (six from each province excepting Drenthe, which supplies four members). These, who constitute a permanent paid committee are termed the Deputed States. The Provincial States, as is the case with the Deputed States, are presided over by a salaried crown commissioner who, in the latter body, is the chief magistrate of the province. This becomes necessary because an important duty of the deputed States is the administration of the common law in the several provinces. Each of the communes (1,081 in 1927) elects a local council varying in size from seven to 45 members. Each member must be 23 years of age and a resident in the commune; the electoral system resembles that in use for the higher bodies. The communal council raises taxes, administers a municipal budget and makes and enforces communal by-laws subject to the approbation of the Deputed States. The crown appoints a mayor, with a six years' term of office, to preside over the communal council which vests its executive power in a college consisting of the mayor and two to six aldermen (*wethouders*). The mayor, as a direct crown representative, not only controls the municipal police but also supervises the work of the communal council and may suspend their resolutions for 30 days, though this extreme step must be reported to the Deputed States for more authoritative deliberation.

Justice.—Trial by jury is unknown in the Netherlands. Minor offences are tried by one judge in the cantonal court, of which 101 exist. More serious cases reach one of the 23 district tribunals with one or three judges in attendance. Beyond these are five courts of appeal, widely spaced over the country, which in turn are subject to the high court (*hooft raad*) of the Netherlands, which sits at The Hague with five judges in deliberation. The high court is not only the final court of appeal on points of law but is also the tribunal for the members of the States-General and for all high Government officials, including judges; the last are normally appointed for life by the sovereign. Recently, as a part of the reform movement in treatment of young criminals, juvenile courts have been called into existence. At these courts children's civil cases are tried by a specially selected judge, who also administers justice in relation to certain criminal acts of persons below the age of 18 years. During the three years 1924-26 there were on an annual average 7,700 males and 320 females in the 28 prisons; 16,300 males and 850 females in the 27 houses of detention; and 2,900 males and 33 females in the five State-work establishments. The State reformatories are of two types: (a) the more severe reformatory; and (b) the disciplinary school. In the latter, children are admitted by request of parents or guardians. The former during the 1924-26 period had an annual attendance of 900 boys and 100 girls and the latter 430 boys and 85 girls—the last number showing a steady yearly increase.

Charitable Institutions.—The guiding principle, based on the law of 1854, with regard to pauperism in the Netherlands has been that the State takes charge only when private charity fails, and although recent reorganization has tended to reduce the number and somewhat limit the activities of private charities they still occupy a more prominent position in the life of the community than is the case in many countries. The most important of such private institutions aim rather at the utilization of labour in new areas coupled with instruction courses designed to render labour available for new activities. Special mention should be made of the agricultural colonies controlled by the Society of Charity. (See DRENTHÉ.) Nevertheless, in 1925, the State disbursed over 55 million guilders in normal poor relief; a figure which was largely increased by unemployed relief. In 1916 a Government scheme of unemployment insurance was initiated.

A feature of Dutch culture is the large number of prosperous institutions for the encouragement of science and the fine arts; the majority of these institutions were founded during the century (1750-1850). In addition to the strictly national societies, numerous municipal institutions and associations cater for more than local interests. From a long list of such valuable culture aids perhaps special reference can be made to the institute of

Language, Geography and Ethnology of the Dutch Indies (founded 1851 at The Hague) which has undoubtedly contributed materially to sympathetic understanding and the successful administration of Holland's distant colonies.

Religion.—Although the royal family and a large number of the inhabitants belong to the Reformed Church yet entire liberty of religious conscience is granted to citizens of the Netherlands—a continuation of that feature of religious liberty first stated in the revised Constitution of 1848. Financially, the practice is illustrated by the State budget (1928) when the following approximate allowances were made. Protestant churches 1,411,000 guilders; Roman Catholics 579,000; Jews 15,000; Jansenists 12,000. The 1920 census analysis showed the following total adherents throughout the country. Dutch Reformed Church 2,826,633; other Protestants 832,000; Roman Catholics 2,444,583; Jews 115,223; Jansenists 10,461; unknown 1,010 thus leaving the significantly large total of 635,240 (nearly 10%) of other creeds or of no creed. The government of the Reformed church is Presbyterian and its present organization dates from 1852. The controlling body is the main "synod" of deputies meeting annually. The provincial synods at the end of 1927 numbered ten, subdivided into 44 classes and a still larger number of circles drawn from 1,348 parishes in the care of about 1,650 ministers. (These figures include Walloon, English, Presbyterian and Scotch churches whose church government differs but little from that of the much larger Dutch Reformed Church.) Each congregation is governed by a "church council," and the scheme of supervision of ecclesiastical administration, though complicated, covers all stages from the main synod to the individual "church council"; financial control is much more individual. In 1853 the Roman Catholic Church in the Netherlands, previously merely a mission in the hands of papal legates and vicars, was elevated to an independent ecclesiastical province. (See UTRECHT PROVINCE.) In 1927 there were one archbishop (of Utrecht), four bishops and 1,295 parishes. The Roman Catholic element is most marked in the southern provinces of Limburg and North Brabant though the bishops have a much wider extension. The Jewish population of the Netherlands is largely consequent on the influence of Portuguese Jews at the end of the 16th and of German Jews in the beginning of the 17th century. In 1870 they were reorganized under a central authority.—The Netherlands Israelite church. In 1927 the Jews had 146 communities in the country. (For further details of the above and other religious bodies see *The Church in the Netherlands*, by P. H. Ditchfield, London, 1893.)

BIBLIOGRAPHY.—A general official handbook appeared in 1922, *Handboek voor de Kennis van Nederland en Koloniën* (The Hague). Rather technical works include H. Blink, *Nederland en zijne Bewoners* (3 vols., Amsterdam, 1888-92), containing a copious bibliography; *Opkomst van Nederland als Economische-Geographisch Gebied van de Oudste Tijden tot Heden* (Amsterdam, 1925); P. J. Blok, *Geschiedenis van het Nederlandsche Volk* (Eng. trans. parts 1-4, London, 1898-1912); A. A. Beekman, *De Strijd om het Bestaan* (Zutphen, 1887), a manual on the characteristic hydrography of the Netherlands; P. H. Witkamp, *Aardrijkskundig Woordenboek van Nederland* (Arnhem, 1895), is a complete gazetteer with historical notes. Of more general interest are: *Eene halve Eeuw, 1848-98*, edit. by P. H. Ritter (Amsterdam, 1898), containing a series of articles on all subjects connected with the kingdom during that period, and *La Hollande géographique, ethnologique, politique*, etc. (Paris, 1900), is of the same class.

Guide books are numerous; e.g., Baedeker's *Belgium and Holland* (15th ed., London, 1910); Marjorie Bowen, *The Netherlands Displayed* (London, 1927); *Holland*, the Kitbag Travel Book (London, 1928); R. Elston, *The Travellers' Handbook to Holland* (London, 1926).

Books of travel of considerable topographical as well as literary interest include Edmondo de Amicis, *Holland* (translated from the Italian, London, 1883); H. Havard, *Dead Cities of the Zuyder Zee*, etc. (translated from the French, London, 1876); *Old Dutch Towns and Villages of the Zuider Zee*, by W. J. Tuyn (translated from the Dutch, London, 1901); E. V. Lucas, *A Wanderer in Holland* (London, 1923); C. G. Harper, *On the Road in Holland* (London, 1922); P. M. Hough, *Dutch Life in Town and Country* (London, 1901); D. S. Meldrum, *Holland and the Hollanders* (London, 1899); *Friesland Meres and through the Netherlands*, by H. M. Doughty (London, 1887); *Hollande et hollandais* by H. Durand (Paris, 1893). Works of historical and antiquarian interest are *Merkwaardige Kasteelen in Nederland*, by J. van Lennep and W. J. Hofdyk (Leiden, 1881-84);

Noord-Hollandsche Oudheden, by G. van Arkel and A. W. Weisman, published by the Royal Antiquarian Society (Amsterdam, 1891); and *Oud Holland*, edit. by A. D. de Vries and N. de Roever (Amsterdam, 1883-86). Natural history is covered by various periodical publications of the Royal Zoological Society "Natura Artis Magistra," at Amsterdam, and the *Natuurlijke Historie van Nederland* (Haarlem, 1856-63). Military and naval defence may be studied in *De vesting Holland*, by A. L. W. Seijffardt (Utrecht, 1887), and the *Handbook of the Dutch Army*, by Major W. L. White, R.A. (London, 1896). For bibliographical references to statistics and trade see article on NETHERLANDS; *Economics and Financial conditions*. (W. E. WH.)

Geology.—Except in Limburg, where, in the neighbourhood of Maastricht, the upper layers of the chalk are exposed and fol-

lowed by Oligocene and Miocene beds, the whole of Holland is covered by recent deposits of considerable thickness, beneath which deep borings have revealed the existence of Pliocene beds similar to the "Crag" of East Anglia. They are divided into the *Diestien*, corresponding in part with the English Coralline Crag, the *Scaldisien* and *Poederlien* corresponding with the Walton Crag, and the *Amstelien* corresponding with the Red Crag of Suffolk. In the south of Holland the total thickness of the Pliocene series is only about 200 ft., and they are covered by about 100 ft. of Quaternary deposits; but towards the north the beds sink down and at the same time increase considerably in thickness. The Pliocene beds were laid down in a broad bay which covered the east of England and nearly the whole of the Netherlands, and was open to the North Sea. There is evidence that the sea gradually retreated northwards during the deposition of these beds, until at length the Rhine flowed over to England and entered the sea north of Cromer. The appearance of northern shells in the upper divisions of the Pliocene series indicates the approach of the Glacial period, and glacial drift containing Scandinavian boulders now covers much of the country east of the Zuider Zee. The more modern deposits of Holland consist of alluvium, wind-blown sands and peat. Of late years an intensive boring campaign has revealed many interesting details of ancient rock-structures buried at great depths, both coal and salt deposits having been reached in Limburg and at various points near the German frontier. For details see *Jaarverslag der Rijksopboring van Delfstoffen* (annual reports published by the Government). (G. E., R. H. RA.)

ECONOMIC AND FINANCIAL CONDITIONS

The existence of the Netherlands as an independent State dates from the Union of Utrecht, 1579. The 17th century was characterized by a degree of economic and commercial expansion, which made of the Netherlands and especially of the city of Amsterdam one of the great financial and commercial centres—for a time the greatest of all. Colonial expansion and flourishing science and art were the keystones of this period, which is known as "the golden century" of Dutch history and is so vividly described in Sir William Temple's *Observations upon the United Provinces of the Netherlands* (1673). A period of stagnation and partial collapse then followed. The former spirit of enterprise waned and the Dutchman of the 18th century was characterized by a predominantly *rentier* mentality. The founding of the kingdom of the Netherlands in 1813 brought little change at first, notwithstanding the many efforts, and not least of all by William I., to imbue commerce and industry with fresh life. It was not until the second half of the 19th century that a new period of expansion and prosperity commenced, in which the Dutch colonies in Asia played their full share. This new growth is associated on the one hand with the general economic development of western Europe, in which Holland—so favourably situated for international traffic—reaps her full share, and on the other hand with the im-

portant agrarian and industrial revival in Holland. Moreover, the financial position of Holland in the world has, especially since the World War, considerably improved.

Population.—On Dec. 31, 1927, Holland had a population of 7,626,100. In 1830 the total population was 2,613,500, in 1869 3,580,000. The increase since the beginning of the present century is seen from the following table:

Year	(Per 1,000 inhabitants)			Population
	Births	Deaths	Increase	
1899	32.1	17.2	14.9	5,104,100
1909	29.1	13.3	15.5	5,858,200
1913	28.3	12.4	15.9	6,212,700
1919	24.4	12.0	16.3	6,752,100
1923	26.0	9.9	16.0	7,149,800
1927	23.1	10.3	12.8	7,626,100

The increase (1928) is about 100,000 per annum, a figure only exceeded in Europe by Bulgaria, Lithuania, Poland, Rumania and Russia. The birth-rate, however, shows a distinct tendency to fall, whereas a further decrease of the very low death-rate is scarcely possible.

As shown by the following table, the move to the towns has been very marked, especially since 1870:

Census at end of the years	Communities with a population of more than 20,000 in 1920	Other communities	State
1830	100	100	100
1849	116.2	117.3	117.0
1869	142.5	134.5	137.0
1889	209.4	156.4	172.6
1909	320.5	181.7	224.2
1920	391.9	205.7	262.7

In 1920 2,722,000 persons out of a population of 6,865,000 were employed in industry or a profession, as follows:

Figures for the Professions in 1920	
I. Industry	
Metallurgic industry and shipbuilding	196,000
Building trade	191,000
Manufacture of foodstuffs and luxury articles	177,000
Clothing, dyeing and cleaning	124,000
Textiles	66,000
Miscellaneous	174,000
Total	1,028,000
II. Agriculture	623,000
III. Trade	272,000
IV. Transport	262,000
V. Domestic servants	221,000
VI. Liberal professions	143,000
Total including other miscellaneous	2,722,000

A comparison of these figures with previous ones shows that, in the last decades in particular, the degree of employment in industry and transport has gone up (57% and 99% respectively since 1899). The figure for agriculture shows the least increase (8% since 1899).

Agriculture and Cattle-breeding.—Nearly half the territory of the Netherlands lies below sea-level. From the earliest times, intensive cattle-breeding has been a feature of this part of the country, while more recently horticulture has also flourished there. Agriculture is confined to the clay regions, and the higher and sandy regions where these are suitable.

The division of the cultivated land is as follows (in hectares):

	1833	1926
Arable land	756,949	891,761
Horticulture	23,847	64,202
Arboriculture and fruit gardens	22,036	39,458
Meadows	1,093,050	1,266,502
Woods	169,026	249,107
Total	2,064,908	2,511,030

The small farm is a characteristic feature. Only 2.11% of the farms in 1921 had an area of more than 100 hectares, whilst no less than 56% of the farms were managed by the owners themselves. The general agricultural crisis in Europe in the eighties, due for the most part to the considerable imports of grain from the United States, did not lead in the Netherlands to the introduction of grain taxes. By a system of information and guidance and in other ways, the State supported agriculture, and more up-to-date working methods, more intensive culture, and co-operation have helped it to get through the difficult years. The results, in so far as these are reflected in the increase of the yield per hectare, can be gathered from the following statement relating to the principal agricultural products:

Product	Hectares cultivated	Yield in 1,000 hectolitres	Yield per hectare, average for the years	
			1926	1876-80 1921-25
Rye	197,298	4,881	17.4	28.6
Potatoes	170,336	44,211	112.0	253.0
Oats	154,028	7,109	37.0	42.8
Fodder	112,168
Sugar-beet	61,564	2,111,000*	23.4*	32.3*
Wheat	53,340	1,965	21.2	36.9
Peas	36,521	984	20.5	31.8
Barley (Winter)	9,520	458	36.1	45.7
Barley (Spring)	17,935	774	27.1	44.1
Beans	22,073	629	20.5	29.5
Seeds	18,637
Flax	13,851	10,455*	0.43*	0.64*

*In 1,000 kg.

Cattle-breeding also had difficult years to face during the same period. Although essentially dependent on export, it had failed to pay sufficient attention to the quality of the product, with the consequence that other countries like Denmark were able to outbid Holland on the dairy products market. Here especially co-operation, encouraged by the State, had much to do. Co-operative dairy factories and officially controlled standardized qualities of butter have led to a great improvement, whilst the improved water and land communications have greatly facilitated sales. This is also the case with regard to horticultural products.

For 1923 the value of the agricultural and dairy produce was estimated as follows, in millions of guilders:

Agriculture	436.9	Horticulture	131.9
Cattle breeding	660.0	Forestry	7.3

In the absence of protective tariffs, the development of agricultural production has become more and more independent of home consumption. Only $\frac{1}{4}$ of the total amount of wheat consumed is produced in the country itself. On the other hand $\frac{1}{4}$ of the total dairy produce is available for export (the figures are for 1923).

Industry.—On account of its geographical situation and the nature of the soil, the Netherlands' principal resources were agriculture, cattle-breeding, commerce and shipping. The soil contains no ores, the extraction of coal is of recent date, and there were no iron- or steel-works until a short time ago. Consequently the stimulus, usually exercised by these basic industries upon other branches of industry, was absent and Dutch industry was mainly confined to those branches connected with agriculture and cattle-breeding, to ship-building and to those needed local purposes. There have however been certain other industries in existence for a long time, such as textiles, earthenware and paper.

The transition from handicraft to mechanical production was gradual, and, compared with the surrounding countries, late. An exception to this is the cotton industry, which was called into existence with the help of the Dutch Trading Company (Nederlandsche Handel Maatschappij, established in 1824), and found an extensive market in the Dutch East-Indies. Towards the end of the 19th century however, industrialization began to make considerable progress. The increase in population made it necessary to seek new resources, the long crisis in agriculture brought down wages and, thanks to the existing free trade system, raw materials and semi-manufactured products could be imported free, or almost free, of duty.

Industrialization was much accelerated by the World War. Although many emergency industries, called into being as a result of the cessation of imports, have disappeared or decreased, the net result of these years has been expansion and modernization of producing plant. After a reaction due to the general economic crisis in 1921, this plant provided a sound basis for the development which has shown itself ever since.

According to figures produced by the Central Office for Statistics—mainly for 1923, but completed from other sources—the value of the output of Dutch industry for 1923 may be estimated at 1,875 million guilders.

The coal mining industry deserves special mention. Its beginnings date from the end of last century, an increasing percentage of the production now emanating from State-owned mines (1926: 5,200,000 tons as against 3,400,000 tons from private mines). The total annual output, which in 1910 reached 1,292,000 tons, is now well over 10,000,000 tons. The total Dutch consumption of coal is estimated at 12,000,000 tons a year.

The trend of industry since 1920 is reflected in the following figures:

	Unemployment index figure	Number of lost working days (in 1,000 days)	
		Strikes	Lock-outs
1920	5.8	1,680	609
1921	9.0	1,293	77
1922	11.0	778	279
1923	11.2	700	3,245
1924	8.8	410	4
1925	8.1	631	129
1926	7.3	217	3
1927	7.5

The index figures, which include short time, relate to persons coming under the unemployment insurance system (297,600 in 1927). The figures vary considerably with the season and the different professional groups. They are highest in Dec. (figures for 1927) (12.7) and Jan. (13.2), lowest during the summer months (4.9-5.6). The diamond industry (21.0) and cigar industry (10.4) always yield high figures, while, as a result of seasonal fluctuations, the building trade also shows a high average (14.6).

Commerce.—The great importance of Holland as a centre of trade and traffic has always had a great influence on its tariff policy. Besides, about the middle of last century, the principles of Manchester Liberalism were adopted by Holland more completely than by other continental countries. After a number of shipping duties had already been reduced about 1850, the general revision of 1862 brought a free-trade tariff, under which 5% was levied on manufactured products and 2% or 3% on part of the semi-manufactured products, whereas raw materials and the other semi-manufactured products could be imported free of duty. During the war some protectionist measures were introduced temporarily. In 1924—chiefly for revenue purposes—a new Tariff Act was put into operation, providing for an 8% duty on manufactured products. Luxuries are in some cases taxed higher (12%-20%); products other than those for direct consumption are still taxed at 5%; raw materials are for the most part free of duty.

The following figures show the importance of Dutch trade, excluding transit trade which—in view of the geographical situation of the country—is also of prime importance.

Foreign Trade (in millions of guilders)

Year	Imports	Exports	Excess of import over exports
1918	608.4	381.2	227.1
1919	2,825.7	1,411.3	1,414.4
1920	3,332.4	1,701.5	1,630.9
1921	2,240.2	1,369.6	870.6
1922	2,027.6	1,221.2	806.4
1923	2,009.2	1,303.2	706.0
1924	2,363.5	1,660.7	702.9
1925	2,455.3	1,807.7	647.6
1926	2,441.9	1,749.2	692.7
1927	2,548.9	1,899.7	649.2

TOWNS AND CITIES OF HOLLAND AS SEEN FROM THE AIR

1. The heart of Amsterdam, the chief city, though not the political capital of Holland, showing the square known as the Dam. The prominent building in the centre is the Royal Palace, formerly the Town hall, built in the 16th century by Jacob van Kampen. To the right of it is the Nieuwe Kerk, a late Gothic cruciform church originally built about 1408 and several times restored.
2. Middelburg, the ancient capital of the province of Zeeland. In the centre of the old town, which is surrounded by a ring from which the newer streets diverge, is the abbey of St. Nicholas dating from the 11th century, and near it the clock tower, 280 feet high, known as "De Lange Jan," whose chimes ring every 7½ minutes.
3. Delft, in the province of South Holland, about 5 miles from The Hague. The New Church (erected in the 14th century), seen in the centre of the photograph, contains the tomb of William the Silent.
4. Aerial view of Rotterdam, a great port and commercial centre, looking down on the business section and the boulevard Coolsingel.
5. The harbour of Flushing (Vlissingen), from which a daily packet service is maintained to Folkestone, England. The inner harbour for the large fishing fleet is shown in the photograph.
6. Government buildings at The Hague, political capital of the Netherlands. At the upper left corner of the artificial lake, the Vyver, is the Mauritshuis. On one side of the lake is seen the Binnenhof, in the centre of which is the Ridderzaal (Knights' Hall) built in 1252, where the Queen of Holland opens parliament every year. Other buildings are the Treveshall, the first Chamber of the States General (used since 1853 as Assembly hall of the States of Holland and West Friesland), and the palace of the States General. The square beyond is the Plein.

CANAL AND STREET SCENES IN PICTURESQUE TOWNS OF THE NETHERLANDS

1. Dordrecht, shipping town in the province of South Holland; one of the wealthiest of Dutch ports during the Middle Ages. Old gabled houses line the canal
2. Marken, one of the "dead cities of the Zuyder Zee." Marken was separated from the mainland in the 13th century by an inrush of the sea. This island village is a picturesque spot, much visited by tourists. The attire of the little boy in breeches (foreground) indicates that he has reached the age of five; if younger than that he would be dressed in skirts and bonnet. He is under the age of seven, for his hair is not yet cut
3. A canal scene in Delft, showing the shady streets along the waterside.

- Delft craftsmen preserve the traditions of the faience pottery industry, which during the 17th and 18th centuries made the city's name famous throughout Europe
4. Business district of Amsterdam, Holland's most important commercial city, showing the dam or dyke of the Amstel, a canalized river. The city, cut by five semi-circular canals and many intersecting ones, is in reality composed of a succession of islands
5. The promenade at Scheveningen, a fashionable seaside resort. Paved with brick and bordered by hotels and shops, the promenade extends for about a mile along the beach
6. Another canal scene in Dordrecht, showing canal and small boats

Of imports the following deserve special mention (figures for 1927 in millions of guilders):

Wheat and wheat flour.	118.3	Coffee	55.1
Maize	116.8	Copra	43.2
Timber	79.5	Cotton	41.6
Linseed	65.7	Cotton yarns	39.1
Coal (import-balance) .	55.5		

Of exports:

Cotton goods	94.1	Margarine	57.4
Pork	93.8	Eggs	50.9
Butter	85.8	Vegetables	49.0
Cheese	76.7	Condensed milk	45.0
Sugar	58.2	Flower bulbs	39.9

Owing to the considerable improvement of the Dutch trade statistics in 1917 a comparison of values with pre-war figures is not possible, while the quantitative figures also can only be compared with reserves. These reserves apply to the following figures (millions of kilograms):

	1913	1927
Imports	21,302	28,619
Exports	5,848	14,338

The share of the various countries in Dutch trade is shown in the following figures (percentages of total value, 1926):

	Imports	Exports
Germany	27.34	21.77
Belgium	11.08	8.21
U.S.A.	10.57	4.55
United Kingdom	9.47	27.62
Dutch East-Indies	5.92	7.31
Argentina	5.83	0.82
France	4.63	4.73

Transport. Maritime Shipping.—The supplanting of sailing vessels by steamships did not take place in Holland until after other countries had given the lead: the following figures indicate the development of the Dutch merchant fleet:

Year	Sailing vessels		Steamships		Total	
	Number	Tonnage (1,000 tons)	Number	Tonnage (1,000 tons)	Number	Tonnage (1,000 tons)
1905	479	54.5	271	357.8	750	411.3
1910	440	45.8	324	488.5	764	534.3
1913	400	40.2	387	647.4	787	687.6
1915	390	44.6	397	725.5	787	770.1
1920	231	22.2	606	968.6	837	990.8
1921	217	20.2	683	1,174.8	900	1,195.0
1922	214	19.9	692	1,286.5	906	1,306.4
1923	199	18.8	694	1,319.1	893	1,337.9
1924	179	16.8	696	1,302.8	869	1,319.5
1925	168	15.9	721	1,312.0	889	1,327.9
1926	149	14.3	768	1,309.8	917	1,324.1

According to Lloyd's Register of ships over 100 tons, the share of the Netherlands in the fleet of the world was, in 1898: 1.8%, in 1913: 2.8% and in 1926: 4.0%.

The first steamship company dates from 1825 ("Amsterdamsche Stoomvaartmaatschappij") with a regular service to Hamburg; about 1830 a service to Hull was instituted and in 1840 services to London and certain Baltic towns; the company was taken over in 1877 by Messrs. van Es of Rotterdam. In 1856, another steamship company was founded, the "Koninklijke Stoomboot Maatschappij," originally only for the Baltic, but afterwards greatly extended. About 1870, a regular service with the Dutch East-Indies was established by the "Stoomvaart Maatschappij Nederland" of Amsterdam and by the "Rotterdamsche Lloyd" of Messrs. Ruys (in 1875, English capital and English ships came in and in 1883 it became a joint-stock company). The "Nederlandsch Amerikaansche Stoomvaartmaatschappij" was founded during the same period (1873); the connection with the West-Indian colonies was established in 1883 ("Koninklijke West-Indische Maildienst," later taken over by the "Koninklijke Stoomboot Maatschappij"), and that with S. America in 1907 by the "Koninklijke Hol-

landsche Lloyd." and with S. Africa in 1920 by the "Holland Zuid-Afrika Lijn." Also worthy of mention are those Dutch companies which have lines outside Europe, viz. the "Koninklijke Paketvaart Maatschappij" (1888) (Dutch East Indies) and the "Java-China-Japan Lijn" (1902).

The shipping of the Dutch ports considerably expanded after extensive improvements had been effected; Amsterdam, already in 1825 connected with the North Sea by the "Noord-Hollandsche Kanaal," obtained direct access to the sea in 1876 by the "Noordzeekanaal." As the large river connecting Rotterdam with the sea was always subject to becoming blocked with sand, here too the building of a canal ("Nieuwe Waterweg")—completed in 1896—was necessary. The development of shipping of the Dutch maritime ports may be seen from the following figures:

Vessels Entering

	Number	Thousands of registered tons
1880	8,164	3,438
1890	9,475	5,446
1900	12,307	9,458
1910	14,864	14,035
1913	16,996	18,198
1915	6,341	6,622
1920	11,114	11,351
1925	21,005	27,303
1926	28,852	36,602

Before the war one fourth of these vessels flew the Dutch flag; in 1913 the percentage was 25.8; in 1924, 33.07; 1925, 29.58; and 1926: 28.22. The greater part of these entered at the port of Rotterdam; in 1913, 67.9% of the total number, against 13.5% at Amsterdam; 1926: 59.39% and 15.58% respectively. At the same time, the traffic in the ports situated on the Nieuwe Waterweg west of Rotterdam considerably increased (1926: Vlaardingen 9.50%, Schiedam 3.05%, Hook of Holland 1.77%).

Inland Navigation.—An extensive network of rivers, extended by innumerable canals, has led to a considerable development of inland shipping in Holland. The inland fleet consisted in 1920 of 13,000 ships of a tonnage of 1.9 million tons.

The following table gives figures for the inland shipping on some of the most important waterways, to Germany and Belgium, as well as from Amsterdam to Rotterdam and the Rhine.

Total Inland Shipping in Thousands of Tons of 1,000 Kg.

Year	Rhine (German frontier)	Canal through Zuid-Beveland (Antwerp-Rhine)	Amsterdam-Rotterdam	Merwede-kanaal (Amsterdam-Rhine)
1913	52,354	16,897	3,203	10,593
1926	85,931	23,834	4,301	18,759

The importance of transit traffic is evident. The depression caused by the war reached its maximum (as far as the traffic on the Rhine is concerned) in 1918, with 11,624,000 tons.

Railways and Tramways.—Owing to water transport being of such prime importance in Holland, railways developed relatively late; for the same reason they have never been in a position to yield large profits. Since about 1860, the building of railways was largely carried out by the State. In 1916 the two big companies, which had in the mean time absorbed most of the private companies, entered into a pooling agreement—"Nederlandsche Spoorwegen"—whereby the mutual profits or losses are divided on the basis of the capital of each participant. In both companies, the State holds the majority of the shares and has guaranteed a 5% dividend to the share-holders.

After a separate electric line had been built in 1908 between The Hague and Rotterdam (28 km.), the existing line Amsterdam-Rotterdam (84 km.) was electrified in 1927. Competition with motor-bus lines is often very strong and in 1928 the Dutch railways took the operation of motor-bus lines into their own hands. Since the war, the financial results obtained by the Dutch railways have been far from favourable; in 1922, 1923 and 1924 the

State had to meet a deficit of 32.9, 30.5 and 23.0 million guilders respectively. The causes must be sought in the increase of expenditure on staff—in connection with the introduction of the eight-hours day—and in the increase in price of coal: this last factor however belongs to the past and in 1927 the accounts again showed a small surplus (2 million guilders).

Besides the railways there is an extensive tramway system; here too the competition of the motor-buses is strongly felt.

1926	Length of lines (Kilometres)	Traffic receipts		Total including miscellaneous receipts (Million guilders)
		Pas-sengers	Goods	
Railways	3,629	76.5	83.3	159.8
Inter-urban tramways	2,687	10.8	5.3	17.0
City tramways	310	27.6	..	27.6

Post Office: Telegraph and Telephone. Postal Service.—In 1926 the postal service transmitted—

Class of mail	Millions		
	Inland	Abroad	Total
Letters	179.5	73.7	253.2
Postcards	84.7	16	100.7
Printed matter	404.8	43	447.8

The number of letters and postcards increased from 14.3 in 1875 to 47.0 in 1926 per head of population.

Postal Check and Clearing Department.—This service was established in 1918 and was closed Oct. 1923–Oct. 1924 for re-organization. Since it was reopened no interest has been paid on the accounts.

Year	Number of accounts	Deposits in millions of guilders
1918	13,720	37.9
1919	21,824	77.9
1920	32,582	95.4
1921	55,410	138.4
1922	86,885	209.4
1925	113,224	496.6
1926	120,037	103.9

Telegraph and Telephone Services.—The telegraph system comprised in 1926 47,051 km. of wires; 2.4 million inland telegrams were transmitted, and 3.1 million abroad. The inter-urban telephone system covered 291,121 km. of wire, besides 235 local systems, which in the big cities are run by the municipalities.

1926	Millions of guilders	
	Capital invested	Profits
Postal Service	23.1	6.5
Clearing Department	1.7	1.2
Telegraph Service	24.0	3.3
Telephone Service	76.6	5.2

Postal Savings Bank.—The deposits at the end of the year were as follows, in millions of guilders:

1900	84.7	1920	273.0
1910	164.3	1925	311.5
1915	189.1	1927	321.9

Money and Credit. Monetary System.—The present unit, the Dutch guilder, dates from the Constitution of 1798. From 1816 till 1847, the double standard ruled in Holland with a ratio of 1:15.87 between gold and silver. The law of Nov. 26, 1847 introduced the single silver standard with the silver guilder of 9.450 grammes fine silver. The fall in the price of silver about 1870 caused the Government to withdraw in 1873 the free silver coinage for private persons. The silver guilder, however, remained legal tender up to any amount.

Besides the silver guilder, a gold ten-guilder piece was introduced a few years later. By the law of June 26, 1875 the gold pieces contain 6.048 grammes of fine gold, may be coined for private persons and are legal tender up to any amount; thus the present system of the so-called "limping standard" was introduced. Gold coins have however never been in use for large amounts. The system was re-defined by the coinage law of May 28, 1901. Owing to the rise in the price of silver the alloy in the silver coins was reduced in 1919 from $\frac{945}{1000}$ to $\frac{720}{1000}$. One guilder = 1s. 8d.; £1. = 12.107 guilders.

The Netherlands Bank.—The Netherlands Bank was established in 1814. It is a purely private undertaking, which has been granted the monopoly of the issue of bank notes. The share capital is 20 million guilders. Two members of the directorate (the president and the secretary) are appointed by the queen, whilst a royal commissioner exercises a general control, on behalf of the Government.

When the World War broke out the circulation of bank notes amounted to about 300 million guilders. During the war, this increased to 1,000 million guilders, but afterwards gradually fell (by June 25, 1928 to 768 million guilders). The balance in current-account on that date amounted to 50 millions, including the holdings of the Treasury. The Bank Charter leaves the percentage of cover of the circulation to be fixed by royal decree. Before the war, this cover amounted to 40% of the total volume of bank notes, balances in current-accounts and bank drafts. When the war broke out, this percentage was reduced as a precautionary measure to 20%, and during a very short period the cover was slightly under 40%.

During the war the gold reserve, which amounted to about 162 million guilders in July 1914, considerably increased. In 1918 the maximum of about 730 million was reached; then followed a gradual fall to about 400 million. On June 25, 1928 the gold reserve was about 435 million, which, together with the silver reserve of about 24 million guilders, constituted a cover of approximately 56%.

The bill holding and loans were as follows:

(In millions of guilders)

	June 27, 1914	June 25, 1928
Inland bills	66	48
Foreign bills	20	197
Loans	59	103

There is no legal obligation upon the bank to convert its bank notes into gold. In 1903, however, the bank assured the Government that it was prepared to continue to keep its gold reserve available for export, in the event of a rise in the exchange-rates above gold-parity, at the price of 1,653.44 guilders per kg. fine for bullion, and corresponding prices for gold coins, as long as it was in a position to do so. During the war, this declaration became inoperative owing to the ban on exports of gold; Holland and the Dutch East Indies returned to the gold standard at the same time as Great Britain, Australia and New Zealand—April 29, 1925; the prohibition to export gold was withdrawn and the declaration re-established.

The position of the Netherlands Bank has changed considerably in the course of time; the development of private banking, especially since 1911, has gradually given it the character of a bankers' bank. Since 1889 the State has participated in its profits, its share being gradually increased. After payment of a dividend of $1\frac{1}{2}\%$ to the shareholders, $\frac{2}{3}$ of the balance is allotted to the State, whose share is increased up to $\frac{7}{8}$ as soon as the dividend exceeds 7%. The bank acts, free of charge, as agent of the Treasury, whereas the Government has the right to take up a non-interest bearing loan to an amount not exceeding 15 million guilders.

Commercial Banks.—The rise of the private credit banks dates from about 1860. Owing to the concentration movement, which was started in 1911, five big banks have gradually come to the front, and have built up an extensive network of branch-offices and a clearing-system in the provinces, with the assistance of some provincial banking institutions.

During the World War and the first few years after it, the business of the private banks grew rapidly. The crisis of 1920-21 brought a change. One bank had to be liquidated and a few others needed financial support. Nevertheless, the big banks have displayed great capacity of endurance. Since 1924, the bank figures have again shown an increase.

The following figures from the joint balance sheets of the five principal banks:

(In millions of guilders)

	1914	1920	1927
Capital	118	271	246
Reserves	38	162	133
Outside resources	347	1,428	1,170
Loans	275	1,125	813
Bills	92	336	331
Securities and syndicates	73	126	119

In the years after the war, the increased importance of Amsterdam as an international financial centre led to the establishment of several foreign—chiefly German—banks there.

The requirements in mortgage credits are met by a large number of medium-size mortgage banks. The existence of a large number of small banking institutions and middlemen of all kinds—especially in connection with small credits—is still a feature of Holland.

Stock Exchange.—The fact that Holland has for centuries been a country of capital exports and to a large extent still is, is reflected in the stock-exchange transactions. A considerable number of foreign funds, mostly bonds, are registered on the Amsterdam stock exchange; Dutch colonial funds also play a prominent part.

Issues.—The development of issues of stocks and bonds (not including conversion loans and treasury bonds) is as follows:

(In millions of guilders)

Year	Issues		Total
	Internal	External	
1913	156		156
1921	491	18	509
1924	354	49	403
1927	163	351	514

These figures show that foreign issues have very much increased during the last few years. The share of the principal countries in the foreign issues in 1927 was—Germany, 134 million (guilders), France 63, Belgium 31 and the United States 20.

Public Finances.—The financial position of the State during the first few years after the re-establishment of independence in 1813 was not very brilliant. The national debt, which in this year amounted to 619.9 million guilders, had more than doubled in 1844, principally on account of the difficulties which ended in 1830 with the separation of the Netherlands and Belgium. In 1844 the national finances were entirely reorganized, the national debt converted and the State expenditure restricted. Since then the surpluses from the Dutch East Indies, which had begun to flow in since the introduction of the compulsory tilling of State domains, proved of great assistance to the Dutch treasury. It was possible with these surpluses not only to finance the building of railways out of income, but at the same time to redeem part of the national debt. In the eighties, in consequence of the growth of new principles of colonial policy and temporary military operations, the surpluses from the Indies stayed away. At the same time the expenditure of the State began to increase, with the result that the position of the State finances became less favourable. The expenditure has increased rapidly since the end of the previous century: the ordinary expenditure, which amounted to 113 million guilders in 1880, was 154 million guilders in 1900 and 238 million in 1913.

The World War entailed heavy burdens for Holland—neutral though she was. The mobilization of the army, the distribution of foodstuffs and unemployment involved considerable expenditure, whereas the proceeds from taxation could be but slightly in-

creased, which necessitated borrowing on a large scale. The increase in State expenditure continued after the Armistice, due primarily to house building by the State on a large scale, extension of social measures and increase in the general level of prices. Receipts and expenditure connected with the war and the crisis following upon it, formed a separate chapter of the budget during the years 1914-24. Its receipts consisted of a tax on war profits and a supplement on certain taxes levied during this period. The expenditure incurred in connection with the crisis totalled 2,375 million guilders. The service of war loans and post-war crisis loans is administered apart from the budget itself, being defrayed out of certain taxes raised specially for this purpose and out of a supplement on a number of other taxes. The conditions on which these loans had to be contracted were often burdensome. The Government has however now been able to redeem and convert part of them.

The fall in the level of prices and the cutting-down of a number of items of State expenditure are reflected in the budget figures since 1923. The ordinary expenditure, which reached its maximum in 1922 with 632.4 million guilders, has fallen again to 591.8 millions for 1928; the extraordinary expenditure of 284.0 million guilders in 1921 was reduced to 49.1 million in 1927; in 1928 it increased to 173.4 millions, as a result of further redemptions of national debt. The receipts consist for the most part of taxes (546.3 million guilders in 1928), while the balance (1928: 183.3 million guilders) is made up from numerous smaller items, of which at present interest and reimbursement of advances are the principal factors. Part of these items is regarded as extraordinary receipts. The profits of Government undertakings belong to this category; they are however very small. In 1928 the extraordinary receipts amounted to 56.3 million guilders in all.

The origin of the present system of taxation is to be found partly in the taxes introduced during the period of French domination, and partly in levies existing earlier. A State income-tax was introduced in 1892-93. During the war and the succeeding years a number of crisis-taxes were levied and most of the existing taxes increased. In 1926, a beginning was made with some reductions. In 1928, the proceeds from direct taxation formed 48.8% of the total tax proceeds. Among these, income tax yielded 15.6%, the dividend and bonus tax 5.1%, the national defence tax 5.0%; consequently all the taxes on income together yielded 25.7%. The tax on real and personal property yielded 6.1%, taxes on consumption 28.2% and customs 10.4% of the total amount.

The consolidated national debt increased from 1,148.4 million guilders on Jan. 1, 1914 to 2,916.4 million guilders on Jan. 1, 1925; on Jan. 1, 1928 it amounted to 2,739.9 million guilders. While in 1928 130 millions of interest had to be paid, 49.4 millions were redeemed under the redemption-scheme and 187.5 millions outside. The floating debt of the State amounted to 13.2 million

Items of State Expenditure (in thousands of guilders)

	1900	1913	1928
Royal House, Civil List, Parliament, etc.	1,417	2,159	3,515
Internal Administration	23,634	25,176	58,217
Post Office, Mint and Statistical Office	12,344	24,818	9,958
Ministry of Justice	6,353	10,557	24,444
Foreign Office	708	1,188	3,395
Colonies	1,463	2,945	5,900
National defence	32,616	41,859	68,427
Health and housing	267	6,101	24,755
Social welfare	91	2,190	56,282
Poor relief	481	1,384	2,351
Education, art and science	11,786	35,248	129,674
Religion	2,220	2,264	2,436
Fisheries	225	715	828
Agriculture	689	5,918	6,165
Industry and commerce	357	7,452	4,561
Railways	5,907	4,614	12,008
Shipping	8,324	10,514	24,912
Public works	3,375	3,948	33,288
National debt	34,706	38,119	359,025
Other expenditure	7,203	11,538	69,552
Total	154,166	238,727	899,693

guilders on Jan. 1, 1914, 858.7 million on Jan. 1, 1922, and 251.5 million on Jan. 1, 1928. This last figure is however counter-balanced by floating claims to an amount of 275.9 millions on the same date, arising, *inter alia*, from advances of the Treasury to communes, colonies and foreign countries.

Judged in the light of their total expenditure the municipalities are as important as the State. The provinces however have only a subordinate position. The following figures for 1926 may be of interest:

(In millions of guilders)

	State	Municipalities	Provinces
Ordinary expenditure*	697.3	562.7	64.4
Extraordinary expenditure.	78.7	146.6	59.9
Debts (Jan. 1)	3,182.8†	1,917.2‡	171.7
Proceeds from taxes.	567.2	205.1	16.8

*Including interest and loan redemptions.

†306.3 millions of which are short term debts as against short term claims amounting to 283.5 million guilders.

‡Including 628.5 millions of advances of the State.

The municipalities and the provinces meet their expenditure partly from their own taxes and partly from contributions from the State.

MAP SHOWING PROJECTED RECLAMATION OF THE ZUIDER ZEE, HOLLAND
Tentative plans were decided upon by a commission in 1894, but subsequently altered. Actual construction began in June, 1920. Operations to 1929 have been on the new ship-canal and on the dams; the filling in of the polders being left to the last. The four reclaimed areas (polders) total 553,500 acres. The outstanding feature of the present plan is retention of the old waterfront by providing water-ways between the mainland and the reclaimed areas

The taxes per head of population in 1925-26 amounted (in guilders) to: State taxes—74.55, Communal—27.89, Provincial—2.35: Total—104.83.

DEFENCE

Historical.—From the 16th century, when the Dutch won their emancipation from the yoke of Spain, through the struggles against Louis XIV in the 17th and early 18th centuries, Dutch soldiers were constantly engaged in conflicts. Holland was overrun in 1787 by a Prussian army, and in 1795 was conquered by the French under Pichegru, a reorganized Dutch army subsequently taking part under French direction in the Napoleonic wars. Dutch troops fought against Napoleon at Waterloo, but it was not until after the separation from Belgium in 1830 that the history of the present-day all-Dutch army can be said to begin. Holland remained neutral in the World War.

Present-day Army, Recruitment and Service.—The Army is on a militia basis, resembling the Swiss. The Kingdom of the Netherlands is now divided into 12 recruiting areas. All Dutch subjects who are resident, or whose legal guardians are resident in Europe on Jan. 1 of the year of their 19th birthday are registered for military service, as also are certain foreigners domiciled in the Netherlands. Certain exemptions are allowed, either permanent or temporary, for family or professional reasons. Up to 19,500 of the annual contingent drawn by lot are posted to the regular army, the remainder performing some other State service. Military liability for service lasts until Oct. 1 of the 50th year of age for officers, the 45th year for non-commissioned officers, and the 40th year for other ranks. Men liable to service with the colours do a first period of training and a repetition course. All men of the ages prescribed can be called up for military service in war, threat of war or other emergency. The first period of training lasts for 5½ months (which may be reduced to 4 months for those who have previous military training) in dismounted corps and for 9 to 15 months (with the same proviso) in other branches of the service. Exemptions are allowed. The period may be divided, or it may be extended for lack of efficiency. An advanced course, with further exemptions, is done within 6 years of the first period course. This may be done in two periods to complete 40 days, with an extension of 7 days for non-commissioned officers.

There is also a second-line or landsturm, in which service is voluntary. This force is divided into landsturm associations and special corps, in which 300 hours' training are done every year. The landsturm associations (6 groups) conduct preliminary military training. The landsturm corps carry out motor transport, marine and railway services and anti-aircraft lookouts. Enrolment for the former is for men not liable to military service; in the latter for men, and some women, over 16 years of age.

Strength and Organization.—The Budget effectives show only a cadre of about 1,400 officers and 414 non-commissioned

officers (April 1, 1927). To these must be added a proportion of the annual contingent of 19,500 when undergoing training. The staff of the volunteer landstorm numbers 226, and the gendarmeries about 1,200, with 800 police in addition. The infantry is organized in 8 brigades, each of 3 regiments, and a cyclist regiment; the cavalry in 2 regiments each of 4 squadrons and a reserve squadron; the artillery in 4 field "brigades" each of 2 regiments of 3 batteries, in 2 batteries of horse artillery, 1 regiment of 8 companies of fortress artillery, one of 4 companies of coast artillery, and a "corps" of 2 companies of anti-craft artillery; the engineers in one regiment of 3 battalions, each of 2 companies; other services in proportion. The gendarmerie is organized in 4 divisions, the military police in 4 companies. The infantry use the Mannlicher rifle, mounted troops the Mannlicher carbine, while the artillery is armed with the Krupp 7.5 cm. gun.

Colonial Forces.—In the *Dutch East Indies* (Java) 2 divisions and 12 extra battalions and a company are maintained. European inhabitants, if Dutch subjects, are liable to compulsory service. European and native volunteers complete the numbers. The Budget effectives (1928) number 35,878 (28,908 infantry, 981 cavalry, 2,347 artillery and 917 engineers). The infantry in the field army is organized in 6 regiments, each of 3 four-company battalions; the cavalry in 6 squadrons, depot squadron and signal unit; the artillery in 3 regiments, 2 tractor howitzer batteries and 1 fortress company. The command is vested in a Lieutenant General, who is also head of the war department. There is a military air force of 261 (28 officers) included in the above figures, organized in 3 groups, each of 3 flights, with 6 fighting and 24 reconnaissance machines. In the *Dutch West Indies* (Surinam and Curaçao) a small garrison of about 350 is maintained (1928).

Administration.—The War office is the central authority. The minister has the usual departments under him, including a general staff. There is a council of national defence, of which the commander-in-chief of the army is a member, and there are four general officers commanding military areas (The Hague, Arnheim, Breda and Amersfoort).

Headquarters of the 1st Division are at The Hague, the 2nd Division at Arnheim, the 3rd Division at Breda and the 4th Division at Amersfoort. The Headquarters of the "divisions" of gendarmerie are at Hertogenbosch, Maastricht, Arnheim and Groningen. The companies of military police have their Headquarters at The Hague, Amsterdam, Breda, Nijmegen and Zutphen, with main Headquarters at The Hague.

There is a senior military college at The Hague to train officers for the Staff and higher commands (2 year course). At Breda there is a Royal Military Academy to train cadets for commissions and officers of all arms (3 months courses).

The chief points of special interest are the existence of a School for Chemical Warfare under the engineers, a carrier pigeon service at the General Staff and a school for "storm troops" of the 1st and 4th Divisions.

The defensive strength of the Netherlands lies in the power to create inundations. The water-levels are complicated, and the system known only to expert specialists. There are headquarter staffs for the fortified lines covering Dutch territory and for those specially covering the Helder.

The military Air Force, consisting of a staff and 2 companies with Headquarters at Soesterberg and a detachment at Schipol, is directly under the General Staff. Not counting machines used for training, there are 17 fighting aeroplanes and 53 for reconnaissance, no bombing machines.

(See also the *League of Nations Armaments Year-Book*, 1928 (Geneva). (G. G. A.)

Navy.—The navy of the Netherlands protects the Dutch waters and coasts and also provides defence for the Dutch East Indies (*q.v.*). There are four coast defence ships (5,000 to 6,500 tons), two cruisers, three armoured gun-boats, four sloops, five destroyers (510 tons), and four destroyers of 1,620 tons. In addition, Holland possesses eight torpedo-boats, 24 submarines, 12 mine-layers and two submarine depot-ships. There were (1928) two further destroyers under construction, and the budget the same year provides for an expenditure of 40,555,610 florins. (X.)

HISTORY

Rise of the Republic.—The following article deals with the history of the Netherlands after the confederation of 1579. For the events preceding that year the reader is referred to the article NETHERLANDS.

The Union of Utrecht, by which the northern provinces were confederated, was signed on Jan. 29, 1579. It remained in force until the fall of the Dutch republic in 1795, and its formation may therefore be taken as the starting-point of the history of the newly created state; but that state was as yet so far from being fully grown that its leaders did not even consciously desire either republicanism or independence. In this first stage it was a loose federation, for defence, finance, and other limited purposes. The States General were still controlled by the estates of the provinces, in which the work of government had always been shared between the estates and a monarch or his representative. It was eight years before the possibility of a monarch was ruled out, and throughout the whole history of the republic there was never a finally satisfactory adjustment between the powers of the estates, among which the States of Holland were predominant (*see* HOLLAND, COUNTY AND PROVINCE OF), and those of the stadholders (*q.v.*), the old royal lieutenants, who continued to exercise the executive functions which had been theirs as the overlord's representatives. Collisions between the estates and the stadholders were to lead to constant strife and to five successive revolutions: in 1618, in 1650, in 1672, in 1747, and in 1787. For the first 30 years after the Union of Utrecht the war of independence was being waged, and constitutional developments were dictated by its fortunes. William the Silent, who was supreme in Holland and Zeeland, did not welcome the union, because he still hoped to unite all the 17 provinces against Spain. That, however, proved to be impossible, and the military situation grew alarming. Maastricht, Koevorden, Groningen, Delfsyzl, Steenwyk were lost. Philip felt himself strong enough to pronounce the "ban" against William, that is, to declare him an outlaw whom anyone might lawfully kill. William saw that, without foreign aid, the northern provinces could not maintain themselves. He therefore gained the support of France by the offer of the sovereignty of the Netherlands to the duke of Anjou, brother of the French king. With the reservation of ultimate control in all important matters to the states, this arrangement was made in the treaty of Plessis-les-Tours, in Sept. 1580. Anjou, who took the field next year, was inaugurated early in 1582 as duke of Brabant and of Gelderland, count of Flanders and lord of Friesland. He did not become count of Holland and Zeeland. In these provinces he was distrusted as a Catholic, and they would have no sovereign except William himself, who reluctantly yielded to their insistence and had agreed, before his death, to accept the title of count. At the same time the northern provinces solemnly repudiated the sovereignty of Philip II. and declared themselves absolved from their allegiance to him (July 26, 1581). In 1581 and 1582 military events continued unfavourable: more fortresses were lost, and Anjou was chafing at the limitations imposed on his sovereignty. On Jan. 17, 1583, his troops attempted to obtain possession of the city of Antwerp. By the vigilance of the citizens, this "French Fury" was frustrated, and in June the discredited Anjou returned to France, where he died whilst planning his return. William continued to organize defence from his refuge in Delft, though with little success, for Zutphen fell. He had been severely wounded by one of the gunmen let loose by Philip's ban; on July 10, 1584, another, a fanatical young Catholic from Franche-Comté, named Balthazar Gérard, got admission to his house and shot him.

The States and Leicester.—The loss of the "Father of his Country" made the position of the rebels almost desperate, but their courage did not flag. His eldest son being in the hands of the Spaniards, the second, Maurice of Nassau, was appointed president of the newly constituted Council of State, and stadholder of Holland and Zeeland: but as he was still only 17 years old, the real leadership passed for the time being to the ablest men of the estates, in particular to Paul Buys, advocate of Holland until 1585, and Johan van Oldenbarnevelt, who was to hold that office from 1586 until 1618. They tried to revive the French

policy of William, but Henry III. of France was in no position to take risks, and refused their offers of sovereignty in July 1585. Meanwhile the war went from bad to worse. One after another the towns fell before Parma: Ypres, Bruges and Ghent in Flanders; Brussels and Mechlin in Brabant; then Nymegen and Doesburg in the east. Antwerp itself, the richest and most vitally needed of all, was besieged. While its fate was in the balance ambassadors were pleading for the help of the queen of Protestant England. Elizabeth, who had allowed her subjects to give unofficial help since 1572, was no friend to rebellion; she did not wish to precipitate open war between herself and Spain, and if it seemed to her interest she would leave her allies in the lurch. It was only after Antwerp had fallen (1585) that she came to terms. Refusing the sovereignty, she promised to send 5,000 foot and 1,000 horse under her favourite, the earl of Leicester; but her expenses were to be guaranteed, and as surety she took the towns of Flushing and Brill and the fort of Rammekens. These pledges were held until the debt was settled in 1616.

Leicester was in Holland from Dec. 1585, and did not finally leave until Dec. 1587, but his rule was an utter failure. Without Elizabeth's authority, and contrary to her wishes, he accepted the title of governor-general, with greater powers than had been enjoyed by Anjou or even William himself. His influence with the queen had been his greatest asset, but it proved almost useless, and he had little ability either in war or in politics. He saw clearly the defects of the improvised constitution, and tried to remedy them by centralizing the financial and naval organization; but he did not know how to work with the States of Holland. He alienated them by prohibiting all trading with the enemy, though Holland and Zeeland were growing rich by that means and drawing from it taxes which financed the war. He set himself at the head of democratic and Calvinist extremists. Worst of all, he could not check the victories of Parma: one after another there were lost Grave, Venlo and Deventer, and the siege-works made for the recovery of Zutphen—the last two reverses being due to the treachery of English Catholic commanders. Finally Sluys, a port to the south of the Scheldt, surrendered. Made still more unpopular by a peace-move which Elizabeth compelled him to take, Leicester attempted a *coup d'état* but failed.

Maurice and Oldenbarnevelt.—This was the lowest ebb of the rebels' fortunes. After 1587 Parma could not press them so hard. The year 1588 was that of the Spanish Armada: the shifting of Spain's effort to England and the sea meant that less could be done against Holland. Twice within the next four years, in 1590 and 1592, Philip made Parma, against his better judgment, lead away his forces against Henry of Navarre in the civil wars of France. Such a course might have been justifiable if nothing had changed on the side of the rebels; but Maurice and his older cousin, William Louis, stadholder of Friesland, proved to be soldiers of genius. They reorganized the Dutch army and worked out innovations in discipline, equipment, tactics and transport which gave them the model fighting force of the world. Parma's absence in 1590 was the signal for ending the defensive action which had lasted so many years. Maurice took Breda by surprise and then captured Steenberg and other places. Next year he got the consent of the states-general to a bolder offensive campaign, and with brilliant results. The recovery of Zutphen and the capture of Deventer gave him the line of the Yssel. He pushed on to take Delfszyl, Hulst and Nymegen. In 1592 he added Steenwyk and Koevorden, and his troops, successful in so many sieges, won their first victory in open battle since the pacification of Ghent. At the end of that year Parma died a disappointed man. The prizes of the next two years were Geertruidenberg and Groningen. The latter was the capital of the most northerly province, of which William Louis became stadholder. Practically no Spanish garrisons now remained in the northern provinces. The states had complete control of the resources and communications within their territories. The war had ceased to have any of the aspects of a civil war and had become a regular war along the frontiers of the new state. The Triple Alliance concluded in 1596 between the Dutch, the French and the English, though it brought little military help, was significant of the repub-

lic's progress: it was now recognized as a sovereign state of which France and England could make an open ally. The successes of Prince Maurice, though not absolutely unbroken, continued, and this phase of the struggle culminated in 1597, when a considerable battle was won at Turnhout and there was added to the tale of captured towns Rheinberg (lost in 1590), Meurs, Grol, Bredevoort, Enschede, Ootmarsum, Oldenzaal and the fortress of Linghen.

The year 1598 saw important political changes. By the Treaty of Vervins, France made peace with Spain, a separate peace in which neither the Dutch nor the English were included. Philip II. died in the same year, after arranging a new régime for the southern Netherlands. The cardinal archduke, Albert of Austria, who had become governor in 1596, was to marry his cousin, Philip's daughter, the Infanta Isabella, and the two were jointly to rule the Netherlands as an independent sovereignty. If, however, they had no heirs, the sovereignty was to revert to Spain, as it ultimately did in 1633. In practice, however, the "cession" made little difference to the dependence of the provinces on Spain, and it did nothing towards bringing about a reconciliation with the north. The Spaniards could not bring themselves to concede freedom of worship, and another factor now arose which made it impossible for the Dutch to gain peace except through victory. In 1595-98 came the first Dutch voyage to the East Indies. By 1600, when the united Dutch East India Company was founded (see DUTCH EAST INDIA COMPANY), Dutch ships were trading everywhere in the East and West, and the Spanish colonial empire was endangered. Nine more years were needed before the Spaniards would recede from their colonial claims. On land the character of the war altered. In 1600 Oldenbarnevelt and the other politicians made the unwilling Maurice undertake a march westwards across Flanders to strike at Dunkirk, from which port privateers preyed on the commerce of the channel. Maurice won a spectacular victory at Nieupoort (July 1); but nothing more. The great business of the next three years was the Archduke Albert's siege of Ostend, the isolated port which the Dutch were enabled to hold by their command of the sea. While the siege was in progress Maurice took Cadzand, Grave and the port of Sluys, which had been lost by Leicester; but Ostend itself he could not save. It fell on Sept. 20, 1604, after a resistance of 38 months, to Ambrosio Spinola, a member of the great Genoese banking house, who was equally eminent in policy and in arms. In 1604 King James I. of England made his peace with Spain, and the Dutch, now without allies, could no longer make such headway as before. Oldenzaal and Linghen were lost, and after them Grol and Rheinberg; but the resources of Spain had been sapped by the long war, and especially by disasters at sea. In 1607 Jacob van Heemskerck won a striking victory off Gibraltar. Soon after that the Spaniards' need for peace led to serious negotiations. These were not easy, and the two stadholders would have been well content to continue the war; but by the mediation of France there was concluded, on April 9, 1609, a twelve years' truce. It was made with the provinces as free states over which neither Spain nor the archdukes made any claims. The frontiers were to be as they actually stood at the time. Nothing was said about religion or the Indies, but in a secret treaty King Philip III. undertook to permit Dutch trading there. So ended gloriously and advantageously the first act of the war of independence.

The interval provided by the truce was marked by little of importance in external relations. The only event that need be named is the intervention of the republic in the dangerous succession-dispute in the neighbouring duchies of Cleves-Jülich (1609-14). With this external calm there went growing economic prosperity, but also lamentable strife in domestic politics and religion. Estrangement between Maurice and Oldenbarnevelt had begun as far back as the Nieupoort campaign, had been accentuated in the negotiations for the truce, and now became open enmity. A theological professor at Leyden, Jacobus Arminius (*q.v.*), had criticized the orthodox Calvinistic doctrine of predestination. His subtle argument led to a raging controversy in which one of the issues was the right of the States to control the Church. The followers of Arminius addressed a remonstrance, from which they

were called Remonstrants, to the States of Holland. Among the liberal-minded men of affairs who composed that body they had many adherents, including the advocate himself, though not the representatives of Amsterdam, the leading town. The States tried to preserve unity, first by silencing the controversy and, when that failed, by taking the side of the Remonstrants; but Maurice and four provinces out of seven in the States General took the orthodox Calvinist side. The States General wished to call a national Synod or Church Assembly to settle the disputed questions, but the States of Holland refused their consent. Exasperated by their failures, they passed a resolution which asserted the principle of provincial independence in such a way as to threaten the unity of the republic; they raised levies of local militia (*waardgelders*) to enforce their will, and instructed the contingents of the regular army paid by Holland that they owed no allegiance to the "generality." The States General and Maurice, with the army behind him, overawed the opposition and removed its leaders from their positions in the town governments. Oldenbarnevelt, the famous Hugo Grotius, and others were arrested. A special tribunal was erected to try, or rather to condemn, them. Meanwhile the national Synod had met at Dordrecht (Dort) on Nov. 13, 1618. Its decisions were entirely against the Arminians, who were silenced. The Synod closed on May 9, and four days later Oldenbarnevelt, in spite of long public service, was beheaded.

THE GOLDEN AGE

The twelve years of truce came to a conclusion in 1621, and, Maurice and his party being supreme, the war with Spain was automatically resumed. Three years earlier the Thirty Years' War had broken out, and the Dutch frontiers were therefore merely one of the theatres of a general conflict. The republic at first failed to adapt its policy to the new conditions, and Maurice had lost his old vigour. After failing to relieve Breda from Spinola's siege, he died on April 23, 1625. His younger brother Frederick Henry (*q.v.*), now prince of Orange, who succeeded him in all his titles and offices, was an abler politician and a competent soldier. During his stadholdership of more than a quarter of a century the golden age of the republic set in. Political and religious affairs became more harmonious; the stadholder maintained a princely court; learning, literature, and painting reached a dazzling brilliance. Commerce flourished; an eastern empire was acquired, and large, though not lasting, conquests were made in South America. The capture of the Mexican silver fleet by Piet Hein, in 1628, was the greatest of many naval exploits (*see* DUTCH EAST INDIA COMPANY; DUTCH WEST INDIA COMPANY). Financial and other help came from England and France, the latter in exchange for the grant of naval assistance to Cardinal Richelieu for the subjugation of the Huguenots in La Rochelle. This was withdrawn, but the old dreams of international religious solidarity were ending. In 1626 Oldenzaal was recovered, and in 1627 Grol. In 1629 Frederick Henry captured the virgin fortress of Hertogenbosch (Bois-le-duc), and the seizure of Wesel interrupted the enemy's communications by the Rhine. Two years later, there came the defeat of an invading fleet in the Slaak, and in 1632 the taking of Maastricht, a crossing of the Meuse. After this there were negotiations for peace, which in spite of the growth of a peace-party in Holland, led to nothing. A treaty of alliance with France in 1635 opened the prospect of a partition of the southern Netherlands between the French and Dutch, but the dissensions of the allies and the good generalship of their new opponent, the Cardinal Infant Ferdinand, prevented any notable success until 1637, when Breda was retaken. The grudging grants of supply from the province of Holland were insufficient for ambitious plans in the next two years, and a dash on Antwerp was frustrated; but Spanish sea-power received a smashing blow when on Oct. 21, 1639, a great fleet of warships and transports under Oquendo was engaged in the Downs by Martin Tromp. Incidentally this gave umbrage to Charles I. of England, a squadron of whose navy had watched this battle in waters where he claimed a sovereignty. He and his father had already, in connection with the herring fishery and other matters, tried to assert this claim of maritime sovereignty against the Dutch. Commercial jealousy of

the Dutch was becoming strong in England, and there was a growing tale of grievances against their East India Company, of which the "massacre of Amboyna" of 1623 was the most sensational. But Charles, far from being able to press these home, was in need of help against the opposition which was soon to break out in civil war. He therefore consented to the marriage of his daughter Mary, the princess royal, to Frederick Henry's 14-year-old son William, who had been recognized as his father's successor in all his offices. This was the first of three marriages of princes of Orange with English princesses, a social promotion which was to bring the republic into the cross-currents of dynastic interests. It had no influence on the course of war. Two great changes now brought the possibility of a satisfactory peace in sight. Portugal, subject to Spain since 1580, broke away again in 1640, and the Spaniards, besides being weakened in Europe, had no longer much reason for maintaining the colonial quarrel with the Dutch, since it was in the Portuguese spice-islands and Brazil, now lost to Spain, that the Dutch had established themselves. The other great change was the rise of France as a military power. At Rocroy, in 1643, the Spaniards were thoroughly beaten by the French. The danger opened out was that the southern Netherlands might pass from decadent Spain to the rising power of France. Negotiations were begun in that year which ultimately led to a settlement. While they were in progress, Frederick Henry won his last victories. In 1644 he captured Sas van Ghent, in 1645 Hulst, thus gaining a foothold on the southern bank of the Scheldt. The frontier-line to which he had pushed forward his armies remained almost unaltered until the end of the republic. He died on March 14, 1647, less than a year before the Treaty of Münster (part of the Peace of Westphalia), in which this frontier was confirmed. The Scheldt was closed to trade, as it had been, in fact, since 1572. Dutch independence was finally recognized, and with it all that had been gained in the East and West. The "eighty years' war" was over.

William II.—It had been terminated by a separate peace which left France and Spain at war, and that had not been to the liking of the able and ambitious young soldier, William II., who had lately succeeded his father. With the support of Zeeland and Utrecht he had opposed the settlement. For the time being the States of Holland, with the help of the other provinces, had easily got their way; but the peace meant a renewal of the contest which had arisen after the truce of 1609 between the Orangist tendency towards constitutional unity and the decentralizing policy of the pacific oligarchies of the states. The latter had its stronghold in the patriciate of Amsterdam, then the richest trading city of the continent. William entered upon secret negotiations for a renewal of the war in alliance with France, of which the daring purposes were to be a partition of the southern Netherlands and the restoration of his exiled cousin, Charles II. of England. The domestic counterpart of this was to be the strengthening of his own powers. Issue was joined over the disbanding of the troops rendered superfluous by the conclusion of peace. The States General, in which the other six provinces now took the prince's side, wished to retain the cadres of the disbanded regiments, which could thus be quickly raised to a war-footing; the States of Holland objected, and ordered the disbanding of those troops for which they provided the money. There thus arose an intricate legal question similar to that of 1618, and the resources of the constitution were exhausted in the attempt to settle it. On July 31, 1650, six leaders of the States of Holland were clapped into the castle of Loevestein, from which the states party were known until long afterwards as the Loevestein faction. Troops under the command of William Frederick, stadholder of Friesland, moved against Amsterdam. The gates were manned; but the town council had no heart to fight. It made its submission. William used his success as skilfully as he had won it. The prisoners were released, and he was virtually master of the republic. His triumph ended suddenly: he died of smallpox on Nov. 6.

The Rule of the States.—A week after William's death his widow gave birth to a son, who was to become William III. of Orange and of England. This child was now the head of the house of Orange; but the power of that house was only what a strong

man could make it. The Loevestein party took its opportunity. A Great Assembly of the provinces, like the States General but more numerous and solemn, met at The Hague on Jan. 18, 1651, to regulate the constitution for this "first stadholderless period." Its results were to strengthen the sovereignty of the provinces within their own borders, including the control of the army and religion. This implied the preponderance of Holland, by far the richest and strongest in external and general affairs. None of the provinces, except Friesland and Groningen, which remained faithful to William Frederick, now had a stadholder. This limitation of the central and executive powers aggravated the defects of the constitution; delays, obstructions and disputes were multiplied; but the Dutch were experts in public business, and they worked this cumbrous machine through 20 years of difficulties and dangers until the greatest crisis of their history, for which alone it proved inadequate. Much of the credit for this is due to John de Witt, the son of one of the prisoners of Loevestein, who became *raadpensionaris* (council pensionary) of Holland in 1653 (see HOLLAND, COUNTY AND PROVINCE OF). He had no equal in the art of political management, and few in that of international diplomacy; but with these he combined higher gifts. His intellectual distinction, his broad and deep political knowledge, entitle him to be called the most scientific statesman of his time. His appointment came during the course of the first English war. The commercial and colonial rivalry with England had been growing hotter all through the century. In the year 1651 it reached boiling-point. The Dutch had declined far-reaching proposals of alliance from the new sister-republic and Orange partisans had insulted the ambassadors of the regicides. The English navy, in stamping out royalist resistance, interfered with Dutch commerce. The celebrated Navigation Act inflicted, or rather was meant to inflict, a severe blow on the Dutch carrying trade. The war was fought entirely at sea. It lasted from May 1652 to April 1654, in which time there were 12 fleet actions. This evenly balanced fighting was something new in naval history; the Dutch commanders, Tromp (killed Aug. 10, 1653), and de Ruyter, did wonders, as did the Englishmen, Blake and Monk. Dutch commerce suffered enormously. In the end the English had the upper hand, and the Protestant idealist Cromwell, now Protector, had no wish to continue the war. In the Treaty of Westminster (April 5, 1654), the Dutch agreed to pay compensation for the East Indian claims and to make the formal acknowledgment of the British sovereignty of the narrow seas by saluting with the flag. Another condition was added, since the States General refused to accept it, in a secret treaty which the States of Holland under de Witt's influence made as a separate sovereign state. In this Holland was pledged to the Act of Seclusion, by which the prince of Orange, in despite of popular opinion, was to be excluded from the office of stadholder. Baltic affairs next gave trouble. The trade there was of great importance to the Dutch, and was adversely affected by the war between Sweden and Denmark (1657-60). By a skilful use of force and diplomacy John de Witt, in concert with France and England, imposed a settlement. The expulsion of the Dutch from Brazil had led to war with Portugal in 1657, but this too was satisfactorily terminated in 1661. Meanwhile, Charles II. had been restored, and to conciliate him de Witt, secured the repeal of the Act of Seclusion. The dynastic question was however subordinate. It was in an alliance not with England but with France (1662) that the Dutch put their trust. Parliament re-enacted and strengthened the Navigation Act. Dutch posts on the West Coast of Africa were seized (1664) in time of peace; the colony of New Netherland was seized soon afterwards and its capital New Amsterdam renamed New York after James, duke of York. The second English war broke out in 1665. This too was an obstinately contested sea-war. The land operations were insignificant, but it differed from the first war in that it was not a mere duel, the English having as an ally the bishop of Münster, against whom the Dutch were aided by the French, in accordance with the alliance of 1662. The general result was less favourable to the English, and negotiations were already in progress when the Dutch made their memorable raid on the Medway and burnt the

British fleet where it had been unwisely laid up in harbour. Naturally they had the better of the treaty. True, New Netherland was handed over in exchange for Surinam and Run; but it may be doubted whether it could have had much future under the Dutch. The commercial and maritime clauses included concessions by the English. In the following year de Witt and Sir William Temple negotiated the triple alliance of England, Holland and Sweden. The purpose of this was to force a peace upon Louis XIV., who in 1667 had invaded the Spanish Netherlands and now was making dangerous progress. In later days, when England and Holland stood side by side against French ambition, the alliance was famous as an anticipation of their policy; but its immediate consequences were far from splendid. Louis did indeed make peace, for which he had other sufficient reasons, but he kept it for no more than four years, and he spent those years in preparing the way for a new war of aggression in which the Spanish Netherlands were still the ultimate objective, but the direct enemy was the Dutch republic, which had taken upon itself to be their friend. Louis' diplomacy isolated the Dutch completely. Charles II. sold himself cheap by the Treaty of Dover (1670); neither to Sweden nor to Spain, nor to any among the German states, could the republic look for support. John de Witt with all his foresight had not done enough. The fleet was strong and well-equipped, but, from jealousy of its Orange sympathies the oligarchs had neglected the army. By 1672 Louis was ready. He moved against the eastern frontier in apparently overwhelming force. The English picked a quarrel over the salute to the flag and, before declaring war, attacked a Dutch merchant fleet in the Channel.

William III.—In this extremity it was futile to resist the wave of feeling which demanded that William of Orange should be called to power; he became stadholder of Zeeland, stadholder of Holland, captain-general of the Union (June 1672). Unable to hold the frontier on the line of the Yssel, he prevailed on his countrymen to save the more westerly territory by opening the dikes and awaiting the enemy behind the inundations of the "Old Holland Water-Line." The French were held up within a day's march of Amsterdam. The insulting peace-terms offered by Louis were rejected. Unhappily, those heroic days were stained by a brutal crime. In The Hague an infuriated mob set upon John de Witt and his brother Cornelius and tore them limb from limb.

For the next 40 years Dutch history turned on the struggle against France. William, though not the equal of the French marshals who opposed him, was the most resolute man in Europe. In the field he never admitted defeat, and in diplomacy he seldom met it. Before the end of 1673 the direct danger to the existence of the Dutch republic was ended. Brandenburg, the emperor and Spain were induced to declare war against France. William was able to come out and surprise the Rhine fortress of Bonn, thus threatening the enemy's communications. In 1674 the land war made no great headway, but at sea the English, among whom a powerful section were unfriendly to Louis, had had enough. The Treaty of Westminster (Feb. 14) provided for the restoration of all conquests. Before very long Charles found it to his interest to work for a time with the anti-French party, and the improvement in the republic's military and diplomatic situation was signally shown by the marriage (1677) of William to Mary, the elder daughter of Charles's heir presumptive, the duke of York. The bridegroom had still his war to finish, but the years 1675-77 had been tolerably successful at sea, though not in the principal theatre, and negotiations were already in progress. They terminated by the general settlement of Nijmegen (Aug. 1678), in which, though it marked the greatest extent of Louis's conquests, the Dutch surrendered nothing. Ten years elapsed before the next war between Holland and France, and in contrast with the period before 1672 they ended with the almost complete isolation of Louis XIV. England remained an uncertain factor until 1688, when the clumsiness of James and Louis, the generous patriotism of the Dutch regents, including those of Amsterdam, and the genius of William brought about one of the decisive events of modern times. William and Mary became king and queen of England (see FRANCE: History; ENGLISH HISTORY). In Holland

this greatly raised William's authority, which in no way suffered from his frequent absences in his kingdom. He still had to contend with the particularism of the regents in Amsterdam and elsewhere, but his mastery of Dutch political devices was equal to that of John de Witt, and he exercised a less restricted power as stadholder of Holland than as king of England. In the war he was undisputed head of the Allies. Holland's part was subordinate to that of England, and she suffered both by sea and land only less severely than in the earlier wars of the century; but by the peace of Ryswyk (1697) she gained, besides the indirect benefit of William's recognition as king, a favourable commercial treaty. Afterwards she garrisoned a number of "barrier fortresses" in the Spanish Netherlands. This barrier policy was, however, unsound. The mercantile Dutch did not desire an extension of frontiers but trusted to making themselves safe in the south, as they had already done in the east, by maintaining garrisons which should shore up the resistance of buffer-states, strong enough to serve for defence but too weak to be dangerous. In the great war of the Spanish Succession, which began soon after William's death in 1702 and was a continuation, with still greater stakes, of the last war, one weakness of this scheme at once became apparent. Spain was now in alliance with France, and the garrisons could not hold on in what had thus become an unfriendly country.

William's death began a second "stadholderless period" which lasted until 1747. In 1672 the stadholdership in his five provinces had been declared hereditary, but William died childless and the jealousy of Holland prevented the appointment of his cousin, the stadholder of Friesland and Groningen. The evils of this disunion were, however, mitigated by the statesmanship of Antonie Heinsius (council-pensionary 1689-1720), and the duke of Marlborough (deputy captain-general and British ambassador at The Hague) who carried on the tradition of William III. After the fall of Marlborough, however, a treaty settlement was made (1713-15) which disappointed Dutch expectations. Small patches of territory on the Meuse were gained. In the southern Netherlands, now handed over by Spain to Austria, a barrier was conceded less advantageous than had been promised by the English during the course of the war.

THE REPUBLIC IN DECLINE

The finances of the republic were exhausted. From this time it was no longer one of the Great Powers; but its geographical situation, and the wars of its great neighbours, England and France, made international politics the ruling factor in its destiny. Economic decline began to set in seriously towards the middle of the 18th century, so that the political influence of the Dutch was further diminished. They supported the Hanoverian dynasty in England by sending troops when it was in danger, but they followed in general a policy of peace and abstention from European complications. In 1723-31 they departed from this in order to obtain the suppression of the East India Company, which the Emperor, Charles VI., had set up at Ostend in the Austrian Netherlands, a competitor which might have undone much of the advantage gained by the Dutch from the closing of the Scheldt (*see OSTEND COMPANY*). In exchange for this suppression they guaranteed the Pragmatic Sanction, by which Maria Theresa was to succeed to all the hereditary dominions of her father, Charles VI., and therefore they were unable to avoid joining, in 1743, in the war of the Austrian succession. They were now, as in 1689-1713, in alliance with the English and Austrians against the French, but they confined their help to unimportant contingents and subsidies. The French under Marshal Saxe made short work of the Austrian Netherlands and the barrier fortresses. After holding back in the hope that the Dutch would be neutral, they marched in 1747 into the defenceless Dutch territory south of the Scheldt, Dutch Flanders. Then followed a parody of the revolution of 1672. Popular opinion everywhere demanded a stadholder who should save the country as it had been saved by William III. The man marked out by fate was William IV., prince of Orange, and already stadholder of Friesland, Groningen and Gelderland and the son-in-law of George II. of England.

He was the grandson of that cousin of William III. who had been stadholder of the northern provinces. Some English men-of-war in port in Orangist Zeeland gave the first impulse to a swift and bloodless revolution, by which he became stadholder of the remaining provinces and captain and admiral general of the Union. Before long his offices were declared hereditary. He was an eloquent speaker and a believer in constitutional legality, but he lacked all the qualities of the man of action. His high hopes of effective Dutch exertions in the war came to nothing; even in the making of the Treaty of Aix-la-Chapelle in 1748 he had no influence. He and still more his adviser, Willem Bentinck van Rhoon, saw the need for reform in the system of taxation and the machinery of government; but they could not overcome the slackness and obstructiveness of the regents. By the time of William's death (Oct. 22, 1751) nothing remained of the dreams of a revived republic strongly led by a stadholder in the old alliance with Austria and England. In the Seven Years' War (1756-63) the republic remained neutral. After the death in 1759 of William's English widow, Anne, the States were regents for her son who was declared to be of age in 1766. William V. was a man of the feeblest character, ruled by his spirited wife, Frederica Wilhelmina of Prussia. In the American War of Independence he favoured the English; most of the Dutch people sympathized with the rebellious colonists. It was, however, the interference of the British with neutral shipping which brought the Dutch into their fourth English war. By a majority of four provinces to three the States General decided to join the "Armed Neutrality," the combination promoted by Catherine II. of Russia (1780). The war which ensued was an unrelieved disaster. Party strife paralysed every organ of the State, and, though a stout fight was put up in the indecisive naval action of the Dogger Bank (1780), the Dutch could not hinder the English from taking possession of all their shipping and all their colonies. In the Treaty of Paris (1784), deserted by their allies, they had to give up Negapatam in southern India and grant the English the right of navigating through the Moluccas. The economic effects of the war had been disastrous.

Perhaps undeservedly but not unnaturally it was the stadholder and his party who were blamed for these humiliations, and the strongest element in the republic for the next few years was that of the successors of the old "states party." These were the "Patriots," liberals inspired by French philosophical ideas and politically inclined to France. They used their power to hamper and limit that of the stadholder. In 1784 the emperor, Joseph II., took advantage of these dissensions to announce his intention of opening the Scheldt, and the Dutch had no means of averting this except by the payment of a heavy compensation. But the Patriots went too far, and the opponents of France were determined not to lose their chances of controlling Dutch policy through the house of Orange. Sir James Harris, the British ambassador, had long been preparing a stroke. In 1787 the king of Prussia, on the pretext of an insult offered to his niece, dispatched an army of invasion. Amsterdam capitulated, the Patriots were driven from office and William V. was restored.

This might have been the prelude to fundamental reforms had not Dutch history been projected into a new era by the French revolution. In 1792 the French threw open the Scheldt, as Joseph II. had threatened to do. They declared war on George III. of England in the following year, and they were merely registering the results of 1787 when they included the prince of Orange in the declaration. The course of events in the war and in France protected the Dutch until the winter of 1794-95, when the army of Pichegru swept all before it, even the fleet being captured in the Texel by cavalry which crossed the ice. William V. and his family fled to England. All the characteristic institutions of the antiquated republic were done away with, and the French and patriots together organized the Batavian republic on the French model (1795-98). The Dutch soon found what it was to be a client-state of France. The English seized all their colonies, shut up all their shipping and at Camperdown (1797) destroyed their navy. Constitutions, growing less democratic, followed one another as in France. At the peace of Amiens England restored the

Cape of Good Hope and the West Indian colonies, only to occupy them anew when war was resumed in 1803. In 1805 Napoleon imposed a new constitution and Rutger Jan Schimmelpenninck took the leading place with the title of council-pensionary. In the next year, however, the French emperor sent his brother Louis to Holland to rule it as a king. Louis, particularly in the matter of the continental system, put his subjects' interests before his master's: hence in 1810 he had to abdicate. The country was incorporated in the French empire and had to pay its share of men and money for Napoleon's costly last campaigns.

MONARCHY

When Napoleon was defeated at Leipzig in 1813 there was a general rising of the Netherlands. The prince of Orange, the son of William V., who had died in exile, hastened back and, amid general enthusiasm, accepted at Amsterdam (Dec. 1813) the title of sovereign prince. The drafting of a constitution was begun. Next year the powers victorious over Napoleon decided to set up, as a bulwark against the French a state uniting all the Netherlands, divided since 1579, together with the bishopric of Liège and the little duchy of Bouillon. At its head was Orange with the title of William I., king of the Netherlands (*q.v.*). His share in the German inheritance of the Nassau family was exchanged for Luxembourg, of which he became grand duke, thus bringing it into a personal union with his kingdom. When Napoleon returned from the hundred days, the king's son and heir, now called prince of Orange, at the head of the Dutch troops, won distinction at Quatre Bras and at Waterloo, where he was wounded. King William's coronation at Brussels on Sept. 27, 1815, inaugurated a new era, which had its own problems, but in which those of the older history of the country were finally settled by national unity under a hereditary monarchy.

BIBLIOGRAPHY.—G. Edmundson, *History of Holland* (Cambridge, 1922), and the same writer's chapters in *Cambridge Modern History*, vols. iii.-v. (Cambridge, 1907-08) are the best short general accounts in English: both works have bibliographies. For original authorities and books in the Dutch language see the lists in I. H. Gosses and N. Japikse, *Handboek tot de staatkundige geschiedenis van Nederland* (The Hague, 1920), which is the best handbook; and P. J. Blok, *History of the People of the Netherlands* (New York and London, 1898-1912), the standard work. J. L. Motley, *The Rise of the Dutch Republic* (1856, and many subsequent editions), is a classic, and still a popular favourite; his *United Netherlands* (1860-67) covers the period from 1584 to 1609, and is followed by his *Life and Death of John of Barneveld* (1874); these are important though less successful. Sir William Temple, *Observations upon the United Provinces of the Netherlands* (1673, and often reprinted), is a political classic; A. Lefevre-Pontalis, *John de Witt* (1885), is the best account of that statesman in English. On special aspects of Dutch history the following are authoritative works with full indications of further literature:—Economic History: E. Baasch, *Holländische Wirtschaftsgeschichte* (Jena, 1927); Military to 1672: F. G. ten Raa and F. de Bas *Het staatsche leger* (The Hague, 1911-21); Naval: J. C. de Jonge, *Geschiedenis van het nederlandsche zeewezen*, 2nd. ed. (Haarlem, 1858-1862); J. E. Elias, *Schetsen uit de geschiedenis van ons zeewezen* (The Hague, 1916-27); Ecclesiastical: L. Knappert, *Geschiedenis der nederlandsche hervormde kerk* (1911-12); Colonial: H. T. Colenbrander, *Koloniale geschiedenis* (The Hague, 1925); Constitutional: R. Fruin, *Geschiedenis der staatsinstellingen in Nederland* (2nd ed. The Hague, 1922); this author was the greatest of modern Dutch historians and his other works are indispensable to the specialist. Two invaluable works of reference are the biographical dictionary *Nieuw nederlandsch biografisch woordenboek* (Leyden, 1911-), and the great *Geschiedkundige atlas van Nederland* (The Hague, 1911-), both in progress. Surveys of current historical literature appear regularly in the periodical *Bijdragen voor vaderlandsche geschiedenis en oudheidkunde* (The Hague).

FROM 1815 TO 1914

The inclusion of the Belgian Netherlands in the new State of William I. set Dutch statesmanship a great task. In the conception of the European Powers who had promoted the creation of the United Netherlands kingdom (of England in the first place) it was to be a bulwark against the aggression of France. This conception harmonised quite naturally with the heroic traditions of Dutch foreign policy of which the House of Orange could consider itself to be in a special sense the guardian, but which were regarded as out of date by those who had no further national ambition beyond neutrality. Yet from another point of view

less obvious to European diplomacy, the union might have been expected to appeal to Dutch public opinion. The Flemish half of the southern Netherlands had since the forced separation in the eighties of the 16th century become estranged from the northern Netherlands; during the 20 years of annexation to France which had just been brought to a close, the upper classes had been deliberately, and to a large extent successfully, denationalized. Yet the origins of Dutch civilization had been rooted in Flanders and even now the mass of the people north of the ancient linguistic frontier, however completely out of touch with the literary language or the thought of Holland, still preserved their dialects in their original purity. The union might well seem a great opportunity to win them back for Dutch nationality.

The Belgian Revolution.—The king and his principal advisers, Van Hogendorp, Falck, Van Maanen, saw matters in this light. The government endeavoured to restore the Dutch language to its natural position in the public life of the Flemish regions and it tried to base a new conception of a greater Netherlands nationality on what the king ostentatiously called "the national language." The inclusion of the Walloons in his kingdom was inevitably a hindrance to a policy of this kind, which moreover had to overcome the strong gallophil proclivities of the leading classes in Flanders. The conflict with the Roman Catholic hierarchy which the king, heedless of the warning example of Joseph II.'s reign—did not avoid, tended to alienate the sympathies of the Flemings even more than of the Walloons, who, moreover, were especially benefited by the judicious and untiring care which the king bestowed on the economic development of his country. Yet when in 1830, under the immediate effect of the July revolution in France, the rising against Dutch rule began at Brussels, it was the Walloons who, with the gallicized Bruxellois assumed the initiative. The Flemish provinces followed only after the first reverses of the government, and in fact, in the new Belgian Kingdom, which owed its birth to French influences and French interference, they were destined to play a subordinate part. The Dutch regime had not lasted long enough to weld them and the northern provinces together in a conscious national unity, but it had, by reversing the process of gallicization and introducing a system of elementary education, saved the Flemish language from extinction and paved the way for the Flemish movement which is an important element in the 20th Century life of Belgium and in the relations between Holland and Flanders.

Dutch public opinion had taken little interest in the great work that had been done in the south for Dutch civilization. It made no distinction between Flemings and Walloons, and when the revolution broke out it embraced all Belgians in the same resentment, and while largely responding in 1831 to the king's call for an invasion of Belgium in order to obtain better terms of separation, the Dutch people were relieved that the union had come to an end. At the time of the restoration the Dutch people shaken by the vicissitudes of the "French period" and impoverished by the loss of trade had entrusted their interests to William of Orange with the confidence of exhaustion. The years of union with Belgium are marked by an absence of interest in public affairs, surprising on the part of a people with the political tradition of the Dutch. When the Belgian opposition began to ask, ever more insistently, for ministerial responsibility and similar reforms, the Dutch had only supported the government with greater docility. Events after 1831 brought about a change in this attitude.

It had become clear almost at once after the insurrection of the southern provinces that no help was to be expected from the powers (which 16 years before had helped to form the united Netherlands kingdom) to coerce the rebels back under the sovereignty of William I. The attention of Russia, Prussia and Austria, was soon distracted by an insurrection in Poland, while England, especially after the formation of the Whig cabinet in November, was anxious to settle the whole question in amicable consultation with France. The international conference which met in London at the request of William I. to discuss the matter had, on December 20, 1830, pronounced the dissolution of the kingdom. The principles of separation which it laid down a month later were not unacceptable to Dutch opinion, but in June-July 1831 the

conference drew up the so called eighteen articles, which differed essentially from the Bases of January and which Holland rejected. When Leopold I. accepted them, William I. denounced the armistice and in the ten days' campaign the Dutch army routed the Belgians and withdrew only when a French army appeared on the scene. The demonstration was not without effect. The conference again altered its verdict and the twenty-four articles (Oct. 1831) were much more favourable to Holland. But William I. refused to accept them, ostensibly on account of the loss of part of Luxemburg, in reality because he had not given up hope of recovering the lost provinces. It was not until March 1838 that he intimated his readiness to accept the twenty-four articles; and more than a year later the definitive treaty of separation between Holland and Belgium was signed at London and guaranteed in a collective treaty by the five Powers.

The treaty left to Holland the ancient territory of the Dutch republic with the addition of a strip of land along the Maas in order to connect the old enclaves of Maastricht and Venlo with the body of the country. It was as a compensation for this strip of land that the king in his capacity of Grand Duke ceded the Walloon part of Luxemburg to Belgium. The Belgians undertook to share the burden of the public debt of the defunct kingdom. The Scheldt was declared to be free to international navigation and Holland undertook to maintain its navigability. (See also BELGIUM.)

Constitutional Reform.—The obstinacy with which King William had maintained his "system of persistence" from 1831 to 1838 had greatly embarrassed Dutch finances and had roused Dutch public opinion against the system of irresponsible government which in 1814 had been accepted without a murmur. The Government had been able to finance the protracted mobilization only by drawing largely on the colonies. Here the so-called "cultures-system" had been introduced by Van den Bosch who had first been governor-general, then minister of the colonies. This system really meant a return to the principles of the Dutch East India company; under it the Dutch Government asserted a monopoly for trading in agricultural articles obtained by forced labour on a large scale. The Netherlands Trading Company which the king had founded in 1824 and in which he had a considerable personal interest, was drawn into the service of the government cultures, and both through it and directly, the State made enormous annual profits. Altogether, these financial transactions which the constitution by committing the government of the colonies to the king's sole care shielded from the control of the chambers, evoked much criticism and intensified the demand for a revision of the constitution. In 1840 a revision was undertaken, which, in addition to certain further not very important changes, brought colonial finance under the competence of the chambers. A few weeks afterwards the king abdicated.

Under William II., the drastic fiscal measures necessary to avoid a public bankruptcy were forced through by Van Hall but at the same time it appeared that the revision of 1840 had by no means satisfied liberal opinion, and the agitation for a further strengthening of the power of the States-General continued.

The leader of liberal thought in the country was J. R. Thorbecke, professor of constitutional law at Leyden and member of the second chamber. In 1844 he with eight other liberal members introduced a bill for further revision. In the chamber, elected on a narrow property basis, there was no majority for his ideas, but instructed middle class opinion outside was largely with him. Yet when in 1848 the Government suddenly moved in his direction, it was impelled by the revolutionary events in France and Germany rather than by any immediate menace in the country itself.

It was largely the personal action of the highly-strung king which caused the victory of the liberal ideas to be so complete. Thorbecke's was the ruling mind in the royal commission which elaborated the new constitution, but his domineering and somewhat pedantic temper brought him many enemies and kept him out of the ministries formed in that eventful year. The largely conservative States-General dared not block the way when the king himself led the forces of progress, and in Oct. 1848 the new constitution came into force, under which full ministerial responsi-

bility, complete control by the States-General of public finance and of colonial administration, direct elections, freedom of meeting, and many other features characteristic of the liberal parliamentary system of government were introduced.

The Liberal Party.—King William II. died a few months later and it was under his son, William III., who was personally inclined towards autocratic principles and in particular distrusted Thorbecke, that the first great lesson in the practice of parliamentary government was taught, when the new king saw himself obliged to entrust the hated statesman with the formation of a ministry. The lesson had not been taught so completely but that in 1853, when the institution of a new Roman Catholic hierarchy gave rise, in Holland as in England, to an outburst of Protestant feeling, the king at once used the opportunity to get rid of Thorbecke. And it was not until 1868, after the king had obstinately maintained in power a conservative cabinet under Heemskerk and two general elections had been fought on the issue of royal versus parliamentary ministries that the question was definitely decided in the liberal sense.

Thorbecke's first ministry (he was again at the head of the Government from 1862 to 1866 and died shortly after the formation of his third cabinet in 1872) produced a great record of legislative achievements. The liberal State, postulated in the new constitution, was realised by means of organic laws, regulating the electoral system, provincial and municipal administration. A navigation act did away with differential treatment of Dutch shipping, a first step in the direction of complete free trade. The impulse given by Thorbecke lost much of its force after his resignation in 1853. In his second ministry it was especially the colonial question that claimed attention. Van den Bosch's "cultures system," the profits of which had become hardly less dear to the hearts of parliamentary governments than they had been to the autocratic king, was attacked both on account of the hardships it meant to the native populations and in the name of liberal economics: "free labour" was advocated in the interests of the Javanese and of Dutch capitalists alike. On this point Thorbecke and his more radical colonial minister, Fransen van de Putte differed, and it was not until 1870 that the "cultures system" was abolished; only government cultures of coffee were maintained for a further number of years.

Education Controversy.—During the whole of this period liberalism may be said to have been the only vital force in Dutch political life. The conservatives had no principle of their own to oppose it; they only questioned and retarded. Other parties, however, were in being, the guardians of distinct and positive traditions of their own, and if so far they had been powerless, or had not cared to exert their power against liberalism, the time had now come when they had begun to oust the colourless conservatism of men like Van Hall and Heemskerk and to play an increasingly important part in politics.

The Catholics had long supported the Liberal Party, to whose political progenitors, the Patriots, they owed possession since 1795 of full citizens rights, and whose victory in 1848 had enabled them to organise their church again. After the outburst of Protestant fury in 1853, Thorbecke had found a constituency in the Catholic South (at Maastricht). The formation of the kingdom of Italy, Pius IX.'s challenge of liberal principles, and the rise of ultramontanism disturbed these friendly relations. The Catholics were organised in a separate party and as they numbered about one third of the total population, this party was bound to be a powerful one. Its views on the education question soon brought it into active opposition to the Liberals and at the same time brought about an alliance with another party, which in the past had always been its chief enemy.

Calvinism had suffered a long eclipse. In the first decades of the 19th century the prevailing tone in religious life was "liberal" and "enlightened." Among the people the old doctrines lingered on, and in the '30s there had been a Calvinist secession from the Reformed Church, which William I., imbued with Napoleonic "étatisme" and erastianism, had vainly tried to drag back to conformity. At the same time, a religious revival, influenced by Swiss Huguenots (hence its French name: the Réveil), and com-

parable to evangelicism in England, had affected a number of men and women in other classes of society. To this group belonged Groen van Prinsterer, who attempted to apply orthodox protestant principles to politics. He effected a contact between the new anti-revolutionary idealism and the old popular Calvinism, and through sheer force of personality he was able to appear as Thorbecke's chief opponent in the chamber, the bearer of a principle to which Liberalism had to define its attitude. It was only after his death in 1876 however, that, helped by the political awakening and enfranchisement of the lower classes, and by pooling forces with the Roman Catholic Party, the new leader of the Anti-Revolutionary Party, Dr. Abraham Kuyper, could undermine the Liberal ascendancy until, at length, in 1901, it crashed.

It was the education question that made the Calvinist-Catholic coalition possible. Holland had possessed a national elementary school system since 1806. The constitution of 1848 laid down that the Government was to give constant care to it and to see that public elementary instruction was available in all parts of the kingdom. According to an act passed in 1857, the public elementary school was to educate the child to "all social and Christian virtues," a provision which it was hoped would meet the objection of the orthodox to the "neutral," or as they said, the "godless," character of the State schools. It did nothing of the sort, and when in 1878, the Liberals under Kappeyne van de Coppello strengthened the Act of 1857 without making any concessions to the religious scruples of orthodox Protestants and Catholics, the agitation was doubled in intensity. It was urged that to make these groups of the population pay towards the upkeep of State schools to which conscience forbade them sending their children so that they had to pay again for the upkeep of private denominational schools was the height of unfairness, and it was proposed that the State should give financial support to privately managed denominational schools as well. This demand was strenuously resisted by the Liberals, and the constitution, by committing public elementary instruction to the Government's especial care, undoubtedly made it difficult to go very far in the direction of state support for denominational education. The constitution could be altered only by the two-thirds vote of a specially elected States General. So the first coalition (Anti-Revolutionary cum Catholic) ministry, 1887-91, could only make a modest beginning with the subsidizing of denominational schools, which did not at all satisfy their followers.

The Franchise.—The coalition majority in 1887 was the direct outcome of an extension of the franchise which increased the number of electors from 140,000 to 300,000, in a population of 4,400,000. The Liberal Party had failed to adapt itself to the new circumstances. In 1889 there was a secession from the Liberal Party to found a Radical Party. The rump nevertheless evolved tendencies too radical to the taste of some, who seceded in 1894 and formed a Free Liberal Party. The multiplication of groups has ever since characterized Dutch parliamentary life. Another Party had meanwhile made its appearance. In 1887 the first Socialist was elected to the second chamber. The growth of the Socialist Party was at first slow, not only because of internal dissensions, but also because Holland was still a not very strongly industrialized country. Moreover, the bulk of the working-class population was still without the vote. The new franchise act of 1896 carried by Van Houten, a member of the Liberal Cabinet, increased the number of voters to 577,000 but this was still far removed from universal suffrage. It was again the constitution that blocked the way, but the failure of the Liberal Party to solve the question in a bold fashion alienated working class sympathies from it. Yet shortly before its final fall from power, the Liberals produced a cabinet that firmly tackled the social legislation which many considered to be long overdue. Workmen's insurance against accidents, improvement of housing conditions, compulsory education for children from six to twelve, were all measures carried by the Goeman Borgesius ministry between 1897 and 1901.

Progress.—A very great change had by this time taken place in the economic and intellectual life of the country. Holland had been very slow in recovering from the exhaustion which the interruption of overseas trade during the "French period" had

caused. The working class population of the towns remained poor, capital cautious and unenterprising, the whole tone of society middle class and dull. In the universities theology and philology still flourished; Beets and Potgieter, Busken Huet and Douwes Dekker (Multatuli) were writers of real distinction; the Hague school of painters in the '60s and '70s produced work of lasting value. Yet on the whole Dutch life was narrow and uninspired, and with the exception of the first named, the writers mentioned felt profoundly dissatisfied and criticized often with an almost despairing bitterness. In the last quarter of the century however, hope for the future was born afresh. The rapid economic development of Germany and especially of the industrial districts on the Rhine after 1870 was an important factor in this process. It enabled Rotterdam to grow into a port of the first magnitude. But the national revival manifested itself in many ways. Amsterdam was given good access to the sea by the construction of the North sea Canal to Ymuiden (1865-76). Rotterdam, too, got its New Waterway (1866-71). Lakes were turned into land, waste grounds were reclaimed. In Twente and North Brabant textile industries grew up, while along the rivers shipbuilding yards increased in numbers. The Dutch merchant fleet, too, began to grow rapidly. Economic development and increasing prosperity reacted on politics. The new vitality of the Socialist movement as well as the democratic tendencies of the Anti-Revolutionary and Catholic Parties, and generally the vigour with which social reconstruction was debated and undertaken, were largely attributable to the passing of material stagnation. Literature, too, in the '80s entered upon a period remarkable for enthusiasm and faith in the future no less than for brilliant achievements. In fact the promise of the *Nieuwe Gids* movement was hardly fulfilled, although especially in the domain of poetry Dutch literature has been permanently enriched by it and the language and the spirit of the nation were profoundly stimulated. In the universities nothing perhaps was more noteworthy than the revival of scientific studies which was to bear its richest fruit a little later and in the 20th century.

Achin.—In the sphere of colonial government, too, a new spirit began to make itself felt as the 19th century approached its close. One expedition after another was undertaken to bring regions which had so far been only nominally parts of the Dutch empire under effective control. The war with Achin, which had dragged on since 1873 was brought to a close by General Van Heutz who, when shortly afterwards (1904) he was made Governor-General, directed the last and most energetic stage of this forward movement in the whole of the Archipelago. At the same time, while the resources of the islands were developed by capitalistic enterprise, the Government began to display a more active care for the economic and intellectual welfare of the Indian peoples.

Home Politics.—At home meanwhile, in 1901, the clerical parties had won a decisive victory at the polls and a cabinet was formed by Dr. Kuyper. This remarkable man, a dissident minister of religion, a powerful writer and a speaker with a gift of arresting statement, had for 25 years already exercised an enormous influence over the orthodox Calvinist section of the Dutch people. His advent to power opened a stormy chapter in Dutch politics. Events, however, took an unexpected turn. A further installment of educational reform was procured by the act making it possible to found private universities on a denominational basis. This act emancipated the existing Calvinist University of Amsterdam (a different body from the municipal university of that town) and enabled the Catholics too, to erect a university of their own (Nijmegen, 1924). But the programme of social reform, sponsored by Dr. Kuyper's colleague Talma, was slow in materializing. Instead, in 1903, Dr. Kuyper got into a very violent conflict with the growing forces of trades-unionism and socialism when he used the forces of the State to break a railway strike. From that moment onwards, the Socialists denounced him as a ruthless opponent of the proletariat and derided his professions of democratic sentiment and religious faith as cant. The general election of 1905 resulted in a deadlock. A very weak Liberal Government was formed, which was in 1907 replaced by another Coalition Government. The political situation did not permit Dr. Kuyper's strong personality to be included, and when

COSTUMES AND HOUSE INTERIORS OF THE NETHERLANDS

1. A woman of Zoutelande, Zeeland. The bare floor, made either of terra cotta or white or blue brick, is typical of many Dutch houses of the middle classes. The national love of flowers is reflected by the potted plants in the window
2. A group of women with market baskets in Flushing (Vlissingen) on the Zeeland coast. With the exception of ornamented caps the costumes of this section are inconspicuous, being of a dark colour, generally blue
3. Zeelanders. The tightly fitting caps of the women are of fine cambric or linen, and the short-sleeved gowns are cut low to display the chemise which is elaborately embroidered. The wing-like puffs on the shoulders are a local fashion. The most distinguishing features of the male costume are the embroidered, silver-buttoned vest and the

- belt buckle, also of silver, which ranges, according to the prosperity of the wearer, from a small size to a diameter of about 6 inches
4. Scene in Volendam, fishing village of the Zuyder Zee. The brick streets and the gabled houses with their small *stoepen* are characteristic of the Dutch village. The children's costumes closely resemble those of their elders
5. Interior of a home on the island of Marken. The curtains conceal cupboard beds, an economical wall feature found in many rural houses. The woman's coiffure follows a local style which demands long braids
6. Dutch rural interior. The family is grouped about the fireplace, the chimney piece of which, shaped like an overhanging hood, is decorated with a flounce of light print *schoorsteenval* and with a row of plates

VIEWS OF INDUSTRIAL HOLLAND

1. Hyacinth field near Haarlem, a centre of the bulb-growing industry. These plants, which are exported to all parts of the world, are cultivated with extreme care, the bulb not being ready for market until five years after it has budded out on the mother bulb
2. Loading Edam cheeses for market. Although some Dutch cheese is still made on the farm with home equipment, a large amount is manufactured in factory dairies, many of them owned by co-operative groups and all supervised by the government. It is estimated that about 15,000,000 kilograms of full-cream Edam cheese (40% cream) are produced yearly
3. Rotterdam harbour, showing floating steam cranes and grain elevators. The steam cranes are equipped with automatic grapples and other appliances for the unloading of coal, and the floating elevators can handle from 180 to 200 tons of corn per hour. The port handles a heavy river traffic from Germany in addition to ocean traffic
4. Great Market, Delft, on market day. In the background can be seen Nieuwe Kerk, formerly the church of St. Ursula, built in 1396-1496, where William the Silent is buried. The statue in the market place is that of Hugo Grotius, erected in 1886
5. International bee market at Veenendaal, the largest in the world. Situated in the honey-producing district of Veluwe, the Veenendaal market usually displays from 2,000 to 2,500 swarms of bees, each swarm selling for 5 to 8 Dutch gulden (\$2.00 to \$3.20). They are purchased by foreign farmers chiefly for the purpose of introducing a fresh strain into old swarms
6. A saw-mill at Leyden on the banks of the so-called "Old Rhine." The Dutch wood industry and its most important branch, that of sawing and planing, were greatly stimulated by the introduction of steam; where the windmill, as that in the photograph, has not been replaced, it has in a majority of cases been supplemented, by steam appliances

in 1909 the general election led to further disaster for the Liberals, he nevertheless remained discarded.

Heemskerck was the leading member of this Government which was somewhat too moderate in its religious policy for the more fanatical Kuypersians, whose zeal for social reform was gratified by the grandiose scheme for state disability and old age insurance on which the minister of labour, Talma, worked strenuously. The scheme, however, had not yet been carried into effect when the defeat of the Coalition at the polls in 1913 hung it up indefinitely.

The parties of the Left proved unable, in 1913, to assume the responsibilities of government. The once powerful Liberal Party was now broken up into several sections; moreover, the Socialist Party now claimed a large proportion of the forces of the Left, and there was little sympathy between it and the so-called Free Liberals. An attempt was made, nevertheless, to form a coalition of the Left, under Dr. Bos, the Radical leader, on a programme that included universal suffrage. The Free Liberals agreed to this programme, but the Socialists, although their leader, P. J. Troelstra, was in favour of accepting, refused to co-operate.

In this difficulty an extra-parliamentary cabinet was formed by Cort van der Linden. In conformity with the verdict of the electors it bore a decidedly "Left" character, but it attempted to find final solutions for both the questions which had long paralysed Dutch political life. Cort van der Linden and his colleagues proposed to bring about a revision of the constitution (for which purpose a two-thirds majority of the chamber is required) by an agreement of all parties. In it the Clerical groups would find the solution of the school problem and the Liberals, Radicals and Socialists the final extension of the suffrage.

Although faced with the problems arising out of the World War, the Government persevered with this task, and indeed the quickened sense of national solidarity helped it rather than otherwise. In 1917 its programme was carried out. Universal suffrage and proportional representation were introduced; at the same time, the principle of absolute equality with regard to the public exchequer of "public" undenominational education, and "private" denominational education, was conceded in full and written in the Constitution.

THE WORLD WAR

Although Holland did not take part in the World War, it was a great event in her history.

Neutrality.—Holland's situation has always been a perilous one, not only because she is surrounded on all sides by the nations whose wars convulse Europe, but because important waterways, on which her neighbours' trade depends, flow out into the sea across her territory. In the years before the war, more than one acute controversy between the two opposing groups of European Powers had centred round the position of Holland. First, Belgium had been used in an attempt to make Holland give up her attitude of detachment. The Dutch-Belgian *rapprochement*, which was so much talked about in those years, did not proceed from the Dutch-speaking Flemings, but from Francophil circles. It never went very far, and it was forgotten in the outcry raised over the proposal to fortify the mouth of the Scheldt which was submitted by the Dutch Government to the Chamber in 1910. The contention, however, that Holland was obliged, or even that it had the right, to allow Entente forces to use the Dutch part of that river in case of a German threat to Antwerp was quite untenable. The Entente Governments tacitly recognized the correctness of Holland's behaviour, and in 1911 and 1912 official visits of President Fallières to The Hague and of Queen Wilhelmina to Brussels and Paris made it plain to the World that there was no ill-will between Holland and the Entente.

Probably, indeed, a desire to allow Germany no possible pretext for an attempt to occupy the Dutch ports in case of an Anglo-German conflict had as much to do with the decision to fortify the mouths of the rivers as any idea that the fortifications might ever actually be used against Great Britain. While English and French newspapers were protesting against this scheme, Holland was also remodelling her system of land defence to excellent effect. The German general staff were so much impressed with these reforms that they thought it necessary to rearrange their

plan of operations for the event of a war with France. From Von Moltke's memoirs it appears that at the time of his predecessor, Von Schlieffen, the German staff intended to violate Dutch as well as Belgian territory, trusting that when they rushed their armies westward through the Dutch province of Limburg (which juts out to the south, covering part of the eastern frontier of Belgium), the Dutch Army would remain inactive behind the "water line," the inundated area, which protects only the western part of the country. Von Moltke, realizing that the Dutch army was made mobile and would be used to strike, even if only the outlying province of Limburg were violated, decided to respect Dutch neutrality, although the détour necessitated by the change of plan would delay the German advance from Crefeld by some precious days.

Holland's attitude, then, in those crucial years was strictly and impartially neutral. The sympathies of the public could less easily be controlled. The memories of the Boer War had already lost much of their bitterness, largely owing to the grant of self-government to the late Boer republics and the consequent appeasement in South Africa itself. The economic prosperity of the country was to a certain extent bound up with the tremendous development of the German hinterland since 1870, but the Dutch people felt oppressed by the militarist temper and the blatant imperialism which appeared to possess their powerful eastern neighbour. On the outbreak of war in 1914, it was the violation of Belgian neutrality and the subsequent acts of repression in the occupied territory which made the deepest impression and determined the attitude of Dutch public opinion.

The Government at once proclaimed, and rigidly maintained to the end, strict neutrality. Inevitably there were times when each group of belligerents felt Holland's neutrality, however impartially administered, as a burden. The British navy was able to see to it that Holland did not provide Germany with the food and other materials she wanted from overseas, but the enforcement of the blockade gave rise to a good deal of friction. Moreover, Holland's neutrality undoubtedly had the effect of covering Germany's right flank. On the other hand, the closure of the Scheldt, once Antwerp had fallen, was all to the advantage of Great Britain, as Germany was thus prevented from using Antwerp as a submarine base.

Disputes about particular points were practically continuous, but the sincerity and reality of Dutch neutrality were recognized on both sides, and neither attempted to use violence against Holland. The efficiency of Holland's defense forces contributed to this. The army, 450,000 strong, had been mobilized without a hitch in the last days of July 1914, and was kept on a war footing, at a great cost financially and morally, till 1918. It had to cope with no serious incidents. Some thousands of Belgian and British troops were interned after the fall of Antwerp. German and British aeroplanes sometimes strayed on to Dutch territory. The naval forces occasionally had to intern a submarine or a destroyer, and to them fell the dangerous work of mine-sweeping along the Dutch coast. The Government carried out its international obligations as a neutral with consistent firmness and moderation.

The Blockade.—Unfortunately, frequent cases arose in which the vague principles of international law could be variously interpreted. Great Britain, for instance, protested when Holland excluded armed merchantmen from her harbours, contending that the article in Holland's original proclamation of neutrality to which Mr. Loudon, the foreign minister, appealed was drawn when Germany's resort to unrestricted submarine warfare was not foreseen; and it was in reply to those utterly illegal methods that Britain had started arming her merchantmen. In this case Holland maintained her attitude. The sand and gravel dispute, which dragged on throughout 1917 and 1918, was more acrimonious, and at one time endangered Holland's neutrality. The Entente Governments protested against Holland's allowing the Germans to use her waterways for the transport of sand and gravel to Belgium for use in the construction of a new kind of ferroconcrete dugouts. Both belligerents put the severest pressure on Holland, Great Britain penalizing her for concessions to

Germany, Germany threatening her for concessions to Britain. Loudon at last consented to ration this traffic on the footing of pre-war statistics; but in the spring of 1918 when Germany was making her final offensive, Ludendorff wanted this arrangement to be used as a pretext to overrun Holland and make a dash for the Dutch ports. An ultimatum was actually presented, and only the determined intervention of representatives of the civil power in Germany prevented Ludendorff from having his way.

The most real difficulties, however, were economic; and these began to be of the most tragic importance to the Dutch people in 1915. For Holland international commerce is not a luxury but a necessity. It directly supports an important part of the community, Dutch industries are dependent on it for most of their raw materials and their coal, while four-fifths of the grain supply comes from abroad. Seaborne trade was gradually extinguished as the war went on. The Germans began by laying mines in front of the English ports. The British retaliated by laying a minefield in the North sea. In order to make their blockade of Germany effective they exercised an ever more stringent control over imports into the adjacent states, regardless of the provisions of the Declaration of London. They prescribed to neutral traffic a route along the south coast of England, so as to be able to examine cargoes at leisure. The Germans then prescribed the route round the North of Scotland, and declared the Channel area an area of war. In March 1915 the Entente Powers did away with all distinctions between legitimate and contraband trade, and prohibited the import into Holland of all goods, whatever their nature, which could be suspected of being destined for transmission to Germany. All goods imported into Holland had to be consigned to an unofficial body (the Netherlands Oversea Trust), which possessed the confidence of the Entente authorities and undertook that they should go no further.

The Allies gradually assumed control of the entire economic life of Holland, allowing her the bare necessities of life, withholding anything that could be used to replace goods sent to Germany. Even Holland's trade with her own colonies was subject to this control. As Holland depends on Germany for certain indispensable articles, e.g., coal, she was driven to export food which she really could not do without, in order to obtain them in exchange. Meanwhile in 1915 Dutch vessels had begun to fall victims to German U-boats. After the unrestricted submarine war had been proclaimed early in 1917, practically all overseas traffic ceased. Food scarcity became almost as serious in Holland as in Germany itself, certainly more serious than in England. In the last stages of the war Holland's industrial life was at a complete standstill.

FROM 1918 TO 1928

Negotiations with Belgium.—One big surprise was the discovery that Belgium proposed to advance at the Peace Conference certain claims involving Dutch sovereignty. In the first months of the war, when the Germans advanced through Belgium, a stream of Belgian refugees had sought safety on Dutch soil, where they were hospitably received. At one time their number exceeded 1,000,000, and their support, the provision of food and shelter, was an exceedingly heavy charge. In spite of this Holland found herself decidedly unpopular in some of the Allied countries. The firm refusal of the Dutch Government in 1920 to surrender the ex-Emperor William, who had taken refuge there in Nov. 1918, gave rise to excited denunciations of Holland's alleged tenderness for the Hohenzollerns. Holland's attitude in the war was widely represented in the most unfriendly light. Belgium declared that Holland's claim to sovereignty over the Scheldt mouth, and her action in closing it against the Allied forces, had made the defence of Antwerp impossible, while her possession of the province of Limburg had hindered the defence of Belgium's eastern frontier, which ought to have been based on the River Maas. It has been argued above that Holland's action in the war had really benefited the Allied cause, but the opposite contention was made by the Belgian *Comité de politique nationale*, which advocated annexation of the disputed regions. It claimed that Belgium should be given sovereignty over Dutch Flanders, on the left bank

of the Scheldt, and over Dutch Limburg, on the ground that the treaties of 1839, guaranteeing the neutrality of Belgium, having lapsed, these territories were now necessary for her protection. The question was eventually referred to direct negotiation between the two countries. (See H. W. V. Temperley, *History of the Peace Conference in Paris*, vol. ii., pp. 192 seq., 1920.)

These negotiations on new arrangements for the régime on the Scheldt, on the Ghent Terneuzen canal, etc., were, however, carried on in a somewhat unfavourable atmosphere. Dutch public opinion was greatly irritated. The populations of Limburg and Dutch Flanders protested their loyalty to the Dutch fatherland. Meanwhile the annexationist agitation in Belgium went on, and was still supported by the Government, as was proved when a secret circular, emanating from the Belgian Foreign Office to "Belgian agents" in Dutch Limburg, was disclosed by Flemings friendly to Holland. Yet the Dutch Government was prepared to go far to meet Belgian wishes.

Early in 1920 a treaty in which several Dutch concessions were laid down was ready for signature, when a new dispute arose, about the sovereignty of the Wielingen channel, which connects the Schelde estuary with the open sea. Although that channel runs along the Belgian coast within the three-mile limit, Holland had exercised sovereign rights over it since mediaeval times. But, later, when conditions everywhere grew more stable, the treaty of 1920 was signed at The Hague on April 3, 1925, without Holland having changed her attitude towards the Wielingen question, which was suffered to remain in its original state, the Belgians basing their claim on the three-mile limit, the Dutch on ancient rights of possession.

Ratification by Holland was, however, delayed by prolonged political crisis; and meanwhile it was subjected to lively criticism. In 1919 and 1920 Holland had been willing to make economic concessions to avoid a threat to her sovereign rights; and Van Karnebeek's conduct of the delicate negotiations had been generally admired. When in 1925, however, the treaty was at last published in its entirety, the danger which loomed so large five years before seemed altogether negligible, and the proposed concessions were scrutinized entirely on their merits, wide-spread dissatisfaction manifesting itself at the one-sided character of the treaty. When the Second Chamber on Nov. 11, 1926, nevertheless approved it, the agitation redoubled in intensity, with the result that on March 24, 1927, the First Chamber, with 33 votes against 17 rejected it.

Effects of the Treaty.—Criticism had mainly centred round two points. Firstly there was Holland's consent to the construction over her territory of canals from Antwerp to Moerdijk and from Antwerp to Ruhrort; these canals were obviously intended to deflect to Antwerp part of the Rhine trade from its natural course down the river; a plan which was naturally deeply resented at Rotterdam. Secondly the provisions for a new Dutch-Belgian régime on the Scheldt were generally thought to be too far-reaching. New conversations were begun between the two Governments in Oct. 1928.

Home Affairs.—The first elections under the new suffrage law after the revision of the constitution were held while the war was still going on, and resulted in further disaster for the Liberal groups; the Cort van der Linden administration resigned, and another Calvinist-Catholic cabinet was formed (July 1918). The Premier, Ruys de Beerenbrouck, was a Catholic, a thing without precedent in Dutch history. This Government's mandate was confirmed by the elections of 1921, when the Coalition parties increased their number of seats to 60 out of the 100 which constitute the second chamber. At the elections of 1925 they lost some ground, but still retained the majority, and when Ruys retired, Colijn, leader of the Calvinist anti-revolutionary party, formed another Coalition cabinet. In Nov. 1925 internal disagreements compelled that Government to resign. Each of these elections since proportional representation came into force meant a further stage in the disintegration of the Liberal parties, of which only the Radical group held its own. The Socialists, on the contrary, made a big advance in 1918, and although they suffered a setback in 1921 they more than retrieved their for-

tunes in 1925. They then numbered 24 members and were the second largest party in the chamber after the Catholics with 32. The 1921 election was the first at which women's suffrage was in full working order. Six out of the 100 seats were occupied by women in the chamber of 1925.

The years of Coalition Government through which Holland passed after the Armistice can be divided into two very distinct periods. The years 1919 and 1920 were feverish ones, when a fallacious sense of prosperity stimulated enterprise in business and politics alike. It is not perhaps unfair to connect the zeal for social reform which characterised those days with a certain nervousness which remained after the "November days" of 1918.

But the fictitious prosperity was succeeded by a severe depression. Shipping and shipbuilding particularly felt the effects, and no place suffered more from the occupation of the Ruhr area and from the preference granted by France to her own and Belgian commerce than the great port of Rotterdam. When international conditions improved in 1924, economic conditions in Holland soon felt the effect. Yet unemployment remained still a drain on Dutch resources. The one really bright spot in the picture was the prosperity of the East Indian "cultures."

Meanwhile, the stress of the times occasioned a radical change in the Government's policy. Economy came to be the cry. The building subsidies were cut down. In order to enable Dutch industry to compete with the countries with debased currencies, dispensations from the act restricting the hours of labour were freely granted. On yet another point a revulsion of feeling manifested itself against legislation passed almost without opposition a few years previously. The new cabinet of the Right had to carry into practice the general provision of financial equality for denominational education which their predecessors had written into the Constitution. It was now felt that the multiplication of small State-subsidized schools, which resulted from Dr. De Visser's (the minister of education 1918-25) measures, overburdened the taxpayer.

During the years 1922-4 Dutch politics centred round the financial situation. In the early summer of 1923 the Government strengthened itself with a new minister of finance, Mr. Colijn, who two years later was to succeed Mr. Ruys in the premiership. Colijn, a strong personality, was expected to carry out a programme of ruthless economy. The prime object of Colijn's severe policy, at all events, was reached: in the course of 1925 the budget was balanced. An improvement in the yield of direct taxation, as a consequence of the economic revival, contributed to this event.

In spite of this success, Colijn's Government soon was unable to carry on. It was freely predicted at the time that the elimination of the education grievance would soon bring about the dissolution of the Coalition, and that thus the way would become clear for a more natural grouping of parties on economic and political lines. In Oct. 1923 it was thought that the knell of the Coalition had been sounded when 10 Catholics joined the parties of the Left and the bill for the strengthening of the naval defences of the Dutch East Indies was rejected. After a crisis of several months, however, the Coalition was patched up and the elections of June-July 1925 were fought on the old lines. Colijn formed a new Government in July. But a new crisis was occasioned by a motion, introduced by an independent Christian Historical member of the chamber, to abolish diplomatic representation at the Vatican, which had been introduced during the war by the Cort van der Linden Government. The whole Christian Historical Party voted for it, and the motion was carried. The Liberals, Radicals and Socialists, while caring little for the question itself, had voted for the motion in order to show up the unreality of the Coalition. The Catholic ministers in Colijn's cabinet resigned on Nov. 11, 1925, and the next day the premier offered the resignations of himself and all his other colleagues.

Co-operation between the Christian Historicals and the Roman Catholics had now become exceedingly difficult, but the hopes of those who wanted to see the Coalition give way to a new grouping of parties were disappointed. Radicals and Socialists have long aspired to an alliance with the Catholics, among whom democratic tendencies are strongly, although by no means ex-

clusively, represented. An attempt (Nov. 24-Dec. 1, 1925) on the part of the Radical leader, Marchant, to form a democratic ministry, however, met with a unanimous refusal from the Catholics, in spite of Marchant's offer to rescind the vote against the Vatican legation. The result was that Dutch parliamentary politics appeared to have reached an absolute deadlock. After a crisis of unprecedented duration, Jonkheer De Geer, therefore, on March 3, 1926 formed a non-parliamentary cabinet with a programme of all-round economy, including reductions in the army and navy and productive State works for the unemployed.

The frequent resort to extra-parliamentary cabinets is a curious feature of modern Dutch politics. It should not be regarded as a reversion to the system of royal government. The system has grave drawbacks, but as long as the numerous parties in the chamber cannot combine, it will probably be indispensable.

Latest Developments.—Up to 1928 the De Geer administration had been successful enough. The economic situation greatly improved, unemployment declined and the yield of taxation increased. Some anxiety was caused by communist outbreaks in the Dutch East Indies (Nov. 1926), which, however, were easily put down. While the Dutch Socialists are inclined to criticize methods of repression, they deprecate the appeal to force on the part of Indian nationalists and admit that Dutch rule cannot yet be dispensed with. The Government, for its part, does not consider that the communist movement, limited as it is to a small portion of the Indian peoples, would warrant an interruption, or even a slowing down, of constitutional evolution, and a plan for giving to native elected members a majority of the seats of the *Volksraad* was passed by the States General in Oct. 1928.

Now that the shocks of the war period have been overcome, it may be discerned that the vigorous movement of material and intellectual expansion which began in the last decades of the 19th century has not yet spent its force. New industries are still coming into being, as for instance, the Phillips electrical works at Eindhoven, the artificial silk industry at Breda, etc. At the same time, agriculture, especially cattle breeding and dairy farming, horticulture, all of which a generation ago began to make very successful use of new methods of organization and scientific research and on an even larger scale to produce for the English and German markets, are greatly flourishing. The coalfields in South Limburg, to which attention was directed when during the war the supply of German coal ran short, have been developed, in part, under State management, with striking success. A gigantic scheme for the reclamation of the *Zuider Zee*, which is to add a 12th province to the country is in the course of execution. Amsterdam has since the war advanced in importance as an international banking centre, while with Rotterdam it counts among the great commercial ports of the continent. The Olympic Games of 1928 were held at the new Amsterdam stadium.

The growing reputation of Dutch architecture and its influence on the appearance of Dutch towns has already been mentioned. Meanwhile the fame of Dutch science stands very high. No less than 17 Nobel prizes have been won by Dutch scientists.

The political emancipation of the Calvinist and Catholic sections of the nation, as well as the organization and rise in prosperity of the working class, has added variety and depth to Dutch intellectual life. The growth of a feeling of kinship with the Flemish people, who are again making a valuable contribution of their own to Netherlands civilization, is widening the national horizon.

HOLLAND, COUNTY AND PROVINCE OF. The first mention of Holland in any document is found in an imperial *gift brief* dated May 2, 1064. A comparison with other documentary evidence leads to the identification of Holland with the *forestum Merweda*, or the bush-grown fenland lying between the Waal, the old Meuse and the Merwe. It is the district surrounding the town of Dordrecht. A portion of the original Holland was submerged by a great inundation in 1421, and its modern appellation of Biesbosch (reed-forest) is descriptive of what must have been the condition of the entire district in early times. The title count of Holland appears to have been first borne by the Frisian count Dirk III., who founded Dordrecht (*see below*). It was not, however, till late in the 11th century that his successors adopted the style "*Hollandensis comes*" as their territorial designation, and that the name Holland becomes gradually extended northwards to connote all the land subject to the rule of the counts between Texel and the Maas.

The First Line of Counts.—The beginnings of the history of this feudal State centre in the abbey of Egmont in the archives of which its records have been preserved. In 922 Charles the Simple gave in full possession to a count in Frisia, Dirk by name (a shortened form of Diederic, Latin Theodoricus), "the church of Egmont with all that belonged to it from Swithardeshage to Kinhem." This man, usually known as Dirk I., died about 939 and was succeeded by his son of the same name, Dirk II., the founder of the abbey of Egmont. He obtained in 983 from the emperor Otto III., with whom he was in great favour, a considerable extension of territory, that now covered by the Zuider Zee and southward down to Nijmegen. In other words his rule extended over the whole country from the right bank of the Meuse to the Vlie. He appears also to have exercised authority at Ghent. He died in 988. His elder son Arnulf was count till 993, when he was slain in battle against the west Frisians, and was succeeded by his 12-year-old son Dirk III. In his minority the boy was despoiled of almost all his possessions, except Kennemerland and Maasland. Afterwards he made himself master not only of his ancestral possessions, but of the district on the Meuse known as the Bushland of Merweda (*forestum Merweda*), hitherto subject to the see of Utrecht. In the midst of this marshy tract, at a point commanding the courses of the Meuse and the Waal, he built a castle (about 1015) and began to levy tolls. Around this castle sprang up the town of Thuredrecht or Dordrecht. The possession of this stronghold was so injurious to the commerce of Tiel, Cologne and the Rhenish towns with England that complaints were made by the bishop of Utrecht and the archbishop of Cologne to the emperor, who commissioned Duke Godfrey of Lorraine to chastise the young Frisian count. Duke Godfrey invaded Dirk's lands with a large army, but was totally defeated with heavy loss (July 29, 1018). This victory of 1018 is often regarded as the true starting-point of the history of the county of Holland. Having thus established his rule in the south, Dirk next proceeded to bring into subjection the Frisians in the north. He appointed his brother Siegfried or Sikka as governor over them. In his later years Dirk went upon a pilgrimage to the Holy Land from which he returned in 1034; and ruled in peace until his death in 1039.

His son, Dirk IV., was one of the most enterprising of his warlike and strenuous race. His reign was marked by a notable victory over an imperial army which had occupied Zeeland (1047). It is in his time that the dispute between the counts of Flanders and Holland for the possession of Zeeland and Walcheren began. In 1049 he was killed in battle against the forces of a coalition headed by the archbishop of Cologne and the bishop of Utrecht. He was succeeded by his brother Floris I., who, like his predecessors, was hard-fighting and tenacious. He found a formidable adversary in the able and warlike William, who, becoming bishop of Utrecht in 1054, was determined to recover the lost possessions of his see; and in 1058, in alliance with Hanno, archbishop of Cologne, Egbert, margrave of Brandenburg, the bishop of Liège and others, invaded the Frisian territory. At first success attended the invaders and many places fell into their hands, but finally they were surprised and defeated near Dordrecht. The counts of Guelders and Louvain were among the prisoners that fell

into the hands of Floris. The attack was renewed in 1061. In a battle at Nederhemert Floris met with his death in the hour of victory. He was succeeded by his son, Dirk V. a child, under the guardianship of his mother, Gertrude of Saxony. Bishop William seems now to have seized his opportunity and occupied all the territory that he claimed. In this he was confirmed by two charters of the emperor Henry IV. (April 30 and May 2, 1064). Among the possessions thus assigned to him is found *comitatus omnis in Hollandt cum omnibus ad bannum regalem pertinentibus*. An examination of these documents shows the possessions of Dirk as *in Westfinge et circa oras Rheni, i.e., west of the Vlie and around the mouths of the Rhine*. Gertrude and her son appear to have withdrawn to the islands of Frisia (Zeeland), leaving William in undisturbed occupation of the disputed lands. In 1063 Gertrude contracted a marriage with Robert, the second son of Baldwin V. of Flanders. On his marriage his father invested him with Imperial Flanders, as an apage including the islands of Frisia (Zeeland) west of the Scheldt. He now became guardian to his stepson, in whose inheritance lay the islands east of the Scheldt. Robert thus, in his own right and that of Dirk, was ruler of all Frisia (Zeeland), and thus became known among his Flemish countrymen as Robert the Frisian. On the death of Bishop William of Utrecht (April 17, 1076) Dirk V. with the help of his stepfather Robert recovered the county of Holland and the other lands which the bishop had held. Henceforth the Frisian counts became definitively known as counts of Holland. Dirk V. died in 1091 and was succeeded by his son Floris II. the Fat. This count had a peaceful and prosperous reign of 31 years. After his death (1122) his widow, Petronilla of Saxony, governed in the name of Dirk VI., who was a minor. The accession of her half-brother, Lothaire of Saxony, to the imperial throne on the death of Henry V. greatly strengthened her position. The East Frisian districts, Oostergoo and Westergoo, were by Lothaire transferred from the rule of the bishops of Utrecht to that of the counts of Holland (1125). But the Frisian peasants and fishermen were equally refractory to the rule of any distant overlord, and after a rebellion in 1132 they were replaced under the bishop's authority by the emperor Conrad III. (1138). Dirk VI. was succeeded in 1157 by Floris III.

Floris III. reversed the traditional policy of his house by allying himself with the Hohenstaufen. He became a devoted adherent and friend of Frederick Barbarossa, whom he accompanied upon the third Crusade, of which he was a distinguished leader. He died in 1190 at Antioch of pestilence. His son, Dirk VII., had a stormy, but on the whole successful reign. Contests with the Flemings in West Zeeland and with the West Frisians, stirred up to revolt by his brother William, ended in his favour. The brothers were reconciled and William was made count of East Friesland. In 1202, however, Dirk was defeated and taken prisoner by the duke of Brabant, and had to purchase peace on humiliating terms. He died early in 1204, leaving as his only issue a daughter, Ada, aged 17 years. Her succession was challenged by William, count of East Friesland, who became undisputed count of Holland in 1206. He took an active part in the events of his time. He fought by the side of the emperor Otto IV. in the great battle of Bouvines in 1214 (*see PHILIP AUGUSTUS*), and was taken prisoner. Two years later he accompanied Louis, the eldest son of Philip Augustus, in his expedition against King John of England. William is perhaps best known in history by his part in the fourth Crusade. He distinguished himself greatly at the capture of Damietta (1219), and died in 1222. The earliest charters conveying civic privileges in the county of Holland date from his reign—those of Geertruidenberg (1213) and of Dordrecht (1220). His son Floris IV., being a minor, succeeded him under the guardianship of his maternal uncle, Gerard III. of Gelderland. He maintained in later life close relations of friendship with Gerard, and supported him in his quarrel with the bishop of Utrecht (1224-26). Floris was murdered in 1235 at a tournament at Corbie in Picardy by the count of Clermont. Another long minority followed his death, during which his brother Otto, bishop of Utrecht, acted as guardian to his nephew William II.

Floris V.—William II. became a man of mark. Pope Innocent IV., having deposed the emperor Frederick II., caused the young count of Holland to be elected king of the Romans (1247). William took Aachen in 1248 and was there crowned king; and after Frederick's death in 1250, he had a considerable party in Germany. He was on the point of proceeding to Rome to be crowned emperor, when in an expedition against the West Frisians he perished, going down, horse and armour, through the ice (1256). Like so many of his predecessors he left his inheritance to a child. Floris V. was but two years old at his father's death; and he was destined during a reign of 40 years to leave a deeper impress upon the history of Holland than any other of its counts. Floris was a man of chivalrous character and high capacity; alike in his troubles with his turbulent subjects and in the perennial disputes with his neighbours he pursued a strong, far-sighted and successful policy. But his active interest in affairs was not limited to the Netherlands. He allied himself closely with Edward I. of England, and secured great trading advantages for his people; the staple of wool was placed at Dort (Dordrecht) and the Hollanders and Zeelanders got fishing rights on the English coast. So intimate did their relations become that Floris sent his son John to be educated at the court of Edward with a view to his marriage with an English princess. To balance the power of the nobles he granted charters to many of the towns. Floris made himself master of Amstelland and Gooiland; and Amsterdam, destined to become the chief commercial town of Holland, counts him the founder of its greatness. Its earliest extant charter dates from 1275. In 1296 Floris forsook the alliance of Edward I. for that of Philip IV. of France, probably because Edward had given support to Guy, count of Flanders, in his dynastic dispute with John of Avesnes, count of Hainaut, Floris's nephew (*see* FLANDERS). Shortly afterwards a conspiracy of disaffected nobles was formed against him, and he was basely murdered in the castle of Muiden (June 27, 1296). The burghers and people, who knew him to be their best friend, took such vengeance on his slayers as permanently to reduce the power of the nobles.

With his son, John I. (1296-99), husband of Eleanor, daughter of Edward I., the first line of counts ended after a rule of nearly 400 years. Europe has perhaps never seen an abler series of princes than these 14 lineal descendants of Dirk I. Excepting the last, there is not a weak man among them. Physically handsome and strong, model knights of the days of chivalry, hard fighters, wise statesmen, they were born leaders of men; always ready to advance the commerce of the country, they were the supporters of the growing towns, and likewise the pioneers in the task of converting a land of marshes and swamps into a fertile agricultural territory rich in flocks and herds. As individuals they had their failings, but one and all were worthy members of a high-souled race.

The House of Avesnes.—The first count of the new line, who took the title of John II., was the son of John of Avesnes, count of Hainaut, and Alida, sister of William II. of Holland. On his succession the Zeelanders were hostile, and a long struggle ensued before his authority was generally recognized. In 1301 Bishop William of Utrecht invaded Amstelland, but was killed in battle. John made use of his victory to secure the election of his brother Guy as bishop in his place. A war with the Flemings followed, in which the Flemings were at first victorious, but after a struggle of many vicissitudes they were at length driven out of Holland and Zeeland in 1304. John II. died in that year and was succeeded by his son William III., surnamed the Good (1304-37). In his reign the long-standing quarrel with Flanders was finally settled by the treaty of 1323, by which the full possession of West Zeeland was granted to William, who on his part renounced all claim in Imperial Flanders. The Amstelland with its capital, Amsterdam, which had hitherto been held as a fief of Utrecht, was by William, on the death of his uncle Bishop Guy, finally annexed to Holland. This count did much to encourage civic life and to develop the resources of the country. He had close relations through marriage with the three principal

European dynasties of his time. His wife was Jeanne of Valois, niece of the French king: in 1323 the emperor Louis the Bavarian wedded his daughter Margaret; and in 1328 his third daughter, Philippa of Hainaut, was married to Edward III. of England. By their alliance William III. occupied a position of much dignity and influence, which he used to further the interests of his hereditary lands. He was in all respects a great prince and a wise and prudent statesman. He was succeeded by his son, William IV., who was the ally of his brother-in-law, Edward III., in his French wars. He was killed in battle against the Frisians in 1345. He left no children, and the question as to the succession now brought on Holland a period of violent civil commotions. His inheritance was claimed by his eldest sister, the empress Margaret, as well as by Philippa of Hainaut, or in other words, by Edward III. of England. Margaret came in person and was duly recognized as countess in Holland, Zeeland and Hainaut; but returned to her husband after appointing her second son, Duke William of Bavaria, as stadholder in her place. In 1349 Margaret was induced to resign her sovereignty, and the stadholder became count under the title of William V. This was the time of the formation of the famous parties in Holland, known as Kabbeljauws (Cods) and Hoeks (Hooks); the former, the burgher party, were the supporters of William, the latter the party of the disaffected nobles, who wanted to catch and devour the fat burgher fish. The struggle between the nobles and the cities broke out into civil war. In 1350 the nobles invited Margaret to return to Holland. Edward III. came to her aid, winning a sea-fight off Veere in 1351; a few weeks later the Hooks and their English allies were defeated by William and the Cods at Vlaardingen—an overthrow which ruined Margaret's cause. Edward III. shortly afterwards changed sides, and the empress saw herself compelled (1354) to come to an understanding with her son, he being recognized as count of Holland and Zeeland, she of Hainaut. Margaret died two years later, leaving William, who had married Matilda of Lancaster, in possession of the entire Holland-Hainaut inheritance (July 1356). But before the close of 1357 he showed such marked signs of insanity that his wife, with his own consent and the support of both parties, invited Duke Albert of Bavaria, younger brother of William V., to be regent, with the title of *Ruward* (1358). William lived in confinement for 31 years. Albert died in 1404, having ruled the land well and wisely for 46 years, first as Ruward, then as count. He was succeeded by his son, William VI., in 1404. On his accession to power William upheld the Hooks, and secured their ascendancy. His reign was much troubled with civil discords, but he was a brave soldier, and was generally successful in his enterprises. He died in 1417, leaving an only child, a daughter, Jacqueline (or Jacoba), who had in her early youth been married to John, heir to the throne of France.

Accession of the Burgundian Dynasty.—At a gathering held at The Hague (Aug. 15, 1416) the nobles and representatives of the cities of Holland and Zeeland had promised at William's request to support his daughter's claims to the succession. But John of France died (April 1417), and William VI. about a month later, leaving the widowed Jacqueline at 17 years of age face to face with a difficult situation. She was at first welcomed in Holland and Zeeland, but found her claims opposed by her uncle, John of Bavaria, supported by the Cod party. Every one from whom she might have expected help betrayed her in turn, her second husband John IV. of Brabant, her third husband Humphrey of Gloucester, her cousin Philip the Good of Burgundy, all behaved shamefully to her. Her romantic and sad life has rendered the courageous and accomplished Jacqueline the most picturesque figure in the whole history of Holland. She struggled long against her powerful kinsfolk, nor did she know happiness till near the end of her life, when she abandoned the unequal strife, and found repose with Francis of Borselen, Ruward of Holland, her fourth husband. Philip the Good, duke of Burgundy, craftily seized him, and thereby in 1433 the duchess Jacqueline was compelled to cede her rights over the counties of Holland and Hainaut. Consequently at her death in 1436, as she

left no children, Philip succeeded to the full and undisputed possession of her lands. Now, with the extinction of the Bavarian line of counts, Holland ceased to have an independent existence and became an outlying province of the growing Burgundian power (see BURGUNDY). Holland during this time contented herself with growing material prosperity. Her herring fishery, rendered more valuable by the curing process discovered or introduced by Benkelszoon, brought her increasing wealth, and her fishermen were already laying the foundations of her future maritime greatness. It was in the days of Duke Philip that Lorenz Koster of Haarlem contributed his share to the discovery of printing. During the reign of Charles the Bold (1467-77) the Hollanders, like the other subjects of that warlike prince, suffered much from the burden of taxation. They were much aggrieved by the establishment of a high court of justice for the entire Netherlands at Mechlin (1474) which was regarded as a serious breach of their privileges. The succession of Mary of Burgundy led to the granting to Holland, as to the other provinces of the Netherlands, of the Great Privilege of March 1477, which restored the most important of their ancient rights and liberties (see NETHERLANDS). A high court of justice was established for Holland, Zeeland and Friesland, and the use of the native language was made official.

HABSBURGS AND THE HOUSE OF ORANGE

By the sudden death of the Duchess Mary in 1482 her possessions, including the county of Holland, passed to her infant son, Philip, under the guardianship of his father the Archduke Maximilian of Austria. Thus the Burgundian dynasty was succeeded by that of the Habsburgs. During the regency of Maximilian the turbulence of the Hooks caused much strife and unrest in Holland. Their leaders, Francis of Brederode and John of Naaldwijk, seized Rotterdam and other places. Their overthrow finally ended the strife between Hooks and Cods. The "Bread and Cheese War," an uprising of the peasants in north Holland caused by famine, is a proof of the misery caused by civil discords and oppressive taxation. In 1494, Maximilian having been elected emperor, Philip was declared of age. His assumption of the government was greeted with joy in Holland, and in his reign the province enjoyed rest and its fisheries benefited from the commercial treaty concluded with England. The story of Holland during the long reign of his son and successor Charles III. (1506-55), better known as the emperor Charles V., belongs to the general history of the Netherlands (see NETHERLANDS). On the abdication of Charles, his son Philip II. of Spain became Philip III., count of Holland, the ruler whose arbitrary rule in Church and State brought about the revolt of the Netherlands. His appointment of William, prince of Orange, as stadholder of Holland and Zeeland was destined to have momentous results to the future of those provinces (see WILLIAM, 1533-1584).

The Revolt of the Netherlands.—The capture of Brill and of Flushing in 1572 by the Sea-Beggars led to the submission of the greater part of Holland and Zeeland to the authority of the prince of Orange, who, as stadholder, summoned the states of Holland to meet at Dordrecht. This act was the beginning of Dutch independence. From this time forward William made Holland his home. It became the bulwark of the Protestant faith in the Netherlands, the focus of the resistance to Spanish tyranny. The act of federation between Holland and Zeeland brought about by the influence of William was the germ of the larger union of Utrecht between the seven northern provinces in 1579. But within the larger union the inner and closer union between Holland and Zeeland continued to subsist. In 1580, when the sovereignty of the Netherlands was offered to the duke of Anjou, the two maritime provinces refused to acquiesce, and forced William to accept the title of count of Holland and Zeeland. In the following year William in the name of the two provinces solemnly abjured the sovereignty of the Spanish king (July 24). After the assassination of William (1584) the title of count of Holland was never revived.

In the long struggle of the united provinces with Spain, which followed the death of William, the brunt of the conflict fell upon

Holland. More than half the burden of the charges of the war fell upon this one province; and with Zeeland it furnished the fleets which formed the chief defence of the country. Hence the importance attached to the vote of Holland in the assembly of the States-General. That vote was given by deputies at the head of whom was the advocate (in later times called the grand pensionary) of Holland, and who were responsible to, and the spokesmen of, the provincial states. These states, which met at The Hague in the same building as the States-General, consisted of representatives of the burgher oligarchies (regents) of the principal towns, together with representatives of the nobles, who possessed one vote only. The advocate was the paid minister of the states. He presided over their meetings, kept their minutes and conducted all correspondence, and, as stated above, was their spokesman in the States-General. The advocate (or grand pensionary) of Holland therefore, if an able man, had opportunities for exercising a very considerable influence, becoming in fact a kind of minister of all affairs. It was this influence as exerted by the successive advocates of Holland, Paul Buys and Johan van Oldenbarnevelt, and the pensionaries, of whom John de Witt was the greatest, which ensured the undisputed hegemony of Holland in the federation, in other words, of the burgher oligarchies who controlled the town corporations of the province, and especially Amsterdam. This authority of Holland was, however, more than counterbalanced by the extensive powers with which the stadholder princes of Orange were invested; and the chief crises in the internal history of the Dutch republic are to be found in the struggles for supremacy between two, in reality, different principles of government. On the one side the principle of provincial sovereignty which gave to the voice of Holland a preponderating weight that was decisive; on the other side the principle of national sovereignty personified in the princes of Orange, to whom the States-General and the provincial states delegated executive powers that were little less than monarchical. Until the final destruction of the federal republic by the French armies in 1795, the perennial struggle went on between the Holland or federal party (*Staatsgesinden*) centred at Amsterdam—out of which grew the Patriot Party under William V.—and the Orange or Unionist Party (*Oranjesinden*), which was strong in the smaller provinces and had much popular support among the lower classes. The French conquest swept away the old condition of things never to reappear; but allegiance to the Orange dynasty survived, and in 1813 became the rallying point of a united Dutch people. At the same time the leading part played by the province of Holland in the history of the republic has not been unrecognized, for the country ruled over by the sovereigns of the house of Orange is always popularly, and often officially, known as Holland.

Constitution.—The full title of the states of Holland in the 17th and 18th centuries was: *de Edele Groot Mogende Heeren Staaten van Holland en Westfriesland*. After 1608 this assembly consisted of 19 members, one representing the nobility (*ridder-schap*), and 18, the towns. The member for the nobles had precedence and voted first. The interests of the country districts (*het platte land*) were the peculiar charge of the member for the nobles. The nobles also retained the right of appointing representatives to sit in the College of Deputed Councillors, in certain colleges of the admiralty, and upon the board of directors of the East India Company, and to various public offices. Each town (as did also the nobles) sent as many representatives as it pleased, but the 19 members had only one vote each. Each town's deputation was headed by its pensionary, who was the spokesman on behalf of the representatives. Certain questions such as peace and war, voting of subsidies, imposition of taxation, changes in the mode of government, etc., required unanimity of votes. The states of Holland sat at The Hague in the months of March, July, September and November. During the periods of prorogation the continuous oversight of the business and interests of the province was, however, never neglected. This duty was confided to a body called the College of Deputed Councillors (*het Kollegie der Gekommitteerde Raden*), which was itself divided into two sections, one for the south quarter, another for the north quarter.

The grand pensionary presided over the meetings of the college, which had the general charge of the whole provincial administration, especially of finance, the carrying out of the resolutions of the states, the maintenance of defences, and the upholding of the privileges and liberties of the land. With particular regard to this last-named duty the college deputed two of its members to attend all meetings of the States-General, to watch the proceedings and report at once any proposals which they held to be contrary to the interests or to infringe upon the rights of the province of Holland. The College of Deputed Councillors might be described as a vigilance committee of the states in perpetual session.

HOLLAND, a city of Ottawa county, Michigan, U.S.A., 25 m. S.W. of Grand Rapids, on Macatawa bay (or Black lake), 5 m. from Lake Michigan. It is served by the Pere Marquette railroad, by lake steamers to Chicago the year round, and by motor-bus lines in every direction. The population was 12,183 in 1920 (82% native white) and was estimated locally at 14,000 in 1928. Within 10 m. of the city are numerous resorts, which in summer add at least 15,000 to the population. Holland was founded by Dutch settlers in 1847, under the leadership of the Rev. A. C. Van Raalte, and the population is still predominantly of Dutch descent. It is the seat of Hope college, founded in 1851 by the Dutch Reformed Church, and of the Western Theological seminary of the same denomination (1869); and two weekly papers printed in Dutch are published here. The city has substantial manufacturing industries, with an output in 1925 valued at \$19,175,476; and the traffic of its harbour in 1925 (50,661 tons) was valued at \$13,177,000. Its leading products are hot-air furnaces, smokeless furnaces and stokers, furniture, shoes, pianos, drugs, cosmetics and food products. Holland was chartered as a city in 1867.

HOLLAND. A cloth so called from the country where it was first made. It was originally a fine plain linen fabric of a brownish colour—unbleached flax. Several varieties are now made: hollands, pale hollands and fine hollands. They are used for casement curtains, aprons, blinds, shirts, blouses and dresses.

HOLLANDER, BERNARD (1864–), British physician and writer on medical subjects, was born in Vienna in 1864. He came to London in 1883, and was naturalized in 1899. He published in 1899 the results of his first investigation into the localization in the brain of the fundamental psychical functions. He has written many papers for various learned societies, and is well known for his studies of abnormal mental conditions and as an exponent of psychotherapy.

His many publications include *The Mental Functions of the Brain* (1902); *Scientific Phrenology* (1902); *Psychotherapeutics of Insanity* (1908); *The Unknown Life and Works of Dr. Francis Joseph Gall* (1909); *The Insanity of Genius* (1913); *In Search of the Soul and the Mechanism of Human Thought, Emotion, and Conduct* (1920); *Psychology of Misconduct, Vice and Crime* (1922).

HOLLANDS: see SPIRITS.

HOLLAND VEHICULAR TUNNEL. In 1906 the States of New York and New Jersey created the New York State bridge and tunnel commission and the New Jersey Interstate bridge and tunnel commission for the purpose of studying means of vehicular intercommunication across the Hudson river, which separates them. The joint commission recommended a vehicular tunnel

SECTIONAL STUDY OF ONE OF THE TWIN TUBES OF THE HOLLAND VEHICULAR TUNNEL

from Canal street in the borough of Manhattan to Journal square, Jersey City. In 1919 actual preparations for construction began under the direction of Clifford M. Holland, who died on Oct. 27, 1924, and was succeeded by Milton C. Freeman. Mr. Freeman died on March, 24, 1925 and was succeeded by Ole Singstad, who was in charge of the work until its completion.

The first 40ft. boring shield was set up in the Canal street shaft on Sept. 11, 1922. On Oct. 29, 1924, the first two entries were connected. The total cost of construction was \$48,400,000. It has provided two tunnels, 9,250ft. long and 20ft. 6in. in diameter,

each capable of accommodating a double line of traffic. Its designed capacity is 46,000 vehicles per day.

The tunnel is ventilated by fresh air forced through the spaces between the roadway and the bottom of the tube, and drawn by fans through a similar space at the top. The provision for traffic control and for fire emergencies are unusually complete. The tunnel was opened for traffic on Nov. 12, 1927, and its capacity was found to be considerably greater than anticipated.

HOLLAR, WENZEL or WENCESLAUS (VACLAV HOLLAR) (1607–1677), Bohemian etcher, was born at Prague on July 13, 1607, and died in London, being buried at St. Margaret's church, Westminster, on March 28, 1677. The earliest of his works that have been handed down are dated 1625 and 1626; they are small plates, and one of them is a copy of a "Virgin and Child" by Dürer, whose influence upon Hollar's work was always great. In 1627 he was at Frankfurt, working under Matthew Merian, an etcher and engraver; thence he passed to Strasbourg and thence, in 1633, to Cologne. There he attracted the notice of the famous amateur Thomas, earl of Arundel, then on an embassy to the imperial court; and with him Hollar travelled to Vienna and Prague, and finally came in 1637 to England. Though he lived in the household of the earl of Arundel, he seems to have worked not exclusively for him, but to have begun that slavery to the publishers which was afterwards the normal condition of his life. In his first year in England he made for Stent, the print-seller, the magnificent View of Greenwich, nearly a yard long, and received thirty shillings for the plate. Afterwards there is mention of his fixing the price of his work at fourpence an hour, and measuring his time by a sand-glass. The earl of Arundel left England in 1642 and Hollar passed into the service of the duke of York. With other Royalist artists, notably Inigo Jones and Faithorne, he stood the long and eventful siege of Basing House; and there exist some hundred plates from his hand dated during the years 1643 and 1644. Taken prisoner, he escaped or was released, and joined the earl of Arundel at Antwerp, where he spent eight years, the prime of his working life, and produced his finest plates of every kind, his noblest views, amongst them being "The Long View of London from the Bankside," his miraculous "muffs" and "shells" and the superb portrait of the duke of York. In 1652 he returned to London and lived for a time with Faithorne the engraver near Temple Bar. During the following years were published many books which he illustrated:—Ogilby's *Virgil and Homer*, Stapylton's *Juvenal*, and Dugdale's *Warwickshire*, *St. Paul's* and *Monasticon* (part i.). After the Great Fire he produced some of his famous "Views of London"; and it may have been the success of these plates which induced the king to send him in 1668 to Tangier, to draw the town and forts. During his return to England occurred the desperate and successful engagement fought by his ship the "Mary Rose," under Captain Kempthorne, against seven Algerine men-of-war, a brilliant affair which Hollar etched for Ogilby's *Africa*. He lived eight years after his return, still working for the booksellers and retaining to the end his wonderful powers; witness the large plate of Edinburgh (dated 1670), one of the greatest of his works. He died in extreme poverty, his last recorded words being a request to the bailiffs that they would not carry away the bed on which he was dying.

Almost complete collections of Hollar's works exist in the British Museum and in the library at Windsor Castle. Two admirable catalogues of his plates have been made, one in 1745 (2nd ed., 1759) by George Vertue, and an exhaustive one (Berlin, 1853) by Parthey.

HOLLES, DENZIL HOLLES, BARON (1599–1680), English statesman and writer, second son of John Holles, first earl of Clare (c. 1564–1637), by Anne, daughter of Sir Thomas Stanhope, was born on Oct. 31, 1599. He was in early youth the playmate and intimate companion of Prince Charles. In 1624 Holles was returned to parliament for Mitchell in Cornwall, and in 1628 for Dorchester. On March 2, 1629, when Sir John Finch, the speaker, refused to put Sir John Eliot's Protestations and was about to adjourn the House by the king's command, Holles with another member thrust him back into the chair and swore "he should sit still till it pleased them to rise." Meanwhile Eliot, on the refusal of the speaker to read the Protestations, had himself thrown them

into the fire; the usher of the black rod was knocking at the door for admittance, and the king had sent for the guard. But Holles, declaring that he could not render the king or his country better service, put the Protestations to the House from memory, all the members rising to their feet and applauding. He, with others, was arrested and arraigned first in the Star Chamber and subsequently in the King's Bench. When brought upon his *habeas corpus* before the latter court Holles offered with the rest to give bail, but refused sureties for good behaviour, and argued that the court had no jurisdiction over offences supposed to have been committed in parliament. On his refusal to plead he was sentenced to a fine of 1,000 marks and to imprisonment during the king's pleasure. Holles was confined, first in the Tower of London, and then in the Marshalsea. His resistance to the king's tyranny did not prove so stout as that of some of his comrades in misfortune. Having given the security demanded for his good behaviour, he was liberated early in 1630, and retired to the country.

Holles was a member of the Short and Long Parliaments assembled in 1640. According to Laud he was now "one of the great leading men in the House of Commons," and he sought to find means of preserving his brother-in-law, Strafford, from execution. He was one of the chief movers of the Protestation of May 3, 1641. He took up the impeachment of Laud to the House of Peers, supported the Londoners' petition for the abolition of episcopacy, and the Root and Branch bill. Together with Pym, Holles drew up the Grand Remonstrance, and made a vigorous speech in its support on Nov. 22, 1641, in which he argued for the right of one House to make a declaration, and asserted: "If kings are misled by their counsellors we may, we must, tell them of it."

After the failure of the attempt by the court to gain over Holles and others by offering them posts in the administration, he was one of the "five members" impeached by the king. Holles at once grasped the full significance of the king's action, and after the triumphant return to the House of the five members, on Jan. 11, threw himself into still more pronounced opposition to the king's policy.

On the outbreak of the Civil War (*see* GREAT REBELLION) Holles took a command in the field, fighting at Edgehill and at Brentford. But he soon returned to London, moderated his tone, and advocated peace and a settlement of the disputes by concessions on both sides. He supported the peace negotiations on Nov. 21 and Dec. 22, 1642, and his attitude led to a breach with Pym and the more determined party. In June 1643 he was accused of complicity in Waller's plot, but swore to his innocence; and his arrest with others of the peace party was even proposed in August. In November Holles and Whitelocke headed the commission appointed to treat with the king at Oxford. He endeavoured to convince the royalists of the necessity of yielding in time, before the "new party of hot men" should gain the upper hand. Holles and Whitelocke had a private meeting, not reported to parliament, with the king, when at Charles's request they drew up the answer which they advised him to return to the parliament. Holles was also a commissioner at Uxbridge in Jan. 1645. As leader of the moderate (or Presbyterian) party Holles now came into violent antagonism with Cromwell and the army faction, and was one of those who sought to secure Cromwell's impeachment.

On June 16, 1647, eleven members including Holles were charged by the army with various offences against the state, followed on the 23rd by fresh demands for their impeachment and for their suspension, which were refused. On the 26th, however, the eleven members, to avoid violence, asked leave to withdraw. They were recalled, expelled, imprisoned and again recalled.

Holles was one of the commissioners appointed to treat with the king at Newport on Sept. 18, 1648, and was one of those who stayed behind the rest in order to urge Charles to compliance. On Dec. 1 he received the thanks of the House. On the occasion of Pride's Purge on Dec. 6 Holles absented himself and escaped to France. From his retirement there he wrote to Charles II. in 1651, advising him to come to terms with the Scots as the only means of effecting a restoration; but after the alliance he refused Charles's offer of the secretaryship of state. In March 1654 Crom-

well sent Holles a pass "with notable circumstances of kindness and esteem." The date of his return to England is uncertain, but in 1656 Cromwell's resentment was again excited against him as the supposed author of a tract, really written by Clarendon. Holles appears to have been imprisoned, for his release was ordered by the council on Sept. 2, 1659.

Holles took a leading part in the Restoration, was one of the 34 commissioners appointed to try the regicides, and entered the House of Lords as Baron Holles in 1661. He was ambassador to France (1663-66), and an envoy at the peace with Holland at Breda (1667). He became with Halifax and Shaftesbury a leader in the resistance to the domestic and foreign policy of the court, and in 1676 was summarily dismissed from the council. In order to bring about the downfall of Danby (afterwards duke of Leeds) and the disbanding of the army, which he believed to be intended for the suppression of the national liberties, Holles engaged (1677-1679), as did many others, in a dangerous intrigue with Courtin and Barillon, the French envoys, and Louis XIV.; he refused, however, the latter's presents on the ground that he was a member of the council, having been appointed to Sir William Temple's new modelled cabinet in 1679. Barillon described him as at this period in his old age "the man of all England for whom the different cabals have the most consideration," and as firmly opposed to the arbitrary designs of the court. He showed moderation in the Popish Plot, and on the question of the exclusion of James, duke of York, followed Halifax rather than Shaftesbury. He died on Feb. 17, 1680.

The character of Holles has been drawn by Burnet (*Hist. of His Own Times* vi. 257, 268), with whom he was on terms of friendship. "Holles was a man of great courage and of as great pride. . . . He was faithful and firm to his side and never changed through the whole course of his life. . . . He argued well but too vehemently; for he could not bear contradiction. He had the soul of an old stubborn Roman in him. He was a faithful but a rough friend, and a severe but fair enemy. He had a true sense of religion; and was a man of an unblameable course of life and of a sound judgment when it was not biased by passion."

See C. H. Firth in the *Dictionary of National Biography* and authorities there quoted.

HOLLIDAYSBURG, a borough in the mountainous region of central Pennsylvania, U.S.A., 8m. S. of Altoona; the county seat of Blair county. It is served by the Pennsylvania railroad. The population was 4,071 in 1920 (96% native white). Coal, iron and limestone abound in the vicinity. The borough has foundries and machine shops and other manufacturing industries.

HOLLOWAY, THOMAS (1800-1883), English patent-medicine vendor and philanthropist, was born at Devonport, on Sept. 22, 1800, of humble parents. At the age of 28 he came to London where he met Felix Albinolo, an Italian, from whom he obtained the idea for the ointment which was to carry his name all over the world. The secret of his enormous success in business was due almost entirely to advertisement, in the efficacy of which he had great faith. He soon added the sale of pills. He is remembered by the two princely foundations—the Sanatorium and the College for Women at Egham (q.v.), endowed by him towards the close of his life, more than a million sterling having been set apart by him for their erection and permanent endowment. In the deed of gift of the college the founder credited his wife, who died in 1875, with the advice and counsel that led him to provide what he hoped might ultimately become the nucleus of a university for women. The philanthropic and somewhat eccentric donor (he had an unconcealed prejudice against doctors, lawyers and parsons) died of congestion of the lungs at Sunninghill on Dec. 26, 1883.

HOLLOW-WARE. Hollow-ware is a term which may be used to describe all articles of concave shape employed for domestic, particularly culinary, purposes; but actually, according both to the popular and to the trade usage, it is applied only to those which are made of metal. Even with this limitation the term covers a wide variety of articles, which are produced by several distinct industries. Some account of the development of those industries will show how the various branches of the

manufacture grew up. It is not necessary to look back beyond the middle of the 18th century, since it was not till then that any considerable variety in the types of article in use began to appear. At that time the metal kitchen utensils, such as kettles, pans, and ale-warmers, were made of sheet copper, brass or, less frequently, iron; whilst cast bronze skillets, which corresponded to the modern saucepans, and cauldrons were very common. Non-ferrous metal vessels of these various types were frequently tinned on the inside. The lighter domestic hollow-ware, such as kettles, trays, jugs and cups, was occasionally made of tinplate and sometimes japanned. Articles of this material, besides being produced by tinmen in many different parts of Europe, were made in quantity in south Wales and south Staffordshire under the name of "Pontypool" wares. Further, utensils such as plates, bowls, dishes and cups, were often made of pewter; while similar articles of a more expensive kind were of silver or silver-plate. Cast-iron was employed only for the heavier and cruder types of hollow-ware, e.g., cauldrons and mortars, because the charcoal-smelted iron, which was then the only kind available, ran too thick to be cast into light domestic utensils.

During the latter half of the 18th century important changes occurred. The use of coke in the blast furnace resulted in the production of an iron which was suitable for the manufacture of light cast pots and pans, and so foundries began to be established for this purpose in several British industrial centres, particularly in south Staffordshire, at West Bromwich and Wolverhampton. During the same period a process was introduced for coating the interior of cast and wrought-iron hollow-ware with tin, and this, since it obviated the danger of rust, greatly extended the use of iron at the expense of non-ferrous articles. Further, a new alloy, known as Britannia metal, of which the constituents were copper, tin and antimony, came to be used for making tea and coffee-pots; so that by 1800, in addition to the older types of copper, brass, sheet iron, pewter, silver-plate and tinplate and japanned hollow-ware, there were tinned and "black" cast-iron and Britannia metal articles. Soon after 1800 stove-dried varnish began to be employed as an outside coating for tinned iron kettles and pans.

Introduction of Enamelling and Galvanizing.—Before 1850, in addition to the improvements which were made in finishing processes, several new varieties of hollow-ware came into existence. Processes had long been known for the coating of iron with vitreous enamel and, early in the century, they had been applied by Continental producers; but it was not until about 1840 that an enamelled hollow-ware manufacture was established in Great Britain. From then onwards enamelled ware began slowly to supersede tinned articles, chiefly owing to the former's resemblance to glazed pottery and to the ease with which it could be cleaned. A few years later the makers of wrought-iron utensils adopted a process for covering their goods with zinc, and so the galvanized iron hollow-ware trade came into existence. British producers in this branch of industry benefited greatly by the increased colonial demand which occurred after the middle of the century. Meanwhile, the electro-plating trade had risen to prominence after 1840 and began to produce teapots and similar articles, which had before been made of pewter, tinplate, silver-plate or Britannia metal. For a time this last material was used as a base metal in the manufacture of electro-plate ware; but it was slowly superseded by German or nickel silver, which bore a considerable resemblance to it. During the '30s, moreover, the stamp began to come into use in the sheet metal branches of the industry, particularly in tinplate ware production in which thin sheets were employed; and, after this time, many articles such as dishes and pans, which had previously been made of separate pieces of metal brazed together, came to be raised out of a single sheet. There were, however, many kinds of tinplate ware which still had to be made by the older methods; and the stamp was not used to any extent, even in the '60s, for the production of heavier gauge cooking utensils of wrought-iron.

Stamped Steel and Aluminium Ware.—Up to the '70s, while most of these branches of the industry had come into existence in Europe and North America, only the British manufac-

turer had developed a large export trade, and he then sent his goods to Europe and the United States, besides supplying most of the hollow-ware used in the colonies and a large proportion of the African, Indian and South American demands. During the next decade, however, a new form of wrought hollow-ware, made of stamped steel, came into use, and although British manufacturers took up its production, a large quantity came to be imported into England before the end of the century and sent to her previous foreign markets. The change was associated with the rise of the German steel industry after 1880. Before basic Bessemer and Siemens-Martin steel came into use, most of the manufacturing operations in the wrought branch of the industry had been done by hand, as wrought-iron did not lend itself readily to manipulation by presses and stamps. The new mild steel, however, being more ductile, could be treated in that way, and it was therefore possible to produce machine-made steel articles, which were much cheaper than either cast- or wrought-iron wares. Consequently, steel sheets superseded iron sheets as the raw material of the tinned, enamelled, galvanized and "black" sections of the wrought trade; and since enamelled stamped steel hollow-ware could be produced at a low cost, other branches of the industry began to suffer. The demand for cast-iron cooking utensils fell off both in Great Britain and in many of her foreign markets. Partly for the same reasons and partly because of a change of fashion, the use of tinplate kettles, baths, cups, pans and teapots, and of japanned trays and coal-scuttles declined in Europe and England, although the colonial demand did not suffer to the same extent.

These tendencies continued up to the outbreak of the World War, and after 1918 the decay of the manufacture of cast-iron and of certain types of tinplate wares was accelerated by the increasing use of aluminium hollow-ware. Aluminium was first employed in this trade during the later '90s, and up to 1914 the quantity produced was comparatively small. Germany was the first country to develop the manufacture, and most of the aluminium ware used in Great Britain during the years immediately preceding the war came from that source. The experience which was gained in 1914-18 in the manipulation of the metal, however, encouraged British manufacturers to take up the production of domestic utensils of this new type when the demand for munitions came to an end; and during the post-war years a large British output has been maintained. The supersession of cast-iron by enamelled stamped steel and aluminium utensils since the beginning of the 20th century has been stimulated by the increasing use of gas and electric stoves for cooking purposes. In consequence of this development the greater strength of cast-iron ware is no longer such an advantage as it once was; while articles made of that material are less economical in the use of fuel than the lighter forms of hollow-ware.

Manufacture of Hollow-ware in the 20th Century.—As may be inferred from the above historical account, the hollow-ware in use in the 3rd decade of the 20th century may be classified into sections. The first group consists of cast-iron utensils which are either enamelled, tinned, or "black." The "black" ware usually takes the form of Dutch ovens and pots for the use of African natives, South Americans and Indians, and very little is sold in Great Britain or in the civilized western countries. The other wares, which are coated on the inside with enamel or tin and on the outside with stove-dried varnish, consist of frying-pans, saucepans, kettles and other utensils employed for cooking, and are in common use in Europe and in countries colonized by Europeans. These articles are first cast from a special quality of pig-iron, and are then annealed. From the annealing ovens they go to be turned and polished on lathes, after which they are enamelled or tinned. The handles are usually made of wrought-iron and are riveted on to the body of the articles in the mounting shops. Finally, the wares pass to the stoving and varnishing departments. The lids are usually made of tinned or enamelled steel, or are pressed out of tinplate.

The second group covers wrought hollow-ware, which is generally formed from mild steel sheets, and which may be either "black," tinned, enamelled or galvanized. The first three varie-

ties consist of similar types of articles to those produced by the cast section; but the enamelled ware, which is the most important type, also comprises such things as jugs, colanders, bowls, buckets, cups, baths and plates, and thus covers a very wide range of domestic utensils. Many of these articles are fashioned under the stamp or drawing-press, while some, e.g., frying-pans, are spun on the lathe. When a weld is required, the operation is commonly effected by the aid of electricity or of gas. The later processes in this branch of the industry resemble those which have already been briefly described in connection with the various kinds of cast hollow-ware. The latter are more durable and less likely to be adversely affected by heat; while the wrought wares have the advantage of being cheaper, lighter, and more economical in the use of fuel.

Galvanized ware is more suitable for outdoor purposes, or for uses not connected with food preparation, and it comprises such articles as dust-bins, watering-cans, and common coal-scuttles. It seldom consists of articles similar to those which are enamelled, though the two sections overlap at a few points—such things as buckets, baths, washing-bowls and water-cans being common to both. Galvanized ware is, of course, of a lower grade than the enamelled variety. Presses and stamps are employed in the manufacture of certain classes of galvanized utensils; but many of the articles most typical of this trade are of a shape that do not lend themselves to machine production, and a great deal of hand labour is necessary, the more so because much of the ware is made of low-grade steel, which will not stand up to mechanical methods of production.

Some of the more ornamental tinplate and japanned wares, such as tea and coffee-pots, kettles, japanned coal-scuttles, trays, and travelling trunks, have, as already indicated, been superseded in Great Britain by other types; but a great quantity of hollow-ware is still made of this material, and there is a considerable export trade to the dominions, and to tropical and semi-tropical countries. As in the case of galvanized ware, while machinery has been introduced for performing some operations, the nature of many of the tinplate articles is such that hand labour cannot be largely dispensed with for shaping and joining.

The latest type of hollow-ware, viz., aluminium, takes the form of a wide variety of utensils, such as are associated with the enamelled and tinplate ware trades and with the pottery industry, and it ranges from large cast pots for industrial uses to light saucepans, cups and plates. Machinery is as extensively used in this manufacture as in the stamped steel hollow-ware trade; but owing to the nature of the metal, the lathe is more commonly used to shape the cheaper qualities of ware than is the stamp or press. The handles of aluminium articles are usually made of iron or steel, although sometimes a composition which is a non-conductor of heat is used.

Finally there remains to be mentioned the hollow-ware made of brass, copper, electro-plate and nickel silver. This is of an ornamental and expensive kind, and although copper and brass coal-scuttles are produced in fair quantities, these types do not form, in the 20th century, a considerable proportion of what can be strictly regarded as hollow-ware.

The census of production of 1924 affords some indication of the relative importance of the different branches of the hollow-ware industry in Great Britain at that date. As far as the value of its total annual production was concerned, the tinplate branch ranked highest, being slightly ahead of both the wrought enamelled and galvanized sections of the trade, and producing more than twice as much as the aluminium branch. The extent to which cast-iron has been superseded is illustrated by the fact that the value of the total annual output of all types of cast hollow-ware amounted to only three-fifths of that of aluminium and to about a quarter of that of wrought enamelled hollow-ware.

The British Manufacture.—The distinction which has been drawn between the different types of hollow-ware is reflected in the activities of the firms engaged in their manufacture. The large concerns naturally have a wide range of products; but even they specialize on particular kinds of ware. Thus, several manufacturers who were originally makers of enamelled and tinned cast-

iron utensils have taken up the production of stamped steel articles of the same type; the larger firms in the galvanizing section make wrought tinned articles similar in nature to their staple products; and aluminium and sheet copper goods are often manufactured in the tinplate ware factories. But, for the most part, firms concentrate on one of the following five groups; enamelled and tinned steel, the various kinds of cast-iron tinplate and japanned, galvanized, and aluminium ware. The small concerns limit themselves to some sub-division of these main groups, e.g., to "black" native pots, or to galvanized buckets.

The firms engaged in producing enamelled hollow-ware in Great Britain are very few in number, there being only 18 in the wrought and 13 in the cast section. It is not surprising to find, therefore, that the factories in these two sections of the enamelled ware trade are much larger in size than those which make only galvanized, tinplate, "black," or tinned articles. The large scale of these undertakings may be attributed to the fact that the enamelled ware manufacturers require a larger plant and a higher degree of technical knowledge than those in other branches of the industry. In this section firms exist which employ 700 or 800 workers, and in it there is no place for the small producer.

On the other hand, "black" cast-iron hollow-ware is often made in small foundries; and in the tinplate and galvanized ware branches of the industry, where little machinery can be used, many small producers employing under a dozen workers exist. In these branches, indeed, the large factory is exceptional. The manufacturers of aluminium hollow-ware require a good deal of machinery; but although there are two or three large firms in this trade, the majority of those who specialize in aluminium articles employ less than a hundred. Few manufacturers of hollow-ware confine themselves exclusively to that product. The foundries, for instance, frequently produce electrical castings and "oddwork"; i.e., general ironmongery; the tinplate ware factories make such things as oil-stoves; and all hollow-ware firms concern themselves with other types of hardware.

The chief sub-divisions of the British hollow-ware industry have been localized since the early 19th century in Birmingham and district, particularly at West Bromwich and in the neighbourhood of Wolverhampton; and in 1921 over three-quarters of the 11,976 people engaged in the manufacture of cast and wrought hollow-ware of iron and steel in Great Britain were found in that area, most of the remainder being in south Wales. The coal and the excellent iron and casting sand of south Staffordshire were originally responsible for this concentration of the trade. These causes, however, have long ceased to operate, and it has been the presence of skilled labour and of experienced manufacturers which has maintained the industry in this locality during the first three decades of the 20th century, when the pig-iron required for the foundry cupolas has had to be brought from Derbyshire, and when the steel sheets, which form the raw material of the wrought section, has been obtained from south Wales, or, since the war, to some extent from abroad. Tinplate wares have also been made extensively in Birmingham and Wolverhampton; but in this branch the district has lost some of its importance as a producing centre, owing to the decline in the demand for the type of product in which it has specialized, and greater London and Lancashire were in 1921 the chief seats of the industry. Aluminium hollow-ware manufacture, however, has come to be situated largely in the Birmingham neighbourhood, partly because makers of other types of hollow-ware in that locality have taken up its manufacture, and partly because those who were setting up new establishments were attracted to the district by the presence of the type of labour they required.

The term "hollow-ware" is seldom used in America to describe this group of manufactured articles. These objects are referred to as enamel-ware, aluminum-ware and by various other names. These are discussed under the articles HOUSEHOLD APPLIANCES; TINPLATE; ALUMINIUM and in related subjects.

There is no satisfactory work on the hollow-ware industry or on hollow-ware in general. For an illustrated account of hollow-ware in use before the 19th century see J. S. Lindsay, *Iron and Brass Im-*

plements of the English House (1927). See also W. H. Jones, *Japan, Tinplate Working and Iron Braziers' Trades in Wolverhampton* (1900), and several articles in *The Birmingham and Midland Hardware District*, ed. Samuel Timmins (1866), for information concerning the historical development of the different branches of the industry. See also The Reports of the Census of Production (1924), and of Committees on Wrought Enamelled Hollow-ware (Cmd. 2634), and on Aluminium Hollow-ware (Cmd. 2530), set up under The Safeguarding of Industries Act, 1921. (G. C. A.)

HOLLY (*Ilex*), a large genus of trees and shrubs of the family Aquifoliaceae, containing about 180 species. The genus finds its chief development in Central and South America; is well developed in Asia, especially the Chinese-Japanese area, and has but few species in Europe, Africa and Australia. In Europe, where *I. Aquifolium* is the sole surviving species, the genus was richly represented during the Miocene period by forms at first South American and Asiatic, and later North American in type (Schimper, *Paléont. végét.* iii. 204, 1874). The leaves are generally leathery and evergreen, and are alternate and stalked; the flowers, commonly dioecious, are in axillary clusters and have a persistent four- to five-lobed calyx, a white, rotate four- or rarely five- or six-cleft corolla, with the four or five stamens adherent to its base in the male, and a two- to twelve-celled ovary; the fruit is a globose, usually red drupe, containing two to sixteen one-seeded stones.

The common European holly, or Hulver, *I. Aquifolium*, is an evergreen shrub or low tree, having smooth, ash-coloured bark, and wavy, pointed, smooth and glossy leaves, 2 to 3 in. long, with a spinous margin. The flowers, which appear in May, are ordinarily dioecious, as in all the best of the cultivated varieties in nurseries. Darwin (*Diff. Forms of Flow.*, 1877, p. 297) says of the holly: "During several years I have examined many plants, but have never found one that was really hermaphrodite." Shirley Hibberd, however (*Gard. Chron.*, 1877, ii. 777), mentions the occurrence of "flowers bearing globose anthers well furnished with pollen, and also perfect ovaries." The holly occurs in Great Britain, north-east Scotland excepted, and in western and southern Europe, from as high as 62° N. lat. in Norway to Turkey and the Caucasus and in western Asia. It is found generally in forest glades or in hedges, and does not flourish under the shade of other trees. In England it is usually small, probably on account of its destruction for timber, but it may attain to 60 or 80 ft. in height. Some of the trees on Bleak Hill, Shropshire, are said to be 14 ft. in girth at some distance from the ground. The holly is abundant in France, especially in Brittany. It will grow in almost any soil not absolutely wet, but flourishes best in rather dry than moist sandy loam. The holly is propagated by means of the seeds, which do not normally germinate until their second year, by whip-grafting and budding, and by cuttings of the matured summer shoots. Transplantation should be performed in damp weather. It is rarely injured by frosts in Great Britain, where its foliage and bright red berries in winter render it a valuable ornamental tree. There are numerous holly varieties. Some trees have yellow, and others white or even black berries. In the fruitless variety *laurifolia*, "the most floriferous of all hollies (Hibberd), the flowers are highly fragrant; the form known as *femina* is, on the other hand, remarkable for the number of its berries. The leaves in the unarmed varieties *aureo-marginata* and *albo-marginata* are of great beauty, and in *ferox* they are studded with sharp prickles. The holly is of importance as a hedge-plant, and is patient of clipping. Evelyn's holly hedge at Say's Court, Deptford, was 400 ft. long, 9 ft. high and 5 ft. in breadth.

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

BRANCH OF HOLLY (*Ilex Aquifolium*), SHOWING THE SMALL WHITISH FLOWERS

The wood of the holly is even-grained and hard, especially when from the heartwood of large trees, and almost as white as ivory, except near the centre of old trunks, where it is brownish. It is employed in inlaying and turning, and, since it stains well, in the place of ebony, as for teapot handles. When dry it weighs about 47½ lb. per cu.ft. From the bark of the holly bird-lime is manufactured. The leaves are eaten by sheep and deer, and in parts of France serve as a winter fodder for cattle. The berries provoke in man violent vomiting and purging, but are eaten with immunity by birds.

The custom of employing holly and other plants for decorative purposes at Christmas is one of considerable antiquity, and has been regarded as a survival of the usages of the Roman Saturnalia, or of an old Teutonic practice of hanging the interior of dwellings with evergreens as a refuge for sylvan spirits from the inclemency of winter. A Border proverb defines an habitual story-teller as one that "lees never but when the hollen is green." Several popular superstitions exist with respect to holly. In the county of Rutland it is deemed unlucky to introduce it into a house before Christmas Eve. In some English rural districts the prickly and non-prickly kinds are distinguished as "he" and "she" holly; and in Derbyshire the tradition obtains that according as the Holly brought at Christmas into a house is smooth or rough, the wife or the husband will be master.

In North America some 12 native species occur, found chiefly in the south-eastern United States. The American holly (*I. opaca*), very similar in appearance and uses to the European holly, is a slow growing tree, sometimes 40 ft. or 50 ft. high, with a trunk 3 ft. or more in diameter. It grows in moist woods, mostly near the coast, from Massachusetts to Florida, westward to Texas, and northward in the Mississippi valley to Missouri and Indiana. Like the Old World holly, it is much used for Christmas decoration. The dahoon holly (*I. Cassine*), a shrub or small tree, sometimes 25 ft. high, with oblong, spineless and mostly toothless evergreen leaves, is found from Virginia to Florida and westward to Arkansas and Texas, and also in Cuba and the Bahamas. The cassena or emetic holly (*I. vomitoria*), called also yaupon, Carolina tea and Indian black-drink, because of its use by the Indians as an emetic and purgative, has nearly the same geographic range as the dahoon. It usually grows 10 ft. to 15 ft. high, and has small, minutely wavy-toothed leaves, about 1 in. long, and small fruits. Several North American species have deciduous leaves. Of these the best known is the Virginia winter-berry or black alder, a shrub, 6 ft. to 15 ft. high, native to swamps from Connecticut to Wisconsin and south to Florida and Missouri. The foliage turns black and falls off in autumn, leaving bright red persistent fruits which are used for winter decoration. Other deciduous species are the smooth winter-berry (*I. laevigata*), native to swamps from Maine to Pennsylvania and Georgia; the swamp holly (*I. decidua*), widely distributed in the south-eastern States, and the mountain holly (*I. monticola*), of the Allegheny Mountain region. (See INK-BERRY; MATE; WINTER-BERRY.)

HOLLYHOCK, *Althaea rosea*, a perennial plant of the family Malvaceae, a native of China, which has been cultivated in Great Britain for about three centuries and long since widely grown in America. The ordinary hollyhock is single-blossomed, but the florists' varieties have all double flowers, of white, yellow, rose, purple, violet and other tints, some being almost black. The plant is in its prime about August, but by careful management samples may be obtained in blossom from July to as late as November. Hollyhocks are propagated from seed, or by division of the root, or by planting out in rich sandy soil, in a close frame, with a gentle bottom heat, single eyes from woodshoots, or cuttings from outgrowths of the old stock or of the lateral offsets of the spike. seed may be sown in October under cover, the plants obtained being potted in November, and kept under glass till the following April, or, if it be late-gathered, in May or June, in the open ground, whence, if required, the plants are best removed in October or April. In many gardens, when the plants are not disturbed, self-sown seedlings come up in abundance about April and May. Seedlings may also be raised in February or March, by the aid of a gentle heat, in a light and rich moist soil; they should not be watered till they have made their second leaves, and when large enough for handling should be pricked off in a cold frame; they are subsequently transferred to the flower-bed. Hollyhocks thrive best in a well-trenched and manured sandy loam. The plant is susceptible of great modification under cultivation. The forms now grown are due to the careful selection and crossing of varieties. It is found that the most diverse varieties may be raised with certainty from plants growing near together.

The young shoots of the hollyhock are very liable to the attacks of slugs, and to a disease occasioned by a fungus, *Puccinia malvacearum*, which is a native of Chile and attained notoriety in the Australian colonies, and finally, reaching Europe in 1869, threatened the extermination of the hollyhock, the soft parts of the leaves of which it destroys, leaving the veins only remaining. It has been found especially hurtful to the plant in dry seasons. It is also parasitic on the wild mallows. The disease appears on the leaves as minute hard pale-brown pustules, filled with spores which germinate without a resting-period, but when produced late in the season may last as resting-spores until next spring. In hot dry seasons, red-spider injures the foliage very much, but may be kept at bay by syringing the plants frequently with plenty of water.

HOLLYWOOD, Calif., U.S.A., the principal seat of the motion-picture industry, was annexed to Los Angeles (*q.v.*) in 1910.

HOLLYWOOD, a city of Broward county, Florida, U.S.A., on the East coast, 18m. above Miami; on Federal highway 1, and served by the Florida East Coast and the Seaboard Air Line railways. The population was estimated locally at 7,500 in 1928. The city has 8m. of ocean beach, a deep-water harbour, several manufacturing industries and large hotels. In 1920 the site was a palmetto jungle; in 1927 the assessed valuation of property was \$45,910,230. The city was incorporated in 1926.

HOLMAN, JAMES (1786–1857), known as the "Blind Traveller," was born at Exeter on Oct. 15, 1786. He entered the British navy in 1798, and was invalided out in 1810. He became totally blind, but nevertheless travelled widely in Europe. In 1822 he set out to go round the world, but after travelling through Russia into Siberia, he was arrested as a spy at a point 1,000 m. beyond Smolensk, and after being conducted to the frontiers of Poland, returned home by Austria, Saxony, Prussia and Hanover. (See his *Travels through Russia, etc.*, 1825.) Travelling by another route he accomplished his purpose and his journey is described in *A Voyage round the World, including Travels in Africa, Asia, Australasia, America, etc., from 1827 to 1832* (4 vols., 1834–35). His last journeys were through Spain, Portugal, Moldavia, Montenegro, Syria and Turkey. He died in London on July 29, 1857.

HOLMES, SIR CHARLES JOHN (1868–), English painter and writer on art, was born at Preston on Nov. 11, 1868. He was educated at Eton and Oxford. He worked in the publishing firm of Rivington, Ballantyne and Arnold from 1889–91. In 1903 he became editor of the *Burlington Magazine*; he was Slade professor in Oxford (1904–10); director of the National Portrait Gallery (1909–16); director of the National Gallery (1916–28). He was knighted in 1921. From his early youth he devoted his spare time to the study of art. Encouraged by Charles Ricketts, he etched some 85 plates from landscape drawings during the period from 1892–97. In 1900 he began to exhibit at the New English Art club, of which he was elected a member in 1904. In 1924 he became an associate of the Royal Society of Painters in Water Colour. The subjects of his paintings are mainly taken in the north country, and his style was formed by his study of Japanese art and the old masters. His

theories on art are explained in *Notes on the Science of Picture Making* (1909). Other publications by him are *Hokusai* (1900); *Hiroshige* (1902); *Constable* (1902); *Notes on the Art of Rembrandt* (1911); *The Tarn and the Lake* (1913); *Constable, Gainsborough and Lucas* (1922); *The National Gallery, Italian Schools* (1923); *The Netherlands, Germany and Spain* (1925); *The Making of the National Gallery 1824-1924* (1924). The following public galleries have works by him:—The Tate gallery, the British Museum, Manchester, Johannesburg, the Ashmolean at Oxford and Melbourne.

HOLMES, OLIVER WENDELL (1809-1894), American writer and physician, was born Aug. 29, 1809, at Cambridge (Mass.), one of the "Brahmin caste of New England." From Phillips (Andover) academy he entered Harvard in the "famous class of '29," made further illustrious by the charming lyrics which he wrote for the anniversary dinners from 1851 to 1889, closing with the touching "After the Curfew."

Turning next to medicine, and convinced by a brief experience in Boston that he liked it, he went to Paris in March 1833, where he studied industriously, and in his vacations visited the Low Countries, England, Scotland and Italy. Returning to Boston at the close of 1835, filled with a high professional ambition, he sought practice, but achieved only moderate success. Social, brilliant in conversation, and a writer of gay little poems, he seemed to the grave Bostonians not sufficiently serious. He won prizes, however, for professional papers, and lectured on anatomy at Dartmouth college. He wrote two trenchant and witty papers on *Homoeopathy and its Kindred Delusions* (1842); also a valuable paper on the malarial fevers of New England. In 1843 he published his essay on the *Contagiousness of Puerperal Fever*, which brought upon him bitter personal abuse; but he maintained his position with dignity, temper, and judgment; and in time he was honoured as the discoverer of a beneficent truth. The volume of his medical essays holds some of his most sparkling wit, his shrewdest observations, his kindest humanity. In 1840 he married Amelia Lee Jackson, a lady of rare charm alike of mind and character. In 1847 he was appointed professor of anatomy and physiology in the Medical school of Harvard university, the duties involving the giving of instruction also in kindred departments, so that, as he said, he occupied "not a chair, but a settee in the school." He delivered the lectures on anatomy until Nov. 1882, and in later years these were his only link with the medical profession. They were fresh, witty and lively; and the students were sent to him at the end of the day, when they were fagged, because he alone could keep them awake. In later years he made few finished contributions to medical knowledge; his eager and impetuous temperament caused him to leave more patient investigators to push to ultimate results the suggestions thrown out by his fertile and imaginative mind.

In 1836, being in that year the Phi Beta Kappa poet at Harvard university, he published his first volume of *Poems*. Among these earlier lyrics was "The Last Leaf," one of his most delicate combinations of pathos and humour. In 1856-57 James Russell Lowell agreed to edit a new magazine on condition that he could secure the assistance of Holmes. Holmes, who heretofore had stood rather outside the literary coterie of Cambridge and Boston, accepted with pleasure. He christened the publication *The Atlantic Monthly*; and, as Howells afterwards said, he "not only named but made" it, for in each number of its first volume there appeared one of the papers of the *Autocrat of the Breakfast Table*. The opening of the *Autocrat*: "I was just going to say when I was interrupted" is explained by the fact that in the *Old New England Magazine* (1831-33) Dr. Holmes had published two *Autocrat* papers, which, by his wish, were never reprinted. In the commercial panic of 1857 the new magazine would inevitably have failed had it not been for these fascinating essays. Their originality of conception, their wit and humour, their suggestions of what then seemed bold ideas, and their expression of New Englandism, all combined to make them so popular that the most harassed merchant in that gloomy winter purchased them as a dose of cheering medicine. *The Atlantic Monthly* in return made Dr. Holmes. A success so immediate and so splendid settled the

rest of his career; he ceased to be a physician and became an author. These 12 papers were immediately (1858) published as a volume. No sooner was the *Autocrat* silent than the *Professor* (1859) succeeded him at the breakfast table. The *Professor* was preferred by more thoughtful readers, though it has not been so widely popular as the *Autocrat*. Twelve years later, in 1871, the Landlady had another boarder, who took the vacant chair—the *Poet* (1872). But here Holmes fell a little short. In these three books, especially in the *Autocrat* and the *Professor*, Holmes wrote as he talked at many a dinner table in Boston, but not so well. The animation and clash of talk roused him. The dinners of the Saturday Club are among Boston's proudest tradition, as they were the chief pleasure of Holmes's life. There he met Emerson, Longfellow, Whittier, Lowell, Sumner, Agassiz, Motley and many other charming talkers, and among them all he was admitted to be the best.

There were characters and incidents, but hardly a story, in the *Autocrat* and the *Professor*. Holmes had an ambition for more sustained work, and in 1861 his novel, *Elsie Venner*, at first called *The Professor's Story*, was published. This was illuminated throughout by admirable pictures of character and society in the typical New England town. But the rattlesnake element was unduly extravagant, and in other respects the book was open to criticism as a work of art. It was written with the same purpose which informed the greatest part of Holmes's literary work. By heredity he was a theologian; no other topic enchained him more than did the stern and merciless dogmas of his Calvinist forefathers. His humanity revolted against them, his reason condemned them, and he set himself to their destruction as his task in literature. In spite of attacks made on him as a free-thinker and a subverter of Christianity, he returned six years later to the same line of thought in his second novel, *The Guardian Angel* (1867). This, though not so well known as *Elsie Venner*, has some of the same merits. In 1884 and 1885 it was followed by *A Mortal Antipathy*, an inferior production.

Holmes generally held himself aloof from politics, and from those "causes" of temperance, abolition and woman's rights which enthralled most of his contemporaries in New England. The Civil War, however, aroused him for the time; finding him first a strenuous Unionist, it quickly converted him into an ardent advocate of emancipation. His interest was enhanced by the career of his elder son Oliver. Holmes wrote some ringing war lyrics, and in 1863 delivered the Fourth of July oration in Boston, which showed a masterly appreciation of the stirring public questions of the day. In 1878 he paid an affectionate tribute to one who had been his dear friend, the historian John Lothrop Motley. In 1884 he contributed the life of Emerson to the American "Men of Letters" series. He admired the "Sage of Concord," but was not quite in intellectual sympathy with him. Nevertheless in spite of this handicap the volume proved very popular. In 1888 he began the papers which he happily christened *Over the Tea Cups*. As a *tour de force* on the part of a man of nearly fourscore years they are very remarkable.

After his return from Paris in 1835 Dr. Holmes lived in Boston, with summer sojournings at Pittsfield and Beverly Farms, and occasional trips to neighbouring cities, until 1886. He then undertook a four months' journey in Europe, and in England had a sort of triumphal progress. On his return he wrote *Our Hundred Days in Europe* (1887), a courteous recognition of the hospitality and praise which had been accorded to him. During this visit Cambridge university made him Doctor of Letters, Edinburgh university made him Doctor of Laws, and Oxford university made him Doctor of Civil Law. Already, in 1880, Harvard university had made him Doctor of Laws. He died on Oct. 7, 1894, and was buried from King's Chapel, Boston, in the cemetery of Mount Auburn. (J. T. M.)

BIBLIOGRAPHY.—Among the editions of Holmes's works are the Riverside (13 vols., 1891), The Standard Library (15 vols., including Morse's biography 1896), and the Autocrat edition (13 vol., 1904). Holmes's *Complete Poetical Works* (1895) were edited by H. E. Scudder. The most complete edition of his *Speeches* is that published in 1913. Caroline Ticknor by a series of gleanings from his works presented *Dr. Holmes's Boston* (1915). The principal biography is

by J. T. Morse, *Life and Letters of Oliver Wendell Holmes* (1896). Other monographs are by James Ball (1878), Emma E. Brown (1884), Samuel M. Crothers (1910), W. H. Schroeder (1909), L. W. Townsend (1909), Louis Vossion (1896). See also the *Bibliography* by G. B. Ives (1907).

HOLMES, OLIVER WENDELL (1841—), American jurist, was born at Boston on March 8, 1841, the son of Oliver Wendell Holmes, poet and essayist. He graduated from Harvard in 1861. On the outbreak of the Civil War in that year he enlisted and served three years in the 20th Mass. Volunteers, rising to the rank of lieutenant-colonel. He was wounded three times—at Ball's Bluff, Antietam and Fredericksburg. He concluded his military career as aide-de-camp on the staff of the 6th Division, retiring in July 1864. In that year he began the study of law at Harvard, obtaining his LL.B. in 1866, and was admitted to the Suffolk (Mass.) bar on March 4, 1867. He practised law in Boston, and in 1870 was appointed instructor in constitutional law at Harvard, at the same time becoming editor of *The American Law Review*, which latter position he held for three years. In 1871-72 he was university lecturer in jurisprudence. In 1873 he edited the 12th edition of Kent's *Commentaries*, since recognized as the standard edition. In the same year he became a member of the firm of Shattuck, Holmes and Munroe and engaged in an active practice.

In 1880 Holmes was appointed lecturer on common law at the Lowell Institute. His articles in *The American Law Review* contained the germs of the lectures which he delivered before the institute and these in turn, in an amplified form, were published in 1881, under the title *The Common Law*. The object of the work was to present a general view of the common law, and this was done with a wealth of illustration, a charm of language and a clarity of reasoning which, apart from the erudition displayed, gave Holmes an international reputation. In 1882 he was appointed professor of law at the Harvard Law school, but resigned to accept an appointment on Dec. 8 of the same year as associate justice of the supreme court of Massachusetts. This position he occupied for 17 years, becoming chief justice on Aug. 2, 1899. On Dec. 4, 1902, he became an associate justice of the Supreme Court of the United States. As a judge he has uniformly favoured a liberal interpretation of the constitution and his opinions have been conspicuous for their literary style and epigrammatic force. In 1924 he was awarded the Roosevelt Memorial Association medal for the development of public law. In addition to the works already mentioned he published in 1891 a small volume of *Speeches*, reissued with additions in 1913, and *Collected Legal Papers* (1920).

HOLMES, WILLIAM HENRY (1846—), American anthropologist, was born in Harrison county, O., on Dec. 1, 1846. He graduated in 1870 from McNeely Normal college (Ohio) and in 1872 became an assistant in the U.S. Geological Survey. He was with the F. V. Halden survey in the Rocky Mountain States for eight years, being assistant geologist 1875-80. In 1880 he was appointed geologist and continued his western explorations. From 1888 to 1894 he served as archaeologist with the Bureau of American Ethnology. After a brief period as curator of anthropology at the Field Columbian museum in Chicago (1894-97), he returned to Washington to become head curator of the department of anthropology at the U.S. National Museum (1897-1902). After serving as chief of the Bureau of American Ethnology from 1902 to 1910, he again returned to his position as head curator at the National Museum, which he held until 1920. During 1908-20 he also served as curator for the National Gallery of Art, and in 1920 gave up his archaeological work to become director of that institution. Holmes was one of the pioneers in archaeological investigation in the South-west. His researches in aboriginal pottery have greatly contributed to knowledge on the subject of the habitat and relationships of Indian groups and cultures.

His books include *Art in Shell of the Ancient Americans* (1883); *Ancient Pottery of the Mississippi Valley* (1886); *Pottery of the Ancient Pueblos* (1886); *Ancient Art of the Province of Chiriqué, Colombia* (1888); *Archaeological Studies among the Ancient Cities of Mexico* (1895-97); *Aboriginal Pottery of the Eastern United States* (1903). A complete bibliography of his writings to 1916 is found in *Holmes Anniversary Volume*, *Anthropological Studies* (1916).

HOLMFIRTH, an urban district of the West Riding of Yorkshire, England, 6 m. S. of Huddersfield, on the L.M.S. railway. Pop. (1921), 10,439. It is situated in the narrow, steep-sided valley of the river Holme, a tributary of the Colne, and is walled in by moorland country. The people are employed in woollen manufactories and in the neighbouring stone quarries.

HOLMIUM, a metallic element, belonging to the rare-earth group, was discovered by Soret in 1878 and independently by Cleve in 1879. In 1912 the oxide was obtained in an almost pure form by Holmberg. Holmium occurs along with erbium, etc., in the minerals gadolinite, euxenite, xenotime, samarskite. It has the symbol, Ho, atomic number 67, and atomic weight 163.5. It is best separated by the crystallisation of the bromates and is thereby obtained mixed with yttrium, which may be removed by the fractional crystallisation of the double sodium sulphates in a vacuum at 25°-30° C. Holmium oxide is yellowish, soluble in many acids to form salts possessing an orange-yellow colour and of a high magnetic susceptibility. Solutions show a strong characteristic absorption spectrum. See RARE EARTHS. (C. J.)

HOLOCAUST, strictly a sacrifice wholly destroyed by fire. The word appears in Greek only in the Septuagint (Lev. 6. 23, in the form ὁλόκαυστον "the wholly-burnt thing"). Such are the sacrifices of the Jews, described in the Pentateuch as "whole burnt offerings" (see SACRIFICE). The term is now often loosely applied to a catastrophe on a large scale, whether by fire or not, or to a massacre or slaughter.

HOLROYD, SIR CHARLES (1861-1917), British artist, was born in Leeds on April 9, 1861. He received his art education under Professor Legros at the Slade School, University college, London. After passing six months at Newlyn, where he painted his first picture exhibited in the Royal Academy, "Fishermen Mending a Sail" (1885), he obtained a travelling scholarship and studied for two years in Italy. At his return, on the invitation of Legros, he became for two years assistant-master at the Slade School, and there devoted himself to painting and etching. For the church of Aveley, Essex, he painted a triptych altarpiece, "The Adoration of the Shepherds," with wings representing "St. Michael" and "St. Gabriel," and designed as well the window, "The Resurrection."

Sir Charles Holroyd was as an etcher possessed of profound technical knowledge of the art. Among the best known are the "Monte Oliveto" series, the "Icarus" series, the "Monte Subasio" series, and the "Eve" series, together with the plates, "The Flight into Egypt," "The Prodigal Son," "A Barn on Tadworth Common" (etched in the open air), and "The Storm." In all his work Holroyd displays sincerity, with a fine sense of composition, and of style. He was appointed the first keeper of the National Gallery of British Art (Tate gallery), and on the retirement of Sir Edward Poynter in 1906 director of the National Gallery. He died at Weybridge on Nov. 17, 1917.

HOLST, GUSTAV (1874—), English composer, was born at Cheltenham on Sept. 21, 1874. His father came of a Swedish family, one branch of which had settled in England early in the century. Holst entered the Royal College of Music, London, in 1893, and was a pupil of Stanford for composition, in which branch he gained a scholarship after two years. He also studied piano, organ and trombone. In 1898 he left the College and for some years played trombone in an orchestra. As a teacher he became associated with the Passmore Edwards Settlement (1904), Morley College (1907), Reading College (1909) and St. Paul's Girls' School, London (1905), and since 1919 has taught composition at the Royal College. In 1918 he worked among the troops in Salonika, organizing music under the Young Men's Christian Association. He visited Michigan university in 1923 for the purpose of conducting a concert of his own works. Holst's international reputation as a composer dates from the appearance of his largest symphonic work, *The Planets* (op. 32), in 1919.

Next in importance are the *Hymn of Jesus*, op. 37, No. 1 (1917), for chorus and orchestra; the Choral Symphony, op. 41 (1923); the Vedic Hymns for voice and piano, op. 24 and for chorus and orchestra, op. 26, which, with the opera *Savitri*, op. 28, represent the Eastern period in Holst's music; the opera: *The Perfect*

Fool (produced at Covent Garden, London, 1923); and the very charming examples of his lighter style—St. Paul's Suite for string orchestra (written for St. Paul's Girls' School), and the mediaeval Songs for voice and violin. Holst produces his choral effects with a sureness and ease that tell of long experience. He is particularly successful in writing for female voices. As an instance of the thoroughness of his methods it may be noted that he studied Sanskrit for the purpose of making his own translations for his songs, and himself wrote the libretto for *Savitri*. Characteristic of his idiom is the folk-song strain in his melody and the frequent use of unusual time-signatures. His other works include *Beni Mora*, op. 29, No. 1, oriental suite for orchestra; Suites for military band, op. 28, a, b; Japanese Suite for orch. op. 33; part-songs for mixed voices, op. 34; choral folk-songs, op. 36, No. 2; *Ode to Death* (Whitman) for chorus and orch.; Fugal overture for orch. op. 40, No. 1; Fugal concerto for flute, oboe and string acqpt. op. 40, No. 2.

HOLST, HERMANN EDUARD VON (1841–1904), German-American historian, was born at Fellin in the province of Livonia on June 19, 1841. Barred from his tutorship in Russia because of a political article, he emigrated to America in 1867, remaining there until 1872. He was professor of history in the University of Strasbourg (1872–74) and at Freiburg in Baden (1874–92) and was also a member of the Baden *Herrenhaus*. In 1892–1902 he was head of the department of history at the University of Chicago. He died in Freiburg on Jan. 20, 1904. His principal work is his *Constitutional and Political History of the United States* (German ed., 1873–91; English trans., 1877–92), based on source materials and written from a strongly anti-slavery point of view.

HOLSTEIN, FRIEDRICH VON (1837–1909) from 1878–1906 counsellor (*Vortragender Rat*) in the political department of the German Foreign Office, was the most important personality, after Bismarck, and equally with William II., in the political history of the German Empire. The following account will give first the chief events in his official career, then a picture of his personality, as reconstructed from documents, recollections and oral tradition, and finally an appreciation of the most important of his political decisions.

Life.—Friedrich August von Holstein was born on April 21, 1837, of an old and noble, but untitled, Mecklenburg family. He attended the gymnasium and the university in Berlin, and after passing his examinations in law entered the foreign office in 1860 as attaché. His first post was in Petersburg, under Bismarck, who was at that time Prussian Ambassador. His most important secretarial post was in Paris after the war of 1870–1871, first under Generals von Fabrice and von Waldersee, and later, after the re-establishment of the embassy, under the ambassador Count Arnim. He became secretary of legation in 1872, and in 1876, after Arnim's fall, was recalled to the foreign office, where the rest of his career was passed. At the Congress of Berlin in 1878 he accomplished excellent work, which was recognised by Bismarck, and was promoted *Vortragender Rat*. This was the end of his actual promotions, but his unseen rise to the highest position of real power was only now to begin. The steps by which he rose cannot be measured by exact events.

After Bismarck's fall he appears at once as the "wirepuller in chief," whose extraordinary influence is known to all the initiated. Henceforward no secretary of state or chancellor might draw up any important document unapproved by him. Neither the changes in the Chancellor's Office (Caprivi, Hohenlohe, Bülow), nor at the head of the Foreign Office (Marschall, Bülow, Richt-hofen) in any way changed the fact that Holstein was the only man in the foreign office who mastered the complicated principles of German foreign policy, and was able to lay down its course with an assurance which may have been real and in any case was apparent. This situation continued, contrary to expectation, even during Bülow's long years of office. The first time that Bülow acted independently was during the Moroccan crisis of 1905–06. Holstein thereupon tendered his resignation, as the most effective way of gaining his point; it happened, however, that both chancellor and the secretary of state succumbed to

strokes in quick succession and the secretary of state's deputy, von Tschirschky, submitted Holstein's proffered resignation to the emperor, who accepted it. There is good reason to suppose that Bülow knew what was happening, although he was able afterwards to persuade Holstein to the contrary, and it is certain that the Secretary of State, Freiherr von Richthofen whose illness proved fatal, had declared for Holstein's dismissal. Holstein himself believed the real author of his fall to be the Emperor's friend, Prince Philip Eulenburg, with whom he had quarrelled after an intimacy lasting many years. Even after Holstein's dismissal, Bülow did not despise his advice in later difficulties. A long memorandum by Holstein exerted a decisive influence on the attitude of the German Government in the Bosnian crisis of 1908–09. The promotion of his friend Kiderlen-Wächter to the position of Secretary of State came too late to benefit him. He died in Berlin in the same year, May 8, 1909.

Relations with Bismarck.—Bismarck, on whose staff Holstein had served as attaché in Petersburg, used his attachés principally to write from his dictation, requiring them not only to take down his ideas but to aid expression. It is quite possible that Bismarck was struck here, not only by Holstein's notable eccentricity, but also by his literary and intellectual powers, which were presently to show themselves in the "Notes" with which Holstein afterwards ruled German policy. In any case, Bismarck kept in personal touch with his former attaché, whom he took with him ten years later to headquarters at Versailles, afterwards appointing him to the embassy under Frieher von Arnim. It was here that the first great scandal arose, which is characteristic of Holstein's mentality. Soon after Arnim's appointment to the embassy, Bismarck quarrelled with him, and employed Holstein to spy on his chief. In the trial in which Bismarck broke the Ambassador, Holstein was obliged to come forward as a witness and to admit that he had written letters to the chancellor about his chief, Count Arnim. Bismarck had unmasked the secretary of legation before all the world as an intrigant; and this earned Holstein's undying hatred. He believed that Bismarck had shamed him as a traitor in order to make him a degraded and unresisting tool. The passion of injured pride and vanity with which he reacted against this, the force of hatred which was to endure nearly twenty years, are no less characteristic of Holstein than his secret collaboration with Bismarck against Arnim. Various remarks on Holstein are attributed to Prince Bismarck and his son Herbert: "only useful for underground work"; "the blind spot" and "the man with the hyena eyes, of whom one must beware." (This the chancellor is alleged to have said to Prince William when giving him an account of affairs and personalities in the Foreign Office.) There is no reason to doubt the authenticity of these remarks.

The very bitterness of them betrays how clearly Bismarck must have realised the hatred burning in Holstein's heart against him. They mean, too, that the Bismarcks, father and son, besides respecting Holstein's ability, had also formed a clear idea of the limits of his capacities. The "blind spot" had a symbolical meaning for Bismarck. He felt that Holstein was myopic in dealing with matters that lay under his eyes. Prince Philip Eulenburg is the chief authority for the statement that Holstein was mainly instrumental in bringing about Bismarck's fall. But, he says, Holstein's tread was so soft and so hidden his ways, that he himself failed to detect the secret method of this enemy. It is impossible to say how far Holstein was influenced by his old hatred, how far by boundless ambition, which could not bear even a Bismarck in its path, and how far by political conviction that Bismarck's policy had ceased to be sound. But any of these three motives may have been present, and they show the composition of a character which was now to develop fully for the first time.

Character.—The chief trait of his character, the essential force in the exercise of which his soul resided, was political genius. Difficult as it may be to define more closely the character of this genius, it was beyond question the dominant feature in Holstein's nature. An attempt to reduce it to its basic psychological forces raises the main question whether intellect or will

was the stronger. The verdicts of most of his colleagues and acquaintances point to an unhealthy preponderance of the intellect. Holstein, it is said, was unsurpassed in the art of analysing situations and questions. But he failed to translate thought into action. Dogmatism and failure of will are said to have been characteristic of him; his most important decisions, it is said, were non-decisions. Historians in general have hitherto shared this view. The author of the present essay cannot agree with them. Holstein's reactions were often over-complicated and mixed with error, but always constructive. They never lacked the practical element. How could Holstein have reached and held the position of the absolutely indispensable adviser, had his advice lacked real power? It is true that he believed the human machine to be almost exclusively ruled by the intellect. He did not think it possible that passion and the blindness which passion involved could prove decisive in high places. In his mind the world of politics was composed of a system of interests, and it was only necessary to know their nature and strength in order to calculate events from moment to moment, as in a meteorological institute, and adapt oneself to them.

It is hardly possible to overestimate the power of this systematic thinking, and as this equation of forces, balanced in Holstein's super-refined brain, was upset by the personal factor: as foreign statesmen, Germany's own ministers, and not last the Emperor himself, failed to act according to the system, this resistance ended by engendering in the central brain that irritability which seemed to all observers unnatural and unhealthy. Holstein's proverbial mistrustfulness was the destiny and the curse of his over-systematic spirit. But this curse went so far as to create the illusion that it was unnecessary to treat the personal factor with any consideration. If interests ruled the progress of the world, semi-automatically, then it was possible to pay out Golushowski, when he was minister, for insolence of which he had been guilty when Secretary of Legation in Paris, or to let Salisbury feel the personal dislike conceived against him, even when his Government was making Germany favourable offers. Holstein shunned every official or social contact in which he was not able to balance and dispose as he wished. The emperor saw him only once; but even the simple social duties which would have been required of him as secretary of state, under Bülow's chancellorship seemed impossible for him. Yet he is said to have been capable of exerting great personal charm when he wished, and it was his habit to elaborate his policy with his intimate friends in a wine cellar of western Berlin as discreet as it was luxurious. The best proof of this ability to charm his enemies, and incidentally, to overcome his own nature, was given by his reconciliation with Maximilian Harden, his most embittered adversary in the journalistic world, after his dismissal.

He also saw many journalists while still in office. His name, however, was never mentioned. Only once was this rule broken. The humorous paper "Kladderadatsch" denounced him, Kiderlen and Philip Eulenburg under transparent pseudonyms as the secret tyrants of the foreign office and wirepuller of the Emperor. Holstein challenged the editor of "Kladderadatsch" to a duel with pistols and wounded his man. But this was not the only quarrel which he tried to settle by the pistol, and although in other cases he was at least dissuaded from a duel, yet his fondness for this means is characteristic of the hermit-like, sensitive but violent man, devoured by his own passion.

In the foreign office, he clung to his commanding position with ruthless jealousy. When an ambassador or minister came to Berlin, the first person to whom he had to report was not the secretary of state or the chancellor, it had to be Councillor von Holstein, who insisted on being called "Baron." Telegrams and reports went through his hands first, and it sometimes happened that urgently necessary papers were not available to the secretary of state because Herr von Holstein had gone on leave and locked them away. A large part of the official correspondence was marked "private for Baron Holstein." On the other hand, he sent private telegrams, letters and notes to the ministers, laying down their attitude, and often the way in which he desired them to report. The most surprising detail recorded of Holstein is

his habit, continued almost daily for years, of speculating on the exchange. The correspondence between him and his intermediary, published by the *Berliner Tageblatt* is undoubtedly genuine. It is doubtful what the real aim of Holstein's speculation was. Money for money's sake, money in order to secure himself certain enjoyments, money for political purposes? Or was it the irresistible need to be in touch, to gamble, not merely with the State, but also with the other mighty force—Capital? The laconic notes to the banker give no answer to this question. It is also impossible to say with certainty whether Holstein let himself be led by financial considerations, into political actions contrary to the interests of the Empire. The correspondence as published gives no ground for the supposition that Holstein the speculator ruled Holstein the Statesman.

Diplomatic Decisions.—Whether Bismarck, after the Congress of Berlin, did or did not utter the proud saying, "From now onward I will drive Europe four-in-hand in harness," the foreign office in Berlin was fully convinced that this was Germany's position in Europe, at least up to the Conference of Algieras, and Holstein developed this conviction into a system. As England would never be able to reconcile her differences either with France or Russia, the Triple Alliance would always remain the dominating combination, even in the case, which hardly needed to be considered seriously, of Russia's joining France in the war against Germany. That was Holstein's basic idea. He therefore held the task of German statesmanship to be to play off England and Russia against each other, either placing them under an obligation by some service, or coercing them by threats if the counter-service was not rendered. He did not in any case want to start a war. That was to be left to the two world powers which were described as the bear and the whale, and which, it was thought, must inevitably clash. This clash would then give Germany her great opportunity.

This was the system on which Holstein based his policy. It began with the non-renewal in March 1890 of the German-Russian Treaty of 1887. It would have been consistent with Holstein's policy to keep the treaty, but the system also allowed him to ignore it. For Holstein did not believe that Russia could form an alliance with France which would stand the test of Mediterranean policy. The suggestion that a treaty with Russia, added to one with Austria, was an act of dishonesty towards the latter power, was incorrect. Both treaties were defensive in their terms, and the aim of the double arrangement was not to let either of the two rivals in the Balkans act against the other and thereby against the peace of Europe. It is true, as Caprivi and others maintained, that this policy was more difficult to conduct than one which dealt with Austria alone. But Holstein shunned simplicity rather than sought it; the only explanation of his decision is therefore his hostility to Bismarck. Bismarck's fall was to be final, his return made impossible. Up to Bismarck's death, Holstein was always tortured by the nightmare of the possible return of the "Bismarcks." The danger of return would, however, have been greater on the renewal of the Russian treaty than at any other time. The following year saw Russia's political understanding with France, and 1892 the drafting of that military convention which was still in force in 1914. If it is remembered that at least up to 1908 Russia did not come into any sort of conflict, even with Austria, much less with Germany, it is clear that the one circumstance which drove the Tsar into the arms of France was the non-renewal of the Treaty, which was accompanied by ostentatious advances by the Emperor William to England, causing the Tsar to fear an attack. Thus two days after Bismarck's dismissal, the superiority of the Triple Alliance, which had hitherto been indubitable, vanished, France emerged from her isolation, and a danger of war between the two European systems of alliance arose. The chief responsibility for this must rest on two men: the Emperor and Holstein.

In the succeeding period Holstein's political path always led him nearer to Russia than to England. This attitude was largely due to his dislike of Lord Salisbury. The rebuffs experienced by Bismarck in 1887 and 1889 from the British foreign minister seem to have had a strong after-effect on Holstein. Between 1893

and 1895 came England's refusal to agree to the Italian plan of redrafting the Mediterranean agreement of 1887 more closely and more favourably for Italy. Holstein had supported Italy's wishes, and felt the refusal as a personal rebuff. Again, after the Chinese-Japanese war, Germany joined the Russo-French Note, while England refused at the last moment, making Germany's attitude conspicuous. Holstein believed that England had manoeuvred him into a false position. Then, in 1895, the British prime minister sounded the Powers regarding the partition of Turkey. Here Holstein conceived a fixed idea that British policy was aiming at bringing Germany into opposition with Russia and getting her to pull the chestnuts out of the fire for Great Britain. For Holstein assumed that Salisbury had conceived the whole plan in order to keep Russia quiet in the Far East. Later, after the emperor had met Salisbury's suggestions with a sharp refusal, Holstein saw that the plan had accorded with Russia's interests, and altered the foreign office's recommendation, but too late.

There is, so far, no documentary proof that Holstein had a share in the congratulatory telegram to President Krüger. But the statement made by Prince Bülow, the Chancellor, in 1904 that Holstein's advice had hitherto been followed in all important decisions, with the express reference to "the anti-English trend in 1896," can hardly mean anything except that Holstein was partly responsible for the Krüger telegram. The author of this telegram, Privy Councillor Kayser, was one of Holstein's intimates.

Holstein is quite certainly the spiritual father of Germany's attitude towards the advances made by Chamberlain and Lansdowne in 1899-1901. In England itself, Salisbury consented only with reluctance to negotiations for a general understanding between England and Germany; and the idea immediately encountered the strongest opposition from Holstein. He feared that Germany was to be driven into a war with Russia and France and dropped at the decisive moment. He rightly saw that England would be unable to allow a fresh victory by Germany over France. But he failed to see that if England were bound to Germany by a general understanding, and America and Japan also joined this combination, as seemed possible, then Russia and France would never have dared risk a war with Germany, Austria and Italy. On the other hand, Holstein committed the error of considering England's differences with France and Russia to be insuperable, although Chamberlain made it absolutely clear that England, if rebuffed by Germany, would seek and find a settlement of her differences with Russia and France, which must then necessarily bring her into opposition to Germany. The negotiations were dragged out so long at Holstein's orders, and made so difficult that at last the British Government broke them off in December 1901 after concluding the Treaty with Japan.

When war threatened to break out between Russia and Japan in 1904, Holstein remained so conspicuously deaf to all warnings, particularly from Freiherr von Eckardstein, the well-informed councillor of embassy in London, that at this point the suspicion arises that financial motives influenced his attitude. During the war he adhered to his former policy of contact with Russia and strained relations dangerously with England by allowing Russian ships of war to take in German coal in the Baltic. If England had now joined Japan in her fight with Russia, and if France had supported her ally Russia against England and Japan, the Continental Alliance between Russia, France and Germany would have been formed. Without wishing for a war with England, which would have entailed the sacrifice of Germany's mercantile marine, Holstein envisaged the possibility of this alliance; and there is proof that one of the motives behind the German naval programme was the wish to enhance Germany's value to Russia as a potential ally. The Emperor, indeed, when he afterwards concluded the desired alliance with the downcast Tsar at Björkoe on July 24, 1905, privately altered the Foreign Office draft and limited the obligation of active mutual assistance to Europe, evoking thereby Bülow's offer of resignation, which was as unexpected as it was unwelcome to him. Bülow could have nullified the effect of the treaty of Björkoe, which the Russian Foreign Minister, Count Lamsdorff saw to be impracticable, without resigning; his threat of resignation must be therefore looked on as

a successful attempt to curb the Emperor's power—a typical Holstein manoeuvre. Holstein himself attempted to have the Emperor placed under control as insane only a few years after his accession.

The last time that Holstein determined German policy was over the first Morocco bargain with France. The Anglo-French Entente had just been concluded and England had promised to support France in her action, which was irreconcilable with the 1880 Morocco Convention of Madrid. Holstein had always declared the Anglo-French entente to be a dream, and wished to seize the opportunity to shatter it. If this artificial web were only held to the light of the sun, he thought, the natural opposition of the two Powers in Morocco must pulverize it. The Emperor wanted Germany to remain disinterested in Morocco; but Bülow and Holstein sent him to Tangier against his will. There by a speech, not that drawn up for him by the foreign office, but one of his own—which gave Holstein a nervous shock—he drew on himself public disapproval of his personal interference. The French and British Governments would have been glad to find a diplomatic settlement for the matter, but Holstein insisted on a conference and was not even satisfied by Delcassé's leaving the French Cabinet. He wanted to put forward and enforce such unmistakable and decisive demands as to compromise the Anglo-French entente. As Russia was absolutely out of action at the moment, and the French Government was consequently unable to risk an armed conflict; and as Germany also had international law on her side, which must place the British Government in an embarrassing light, Holstein's campaign, which he planned with great energy, had every prospect of success. But here for the first time Bülow failed to follow his tyrannical advisor. Fear of possible war with Great Britain, which would annihilate Germany's trade, seems to have been his decisive motive. Holstein in consternation tendered his resignation for the fourteenth time, and this time, as said above, it was, contrary to expectation, accepted. Thus he relinquished the reins of policy, after holding them since Bismarck's resignation. Only once again, during the Bosnian crisis, had he an opportunity of affecting a great decision by his advice. Holstein believed that the issue of the crisis had been a victory for Germany, which repaired the defeat of 1906. This was a grave error. Far from loosening the Entente, Russia's defeat over the Bosnian question in 1908-1909 was the occasion for a re-construction of the Entente on lines of closer diplomatic co-operation, and of a definite determination to arm.

This brings us to the final appreciation of Holstein's policy. It was Holstein who by his share in the non-renewal of the German Treaty with Russia, took the decisive step in making Germany dependent on Austria-Hungary. In trying to repair this fault by a rapprochement with Russia, he missed the hour in which Great Britain could have been won for the Triple Alliance, without being able to overcome the hostility of Russia, which dated from 1878 and had its roots in her rivalry with Austria in the Balkans. Finally, when England had composed her difficulties with France and Russia, consequent on which Italy also joined this group, Germany was left alone with Austria-Hungary. Possibly Holstein's Morocco policy would have been a more effective way of breaking the increasing menace of encirclement than Austria's war with Serbia in 1914. But it was due to Holstein's policy that the two central Powers were ever isolated at all.

HOLSTEIN, formerly a duchy of Germany, now incorporated in Prussia. Until about 1110 the county of Holstein formed part of the duchy of Saxony, and it was made a duchy in 1472. From 1460 to 1864 it was ruled by members of the house of Oldenburg, some of whom were also kings of Denmark. By the Treaty of Vienna (Aug. 1864) which concluded the Danish War, Holstein

was ceded to Prussia and Austria jointly, but placed under the administration of Austria, which, however, was forced to deliver it over to Prussia after the Austro-Prussian War of 1866. (See SCHLESWIG-HOLSTEIN; SCHLESWIG-HOLSTEIN QUESTION.)

HOLSTENIUS, LUCAS, the Latinized name of Luc Holste (1596-1661), German humanist, geographer and theological writer, was born at Hamburg. He studied at Leyden university, where he became intimate with the most famous scholars of the age—J. Meursius, D. Heinsius and P. Cluverius, whom he accompanied on travels in Italy and Sicily. Eventually he went to Paris, and was recommended to Cardinal Francesco Barberini, papal nuncio and the possessor of the most important private library in Rome. On the cardinal's return in 1627 he took Holstenius with him as his librarian. He was appointed librarian of the Vatican by Innocent X., and was sent to Innsbruck by Alexander VII. to receive Queen Christina's abjuration of Protestantism. He died in Rome on Feb. 2, 1661. Holstenius was a man of unwearied industry and immense learning, but he lacked the persistency to carry out the vast literary schemes he had planned. He was the author of notes on Cluvier's *Italia antiqua* (1624); an edition of portions of Porphyrius (1630); notes on Eusebius *Against Hierocles* (1628), on the Sayings of the later Pythagoreans (1638), and the *De diis et mundo* of the neo-Platonist Sallustius (1638); *Notae et castigationes in Stephani Byzantini ethnica* (first published in 1684); and *Codex regularum, Collection of the Early Rules of the Monastic Orders* (1661). His correspondence (*Epistolae ad diversos*, ed. J. F. Boissonade, 1817) is a valuable source of information on the literary history of his time.

See N. Wilckens, *Leben des gelehrten Lucae Holstenii* (Hamburg, 1723); Johann Möller, *Cimbria literata*, iii. (1744).

HOLSTER, a leather case to hold a pistol, used by a horseman and properly fastened to the saddle-bow, but sometimes worn in the belt. More loosely it is applied to any pistol or revolver case worn on the person.

HOLT, SIR JOHN (1642-1710), lord chief justice of England, son of a small landowner, Sir Thomas Holt, was born at Thame, Oxfordshire, on Dec. 30, 1642. He studied at Oriel college, Oxford and at Gray's Inn, London. He was called to the bar in 1663. An ardent supporter of civil and religious liberty, he defended accused persons in many state trials. In 1685-86 he was appointed recorder of London, and about the same time he was made king's sergeant and was knighted. His giving a decision adverse to the pretensions of the king to exercise martial law in time of peace led to his dismissal from the office of recorder, but he was continued in the office of king's sergeant in order to prevent him from becoming counsel for accused persons. As a legal assessor to the peers in the Convention he took a leading part in the Revolution, and after the accession of William III. was appointed lord chief justice of the King's Bench. In judicial fairness, legal knowledge and ability, clearness of statement and unbending integrity he has had few superiors on the English bench. He is best known for the firmness with which he upheld his own prerogatives in opposition to the authority of the houses of parliament. Having been requested to supply police to help the soldiery in quelling a riot, he assured the messenger that if any of the people were shot he would have the soldiers hanged, and went himself to the scene of riot to prevent bloodshed. On the retirement of Somers from the chancellorship in 1700 he was offered the great seal, but declined it. He died in London on March 5, 1710. He was buried in the chancel of Redgrave church.

See *Reports of Cases determined by Sir John Holt* (1681-1710) published at London in 1738; and *The Judgments delivered in the case of Ashby v. White and others, and in the case of John Raty and others, printed from original mss.*, at London (1837). *Burnet's Own Times*; *Taiter*, No. xiv.; a *Life*, pubd., 1764; Welsby, *Lives of Eminent English Judges of the 17th and 18th Centuries* (1846); Campbell's *Lives of the Lord Chief Justices*; and Foss, *Lives of the Judges*.

HOLTEI, KARL EDUARD VON (1798-1880), German poet and actor, was born at Breslau on Jan. 24, 1798, the son of an officer of Hussars. After serving in the Prussian army as a volunteer in 1815, he began to study law at Breslau, but abandoned his studies for the stage. In 1821 he married the actress Luise Rogée (1800-1825), and was appointed theatre-poet to the Bres-

lau stage. He next removed to Berlin, where he produced the popular vaudevilles *Die Wiener in Berlin* (1824), and *Die Berliner in Wien* (1825). After his wife's death he wrote a number of plays for the Königsstädter theatre in Berlin, notably *Lenore* (1829) and *Der alte Feldherr* (1829). In 1830 he married Julie Holzbecher (1809-1839), an actress engaged at the same theatre, and with her played in Darmstadt. Returning to Berlin in 1831 he wrote for the composer Franz Gläser (1798-1861) the text of the opera *Des Adlers Horst* (1835), and for Ludwig Devrient (*q.v.*) the drama, *Der dumme Peter* (1837). In 1833 Holtei toured with his wife in Hamburg, Leipzig, Dresden, Munich and Vienna. At Vienna the poet-actor created a sensation by his brilliant recitations, especially of Shakespeare, and was appointed manager of the Josefstädter theatre. Holtei left Vienna in 1836, and from 1837 to 1839 conducted the theatre in Riga. Here his second wife died, and he wandered from place to place, eventually settling in 1847 at Graz, where he wrote the novels *Die Vagabunden* (1851), *Christian Lammfell* (1853) and *Der letzte Komödiant* (1863). The last years of his life were spent at Breslau, where he found a home in the *Kloster der barmherzigen Brüder*, and here he died on Feb. 12, 1880.

As a dramatist Holtei may be said to have introduced the "vaudeville" into Germany; as a reciter, especially of Shakespeare, he knew no rival.

See his interesting autobiography, *Vierzig Jahre* (8 vols., 1843-50; 3rd ed., 1862) with the supplementary volume *Noch ein Jahr in Schlesien* (1864); Holtei's *Theater* appeared in 6 vols. (1867); his *Erzählende Schriften*, 39 vols. (1861-66); M. Kurnick, *Karl von Holtei, ein Lebensbild* (1880); F. Wehl, *Zeit und Menschen* (1889); O. Storch, *K. von Holtei* (1898); Moschner, *Holtei als Dramatiker* (1911).

HÖLTJ, LUDWIG HEINRICH CHRISTOPH (1748-1776), German poet, was born on Dec. 21, 1748, at the village of Mariensee, Hanover, where his father was pastor. In 1769 he went to study theology at Göttingen. Here he formed a close friendship with J. M. Miller, J. H. Voss, H. Boie, the brothers Stolberg and others, and became one of the founders of the famous society of young poets known as the *Göttinger Dichterbund* or *Hain*. He died of consumption on Sept. 1, 1776, at Hanover. Hölty was the most gifted lyric poet of the Göttingen circle. He was influenced both by Uz and Klopstock, but his love for the Volkslied and his delight in nature preserved him from the artificiality of the one poet and the unworldliness of the other. A strain of melancholy runs through all his lyrics. His ballads are the pioneers of the rich ballad literature on English models, which sprang up in Germany during the next few years. Among his most familiar poems may be mentioned "Üb' immer Treu' und Redlichkeit," "Tanzt dem schönen Mai entgegen," "Rosen auf dem Weg gestreut," and "Wer wollte sich mit Grillen plagen?"

Hölty's *Gedichte* were published by his friends Count Friedrich Leopold zu Stolberg and J. H. Voss (Hamburg, 1783); new ed. enlarged by Voss, with a biography (1804); critical edition by W. Michael (2 vols., 1914-18). See H. Ruete, *Hölty, sein Leben und Dichten* (Guben, 1883); A. Sauer, *Der Göttinger Dichterbund*, vol. ii. (Stuttgart, 1894), where an excellent selection of Hölty's poetry will be found.

HOLTZENDORFF, FRANZ VON (1829-1889), German jurist, born at Vietmannsdorf, Brandenburg, on Oct. 14, 1829, studied law at Bonn, Heidelberg and Berlin. In 1860 he was nominated a professor extraordinary at Berlin. The predominant party in Prussia regarded his political opinions with mistrust, and he did not become full professor until February 1873, after he had decided to accept a chair at the university of Munich. At Munich he passed the last nineteen years of his life. Holtzendorff was an authority on criminal and international law. He edited the *Encyclopädie der Rechtswissenschaft* (Leipzig, 1870-71) and other works.

HOLTZMANN, HEINRICH JULIUS (1832-1910), German Protestant theologian, was born on May 17, 1832 at Karlsruhe, where his father, K. J. Holtzmann, ultimately became prelate and counsellor to the supreme consistory. Julius studied at Berlin, and became (1874) professor at Strasbourg. He wrote commentaries on the Synoptics (1889; 3rd ed., 1901), the Johanneine books (1890; 3rd ed., 1908), and the Acts of the Apostles (1901), in the series *Handkommentar zum Neuen Testament*.

Other noteworthy works are the *Lehrbuch der histor.-kritischen Einleitung in das Neue Testament*. (1885, 3rd ed. 1892), and the *Lehrbuch der neuestenamenlichen Theologie* (2 vols., 1896-97; 2nd ed., 1911).

HOLUB, EMIL (1847-1902), Bohemian traveller in south-central Africa, was born at Holitz, eastern Bohemia, on Oct. 7, 1847. In 1872 he went to the Kimberley diamond-fields, and practised as a surgeon. He undertook expeditions to the northern Transvaal, Mashonaland and through Bechuanaland to the Victoria Falls, making extensive natural history collections. In June 1886 he crossed the Zambezi west of the Victoria Falls, and explored the then almost unknown region between that river and its tributary the Kafue. When beyond the Kafue the camp was attacked by the Mashukulumbwe, and Holub had to retreat. He returned to Austria in 1887 with a collection of great scientific interest, of over 13,000 objects, now in various museums. Holub died at Vienna on Feb. 21, 1902.

His principal works are: *Eine Kulturskizze des Marutse-Mambunda-reichs* (Vienna, 1879); *Sieben Jahre in Südafrika*, etc. (2 vols., Vienna, 1880-81), of which an English translation appeared; *Die Colonisation Afrikas* (Vienna, 1882); and *Von der Kapstadt ins Land der Maschukulumbe* (2 vols., Vienna, 1818-1890).

HOLY, sacred, devoted or set apart for religious worship or observance. It is a term characteristic of the sublimity and perfection of God, as the object of human reverence, awe and worship; and it is applicable to all that is held sacred or that excites awe, particularly, though not exclusively, to what is worthy of veneration or reverence on the ground of its moral worth; hence the term is transferred to those human persons, who, either because of their devotion to a spiritual life, or because of their moral perfection, are considered worthy of reverence. See RELIGION.

HOLY ALLIANCE, THE. The famous declaration known by this name was signed in the first instance by Alexander I., emperor of Russia, Francis I., emperor of Austria, and Frederick William III., king of Prussia, on Sept. 26, 1815.

This document, the text of which was not published till 1816, laid down that the reciprocal relations of the Powers were henceforth to be based "on the sublime truths which the Holy Religion of our Saviour teaches"; that "the precepts of Justice, Christian Charity and Peace . . . must have an immediate influence on the councils of Princes, and guide all their steps"; that the three monarchs would, accordingly, "remain united by the bonds of a true and indissoluble fraternity" and "on all occasions and in all places, lend each other aid and assistance," while "regarding themselves towards their subjects and armies as fathers of families" (Art. I.); that the said Governments and their subjects would consider themselves as "members of one and the same Christian nation" (Art. II.). In the last article (III.) all the Powers who should "choose solemnly to avow the sacred principles which have dictated this act" were invited to join "this Holy Alliance."

The credit for inspiring this singular document was claimed by the Baroness von Krüdener (q.v.); in any case it was the outcome of the tsar's mood of evangelical exaltation, and was in its inception perfectly sincere. Neither Frederick William nor Francis signed willingly, the latter remarking that "if it was a question of politics, he must refer it to his chancellor, if of religion, to his confessor." Metternich called it a "loud-sounding nothing," Castlereagh, "a piece of sublime mysticism and nonsense." None the less, all the European sovereigns appended their signatures to it, except the prince regent of Great Britain, the Pope and the Sultan. The prince regent courteously declined to sign, on the constitutional ground that all acts of the British Crown required the counter-signature of a minister, but he sent a letter expressing his "entire concurrence with the principles laid down by the 'august sovereigns' and stating that it would always be his endeavour to regulate his conduct by their 'sacred maxims.'" The Pope could not sign a religious manifesto in common with schismatics and heretics, while the exclusion of the caliph of Islam was so obvious as to lead to sinister suspicions of the Emperor Alexander's motives.

In popular parlance the "Holy Alliance" soon became synony-

mous with the combination of the Great Powers by whom Europe was ruled for some years after 1815, and associated with the policy of reaction which gradually dominated their counsels. For the understanding of the history of this period, however, a clear distinction must be drawn between the Holy Alliance and the Grand or Quadruple (Quintuple) Alliance. The Grand Alliance was established on definite treaties concluded for definite purposes, of which the chief was the preservation of peace on the basis of the settlement of 1815. The Holy Alliance was a general treaty—hardly indeed a treaty at all—which bound its signatories to act on certain vague principles for no well-defined end.

As a diplomatic instrument the Holy Alliance never became effective. None the less, its principles and the fact of its signature had a powerful effect during the 19th century. It strongly influenced Nicholas I. of Russia, to whom the brotherhood of sovereigns by divine right was an article of faith, inspiring the principles of the Convention of Berlin (between Russia, Austria and Prussia) in 1833, and the tsar's intervention in 1849 to crush the Hungarian insurrection on behalf of his brother of Austria. That it had become synonymous with a conspiracy against popular liberties was, however, a mere accident of the point of view of those who interpreted its principles. It was capable of other and more noble interpretations, and it was avowedly the inspiration of the famous rescript of the emperor Nicholas II. which resulted in the first international peace conference at The Hague in 1899. (W. A. P.)

HOLY GHOST: see HOLY, SPIRIT.

HOLYHEAD (Caer Gybi, the fort of Cybi), a seaport and town of Anglesey, North Wales, on Holy Island, at the western end of the county. Pop. (1921) 11,761. It is a terminus of the L.M. S.R. 264 m. from London by rail. The church may occupy the site of the old monastery of St. Cybi (6th or 7th century). There are traces (camps, etc.) of earlier occupation on the high ground near the town. Once a fishing village the town has since the reign of William IV. acquired importance as a packet station for Dublin. It was selected for this purpose in 1801 and in 1815-19 was made the terminus of the great Telford road from England. The harbour protected by a breakwater (1½ m.) was opened in 1873. Additions were made in 1880. There is passenger traffic to Dublin and Greenore and mails are carried to Dun Laoghaire (Kingstown).

HOLY ISLAND or LINDISFARNE, an irregularly shaped island in the North Sea, 2 m. from the coast of Northumberland, in which county it is included. Pop. (1921) 586. It is joined to the mainland at low water by flat sands, over which a track, marked by wooden posts and practicable for vehicles, leads to the island. There is a station on the N.E. railway at Beal, 9 m. south-east of Berwick, opposite the island, but 1¼ m. inland. Its total area is 1,051 acres. On the N. it is sandy and barren, but on the S. very fertile and under cultivation. Large numbers of rabbits have their warrens among the sands, and, with fish, oysters and agricultural produce, are exported. There are several fresh springs on the island, and in the north-east is a lake of 6 acres. At the south-west angle is the little fishing village (formerly much larger) which is now a favourite summer watering-place. Here is the harbour, offering good shelter to small vessels. Its ruins, still extensive and carefully preserved, justify Scott's description of it as a "solemn, huge and dark-red pile." An islet, lying off the S.W. angle, has traces of a chapel upon it, and is believed to have offered a retreat to St. Cuthbert and his successors. The castle, situated east of the village, on a basaltic rock about 90 ft. high, dates from c. 1500.

When St. Aidan came at the request of King Oswald to preach to the Northumbrians he chose the island of Lindisfarne as the site of his church and monastery, and made it the head of the diocese which he founded in 635; hence its name. For some years the see continued in peace, numbering among its bishops St. Cuthbert, but in 793 the Danes landed on the island and burnt the settlement, killing many of the monks. The survivors, however, rebuilt the church and continued to live there until 833, when, through fear of a second invasion of the Danes, they fled inland.

taking with them the body of St. Cuthbert and other holy relics. The church and monastery were again destroyed and the bishop and monks, on account of the exposed situation of the island, determined not to return to it, and settled first at Chester-le-Street and finally at Durham. With the fall of the monastery the island appears to have become again untenanted, and probably continued so until in 1082 the prior and convent of Durham established there a cell of monks from their own house. The inhabitants of Holy Island were governed by two bailiffs at least as early as the 14th century, and, according to J. Raine in his *History of North Durham* (1852), are called "burgesses or freemen" in a private paper dated 1728. Towards the end of the 16th century the fort on Holy Island was garrisoned for fear of foreign invasion. During the Civil Wars the castle was held for the king until 1646, when it was taken and garrisoned by the parliamentarians. The only other historical event connected with the island is the attempt made by two Jacobites in 1715 to hold it for the Pretender. The island has two life-boat stations.

HOLYOAKE, GEORGE JACOB (1817-1906), English secularist and co-operator, was born at Birmingham on April 13, 1817. At an early age he became an Owenite lecturer, and in 1841 was the last person convicted for blasphemy in a public lecture, though this had no theological character and the incriminating words were merely a reply to a question addressed to him from the body of the meeting. He nevertheless underwent six months' imprisonment, and upon his release invented the inoffensive term "secularism" as descriptive of his opinions, and established the *Reasoner* in their support. He was also the last person indicted for publishing an unstamped newspaper, but the prosecution dropped upon the repeal of the tax. His later years were chiefly devoted to the promotion of the co-operative movement among the working classes. He wrote the history of the Rochdale Pioneers (1857), *The History of Co-operation in England* (1875; revised ed., 1906), and *The Co-operative Movement of To-day* (1891). He also published (1892) his autobiography, under the title of *Sixty Years of an Agitator's Life*, and in 1905 two volumes of reminiscences, *Bygones worth Remembering*. He died at Brighton on Jan. 22, 1906.

See J. McCabe, *Life and Letters of G. J. Holyoake* (2 vols., 1908); C. W. F. Goss, *Descriptive Bibliography of the Writings of G. J. Holyoake* (1908).

HOLYOKE, a city, Hampden county, Mass., U.S.A., on the Connecticut river, 8m. N. of Springfield. It is served by the Boston and Maine and the New York, New Haven and Hartford railways. The population was 60,203 in 1920 (33.6% foreign-born white) and was estimated locally at 63,000 in 1928. The city occupies 17 sq.m. in a bend of the river, on the west bank, at the foot of Mount Tom. It is a busy industrial and commercial centre, with a factory output in 1925 valued at \$88,325,281 and bank debits in 1926 amounting to \$196,335,000. The outstanding products are fine writing and envelope papers, in which it leads all the cities of the United States. Cotton, silk, alpaca and woollen goods also are extensively manufactured, and among the many other products are steam pumps, water wheels and machinery. The assessed valuation of property in 1926 was \$117,057,360. The immense water-power from the Connecticut river (which falls 60ft. in 1.5m. just above the city) was not utilized until 1849, when a great dam (1,017ft. long) was completed, a colossal undertaking for the time. Before that Holyoke had been a farming village, originally part of Springfield, and after 1774 of West Springfield; and the population in 1850, when the town was incorporated, was only 3,245. By 1870 it had increased to 10,733, and in 1873 the town was chartered as a city. Between 1870 and 1880 the population doubled, and it continued to grow rapidly until 1910.

HOLY ROMAN EMPIRE: see EMPIRE; EUROPE; HABSBURGS; HOHENSTAUFEN, etc., and under the names of the various emperors. See also PAPACY.

HOLY SPIRIT, THE, a term which developed from the use of the word "spirit" (*spiritus* in the Vulgate), to translate the Hebrew *ruach*, Greek *πνεῦμα*. Etymology and usage suggest that the common meaning of the three terms is the "blowing" of the

wind and the "breathing" of man. This is the physical basis of the remarkable and influential duality of meaning in the three terms—their inclusion of both supernatural and natural aspects of human life and experience. (Primitive thought knows no natural explanation of the wind, and the power or mystery of the wind made it a typical example of the supernatural, lending its name to similar phenomena or agencies.) The usage of the three terms, however, also shows characteristic differences, due to those of the Hebrew, Greek and Roman peoples. *Ruach* becomes a theological term denoting the personal energy of God; *pneuma*, in philosophy or medical science, a permeating principle; *spiritus*, at any rate in its modern equivalents, has tended more and more to denote personal, especially religious, experience—a development which makes the English equivalent one of our most subtle and interesting words (more than a score of different meanings may be found in the *New English Dictionary*, s.v.).

The Old Testament.—The Hebrew word, *ruach*, began its long history not by denoting an element of human personality, afterwards transferred to God, but as a divine activity, subsequently transferred to man. Critical study of the Old Testament shows that *ruach* is not used of the human breathing or with psychical predicates before the exile, whereas from the earliest period it does denote the wind, conceived as a superhuman activity. It was natural, therefore, to use the term of any powerful and mysterious agency, acting on man from without, and of any abnormal display of energy by man himself. At this stage the use is non-moral and comprehensive as to source, not being confined to energies controlled by Yahweh. Only as Israel came to conceive Him as omnipotent and as acting according to ethical standards did *ruach*, the characteristic expression of His energy, move towards the conception of "the Holy Spirit." This full term occurs three times only (Ps. li. 11, Is. lxiii. 10, 11), but the noun alone develops the conception of ethical majesty *pari passu* with the conception of Yahweh Himself (the adjective "Holy" originally denoted not moral character but the "numinous," that aspect of the divine which separates it from the human).

The divine activity expressed by *ruach* is the source of the most varied phenomena, ranging from Samson's outbursts of physical energy without moral purpose (Jud. xiv. 6, 19, xv. 14) to Ezekiel's conception of the changed heart as the spring of moral obedience (xxxvi. 26, 27). In the earlier "prophesying" (e.g., I Sam. xix. 18-24), prominence is given to the physical phenomena ascribed to the Spirit; in the later development of ethical prophecy these sink into the background, without being wholly lost, as we may see from Ezekiel. The outpouring of the prophetic Spirit upon all without distinction is a sign of the "Messianic" age (Joel ii. 28, 29); this is a more external parallel to the inwardness of the "New Covenant" of Jeremiah (xxxi. 31-34), when all shall know Yahweh. Through the whole development of a thousand years *ruach* denotes the transcendent, not the immanent, energy of God. The nearest approach to immanence is that from the exile onwards the term *ruach* denotes the breath or breath-soul or inner life of man, naturally with the suggestion of its divine origin. This is an important fact for the Pauline usage of *pneuma*; the use of the same term to denote the super-normal energy of God and the normal life in man was an implicit assertion of kinship between the human and the divine. Yet we must not press this too far within the Old Testament, because of the sharp antithesis there made between God and man (as in the contrast of Spirit and flesh in Is. xxxi. 3). Even when God is said to be omnipresent by His Spirit (Ps. cxxxix. 7) there is no suggestion of an immanent permeating principle such as is developed in the Greek use of *pneuma*. The Holy Spirit in the Old Testament is a personal, yet unhypos-tasized, activity of God, almost always concerned with human life.

LIMITATIONS OF THE TERM

Between the Testaments.—The subsequent Palestinian Judaism made no fresh contribution to the doctrine of the Holy Spirit, but tended to limit the activity to prophecy and to regard the Torah (Pentateuch) as the Spirit's characteristic work. Thus the Spirit belonged to the past or to the future (Ps. Sol. xvii. 42), rather than to the present, which was conscious of the lack of the

prophetic impulse (Ps. lxxiv. 9, I. Macc. iv. 46, ix. 27, xiv. 41; the Second Temple was said to lack the ark, the fire, the Shechinah, the Spirit, the Urim and Thummim). A new influence, however, came into Alexandrian Judaism through its use of the Greek term *pneuma* (used by the Septuagint to translate *ruach*). The Stoic Posidonius had described God as *pneuma*, with the qualities of both intelligence and fire, formless yet capable of unlimited transformation; the Stoics generally explained the bodily senses as due to the immanent activity of *pneuma*, which might be described as the "material" out of which the *psyche* or soul is composed. The *Wisdom of Solomon* continues this Stoic doctrine of immanence, and blends the idea of the Spirit of God with that of "Wisdom" (vii. 22, cf. i. 4-7, ix. 17); here, perhaps, we may first speak of a "hypostasis" of the Holy Spirit, i.e., of a divine attribute endowed with separate existence. Philo has largely absorbed the content of "Wisdom" and "Spirit" into his characteristic term, "Logos"—a fact which should remind us how elastic were these mediatorial ideas in New Testament times. It is clear that the doctrine of the Spirit did not take anything like so distinctive a place in contemporary Judaism, Palestinian or even Alexandrian, as in the Christian life of the New Testament. It is also clear that the suggestion of immanence in the Greek term *pneuma* might deeply affect its connotation when used to render *ruach*, though this Hellenistic influence can easily be exaggerated (as by Leisegang). The Hebrew connotation of *ruach* remains fundamental in regard to transcendent personal activity and to ethical content.

The New Testament.—Jewish faith expected the Messiah to be endowed with the Holy Spirit (Is. xi. 1 seq.; Ps. Sol. xvii. 39 seq.), and this faith is reflected in the Synoptic account of Jesus, whose birth, baptism and ministry of power are directly linked to the Spirit's activity. He wages war with the demonic world in the power of the Spirit (Mt. xii. 28), and at "Pentecost" this power is consciously realized as resting upon His disciples (Acts ii. 4, 17 seq.). The abnormal physical and psychical phenomena which seem to have accompanied baptism in primitive Christianity were ascribed to the Holy Spirit, and corresponded in some degree with those of early "prophecy" in the Old Testament. It was the Apostle Paul who ethicized this conception and transformed it in a way comparable with that of the eighth century prophets; to him, intelligible and "edifying" prophecy was worth infinitely more than the unintelligible gift of "tongues," which needed an interpreter (I Cor. xiv.) (see TONGUES, SPEAKING WITH). The *charismata* or gifts of the Spirit (I Cor. xii. 4 seq.) were bestowed within, and for, the community; hence "love" was the highest of them all. The fruit of the Spirit was that of the Christlike character (Gal. v. 22, 23). To be "in Christ" was to be a new creation of the Spirit of Christ. Paul drew no clear distinction between the activity of the risen Christ and that of the Holy Spirit, as we may see from the alternations of Rom. viii. 9-11 ("Spirit of God, of Christ, Christ in you, indwelling Spirit"—all with the same connotation of experience). The whole of the Christian experience, as Paul conceived it, can be gathered within the formula of Eph. ii. 18: "through Christ, we have our access in one Spirit unto the Father." The supreme work of the Holy Spirit is to create the Christian fellowship. The Fourth Gospel develops this conception in the light of the experience of the Church during the first century. The Holy Spirit is represented as continuing the work of Christ in and through the Church, as another "Paraclete" or "Helper." The world will be convinced of sin, righteousness and judgment (xvi. 8-11) through the presence of the Spirit with the community of disciples.

So far, nothing has been said of the metaphysical basis of this experience, i.e., what it implies as to the Godhead. We shall find in the New Testament no explicit teaching as to the Trinity, but simply such data of thought and experience as may be held to require such a doctrine to explain them. The two clearest references are those of the benediction (II. Cor. xiii. 14) and the baptismal formula (Matt. xxviii. 19). But the former gives us no more in reality than the reversed line of approach of Eph. ii. 18; the grace of Christ springs from the love of God and operates through the fellowship (of man with God and man with man) created by the Holy Spirit; the baptismal sentence does not carry

us further than this "intensive" line of God's approach to man and man's approach to God. We are hardly warranted in saying more of St. Paul's doctrine of the Godhead than that, for him, the real presence of God, as known through Christ, "the Lord the Spirit" (II. Cor. iii. 18), was inwardly experienced by the believer who had been baptized in the Spirit (I. Cor. xii. 13) and had thus entered the fellowship (Phil. ii. 1). This real presence of God is personally experienced and conceived, and the New Testament data warrant us in asking whether God as Spirit can be conceived as other than personal. But the metaphysical questions were not faced by the New Testament believers; they belong to the next period of the history of the doctrine.

The Dogmatic Development.—The early uncertainties as to the extension of monotheism are illustrated by the *Shepherd of Hermas*, who does not distinguish the pre-existent Son of God from the Holy Spirit, and no trinitarian formula was reached by the Apologists. Meanwhile, the growing emphasis on the more external aspects of the Church, the ministry, and the sacraments provoked the interesting Montanist reaction—an attempt to revive the New Testament "life in the Spirit." Sabellius (fl. 215) regarded the Holy Spirit as a "mode" of the one God (Monarchianism). Origen (185-254) held the Holy Spirit to be the highest of the spiritual beings brought into existence through the Son, though he refrains from using the term *ktisma* (creature); the work of the Spirit is essentially the sanctification of believers. Tertullian—a Montanist—was the first to deal at all adequately with the doctrine of the Trinity. But during the ante-Nicene period there is no settled "Doctrine of the Holy Spirit": thought on the subject is fluid and unformed. At the Council of Nicaea (325) it is significant that whilst the Father and the Son receive careful and elaborate definition, there is but the bare mention of the Holy Spirit in the third place, without any definition at all. But when the *homoousia* (identity of nature with the Father) of the Son had been successfully asserted in the Arian Controversy, the result was transferred, without any corresponding discussion, to the Holy Spirit, as the third *hypostasis* of the Godhead (Synod of Alexandria, 362). Moreover, as the interpretation of Christ in terms of the divine *Logos* (creative reason or word in the world) tended to fall into the background, that of Christ as Son taking its place, functions hitherto often ascribed to the *Logos*, came to be ascribed to the Spirit; the conception of the Spirit therefore became more prominent. The only controversy dealing directly with the doctrine of the Holy Spirit was that known as the "Macedonian," which was hardly more than the closing phase of the Arian Controversy. The orthodox doctrine of the Church was due to the three "Cappadocians" (Basil of Caesarea, Gregory of Nazianzum and Gregory of Nyssa); the three *hypostases* were distinguished by the conception of the Father as "ingenerate," the Son as "generate," and the Spirit as proceeding from the Father through the Son. The Council of Constantinople (381), which repudiated Macedonianism, described the Holy Spirit as "Sovereign and Life-giving, Who proceedeth from the Father, Who with the Father and the Son is together worshipped and glorified: Who spake by the prophets." Its decisions were confirmed at the Council of Chalcedon (451).

The Western Church, at least from Tertullian's time, had asserted that the Holy Spirit proceeded from the Father and the Son, as Augustine definitely argued in the interest of the unity of the Godhead. The Eastern Church, which regarded the Son and the Spirit as in some sense subordinate to the Father, taught that He was the only source of the Spirit. Consequently, the insertion of *filioque* in the Creed, for the first time at the third Council of Toledo (589), created a formal issue between the West and the East which has contributed to their lasting separation. The Eastern position is expressed by John of Damascus (700-754)—"proceeding from the Father and communicated through the Son . . . we do not speak of the Spirit as from the Son."

Scholasticism, concerned with the philosophic defence and elaboration of the faith, contributed no really new feature to the doctrine of the Holy Spirit. The Council of Trent (1545-1563) claimed the direct inspiration of the Holy Spirit for the traditions of the Church as equal in authority to that of the Scriptures

(including the Apocrypha). Justification was regarded as the infusion of righteousness through the Holy Spirit, mediated through the whole system of the Church. On the other hand, the mysticism of the Middle Ages, by its endeavour after a more direct fellowship with God, paved the way for that re-discovery of the activity of the Spirit in Christian experience which characterized the Reformation. The *Theologia Germanica*, for example, forming a direct and important link with Luther, brings us back to the realization of the indwelling presence of God through the surrender of the will to Him.

Augustine had laid the foundation of the Western doctrine of grace, which he held to be the activity of the Holy Spirit, inspiring faith, love and the whole experience of regeneration; but this was bound up with his doctrine of the Church and the sacraments. Luther also made faith and all its sequel to be the gift of the Holy Spirit, but for him the "Word" was the essential link in the chain of divine causality. Melancthon linked with the Word and the Spirit the co-operation of the human will. Calvin emphasized the internal testimony of the Holy Spirit as confirming the authority of the Spirit's utterance in Scripture. It is this emphasis on the Scriptural, in contrast with the predominantly "sacramental," conception of grace—i.e., the mediation of the Spirit through the "Word" of God—which gives to the Protestant doctrine its characteristic features. Quietism (Molinos) and Pietism (Spener and Francke) on the continent, Quakerism and Methodism in England, may all be viewed as a return to the emphasis on Christian experience and on the Holy Spirit as its direct interpretation, as against contemporary intellectualism. The modern appeal to Christian experience as the basis of theological reconstruction began with Schleiermacher, who, in accordance with his Sabellianizing doctrine of God, identified the Holy Spirit with the spirit of the Christian community.

The Modern Approach.—This brief summary of the history has shown that the orthodox doctrine of the nature of the Holy Spirit was substantially reached in the fourth century, as the result of the transference of the *hypostasis* doctrine of the Logos to the third "Person" of the Holy Trinity. On the other hand, the doctrine of the work of the Holy Spirit largely fell into the background till the Reformation. The Protestant emphasis on Christian experience as of "supernatural" origin was accompanied by such a contemporary development of philosophic thought as has made possible a new conception of the nature of Spirit. The static conception of "substance" gave place to the dynamic conception of "subject"; the experience of the (personal) "subject" reveals a unity of objective-subjective factors which may be held to imply both the transcendence and immanence of God. The larger outlook of the modern world on nature and history has given a new background to the activity of the Holy Spirit, and theologians are coming to realize that the special activity within Christian experience must be related to the whole working of the Spirit of God in the universe. The endeavour to recover the New Testament consciousness of a direct fellowship with God through Christ, in reaction from a too external emphasis on the authority of Bible or Church, is leading to doctrinal re-statement in the light of these new categories and data.

It may be argued that the real presence of God (as known through Christ) in the heart of the believer or the Christian community, implies the "personality" of Spirit (God as Spirit). Moral and religious surrender to God has this significant feature—the individuality of the believer is not absorbed, but raised to new powers when he is brought to say, "My life is hid with Christ in God." This suggests that at higher levels of personality or "Spirit" there may be inclusion without absorption, and that the individuality of the "Jesus of history" is not lost but raised to fulness of being in the exalted "Christ of experience." The Spirithood of God becomes the primary category for a doctrine of the God-head, unifying the divine purposes of creation, redemption and sanctification and the divine activities to these ends. We have no experience of triple-centred personality; but our own partial achievement of personality, marked by sociality as well as individuality, points forward to more inclusive and complex conceptions of Spirit which would safeguard the Christian "values" and justify

them ontologically—the values which were safeguarded by the ancient *hypostasis* doctrine. The formulation of such a conception is interwoven with the theological doctrine of mediation and the philosophical problem *par excellence*, i.e., the relation of time and eternity.

The doctrine of the Holy Spirit, therefore, is of the greatest importance to the Christian Church. It is the guarantee that Christian experience originates *ab extra* whilst involving the moral response of the believer. It links that experience with its historical origin in the Person and Work of Christ whilst guaranteeing the continuity of Christian experience and the progressive and continuous character of revelation; it points to the ultimate nature of God. The transforming activity of spirit in man, by which new meanings and therefore new facts are created, suggests that some of the great problems of theology, such as those connected with the doctrine of Atonement, may find their solution in a more comprehensive and adequate doctrine of the Holy Spirit.

(H. W. R.)

HOLYSTONE, a soft kind of sandstone used by sailors for scrubbing and cleaning the decks of ships. The origin of the word is doubtful. Some authorities hold that it arose from the general practice of scrubbing the decks for Sunday service; while others think the name arises from the fact that the stone so employed is naturally porous and full of holes. A small flint or stone having a natural hole in it, and worn as a charm, is also called a holystone.

HOLY WATER, technically the water with which Christian believers sign the cross on their foreheads on entering or leaving church. The decretum of Gratian enjoins that it should be exorcized and blessed by the priest and sprinkled with exorcized salt. This rite is found in the Gelasian, Gregorian and other sacramentaries. In the East the water was blessed once a month; in the Latin Church it is now blessed every Sunday. In the 4th century in the East it was usual to wash the hands on entering the church (see **ABLUTION**). In the early church water was not expressly consecrated for baptisms and other lustrations.

HOLY WEEK, in the Christian ecclesiastical year the week immediately preceding Easter. The earliest allusion to the custom of marking this week as a whole with special observances is to be found in the *Apostolical Constitutions* (v. 18, 19), dating from the latter half of the 3rd century A.D. Abstinence from wine and flesh is there commanded for all the days, while for the Friday and Saturday an absolute fast is enjoined. Of the particular days of the "great week" the earliest to emerge into special prominence was naturally Good Friday. Next came the Sabbatum Magnum (Holy Saturday or Easter Eve) with its vigil, which in the early church was associated with an expectation that the second advent would occur on an Easter Sunday.

For details of the ceremonial observed in the Roman Catholic Church during this week, reference must be made to the *Missal* and *Breviary*. In the Eastern Church the week is marked by similar practices, but with less elaboration and differentiation of rite. See also **EASTER**, **GOOD FRIDAY**, **MAUNDY THURSDAY**, **PALM SUNDAY** and **PASSION WEEK**, and article "Holy Week" in the *Catholic Encyclopaedia*.

HOLYWELL (*Tre'fynnon*, well-town), a small town of Flintshire, north Wales, situated on a height near the left bank of the Dee estuary. Pop. of urban district (1921) 2,908. The

parish church (1769) has some columns of an earlier building, and a strong embattled tower. The remains of Basingwerk abbey (*Maes glas*, green field), partly Saxon and partly Early English, are near the L.M.S. station about 2 m. from the town. It was used as a monastery before 1119, and in 1131 Ranulph, earl of Chester, introduced the Cistercians. It was dissolved in 1535, but used in after years as a Roman Catholic burial place. Scarcely any traces remain of Basingwerk castle, an old fort. St. Winifred's well is a place of pilgrimage for Roman Catholics. The well itself is covered by a fine Gothic building, said to have been erected by Margaret, mother of Henry VII., with some portions of earlier date. In 1870 a hospice for poorer pilgrims was erected. There was some metalliferous mining in the region in the 19th century, though this has become relatively unimportant.

HOLYWOOD, a seaport of Co. Down, Ireland, on the east shore of Belfast Lough, $\frac{1}{2}$ m. N.E. of Belfast by rail. Pop. (1921) 4,035. A religious settlement, founded in the 7th century, later became a Franciscan monastery. Its site is marked by a church dating from the late 12th or early 13th century. A solemn league and covenant was signed here in 1644, and the document is preserved at Belfast. Holywood is now a residential area of Belfast.

HOLZ, ARNO (1863–1929), German writer, was born on April 26, 1863, at Rastenburg, East Prussia, son of a chemist. At the age of 12 he went to Berlin. His early lyric poetry attracted considerable attention, but his principal work, undertaken often in collaboration with J. Schaf, has been critical. In *Die Kunst, ihr Wesen und ihre Gesetze* (1890–92) Holz really inaugurated the German impressionist school. In his *Revolution der Lyrik* (1899) he rejected rhyme, strophe and rhythm and all verbal music, maintaining that poetry must live by its meaning alone. His two volumes *Phantasia* (1898–99) were written on this theory. Holz's original work, which includes verse, fiction and numerous dramas, fell short of greatness, but he exercised a notable influence on the entire current of German literature. His collected works were published in 10 vols. (1924–25) and in 12 vols. (1926). He died at Berlin on Oct. 25, 1929.

HOLZMINDEN, a town of Germany, in the republic of Brunswick, on the Weser, at the foot of the Solinger Mountains, 56 m. S.W. of Brunswick. Pop. (1925) 12,192. It obtained municipal rights from Count Otto of Eberstein in 1245, and in 1410 it came into the possession of Brunswick. The town depends on agriculture, the manufacture of iron and steel wares, and of chemicals and artificial manures. There are also polishing-mills for sandstone. It has river trade on the Weser.

HOLZTROMPETE (Wooden Trumpet), an instrument somewhat resembling the Alpenhorn (*q.v.*) in tone-quality, designed by Richard Wagner to represent the natural pipe of the peasant in the performances of *Tristan und Isolde* at Bayreuth, but since 1891 superseded by W. Heckel's clarina, an instrument partaking of the nature of both oboe and clarinet.

HOMAGE, one of the ceremonies used in the granting of a fief, and indicating the submission of a vassal to his lord. It could be received only by the suzerain in person. With head uncovered the vassal humbly requested to be allowed to enter into the feudal relation; he then laid aside his sword and spurs, ungirt his belt, and kneeling before his lord, and holding his hands extended and joined between the hands of his lord, uttered words to this effect: "I become your man from this day forth, of life and limb, and will hold faith to you for the lands I claim to hold of you." The oath of fealty, which could be received by proxy, followed the act of homage; then came the ceremony of investiture, either directly on the ground or by the delivery of a turf, a handful of earth, a stone, or some other symbolic object. Homage was done not only by the vassal to whom feudal lands were first granted but by every one in turn by whom they were inherited, since they were not granted absolutely but only on condition of military and other service. An infant might do homage, but he did not thus enter into full possession of his lands. The ceremony was of a preliminary nature, securing that the fief would not be alienated; but the vassal had to take the oath of fealty, and to be formally invested, when he reached his majority. The obligations

involved in the act of homage were more general than those associated with the oath of fealty, but they provided a strong moral sanction for more specific engagements. They essentially resembled the obligations undertaken towards a Teutonic chief by the members of his *comitatus* or *gefolge*, one of the institutions from which feudalism directly sprang. Besides *homagium ligeum*, there was a kind of homage which imposed no feudal duty; this was *homagium per paragium*, such as the dukes of Normandy rendered to the kings of France, and as the dukes of Normandy received from the dukes of Brittany. The act of liege homage to a particular lord did not interfere with the vassal's allegiance as a subject to his sovereign, or with his duty to any other suzerain of whom he might hold lands. (See FEUDAL LAWS.)

The word was formerly used of the body of tenants attending a manorial court, or of the court in a court baron (consisting of the tenants that do homage and make enquiries and presentments, termed a *homage jury*).

HOMBERG, WILHELM (1652–1715), Dutch natural philosopher, was born at Batavia (Java) on Jan. 8, 1652. He went to Europe in 1670, to study law at Jena and Leipzig, and in 1674 he became an advocate at Magdeburg. In that town he made the acquaintance of Otto von Guericke. He graduated in medicine at Wittenberg and settled in Paris in 1682. From 1685 to 1690 he practised as a physician at Rome; returning to Paris in 1691, he was elected a member of the Academy of Sciences and appointed director of its chemical laboratory. Subsequently he became teacher of physics and chemistry (1702), and private physician (1705) to the duke of Orleans. He died at Paris on Sept. 24, 1715. Homberg was not free from alchemical tendencies, but he made many solid contributions to chemical and physical knowledge, recording observations on the green colour produced in flames by copper, on the crystallization of common salt, on the salts of plants, on the saturation of bases by acids, on the freezing of water and its evaporation *in vacuo*, etc. Much of his work was published in the *Recueil de l'Académie des Sciences* from 1692 to 1714. The *Sal Sedativum Hombergi* is boracic acid, which he discovered in 1702, and "Homberg's phosphorus" (fused calcium chloride) is prepared by heating sal-ammoniac with quick lime.

HOMBURG-VOR-DER-HÖHE, a town in the Prussian province of Hesse-Nassau, situated at the foot of the Taunus Mountains, 12 m. N. of Frankfurt-on-Main, by rail. Pop. (1925) 16,287. Homburg consists of an old and a new town; the latter was founded by the landgrave of Hesse-Homburg Frederick II. (d. 1708), and came into repute as a watering-place in 1834. On a neighbouring hill stands the palace of the former landgraves, built in 1680. The White Tower is said to date from Roman times, and certainly existed under the lords of Eppstein, who held the district in the 12th century. There are eight mineral springs. The industries embrace iron founding and the manufacture of leather, sugar, biscuits and hats. The prosperity of the town is largely due to the annual influx of visitors. In the neighbourhood lies the ancient Roman castle of Saalburg.

Homburg is also the name of a town in the Saar territory of Bavaria. Pop. (1925) 10,054. It manufactures iron goods. In the neighbourhood are the ruins of the castles of Karlsberg and of Hohenburg. The town came into the possession of Zweibrücken in 1755 and later into that of Bavaria.

HOME, EARLS OF. Alexander Home or Hume, 1st earl of Home (c. 1566–1619), was the son of Alexander, 5th Lord Home (d. 1575), who fought against Mary, queen of Scots, at Carberry Hill and at Langside, but was afterwards one of her most stalwart supporters, being taken prisoner when defending Edinburgh castle in her interests in 1573 and probably dying in captivity. He belonged to an old and famous border family, an early member of which, Sir Alexander Home, was killed at the battle of Verneuil in 1424. Sir Alexander (d. 1491) was created a lord of parliament as Lord Home in 1473, being one of the band of nobles who defeated the forces of King James III. at the battle of Sauchieburn in 1488.

Alexander 6th Lord Home (d. 1619) was warden of the east marches, and was often at variance with the Hepburns, a rival

border family whose head was the earl of Bothwell. Home accompanied James to England in 1603 and was created earl of Home in 1605; he died in April 1619.

His son James, the 2nd earl, died childless in 1633 when his titles passed to a distant kinsman, Sir James Home of Coldingknows (d. 1666), a descendant of the 1st Lord Home. This earl was in the Scottish ranks at the battle of Preston and lost his estates under the Commonwealth, but these were restored to him in 1661. His descendant, William, the 8th earl (d. 1761) fought on the English side at Preston, and from his brother Alexander, the 9th earl (d. 1786), the present earl of Home is descended. In 1875 Cospatrik Alexander, the 11th earl (1799-1881), was created a peer of the United Kingdom as Baron Douglas, and his son Charles Alexander, the 12th earl (1834-1918), took the additional name of Douglas. The principal strongholds of the Homes were Douglas castle in Haddington and Home castle in Berwickshire.

See H. Drummond, *Histories of Noble British Families* (1846).

HOME, DANIEL DUNGLAS (1833-1886), Scottish medium, was born near Edinburgh, March 20, 1833, his father was said to be a natural son of the 10th earl of Home. He went with his mother to America, and on her death was adopted by an aunt. In the United States he came out as a spiritualistic medium, though he never sought to make money out of his exhibitions. In 1855 he came to England and gave numerous séances, which were attended by many well-known people. Robert Browning gave his impression of Home in the unflattering poem of "Sludge the Medium" (1864). Home had many disciples, and gave séances at several European courts. He became a Roman Catholic, but was expelled from Rome as a sorcerer. Home published two volumes of *Incidents of my Life and Lights and Shadows of Spiritualism*. He died at Auteuil, France, on June 21, 1886.

HOME, JOHN (1722-1808), Scottish dramatic poet, was born at Leith. Graduating M.A. at Edinburgh university he was licensed to preach by the presbytery of Edinburgh in 1745. In July 1746 Home was presented to the parish of Athelstaneford, Haddingtonshire. His first play, *Agis: a tragedy*, founded on Plutarch, was rejected by Garrick. The ballad of *Gil Morrice* or *Child Maurice* (F. J. Child, *Popular Ballads*, ii. 263) supplied him with the outline of the simple and striking plot of *Douglas*, on which he spent five years' labour. The play was rejected by Garrick, but was produced in Edinburgh on Dec. 14, 1756 with overwhelming success, in spite of the opposition of the presbytery, who summoned Alexander Carlyle to answer for having attended its representation. Home wisely resigned his charge in 1757, after a visit to London, where *Douglas* was brought out at Covent Garden on March 14. Peg Woffington played Lady Randolph, a part which found a later exponent in Mrs. Siddons. Gray said that the author "seemed to have retrieved the true language of the stage," but Samuel Johnson held aloof from the general enthusiasm. Home died at Merchiston Bank, near Edinburgh, on Sept. 5, 1808.

The Works of John Home were collected and published by Henry Mackenzie in 1822 with "An Account of the Life and Writings of Mr. John Home." Poems omitted from this edition are printed in vol. ii. of *Original Poems by Scottish Gentlemen* (1762). See also Sir W. Scott, "The Life and Works of John Home" in the *Quarterly Review* (June, 1827). *Douglas* is included in numerous collections of British drama.

HOME ECONOMICS. This is a phrase now widely used in the United States to describe a subject of study which would in the past have been called "domestic economy." The range of types of the teaching of home economics is wide, as the subject is taught in elementary schools, high schools, vocational schools, private schools for girls, technical schools, colleges, universities and schools or colleges for teacher training. A further type of teaching is offered by the extension service of the U.S. department of agriculture, the home economics staff (women) doing their work through lectures, demonstrations, printed matter and the training of local leaders. This extension work is done chiefly in rural districts, but in some States there is similar work in cities. The vocational work is under the direction of the Federal board of vocational education.

In the institutional field the opportunities are many. Hospitals, sanitoriums, homes for the aged or for children, homes for the handicapped, such as the blind and crippled, employ "dietitians," "dietitian"-housekeepers or housekeepers trained in home economics. Private schools employ "dietitians," housekeepers and matrons so trained. All these positions are usually resident. Tea-rooms, cafeterias and restaurants employ many trained women in different capacities and are frequently owned by women. Many social welfare organizations, such as charity organization societies, have home economics departments, and these, as well as some hospitals, employ trained women as "visiting housekeepers." They are employed also in health centres, social settlements and other welfare enterprises.

Training for work as budget consultant is part of home economics, and such specialists are employed by banks, welfare organizations and a few department stores. A few are established privately as budget consultants. Women's magazines and some newspapers have home economics workers, often specialists in one or another part of the field.

Those who have done advanced work in physiological chemistry, textile chemistry or some other branch of science with applications to home economics, may do laboratory or research work. Manufacturing and distributing firms whose product is food or household equipment employ trained home economics women as an adjunct to the advertising department. This staff plans the educational work of the firm, plans and prepares leaflets and matter for advertising pages, and co-operates with the advertising department to make sure that all information given to the public is accurate and helpful. Advertising firms sometimes employ a home economics woman for service to their clients, and this may include speaking over the radio, which is popular as a means of advertising foods and household equipment.

For the work described, professional training is necessary. Some women not so trained are now employed in some of the fields other than teaching, but the necessity for training is recognized more each year, so that it is increasingly difficult for a woman with inadequate or no training to secure and hold such positions.

(I. E. L.)

HOME OFFICE: see GOVERNMENT DEPARTMENTS.

HOMER (*Ὅμηρος*), the traditional epic poet of Greece. The name is especially applied to the author of the two great epic poems, the *Iliad* and *Odyssey* (*ἡ Ἰλιάς πόησις, ἡ Ὀδυσσεύς πόησις*), which were recited or performed by rhapsodes at the Panathenaea at Athens, every four years during the classical period. An analysis of their contents will be found under the title HOMERIC POEMS, together with an account of the rest of the Homeric cycle.

The great books which come from an age before literary record are sometimes anonymous, like the Eddas, sometimes attributed to famous figures in the tradition, as the Psalms in mass to David and the Pentateuch to Moses, sometimes to a definite but unknown person, as the *Chanson de Roland* to Thorold, sometimes to gods or mythical characters, like the poems in Book X. of the *Rigveda*. The special difficulty about Homer is that, whereas David and Moses have an independent existence, whether or no they wrote the works ascribed to them, Homer has not: he is nothing but the author of the Homeric Poems. The poems are facts and "Homer" a hypothesis to account for them.

Lives of "Homer."—There are indeed certain traditional "Lives of Homer." Eight are published in the Oxford text of Homer, vol. 5, together with the *Contest of Homer and Hesiod*. The longest and best is composed in Ionic Greek under the name of Herodotus. The dates of these lives are hard to determine, particularly since the latest may contain nuclei of ancient tradition. But it seems likely that the demand for a life of Homer arose at least as early as the general interest in literary biography in Greece, i.e., about the time of Aristotle; and that, when it arose, there was no material for satisfying it beyond romance and conjecture. The existing lives seem to be made up out of deductions from certain passages in the Homeric poems and from proverbs and popular verses. The Lives quote many of these, sometimes lines about particular places—Smyrna and Kyme (Epigr. iv.), Erythrae (Epigr. vi., vii.), Mt. Ida (x.), Neon Teichos

(i.), sometimes about particular trades or occupations—potters, sailors, fishermen, goatherds, etc. The verses are attributed to Homer, and occasions are invented for his uttering them. Similarly various characters in the epics, Mentos, Mentor, Tycheus etc., are explained as real persons whom he rewarded or punished by putting them into his books. There is romance in the conception of the divine poet, blind, old and poor, wandering from city to city; and it may well be real history which, amid the many varying stories, always brings Homer from Ionia, and almost always from that part of Ionia which was originally Aeolic.

Seven cities are recorded as claiming to be Homer's birthplace: "Smyrna, Chios, Colophon, Salamis, Rhodes, Argos, Athenae," but it is not always the same seven. Kyme, Ithaca, Ios, Pylos come in some lists, while Sparta, Egypt and Babylon also compete. Many of these fall away as obvious inventions; Sparta comes from the Lycurgus romance; Egypt and Babylon belong to the conception of Homer as "all-wise," full of the learning of the east. Smyrna and Chios have the most support, followed by Kyme and Colophon.

As to Homer's date, the pseudo-Herodotean *Life* puts his birth at 1102 B.C. Elsewhere the estimates vary from 685 B.C. (the historian Theopompus) to 1159 B.C. (certain authorities in Philostratus). Herodotus considers that "Homer and Hesiod" made the Greek pantheon "not more than 400 years before me": i.e., about 830. Aristarchus puts his floruit at 1044 B.C. These dates seem to be based on the date of the Trojan War and a conjecture of Homer's relation to it.

Sometimes one can place a poet's date and nationality by his dialect. But the Homeric dialect has no contemporary parallel by which it can be judged, and as it comes to us in the poems is clearly not a dialect that was ever spoken, but one created by the epic tradition, and even by the hexameter metre, for its own purposes. In the main it is an Ionic dialect, like an early stage of that written by Herodotus; but the surface of the poems has been unconsciously Atticized, an inevitable result of the Panathenaic recitation and the Athenian book trade. When this surface corruption is removed we find many non-Ionic forms which have all the appearance of being Aeolic—the dialect of Thessaly, Lesbos and Aeolis. It is also clear that, where two forms are metrically equal, the Ionic form is generally preferred.

This would seem, by all analogy, to show that either the poem itself or at any rate the poetry which created the Epic dialect, had once been Aeolic, just as the people of Smyrna, Chios and the neighbourhood had. (The phenomenon is not uncommon in traditional poetry. Thus the English poem, Sir Degrevant, is shown to be taken over from a Norman original by the fact that, while the hero is normally called Degrevaunt, and of course remains so when required to rhyme with "avenaunt," "recreaunt," he becomes "Degrivauns" when he has to rhyme with "countenauns" and "Frauns." In Norman, "Degrevans" was nominative and "Degrevant" accusative.)

But beneath both the Ionic main stream and the Aeolic incidents there is an element of very old Greek, comprising many expressions which were not understood in classical or Alexandrian times, and many more which needed a commentary (*ἀμεινὰ κάρηνα, διάκτορος ἀργειφόντης*). What is more remarkable, there are some forms (such as *ῥάναξ, πτόλις, κέραμος*) which are found in Cyprian and Arcadian, and nowhere else. That is, they belong to the ancient undivided language which survived in these two isolated and mutually remote dialects. The problem may be raised whether the Homeric dialect does not contain an element of the pre-Greek language of the Aegean, derived perhaps from pre-Homeric Minoan poetry. Doubtless there is such an element but it does not seem noticeably stronger in Homeric than in classical Greek (cf. Haber, *De Lingua antiquissimorum Graeciae Incolarum*, 1921.)

The Text of the Poems.—These observations, which seem at first sight so confusing, nevertheless yield a result. The man "Homer" cannot have lived in six different centuries nor been born in seven different cities; but Homeric poetry may well have done so. The man cannot have spoken this strange composite

epic language, but the poetry could and did. Let us turn back therefore from the unknown man to the known book.

The works of Homer "and no other poet" (Lycurg. in Leocr. p. 209) were recited at the Panathenaea in accordance with a law attributed variously to "our ancestors," Solon, Hipparchus or Peisistratus. The "works" were the *Iliad* and *Odyssey*. They had to be recited *ἐξ ὑποβολῆς* or *ἐξ ὑπολήψεως*, i.e., by giving or taking a cue; there was a fixed order, so that where one man left off another began. The custom continued at least to the times of the author of the pseudo-Platonic dialogue *Hipparchus*, and seems to have started with the foundation or re-foundation of the Panathenaea by Peisistratus.

If there was a fixed order, there must have been something like a written text; and as a matter of fact we find in the scholia an accepted tradition, supported by certain corruptions in the text, that the poems were once written in the old Attic alphabet, an archaic and awkward script with no double letters or long vowels. This tradition has been considered incredible on the grounds that the new, or Ionic, alphabet was used in Athens for literary purposes from very early times, the old script being purely for official documents; that Homer must have come to Athens in Ionic script; and finally that several passages in tragedy which describe the writing of heroic times always take the Ionic script for granted. (Eurip. *Theseus*, fr. 382 N.; Agatho fr. 4, Achaëus fr. 33, Theodectes fr. 6.) The conclusion seems to be that, if the Panathenaic text of the *Iliad* and *Odyssey* was ever written in the old Attic script, it must have been an official document, drawn up by order of the state.

There is some evidence that this was so. A tradition which Wolf described as *vox totius antiquitatis* speaks of a text or an arrangement, or recension, of the works of Homer by Peisistratus, tyrant of Athens between 560 and 527 B.C. The oldest witness is one Dieuchidas of Megara in the fourth century B.C., to whom may perhaps be added the Aristotelian Dicaearchus and the grammarian Crates, who founded the art of *grammatike* in Rome. (He was detained there by breaking his leg when on an embassy from Attalus II. to the Senate.) The clearest are writers of the early Roman period and various scholia and lexicographers. Cicero puts it that Peisistratus *primus Homeri libros, confusos antea, sic disposuisse dicitur ut nunc habemus* (is reported to have been the first to arrange in their present order the books of Homer, which were previously in confusion); Josephus says that Homer left nothing in writing; the poems were afterwards put together from the varying memory of different places; Suidas, the Lives, Eustathius and the Townley Scholia explain that Homer sang his poems *σποράδην*, "in a scattered way," as he travelled about, and that Peisistratus afterwards collected them. Pausanias, Aelian, Diogenes Laertius, mention or assume the tradition; indeed one may say that it is the accepted view of the grammarians with the exception of Aristarchus, who held that Homer himself was an Athenian.

Such authority is of course not conclusive. But there is very little of our grammatical record that has more ancient credentials, and even if there were no tradition at all, it is hard to conceive how the Panathenaic recitation could have been established without some editing of the poems, under the orders, presumably, of Peisistratus or his artistic son, Hipparchus.

There must then have been an authoritative Athenian text in the second half of the sixth century B.C. That is the earliest solid fact in the record of the Homeric poems. The curious thing is that this text did not maintain itself. There is little evidence affecting the text of Homer in the fifth century, after the fall of the Peisistratidae, but as soon as quotation becomes common, in the fourth and third centuries, it is clear that the current texts varied considerably both from one another and from our vulgate. Still more striking is the evidence of the early papyri, numbering about 200 which have been discovered since 1890. Eleven of these are earlier than 150 B.C.; the rest later. Roughly speaking those later than 150 B.C. generally agree with our present vulgate texts; of the eleven supposed to be earlier ten differ "wildly" from our vulgate and one (Pap. Ox. 1388), has proved to be later.

The Establishment of the Text.—Evidently something happened about 150 B.C. which reduced the current texts of Homer from disorder into order, and the grammatical tradition enables us to see what it was. It was about 150 B.C. that the famous Aristarchus of Samothrace, then head of the Alexandrian library, published the edition, or rather the two successive editions, of the text of Homer which were afterwards recognized as authoritative. This fact was for long obscured by the language of the scholia, which dwell on Aristarchus's extreme "caution" (*εὐλάβεια*) in treating the text and often seem to be in doubt what his reading really was. When he does not "condemn" a spurious line, that normally means that it had not yet made its way into the text. But it is clear that his caution did not prevent conjectures and large condemnations; and the occasional uncertainty as to his reading only shows that the current texts a few generations afterwards were not infallible and could not be trusted without further question. It seems probable, especially after the recent work of Caer, Wecklein and Bolling, that the present vulgate text was approximately, at any rate, the text of Aristarchus. It is still disputed how far he created that text, and whether it is really some old text—that of Peisistratus, or even of Homer himself—re-established by the great critic out of the mss. which he collected.

It seems clear that from the time of Aristotle and Aeschines on to that of the earliest papyri the texts of Homer were in an extremely fluid state. (Aristotle for example cites from Homer five completely unknown phrases or passages; he quotes many passages in a strange shape; he found several passages not where we have them but in another context; and in order to show how short a *resumé* can be he remarks that Odysseus' story to Penelope in *Od.* xxiii. "occupies only 60 lines," while in our texts it only occupies thirty-three.) The first great Alexandrian scholar, Zenodotus of Ephesus (b. 325) set himself vigorously to cope with this confusion. He rejected freely passages which he thought spurious, and probably he found mss. which were considerably shorter than ours. He had not reached the wonderful knowledge of Homeric idiom which was the distinction of Aristarchus; but he had the advantage of catching the text at an earlier stage, and thus was spared some interpolations which had not yet been made, while he preserved many ancient readings and forms (*φή κίματα* B 144, *δαῖτα* A 5, *κυνύλαγμον* Φ 575, *ἀψ' ἀπὸ Φωκίων* γ 307). His text must have been at least a thousand lines shorter than that of Aristarchus, and it was his vigorous pioneer work which made the "caution" of Aristarchus possible (see *infra*, "Study of Homer in Antiquity").

The Poems Before Aristarchus.—We find thus two stages of something like *terra firma* in the history of the Homeric text: the present vulgate, established (approximately) by a process which set in about 150 B.C. and was probably due to Aristarchus. Before that a long period of uncertainty, and then earlier, about 550 B.C., the so-called "Peisistratean recension," by which we can only mean the text in the old Attic script which was composed or used for the purposes of the Panathenaic recitation. This is the earliest stage of which we have any record; any suggestion about the previous history of the poems must rest on conjecture, and conjecture supported by little external evidence. Yet it is clear that the year 550 B.C. is an extremely late stage in the history of the Homeric poems, or at least of Homeric poetry. As in almost all departments of Greek literature only the latest growth was preserved; the last stage of the epic like the last of choric poetry, and the last of tragedy. We can at best try by different roads to pierce into this darkness.

1. Were the poems recited elsewhere before they came to Athens? It would seem at first sight probable. There certainly was a good deal of epic recitation; but of the *Iliad* and *Odyssey* no public recitation is recorded, and it is noteworthy that when Zenodotus and Aristarchus ransacked the Greek world for mss. they seem never to have lit on any fragment of a pre-Peisistratean ms. No Ionic *Iliad* or *Odyssey* seems to have been in existence in the third century B.C. This seems to show either that the poems had not been committed to writing before they came to Athens,

or else that the poems written in Ionic, and recited for many generations at Ionian gatherings, were in some way completely outshone and driven out of the market by the Attic poems. At any rate there is no trace of an earlier written text of the *Iliad* or *Odyssey* as we know them.

2. For what occasion can the poems have been intended? As epics for reading they are wonderful, yet it seems certain that there was no large reading public in Greece in the sixth century B.C., much less in that far more remote period when Homeric poetry first took shape. As lays for ordinary recitation they are not suitable. A recitation ought not to last more than an hour or two, but the *Iliad* would last about twenty hours. And the poems are decidedly unities; they are not strings of separate lays or cantos. They absolutely refuse to fall apart into separate lays, as is proved by the subsequent history of Lachmann's famous attempt to make them do so. There were rhapsodes reciting Homeric poetry all over Greece in the sixth century; we hear of them at Sicyon, Sparta and Syracuse. But they can hardly have been reciting the *Iliad* and *Odyssey*. Those gigantic wholes must have been meant for some very great and rare occasion, such, for example, as the Panathenaea—the solemn gathering of all the Ionian cities to their Metropolis once every four years. If the poems were first written down in the time of Peisistratus it may well be that they first received their present form at that time. Indeed such would be the natural conclusion. For the rhapsode, at each performance that he gave, regularly drew both upon his memory and his invention. He knew the style, the language and the facts, and could begin his recitation from any point he chose, as bards in the *Odyssey* do. (*τῶν ἀμύθεν γε, Od. i. 10, ἐνθεν ἔλων, Od. viii. 500.*) For the new Pan-Athenian festival which he was founding Peisistratus would naturally have a special version or arrangement made.

3. Thus we cannot be certain that the poems in their present form existed before the sixth century, but we can be quite certain that everything but the form is vastly older. By form is here meant the selection and arrangement of the incidents. The subject matter, the language used in describing it, the poetical style, and above all the manners and customs of the society depicted belong to an age which can in part be dated and in part reaches back to the dimmest antiquity.

Internal Evidence.—In facing this problem the first thing to realise is that the poet is not naively describing the world as he himself knew it, but, like almost all narrative poets after him, describing with deliberate artistic purpose a long past age which he knew from earlier poets and from tradition. This is shown not merely by the occasional contrast between the heroes and "men as they now are" (*οἶοι νῦν βροτοὶ εἶσι, cf. Il. xii. 14 sqq. xx. 302 sqq.*), but much more by the fact that a number of customs are mentioned in metaphors and similes which are carefully excluded from the narrative itself.

Thus in the narrative there are no trumpets, no garlands, no eating of fish (except by starving men, *Od. xii. 331, iv. 368*), fowl, vegetables, milk or boiled meat; but most of these things were evidently known to the poet and occur in similes or descriptions. Paintings are not mentioned, nor yet coins; a statue, and a sitting statue, is once implied but not directly mentioned (*Il. vi. 303*); the art of writing is left doubtful, but any direct mention of it is skilfully avoided and the scholiasts left to take divergent views (*Il. vi. 168, vii. 175 with schol.*). Cavalry is never mentioned (*Od. xviii. 263*) though riding is known: the use of cavalry was extremely old, but the chariot was more "heroic." In a similar archaizing spirit there is no mention of colonies, nor of the great "modern" Ionian trading cities like Miletus, just as there are no Dorians; yet the mask slips, for we hear of an old Sicilian woman (*Od. xxiv. 211, 366, 389*) possibly of a colony (*Od. x. 108 ? Artakia*), and a good deal about certain Heracleidae, who were the Dorian chieftains (*Il. v. 628, ii. 653*) and still more about their ancestor Heracles.

There are abundant "arts and crafts": a famous cup, brooches, belts, necklaces of amber and gold, stained ivory, ivory reins, and a shield from the divine smithy which surpasses the handi-

work of man, but is doubtless modelled on it. As to food, the scholiasts remark that "the heroes" took three meals a day, and each meal consisted of the roast flesh of the larger quadrupeds. The recurrent phrase "unspeakable flesh and sweet strong wine" (*κρέα ἄσπετα καὶ μέθυ ἡδύ*) betrays the admiration felt by a later generation for such heroic tastes. The dead are burned. The bale-fires make a vivid stain in the scenery of the epic. The Greeks had always the custom of burial, and had mostly not enough wood for pyres. The weapons are made of bronze (*χαλκός*).

Homer like Hesiod knows of a time when "black iron was not," except indeed as a material for tools, clubs, arrowheads and other easily workable objects. He knows, as Aristotle knew, that the classical Greek custom of the marriage-dowry was recent, and that in the old days "they bought their women" by giving bride-gifts (*ἔδνα*). It is wonderful how clearly these last three customs are realized, and how carefully the illusion is kept up. There is a slip in the use of a late proverb "iron of itself draws a man on" (*Od.* xvi. 294, xix. 13) where "iron" is used for "a weapon"; and once or twice the word *ἔδνα* is used as if it meant "dowry" (*Od.* i. 277, ii. 53, 196). But in the main the picture of the heroic age is wonderfully well maintained. The schools of bards must have had a fine training in the tradition, though we must remember also that our present text has passed under the eyes of many jealous critics before its final revision by Aristarchus.

For the fact is that the Scholia, or remains of ancient commentaries, with which the *Iliad* is richly provided and the *Odyssey* not deficient, are more occupied with the distinction of the Homeric from the non-Homeric (or "more recent") than with any other problem. Aristarchus and his disciples have lynx eyes for subtle points of language, belief and custom. It is no exaggeration to say that modern scholarship had no conception of many subtle uses of words in Homer until the Scholia to the ms. called Venetus A were published by Villoison in 1788. (E.g., that *φόβος* is "flight," *δέος* "fear," *τρεῖν* is "retire," not "to tremble," *θῦσαι* "to cense," not "to slaughter"; that *φράζω* is "to point out," not "to say," *σῶμα* is "a dead body"; *σχέδον* "near," not "almost," *πάλιν* "backwards," not "again," *τάχα* "quickly," not "perhaps," *γράφειν* "to scratch," not "write".) And the observation of customs was almost equally acute. The explanation seems to be clear. It is not to be supposed that either Peisistratus or Aristarchus had access to a flawless ms. many centuries old by which variations could be checked; but there were traditional texts and a traditional knowledge, both in the schools of bards and to a less extent among the critical public, by which all variations or new compositions could be tested and kept true to standard. It is most instructive to see how those remains of ancient epic which were not selected for the great recitation and thus fell into neglect break all the Homeric rules in language, verse and custom alike, while on the other hand they never approach, as many passages in Homer do, to the lyrical hexameters characteristic of the fifth century.

Study of Homer in Antiquity.—The critical study of Homer, that is, of the mass of epic literature concerned with the heroic saga, began in Greece, as Monro says, "almost with the beginning of prose writing." The first names recorded are those of Theagenes of Rhegium (6th century B.C.) and his pupil Metrodorus of Lampsacus. In the fifth century educated men from the impoverished islands and cities of Ionia sought a living in Athens by teaching literature and especially Homer. A typical instance is the adventurer Stesimbrotus of Thasos. From this time onward the study of Homer was a regular feature of Greek *mousike*.

It is noteworthy that, from the very first, exegesis took two forms: explanation of the *glossae*, or hard words, and allegorical interpretation and justification of the subject matter. The principle set out in the *Homeric Problemata* of Heraclitus (1st century A.D.) "If Homer used no allegory he committed all impieties" (*εἰ μὴδὲν ἠλληγόρησεν πάντα ἡσέβησεν*) was, as one can see from Plato, accepted early, and regarded as a natural thing. On this system Hera was the Air (*ἠρ-α=α-ἠρ*), the adultery of Ares and Aphrodite was the combination in the world of Strife and Love, and so on.

The interpretation of glosses is mentioned in Aristophanes, *Daitales frag.* 222, where a father asks his son the meaning of *κόρυμβα* and *ἀμένηνα κάρηνα*. Many strange interpretations, recorded in the Scholia as coming from "the glossographi" serve to illustrate these painful beginnings of the science of *grammatike*. The phrase *νεκρούς κατατεθνηώτας* ("the dead corpses") was objected to as tautologous. "No," said the glossographi, *Νεκροὶ=νέρι*, "young men," with *κρ* "added for euphony." *Τοῖος* was interpreted as *ἀγαθός*, a meaning of course which it sometimes implies (*τοίου γὰρ καὶ πατρός Od.* iv. 206, and even *τοῖο γέροντος* as *ἀγαθοῦ γέροντος Il.* xxiv. 164). It is noteworthy that Aeschylus actually uses *τοῖος* as "good" (*Suppl.* 400), and so, it is said, did Callimachus.

Many individuals are recorded as having made a text of Homer. Probably it was a common thing for students and poets, such as Antimachus and Philetas, instead of buying a book from a shop, to write out their own text. We hear that Plato's library passed on eventually to the library at Alexandria, which may account for the close resemblance of the Homeric quotations in Plato to our vulgate. Aristotle makes many interesting criticisms on the poems from the aesthetic point of view, but seems to have had a text widely differing from ours. Among fourth-century critics was Zoilus Ὀμηρομάστιξ, who shocked public opinion by his attacks on Homer.

The first approach to a really scientific treatment of the poems was made by the great scholars of Alexandria, Zenodotus (d. 260? B.C.), Aristophanes of Byzantium (about 262-185) and Aristarchus of Samothrace, who resigned his post as head of the Alexandrian library in 137 B.C. The work of Zenodotus is still something hard to appreciate. We can see that the texts of Homer in his time fluctuated wildly and in order to establish a fairly "correct" text he had to cut his way boldly through a jungle. His rejections, as recorded in the scholia, are very extensive; his *Iliad* must have been very much shorter than the present vulgate. He frequently rejected passages for "unseemliness," *διὰ τὸ ἀπρεπές* (see below, "Expurgation"). We often hear of lines which Aristarchus or some later scholar doubted, but Zenodotus *οὐδὲ ἔγραψεν*. This used to be explained as a sign of his recklessness; but, as Professor Bolling of Ohio has pointed out, there has been, as far as our record reaches, a constant tendency to add lines to the Homeric text, and probably the statement that Zenodotus "did not even write" a line means that it did not exist in his day.

Zenodotus had nothing like Aristarchus's delicate and intimate knowledge of Homeric idiom: he thought that the dual (which had disappeared by his day) was merely another form of the plural; he was capable of such a metrical solecism as *προφανεῖσας ἰδῶν (Il.* viii. 378). On the other hand he seems often to have preserved ancient forms and readings which were rejected afterwards by Aristarchus (*ἄψ ἀπὸ Φωκῆων Od.* iii. 307; *φῆ=ῶς Il.* ii. 144, xiv. 499; *ἐπεὶ κυνλαγμὸν ἀκούσῃ Il.* xxi. 575).

Our knowledge of Aristarchus comes chiefly from the rich scholia to the Venetus A, first published by Villoison in 1788. They quote largely from four scholars Aristicus (Augustan era), Didymus (who wrote against Cicero *De Republica*), Herodian and Nicanor (2nd century A.D.). They are sometimes in doubt about Aristarchus's views, and evidently possessed no ms. which could be held as authoritative. We learn from them of his *σημεῖα* or signs, which frequently occur in the Venetus A itself. One would have expected, considering the very imperfect state of Greek *γράμματα* at the time, with no system of punctuation or even of dividing word from word, that any new "signs" would have been devoted to supplying this want; but Aristarchus's signs deal chiefly with the genuineness or spuriousness of particular lines. There was also a sign (*diple*, like a V on its side) to give the reference to a note; and another to call attention to mistakes of Zenodotus (*diple* with dots).
